To: Kyle Perata
Acting Planning Manager
Community Development, City of Menlo Park
701 Laurel St., Menlo Park, CA 94025
ktperata@menlopark.org

Hello Mr. Perata: Thank you for the opportunity to provide comments on the above-referenced draft environmental impact report (Draft EIR) on behalf of the San Francisco Public Utilities Commission (SFPUC).

A1-1 The proposed project includes the construction of a roundabout on the SFPUC's right-of-way (ROW) property and is described in the Draft EIR as follows: *At the southeast corner of the main Project Site, the Proposed Project would create a new four-legged roundabout at O'Brien Drive to accommodate site access and area circulation. This intersection would require realignment of O'Brien Drive where it passes through the roundabout. The southern half of the roundabout would then overlay the Hetch Hetchy right-of-way. The new roundabout would provide direct access to Main Street and East Loop Road.*

The Draft EIR states that the intersection design is still being developed; it may include a four-way signal-controlled intersection. Further, the Draft EIR states that the SFPUC must approve the use of its fee-owned ROW and the design of the intersection would be subject to review and approval by the City of Menlo Park and the SFPUC. Because this element of the proposal requires the approval of the SFPUC for the use of its ROW, the Draft EIR identifies the SFPUC as a "Responsible Agency".

In its analysis of potential land use impacts, the Draft EIR states that through adherence to the SFPUC's approval process, the Proposed Project would be consistent with SFPUC's "Right-of-Way Encroachment Policy" and result in a less-than-significant impact.

Thank you for disclosing this information; the SFPUC generally agrees with the Draft EIR analysis. For further clarification, the SFPUC provides the following comments:

A1-2

1. Rather than "SFPUC Right-of-Way Encroachment Policy", the Draft EIR should reference the following two policies (attached) regarding the SFPUC ROW:
   a. SFPUC Interim Water Pipeline Right of Way Use Policy for San Mateo, Santa Clara, and Alameda Counties (Approved January 13, 2015)

A1-2 cont. b. Amendment to the Right of Way Integrated Vegetation Management Policy (Approved January 13, 2015)

A1-3 2. Please be advised that pursuant to the above-referenced SFPUC ROW policies, the SFPUC does not allow third-parties to use SFPUC lands to fulfill any third-party development requirements or to use SFPUC lands to mitigate third-party project impacts. If the use of the SFPUC ROW were to be approved for the proposed project, the authorization would be through a revocable license or other agreement that the SFPUC could revoke if necessary for utility purposes. In addition, the SFPUC charges fair market value for the use of its ROW property by third parties.

A1-4 3. The SFPUC's approval process referenced in the Draft EIR is called Project Review. For more information about Project Review and to submit a Project Review Application, the Project Sponsor may visit the SFPUC's website: https://sfpuc.org/construction-contracts/lands-rights-of-way/project-review-and-land-use-bay-area

Again, thank you for the opportunity to comment on the environmental review document for the proposed project.

If you have any questions or need further information, please contact me.

Sincerely,

*Joanne Wilson*

# SFPUC Interim Water Pipeline Right of Way Use Policy for San Mateo, Santa Clara, and Alameda Counties

**Approved January 13, 2015**

**by**

**SFPUC Resolution No. 15-0014**

**as an amendment to the SFPUC Real Estate Guidelines**

# SFPUC Water Pipeline Right of Way Use Policy for San Mateo, Santa Clara, and Alameda Counties

As part of its utility system, the San Francisco Public Utilities Commission (SFPUC) operates and maintains hundreds of miles of water pipelines. The SFPUC provides for public use on its water pipeline property or right of way (ROW) throughout Alameda, Santa Clara, and San Mateo counties consistent with our existing plans and policies. The following controls will help inform how and in which instances the ROW can serve the needs of third parties—including public agencies, private parties, nonprofit organizations, and developers—seeking to provide recreational and other use opportunities to local communities.

Primarily, SFPUC land is used to deliver high quality, efficient and reliable water, power, and sewer services in a manner that is inclusive of environmental and community interests, and that sustains the resources entrusted to our care. The SFPUC's utmost priority is maintaining the safety and security of the pipelines that run underneath the ROW.

Through our formal Project Review and Land Use Application and Project Review process, we may permit a secondary use on the ROW if it benefits the SFPUC, is consistent with our mission and policies, and does not in any way interfere with, endanger, or damage the SFPUC's current or future operations, security or facilities.[1] No secondary use of SFPUC land is permitted without the SFPUC's consent.

These controls rely on and reference several existing SFPUC policies, which should be read when noted in the document. Being mindful of these policies while planning a proposed use and submitting an application will ease the process for both the applicant and the SFPUC. These controls are subject to change over time and additional requirements and restrictions may apply depending on the project.

The SFPUC typically issues five-year revocable licenses for use of our property, with a form of rent and insurance required upon signing.[2]

*Note: The project proponent is referred to as the "Applicant" until the license agreement is signed, at which point the project proponent is referred to as the "Licensee."*

---

[1] SFPUC Guidelines for the Real Estate Services Division, Section 2.0.
[2] SFPUC Guidelines for the Real Estate Services Division, Section 3.3.

## I. *Land Use, Structures, and Compliance with Law*

The following tenets govern the specifics of land use, structures, and accessibility for a project. Each proposal will still be subject to SFPUC approval on a case-by-case basis.

A. SFPUC Policies. The Applicant's proposed use must conform to policies approved by the SFPUC's Commission, such as the SFPUC's Land Use Framework (http://sfwater.org/index.aspx?page=586).

B. Americans with Disabilities Act Compliance. The Applicant must demonstrate that a Certified Access Specialist (CASp) has reviewed and approved its design and plans to confirm that they meet all applicable accessibility requirements.

C. Environmental Regulations. The SFPUC's issuance of a revocable license for use of the ROW is subject to compliance with the California Environmental Quality Act (CEQA). The Applicant is responsible for assessing the potential environmental impacts under CEQA of its proposed use of the ROW. The SFPUC must be named as a Responsible Agency on any CEQA document prepared for the License Area. In addition, the Applicant shall provide to SFPUC a copy of the approved CEQA document prepared by the Applicant, the certification date, and documentation of the formal approval and adoption of CEQA findings by the CEQA lead agency. The SFPUC will not issue a license for the use of the ROW until CEQA review and approval is complete.

D. Crossover and Other Reserved Rights. For a ROW parcel that bisects a third party's land, the Applicant's proposed use must not inhibit that party's ability to cross the ROW. The Applicant must demonstrate any adjoining owner with crossover or other reserved rights approves of the proposed recreational use and that the use does not impinge on any reserved rights.

E. Width. The License Area must span the entire width of the ROW.
   - *For example, the SFPUC will not allow a 10-foot wide trail license on a ROW parcel that is 60 feet wide.*

F. Structures. Structures on the ROW are generally prohibited. The Licensee shall not construct or place any structure or improvement in, on, under or about the entire License Area that requires excavation, bored footings or concrete pads that are greater than six inches deep.

   i. Structures such as benches and picnic tables that require shallow (four to six inches deep) cement pads or footings are generally permitted on the ROW. No such structure may be placed directly on top of a pipeline or within 20 feet of the edge of a pipeline.

   ii. The SFPUC will determine the permitted weight of structures on a case-by-case basis.

- *When the SFPUC performs maintenance on its pipelines, structures of significant weight and/or those that require footings deeper than six inches are very difficult and time-consuming to move and can pose a safety hazard to the pipelines. The longer it takes the SFPUC to reach the pipeline in an emergency, the more damage that can occur.*

G. Paving Materials. Permitted trails or walkways should be paved with materials that both reduce erosion and stormwater runoff (e.g., permeable pavers).

H. License Area Boundary Marking. The License Area's boundaries should be clearly marked by landscaping or fencing, with the aim to prevent encroachments.

I. Fences and Gates. Any fence along the ROW boundary must be of chain-link or wooden construction with viewing access to the ROW. The fence must include a gate that allows SFPUC access to the ROW.[3] Any gate must be of chain-link construction and at least 12 feet wide with a minimum 6-foot vertical clearance.

## II. *Types of Recreational Use*

Based on our past experience and research, the SFPUC will allow simple parks without play structures, community gardens and limited trails.

A. Fulfilling an Open Space Requirement. An applicant may not use the ROW to fulfill a development's open space, setback, emergency access or other requirements.[4] In cases where a public agency has received consideration for use of SFPUC land from a third party, such as a developer, the SFPUC may allow such recreational use if the public agency applicant pays full Fair Market Rent.

B. Trail Segments. At this time, the SFPUC will consider trail proposals when a multi-jurisdictional entity presents a plan to incorporate specific ROW parcels into a fully connected trail. Licensed trail segments next to unlicensed parcels may create a trail corridor that poses liability to the SFPUC. The SFPUC will only consider trail proposals where the trail would not continue onto, or encourage entry onto, another ROW parcel without a trail and the trail otherwise meet all SFPUC license requirements.

## III. *Utilities*

A. Costs. The Licensee is responsible for all costs associated with use of utilities on the License Area.

[3] SFPUC Right of Way Requirements.
[4] SFPUC Guidelines for the Real Estate Services Division, Section 2.0.

B. Placement. No utilities may be installed on the ROW running parallel to the SFPUC's pipelines, above or below grade.[5] With SFPUC approval, utilities may run perpendicular to the pipelines.

C. Lights. The Licensee shall not install any light fixtures on the ROW that require electrical conduits running parallel to the pipelines. With SFPUC approval, conduits may run perpendicular to and/or across the pipelines.

- Any lighting shall have shielding to prevent spill over onto adjacent properties.

D. Electricity. Licensees shall purchase all electricity from the SFPUC at the SFPUC's prevailing rates for comparable types of electrical load, so long as such electricity is reasonably available for the Licensee's needs.

## IV. *Vegetation*

A. The Applicant shall refer to the SFPUC Integrated Vegetation Management Policy for the *minimum* requirements concerning types of vegetation and planting. (http://www.sfwater.org/index.aspx?page=431.) The Licensee is responsible for all vegetation maintenance and removal.

B. The Applicant shall submit a Planting Plan as part of its application.

*(Community garden applicants should refer to Section VII.C for separate instructions.)*

i. The Planting Plan should include a layout of vegetation placement (grouped by hydrozone) and sources of irrigation, as well as a list of intended types of vegetation. The SFPUC will provide an area drawing including pipelines and facilities upon request.

ii. The Applicant shall also identify the nursery(ies) supplying plant stock and provide evidence that each nursery supplier uses techniques to reduce the risk of plant pathogens, such as Phytophthora ramorum.

## V. *Measures to Promote Water Efficiency*[6]

A. The Licensee shall maintain landscaping to ensure water use efficiency.

B. The Licensee shall choose and arrange plants in a manner best suited to the site's climate, soil, sun exposure, wildfire susceptibility and other factors. Plants with similar water needs must be grouped within an area controlled by a single irrigation valve

[5] SFPUC Land Engineering Requirements.
[6] SFPUC Rules and Regulations Governing Water Service to Customers, Section F.

C. Turf is not allowed on slopes greater than 25 percent.

D. The SFPUC encourages the use of local native plant species in order to reduce water use and promote wildlife habitat.

E. Recycled Water. Irrigation systems shall use recycled water if recycled water meeting all public health codes and standards is available and will be available for the foreseeable future.

F. Irrigation Water Runoff Prevention. For landscaped areas of any size, water runoff leaving the landscaped area due to low head drainage, overspray, broken irrigation hardware, or other similar conditions where water flows onto adjacent property, walks, roadways, parking lots, structures, or non-irrigated areas, is prohibited.

## VI. *Other Requirements*

A. Financial Stability. The SFPUC requires municipalities or other established organizations with a stable fiscal history as Licensees.

   i. Applicants must also demonstrate sufficient financial backing to pay rent, maintain the License Area, and fulfill other license obligations over the license term.

B. Smaller, community-based organizations without 501(c)(3) classifications must partner with a 501(c)(3) classified organization or any other entity through which it can secure funding for the License Area over the license term. Maintenance. The Licensee must maintain the License Area in a clean and sightly condition at its sole cost.[7] Maintenance includes, but is not limited to, regular weed abatement, mowing, and removing graffiti, dumping, and trash.

C. Mitigation and Restoration. The Licensee will be responsible, at its sole cost, for removing and replacing any recreational improvements in order to accommodate planned or emergency maintenance, repairs, replacements, or projects done by or on behalf of the SFPUC. If the Licensee refuses to remove its improvements, SFPUC will remove the improvements I at the Licensee's sole expense without any obligation to replace them.

D. Encroachments. The Licensee will be solely responsible for removing any encroachments on the License Area. An encroachment is any improvement on SFPUC property not approved by the SFPUC. Please read the SFPUC ROW Encroachment Policy for specific requirements. If the Licensee fails to remove encroachments, the SFPUC will remove them at Licensee's sole expense. The Licensee must regularly patrol the License Area to spot encroachments and remove them at an early stage.

---

[7] SFPUC Framework for Land Management and Use.

E. Point of Contact. The Licensee will identify a point of contact (name, position title, phone number, and address) to serve as the liaison between the Licensee, the local community, and the SFPUC regarding the License Agreement and the License Area. In the event that the point of contact changes, the Licensee shall immediately provide the SFPUC with the new contact information. Once the License Term commences, the point of contact shall inform local community members to direct any maintenance requests to him or her. In the event that local community members contact the SFPUC with such requests, the SFPUC will redirect any requests or complaints to the point of contact.

F. Community Outreach.

   i. Following an initial intake conversation with the SFPUC, the Applicant shall provide a Community Outreach Plan for SFPUC approval. This Plan shall include the following information:

      1. Identification of key stakeholders to whom the Applicant will contact and/or ask for input, along with their contact information;

      2. A description of the Applicant's outreach strategy, tactics, and materials

      3. A timeline of outreach (emails/letters mailing date, meetings, etc.); and

      4. A description of how the Applicant will incorporate feedback into its proposal.

   ii. The Applicant shall conduct outreach for the project at its sole cost and shall keep the SFPUC apprised of any issues arising during outreach.

   iii. During outreach, the Applicant shall indicate that it in no way represents the SFPUC.

G. Signage. The SFPUC will provide, at Licensee's cost, a small sign featuring the SFPUC logo and text indicating SFPUC ownership of the License Area at each entrance. In addition, the Licensee will install, at its sole cost, an accompanying sign at each entrance to the License Area notifying visitors to contact the organization's point of contact and provide a current telephone number in case the visitors have any issues. The SFPUC must approve the design and placement of the Licensee's sign.

## VII. *Community Gardens*

The following requirements also apply to community garden sites. As with all projects, the details of the operation of a particular community garden are approved on a case-by-case basis.

A. The Applicant must demonstrate stable funding. The Applicant must provide information about grants received, pending grants, and any ongoing foundational support.

B. The Applicant must have an established history and experience in managing urban agriculture or community gardening projects. Alternatively, the Applicant may demonstrate a formal partnership with an organization or agency with an established history and experience in managing urban agriculture or community gardening projects

C. During the Project Review process, the Applicant shall submit a Community Garden Planting Plan that depicts the proposed License Area with individual plot and planter box placements, landscaping, and a general list of crops that may be grown in the garden.

D. The Applicant shall designate a Garden Manager to oversee day-to-day needs and serve as a liaison between the SFPUC and garden plot holders. The Garden Manager may be distinct from the point of contact, see Section VI.E.

E. The Licensee must ensure that the Garden Manager informs plot holders about the potential for and responsibilities related to SFPUC repairs or emergency maintenance on the License Area. In such circumstances, the SFPUC is not liable for the removal and replacement of any features on the License Area or the costs associated with such removal and replacement.

F. The Licensee must conduct all gardening within planter boxes with attached bottoms that allow for easy removal without damaging the crops.

# AMENDMENT TO THE

# RIGHT OF WAY INTEGRATED VEGETATION MANAGEMENT POLICY

**Approved January 13, 2015**

**by**

**SFPUC Resolution No. 15-0014**

## 12.000 RIGHT OF WAY INTEGRATED VEGETATION MANAGEMENT POLICY

### 12.001 General

The San Francisco Public Utilities Commission ("SFPUC") is responsible for the delivery of potable water and the collection and treatment of wastewater for some 800,000 customers within the City of San Francisco; it is also responsible for the delivery of potable water to 26 other water retailers with a customer base of 1.8 million. **The following policy is established to manage vegetation on the transmission, distribution and collection systems within the SFPUC Right of Way ("ROW") so that it does not pose a threat or hazard to the system's integrity and infrastructure or impede utility maintenance and operations.**

The existence of large woody vegetation[1], hereinafter referred to as vegetation, and water transmission lines within the ROW are not compatible and, in fact, are mutually exclusive uses of the same space. Roots can impact transmission pipelines by causing corrosion. The existence of trees and other vegetation directly adjacent to pipelines makes emergency and annual maintenance very difficult, hazardous, and expensive, and increases concerns for public safety. The risk of fire within the ROW is always a concern and the reduction of fire ladder fuels within these corridors is another reason to modify the vegetation mosaic. In addition to managing vegetation in a timely manner to prevent any disruption in utility service, the SFPUC also manages vegetation on its ROW to comply with local fire ordinances enacted to protect public safety.

One of the other objectives of this policy is to reduce and eliminate as much as practicable the use of herbicides on vegetation within the ROW and to implement integrated pest management (IPM).

### 12.002 Woody Vegetation Management

1.0 Vegetation of any size or species will not be allowed to grow within certain critical portions of the ROW, pumping stations or other facilities as determined by a SFPUC qualified professional, and generally in accordance with the following guidelines.

1.1 Emergency Removal

SFPUC Management reserves the right to remove any vegetation without prior public notification that has been assessed by a SFPUC qualified professional as an immediate threat to transmission lines or other utility infrastructure, human life and property due to acts of God, insects, disease, or natural mortality.

1.2 Priority Removal

Vegetation that is within 15 feet of the edge of any pipe will be removed and the vegetative debris will be cut into short lengths and chipped whenever possible. Chips will be spread upon the site where the vegetation was removed. Material that cannot be chipped will be hauled away to a proper disposal site.

---

[1] Woody vegetation is defined as all brush, tree and ornamental shrub species planted in (or naturally occurring in) the native soil having a woody stem that at maturity exceeds 3 inches in diameter.

If vegetation along the ROW is grouped in contiguous stands[2], or populations, a systematic and staggered removal of that vegetation will be undertaken to replicate a natural appearance. Initial removal[3] will be vegetation immediately above or within 15 feet of the pipeline edges; secondary vegetation[4] within 15 to 25 feet from pipelines will then be removed.

1.3 Standard Removal

Vegetation that is more than 25 feet from the edge of a pipeline and up to the boundary of the ROW will be assessed by a SFPUC qualified professional for its age and condition, fire risk, and potential impact to the pipelines. Based on this assessment, the vegetation will be removed or retained.

1.4 Removal Standards

Each Operating Division will develop its own set of guidelines or follow established requirements in accordance with local needs.

2.0 All stems of vegetation will be cut flush with the ground and where deemed necessary or appropriate, roots will be removed. All trees identified for removal will be clearly marked with paint and/or a numbered aluminum tag.

3.0 Sprouting species of vegetation will be treated with herbicides where practicable, adhering to provisions of Chapter 3 of the San Francisco Environment Code.

4.0 Erosion control measures, where needed, will be completed before the work crew or contractors leave the work site or before October 15 of the calendar year.

5.0 Department personnel will remove in a timely manner any and all material that has been cut for maintenance purposes within any stream channel.

6.0 All vegetation removal work and consultation on vegetation retention will be reviewed and supervised by a SFPUC qualified professional. All vegetation removal work and/or treatment will be made on a case-by-case basis by a SFPUC qualified professional.

7.0 Notification process for areas of significant resource impact that are beyond regular and ongoing maintenance:

7.1 County/City Notification – The individual Operating Division will have sent to the affected county/city a map showing the sections of the ROW which will be worked, a written description of the work to be done, the appropriate removal time for the work crews, and a contact person for more information. This should be done approximately 10 days prior to start of work. Each Operating Division will develop its own set of guidelines in accordance with local need.

---

[2] A stand is defined as a community of trees possessing sufficient uniformity in composition, structure, age, arrangement, or condition to be distinguishable from adjacent forest communities to form a management unit.
[3] Initial removal is defined as the vegetation removed during the base year or first year of cutting.
[4] Secondary vegetation is defined as the vegetative growth during the second year following the base year for cutting.

7.2 Public Notification – The Operating Division will have notices posted at areas where the vegetation is to be removed with the same information as above also approximately 10 days prior to removal. Notices will also be sent to all property owners within 300 feet of the removal site. Posted notices will be 11- by 17-inches in size on colored paper and will be put up at each end of the project area and at crossover points through the ROW. Questions and complaints from the public will be handled through a designated contact person. Each Operating Division will develop its own set of guidelines in accordance with local needs.

**12.003 Annual Grass and Weed Management**

Annual grasses and weeds will be mowed, disked, sprayed or mulched along the ROW as appropriate to reduce vegetation and potential fire danger annually. This treatment should be completed before July 30 of each year. This date is targeted to allow the grasses, forbs and weeds to reach maturity and facilitate control for the season.

**12.004 Segments of ROW that are covered by Agricultural deed rights**

The only vegetation that may be planted within the ROW on those segments where an adjacent owner has Deeded Agricultural Rights will be: non-woody herbaceous plants such as grasses, flowers, bulbs, or vegetables.

**12.005 Segments of ROW that are managed and maintained under a Lease or License**

Special allowance may be made for these types of areas, as the vegetation will be maintained by the licensed user as per agreement with the City, and not allowed to grow unchecked. Only shallow rooted plants may be planted directly above the pipelines.

Within the above segments, the cost of vegetation maintenance and removal will be borne by the tenant or licensee exclusively. In a like fashion, when new vegetative encroachments are discovered they will be assessed by a SFPUC qualified professional on a case-by-case basis and either be permitted or proposed for removal.

The following is a guideline for the size at maturity of plants (small trees, shrubs, and groundcover) that may be permitted to be used as landscape materials. Note: All distance measurements are for mature trees and plants measured from the edge of the drip-line to the edge of the pipeline.

- Plants that may be permitted to be planted directly above existing and future pipelines: shallow rooted plants such as ground cover, grasses, flowers, and very low growing plants that grow to a maximum of one foot in height at maturity.
- Plants that may be permitted to be planted 15–25 feet from the edge of existing and future pipelines: shrubs and plants that grow to a maximum of five feet in height at maturity.
- Plants that may be permitted to be planted 25 feet or more from the edge of existing and future pipelines: small trees or shrubs that grow to a maximum of twenty feet in height and fifteen feet in canopy width.

Trees and plants that exceed the maximum height and size limit (described above) may be permitted within a leased or licensed area provided they are in containers and are above ground. Container load and placement location(s) are subject to review and approval by the SFPUC.

Low water use plant species are encouraged and invasive plant species are not allowed.

All appurtenances, vaults, and facility infrastructure must remain visible and accessible at all times. All determinations of species acceptability will be made by a SFPUC qualified professional.

**The above policy is for general application and for internal administration purposes only and may not be relied upon by any third party for any reason whatsoever. The SFPUC reserves the right at its sole discretion, to establish stricter policies in any particular situation and to revise and update the above policy at any time.**

Letter A2

# CITY OF EAST PALO ALTO
## Office of the City Manager

May 20, 2022

Kyle Perata, Acting Planning Manager
Community Development Department
City of Menlo Park
701 Lauren Street
Menlo Park, CA 94025

**Subject**: Notice of Availability for the Facebook Willow Master Plan Project

Dear Mr. Perata:

A2-1 This letter is provided in response to the Notice of Availability (NOA) for the Facebook Willow Master Plan Project. Thank you for providing an opportunity to comment. East Palo Alto values its relationship with Menlo Park and we hope to continue to work cooperatively on the many issues common to both of our communities.

The City commented on the Notice of Preparation on October 17, 2019, and incorporates those comments by reference.

A2-2 **Proximity to East Palo Alto Residential Neighborhoods**

The project site is in very close proximity to East Palo Alto residences, specifically three single family residential neighborhoods: Kavanaugh, University Village and Palo Alto Park. In some instances, the residences are within 300 feet of the site. Given the size of the project and the five-year construction time period, the City requests that equal consideration be given to these neighborhoods as Menlo Park neighborhoods. In some cases, these East Palo Alto neighborhoods would be more impacted by this project. The City has concerns about various impacts (described below) as well as air quality, biological resources, energy, geology and soils, greenhouse gas emissions, hazards and hazardous materials, and hydrology and water quality.

A2-3 **Proximity to the Ravenswood Priority Development Area and the Ravenswood/Four Corners Specific Plan Update**

The project site is located less than 2,000 feet from the Ravenswood Business District (RBD), which is a priority development area and an important jobs center for East Palo Alto. The City is in the process of updating the Specific Plan, which may include increasing the amount of both nonresidential and residential square footage. The Notice of Preparation for the update was released on May 9, 2022; however, the update has

A2-3 cont. been in process, including multiple public hearings, since mid-2020. While the Draft EIR includes the four projects proposed for the RBD area, the text does not acknowledge or discuss the RBD Specific Plan update. The Draft EIR should explicitly include in its analysis the RBD Specific Plan Update. Given the importance of the RBD area for East Palo Alto, that it is a designated priority development area and the pending update, the City is very concerned about the potential impact of the Willow Village project on the ability to develop the RBD area. Specifically, traffic impacts from the Willow Village would directly impact the RBD area.

A2-4 **Jobs Housing Ratio**

The City of East Palo Alto provides a significant amount of housing stock in Silicon Valley. East Palo Alto has more housing units than jobs, the lowest market rate prices in the region, and approximately 30% (or 2,405 of 7,759 units) of the total housing units are currently registered (non-exempt) in the Rent Stabilization Program. The City is concerned that the proposed development of a significant amount of nonresidential square footage would exacerbate the existing housing crisis in East Palo Alto.

A2-5 **Cumulative Impacts**

The Draft EIR tiers off the ConnectMenlo EIR prepared for the General Plan update. ConnectMenlo did not include East Palo Alto projects in the cumulative scenario due to a water moratorium that paused projects in East Palo Alto during the preparation of the DEIR. This DEIR includes a list-based approach for the cumulative analysis. The list used for the cumulative analysis is incomplete. It does not include two projects that were approved but not yet constructed (Clarum University and Sobrato Phase II) nor the RBD Specific Plan Update. Clarum University, located at 2331 University, was approved for the construction of a 47,594 square foot four-story mixed-use building with retail space and parking on the ground level and 33 residential dwelling units on the levels above the ground floor. The Sobrato Phase II project was approved for the demolition of two existing buildings and construction of an eight-story structure with approximately 231,883 square feet of office space and a five-story, 284,094-square-foot parking structure. The City respectfully requests that the DEIR analyze these three projects for cumulative and traffic impacts.

**Aesthetics**

A2-6 The Aesthetics analysis included the viewsheds from two locations within the City of East Palo Alto. The DEIR included a photosimulation which simulated potential views from the Kavanaugh View shed, one of three single family neighborhoods located within 300 feet of the project site. The photosimulation clearly shows the project will significantly alter middle ground views. Buildings over 70 feet in height would clearly be visible from the neighborhood. Although there are no identified scenic vistas, the project would change the character of the area with a significantly taller structures both for the project and cumulatively. The Draft EIR should be revised to incorporate mitigation to reduce the impacts on the viewshed to a less than significant impact.

A2-7 **Construction and Air Quality**

The DEIR identifies three significant unavoidable impacts for air quality. There are a significant number of sensitive receptors within the three East Palo Alto single-family neighborhoods near the perimeter of the project site. The DEIR states that extended construction hours are proposed over the five-year construction period. Work is proposed between 7:00 a.m. to 10:00 p.m. Monday through Saturday. Construction is also proposed on Sunday from 8:00 a.m. to 6:00 p.m. Although it is recognized that air quality issues are beyond the control of any one jurisdiction, the City is significantly concerned about the extended construction hours and five-year time period and the potential impact on East Palo Alto residents and sensitive receptors.

Mitigation Measures AQ 1.1, AQ 2b2 require that prior to the issuance of a building permit that the applicant provide a supplemental analysis by a qualified air quality specialist that the construction would not create air quality impacts that exceed Bay Area Air Quality Management District regulations and CEQA guidelines. Due to the potential direct impacts on East Palo Alto residents, the City requests that the mitigation measure also require submittal of the construction air quality analysis that includes analysis for East Palo Alto impacts be submitted for East Palo Alto review.

**Construction and Noise/Vibration impacts**

A2-8 The DEIR identifies three significant unavoidable impacts related to noise and vibration. As described above, there are three neighborhoods in the City of East Palo Alto that will be directly impacted. The City is significantly concerned due to the proximity of East Palo neighborhoods to the project.

Noise 1.1 and 2a require a construction noise control plan and a noise and vibration analysis to assess and mitigate potential noise and vibration impacts. The plan and analysis should be evaluated to prevent noise impacts on East Palo Alto neighborhoods. Activities that cannot comply with the noise limit of 60dBA at the residential or noise sensitive land use or exceed maximum level of 0.2 in/sec for vibrations should not be permitted. The City also requests to review the noise control plan and noise/vibration analysis prior to the issuance of a building permit.

**Settlement Agreement**

A2-9 Pursuant to Section 2.6 of the Menlo Park General Plan Settlement Agreement, when the preparation of an EIR is required, concurrent with the preparation of the EIR, Menlo Park will conduct a Housing Needs Assessment (HNA). The scope of the HNA, to the extent possible, shall include an analysis of the multiplier effect for indirect and induced employment by the development project and its relationship to the regional housing needs market and displacement. The DEIR includes a HNA in the appendix. The discussion in the DEIR should be consistent with all relevant terms of the Settlement Agreement. The City requests that a summary of the required analysis be incorporated into the DEIR

A2-10 **Population and Housing**

According to the DEIR main report and Housing Needs Assessment Appendix, the growth in units from the Proposed Project is estimated to result in a housing unit deficit of 815 regionally. The DEIR notes that because ABAG and MTC Plan Bay Area Projections 2040 incorporate growth under ConnectMenlo, cumulative impacts related to population and housing are less than significant. The ABAG/MTC housing projections are based on all future housing development, not concurrent development (to the Proposed Project), within Menlo Park and in the region. The regional balancing of jobs and housing from the Proposed Project and other similar projects will only occur if neighboring jurisdictions, including East Palo Alto, but also Palo Alto, Redwood City, and other cities within the commute area keep up with planned housing production, the evidence for which is lacking.

Of particular concern in the Housing Needs Assessment is the estimated number of Extremely-Low, Very-Low, and Low-Income units included in the net decrease in available housing in the region as a result of the Proposed Project: 127 Extremely Low, 270 Very Low, and 727 Low. Given that lower-income housing units have been, and continue to be, produced at much lower levels than above-moderate housing, with most jurisdictions in the region not meeting their lower-income Regional Housing Needs Allocations (RHNA), the deficit from this Proposed Project deserves particular attention.

Since not all new employees will seek housing in Menlo Park, it is estimated that induced employment from the Proposed Project will lead to employees seeking housing elsewhere, with an additional 26 employee households ultimately living in East Palo Alto. This very low number, particularly in combination with findings of the HNA that, "on balance, the analysis suggests the proposed Project would likely, at most, represent a minor contributing factor to the substantial pre-existing displacement pressures in East Palo Alto and Belle Haven," should be viewed with scrutiny to ensure that it is accurate.

**Public Services**

A2-11 East Palo Alto has significant concerns regarding the ability to provide public safety services. Traffic is already having an impact for public safety services post pandemic. Since returning to "normal" following the pandemic, and people returning to work, traffic has increased during commute hours, thus creating congestion throughout the city with traffic coming from Highway 84 to SR 101 in the morning and from SR 101 to Highway 84 in the afternoon. The traffic typically lasts for approximately 3 hours during the morning and afternoon. However, commuter traffic doesn't remain on University Avenue. The traffic spills into our neighborhoods which isn't fair to our residents who live and work in this area, as they must negotiate and navigate through traffic just to get home, pick up children from school or just conduct their daily lives.

During the afternoon, commuters use Pulgas Avenue, Clarke Avenue and Cooley Avenue as a cut through to Bay Road. They also use Euclid Avenue, to Glen Way via Runnymede Street to Bay Road as a cut through, and Dumbarton Avenue to Bay Road during the afternoon. The City already have narrow streets due to a high volume of parked vehicles and it is already difficult to navigate through these streets during peak commute times

A2-11 cont. while performing normal patrol duties. When an emergency occurs during commute times, getting the necessary emergency apparatus to the scene when time is of the essence always is a difficult task because of heavy traffic. There have been at least two occasions when a life flight (helicopter) had to be requested to transport trauma patients to Stanford Hospital (less than 5 miles away), because the commute traffic was so congested an ambulance couldn't get to the scene soon enough. Willow Village Project will add to the traffic congestion and traffic issues we already have with our existing commute traffic. With the potential of increased traffic resulting from this project, this will negatively impact our ability to provide efficient public safety services in a timely manner and thus negatively impact the safety and security of our residents.

**TDM and TMA**

A2-12 The City understands that the project will be required to prepare and implement a Transportation Demand Management program designed to reduce the number of vehicular trips. As noted above, traffic impacts are a regional issue that extend beyond individual city borders. The City of East Palo Alto recently adopted a TDM ordinance requiring that average daily trips be reduced by 40% and has been exploring the formation of a Transportation Management Association (TMA). There is an economy of scale for TDM measures and TMAs. The City requests that the project applicant be required to consult with the City of East Palo Alto to find opportunities to pool resources where feasible to reduce vehicular trips. This can include the formation of a TMA or measures such as coordinating or sharing shuttles or rideshare programs. This would benefit both the City of East Palo Alto and Menlo Park.

**Transportation**

A2-13 East Palo Alto's General Plan identifies a vision for University Avenue which is to transform it from a regional cut-through corridor to a mixed-use boulevard with high density housing and multi-model transportation options. The goal is to reduce traffic volumes, reduce traffic speeds, make the area desirable for pedestrians with wide sidewalks, streetscape improvements such as signage and street trees, and add multi-modal transportation options. The proposed Willow Village project will add a significant amount of traffic onto University Avenue - intersections will be beyond acceptable levels of service; there will be congestion during AM/PM peak hour, significant impacts at interchanges. These issues can be mitigated by design and construction of the University Avenue Improvements project (Grand Corridor) in East Palo Alto. Improvements along University Avenue will be vital and should be constructed alongside the Willow Village project.

Impacts at Kavanaugh Drive/O'Brien Drive should be studied further and a traffic signal/roundabout analysis should be performed. Any necessary improvements to this intersection should be a part of the Willow Village project.

Modification of existing dead-end cul-de-sacs into through streets will increase cut through traffic onto University Avenue. This will impact both O'Brien Drive, Kavanaugh Drive, Gloria Way, and Bay Road. Traffic safety and traffic calming improvements along these roads should be a part of the Willow Village project. These improvements may include roundabouts at intersections, radar speed feedback signs, lighting, ADA improvements, signage and striping, and bulb-outs.

In order to enforce traffic related impacts in the City of East Palo Alto, a traffic enforcement officer should be budgeted for the City of East Palo Alto for a few years upon project completion to ensure effectiveness of traffic controls.

The EIR should clearly identify show all of the fair-share calculation formulas for affected East Palo intersections.

Because several Menlo Park streets adjacent to the proposed project have restricted parking and Kavanaugh street in East Palo Alto does not, there is concern that overflow parking will spill into East Palo Alto streets. The applicant shall work with the City of East Palo Alto to address potential solutions to prohibit overflow parking onto City of East Palo Alto city-streets, primarily within the Kavanagh Drive/Gloria Way neighborhoods.

In order to ensure bike trail connectivity from the proposed project onto the Bay Trail as well as other trails in East Palo Alto, an analysis of bike trail connectivity should be performed and bike trails should be striped as a part of this project.

Cut through traffic along City of East Palo Alto city streets is a major potential concern with the implementation of this project. A cut-through traffic analysis should be performed and measures should be implemented to discourage cut through traffic within City of East Palo Alto neighborhood streets. Measures can include signage in both cities of Menlo Park as well as East Palo Alto.

A2-14

**Utilities and Service Systems**
Because the Kavanaugh Drive/Gloria Way neighborhoods in East Palo Alto are adjacent to the proposed project site, these streets should be improved aesthetically. Undergrounding of power lines in these neighborhoods can significantly improve aesthetics in and around the proposed project site.

There are drainage issues in the vicinity of the proposed project site that can be improved. Primarily, at the north end of Ralmar Avenue to 1170 O'Brien Drive, Menlo Park. There is occasional flooding of Ralmar street in East Palo Alto due to an inadequate drainage system. Collaboration is needed between Menlo Park and East Palo Alto to ensure a storm drain system can be constructed through 1170 O'Brien Drive to avoid flooding in the City of East Palo Alto.

A2-15

**Hydrology**
A detailed hydrology plan would show existing and proposed storm drain systems and drainage areas around the vicinity of the proposed project. This information would be useful to verify whether any of the storm drain systems in the City of East Palo Alto would be impacted. This information should be shared with the City of East Palo Alto when available.

A2-16 **Project Considerations and Concerns**
Since its incorporation in 1983, the City has struggled to achieve economic growth and financial sustainability, especially in comparison to other nearby communities. To address this reality, the City's leadership has ensured a strong focus on actions that strengthen the City's economic profile, with the ultimate goal of improving the lives and enhancing the well-being of East Palo Alto residents.

Staff is concerned that the Project may result in unintended financial consequences for the City of East Palo Alto. For example, it is expected that the Project will include a large grocery store, which is a beneficial amenity for the Belle Haven neighborhood and Menlo Park as a whole, but it is unclear how this store will benefit East Palo Alto. If a significant number of residents shop at this new store, the few smaller grocery stores in East Palo Alto may experience negative impacts to their businesses, and the City will
A2-17 receive decreased sales tax revenues. In addition, increased traffic created by East Palo Alto residents traveling to the new store will only worsen current traffic concerns.

A2-18 Staff is also concerned that the East Palo Alto Police Department could be impacted by an increase in calls for service, which would require the City of East Palo Alto to fund more police officers during a time when the City has a significant budget deficit.

A2-19 The Facebook/Meta expansion is located just feet away from the Cesar Chavez Ravenswood Middle School, which already experiences traffic congestion during common drop-off and pick-up hours. Staff hopes that Facebook/Meta and the City of Menlo Park will develop strategies to ensure that the Project does not impact the students, staff, and other community members connected to the middle school campus. It is not that long ago a tragic schoolgirl fatality occurred in this area.

A2-20 The greatest areas of concern for staff are the related issues of traffic and air quality, resulting from increased vehicle travelling through East Palo Alto to access to future Project. Staff hopes that Facebook/Meta and the City of Menlo Park will acknowledge these realities and partner with the City of East Palo Alto to consider necessary infrastructure projects that may be of mutual benefit.

A2-21 The City of East Palo Alto has a critical need for emergency-access water storage locations. As such, staff hopes that Facebook/Meta and Menlo Fire will collaborate to determine if water storage may be included in the Project's design, thus offering support to East Palo Alto residents during a potential emergency.

A2-22 In conclusion, the City values its relationship with the City of Menlo Park and Facebook/Meta, yet many aspects of the Project raise concerns that may impact the City of East Palo Alto's goal of achieving financial self-sufficiency and economic growth for our residents. However, an effective partnership between the City of Menlo Park, Facebook/Meta, and the City of East Palo Alto may successfully mitigate these concerns, thus ensuring that all three entities thrive in the future. The City would be eager to engage in these discussions.

Sincerely,

Patrick Heisinger

**Re: Willow Village Master Plan Project Draft Environmental Impact Report (DEIR)**

Dear Kyle Peralta:

Thank you for including the California Department of Transportation (Caltrans) in the environmental review process for the Willow Village Master Plan Project. We are committed to ensuring that impacts to the State's multimodal transportation system and to our natural environment are identified and mitigated to support a safe, sustainable, integrated and efficient transportation system. The following comments are based on our review of the April 2022 DEIR.

**Project Understanding**

A3-1 The proposed Project would demolish all existing onsite buildings and landscaping and construct new buildings and site improvements. The proposed Project would result in a net increase of approximately 1 million square feet (sf) of nonresidential uses (office space and non-office commercial/retail), for a total of approximately 2 million sf of nonresidential uses at the Project site. The nonresidential sf would include approximately 1,750,000 sf offices, up to 200,000 sf retail/non-office commercial uses, and approximately 10,000 sf community serving space. In addition, the Proposed Project would include multi-family housing units (approximately 1,735 units), a hotel (approximately 200-250 rooms), an approximately 4-acre park, and other public open space. The Project Site would include a circulation network for vehicles, bicycles, and pedestrians inclusive of both.

A3-1 (cont.)

**Travel Demand Analysis**
With the enactment of Senate Bill (SB) 743, Caltrans is focused on maximizing efficient development patterns, innovative travel demand reduction strategies, and multimodal improvements. For more information on how Caltrans assesses Transportation Impact Studies, please review Caltrans' Transportation Impact Study Guide (*link*).

Caltrans' acknowledges that the project Vehicle Miles Travelled (VMT) analysis and significance determination are undertaken in a manner consistent with the Office of Planning and Research's (OPR) Technical Advisory. Per the DEIR, this project is found to have significant VMT impacts. Caltrans supports the Transportation Demand Management (TDM) Program and encourages yearly monitoring to evaluate the effectiveness of the TDM measures proposed, in conjunction with the City of Menlo Park and C/CAG.

Regarding the Transportation Impact Analysis (TIA), please consider the following:

- Include the Hamilton North and Hamilton South redevelopment sites in all Figures in the TIA depicting the proposed project;
- To fully understand the movement of the Bayfront Expressway between Marsh Road and University Avenue, include a typical field observation day, instead of the atypical observation day (page 44);
- Clarify the method and tools used for the Freeway Analysis. Note that the Freeway Analysis should be conducted for the 2040 Cumulative Conditions;
- Provide details of freeway analysis to substantiate information in Table 23 (i.e., demand volumes, capacities that reflect field conditions). Also, clarify if demand volumes or count volumes are used in the analysis;
- Clarify if the Traffic Volumes of both existing and near term plus project conditions used in the Ramp Capacity Analysis are count volumes or demand volumes. The analysis should be based on demand volumes; and
- The notes in Table 26 in the TIA indicated the existing volumes referenced intersection counts collected in 2019. Provide said traffic counts for review (Appendix A: Traffic Counts is missing from the TIA). Also, provide the calculation of demand volumes for review.

A3-2

**Environmental Analysis- Cultural Artifacts**
Should ground-disturbing activities take place within Caltrans' Right-of-Way (ROW) and there is an inadvertent archaeological or burial discovery, in compliance with CEQA, PRC 5024.5, and the SER, all construction within 60 feet of the find shall cease and the Caltrans District 4 Office of Cultural Resource Studies (OCRS) shall be immediately contacted at (510) 847-1977.

A3-3 **Hydraulics and Maintenance**

Please note the following:

- Coordinate with Caltrans to review the proposed development, as Caltrans is responsible for design and maintenance of pump stations along State Route (SR)- 84. The entire project area and surrounding areas drain to a major trunk line that leads to the Caltrans Ravenswood Pump Station. The pump station pumps the stormwater trunk line to Ravenswood Slough in San Francisco Bay on the north side of SR- 84.
- As part of a holistic approach to understanding existing conditions and impacts from proposed flood protection measures being considered, Caltrans encourages the Project development staff to coordinate with the Strategy to Advance Flood Protection, Ecosystems and Recreation (SAFER) Bay project. The proposed flood protection measures from both projects may impact the tailwater conditions, potential conflicts, flood-related design objectives due to sea level rise and other factors.

A3-4 **Equitable Access**

If any Caltrans facilities are impacted by the project, those facilities must meet American Disabilities Act (ADA) Standards after project completion. As well, the project must maintain bicycle and pedestrian access during construction. These access considerations support Caltrans' equity mission to provide a safe, sustainable, and equitable transportation network for all users.

A3-5 **Encroachment Permit**

Please be advised that any permanent work or temporary traffic control that encroaches onto Caltrans' ROW requires a Caltrans-issued encroachment permit. As part of the encroachment permit submittal process, you may be asked by the Office of Encroachment Permits to submit a completed encroachment permit application package, digital set of plans clearly delineating Caltrans' ROW, digital copy of signed, dated and stamped (include stamp expiration date) traffic control plans, this comment letter, your response to the comment letter, and where applicable, the following items: new or amended Maintenance Agreement (MA), approved Design Standard Decision Document (DSDD), approved encroachment exception request, and/or airspace lease agreement. Your application package may be emailed to D4Permits@dot.ca.gov.

Please note that Caltrans is in the process of implementing an online, automated, and milestone-based Caltrans Encroachment Permit System (CEPS) to replace the current permit application submittal process with a fully electronic system, including online payments. The new system is expected to be available during 2022. To obtain information about the most current encroachment permit process and to download

A3-5 cont. the permit application, please visit https://dot.ca.gov/programs/traffic-operations/ep/applications.

Thank you again for including Caltrans in the environmental review process. Should you have any questions regarding this letter, or for future notifications and requests for review of new projects, please email LDR-D4@dot.ca.gov.

Sincerely,

Mark Leong

Letter A4

**Perata, Kyle T**

**From:** Johnston, Jon <JonJ@MenloFire.org>
**Sent:** Wednesday, May 25, 2022 4:39 PM
**To:** Perata, Kyle T
**Cc:** Lorenzen, Mark; Johnston, Jon
**Subject:** Willow Village EIR comments

Kyle,

Please find the Menlo Park Fire District response to impacts from the Willow Village proposed project.

A4-1 We find that Menlo Park Fire District responses in the ConnectMenlo Final EIR are still applicable to this project.

A4-2 The water infrastructure at this location currently cannot meet the demand for this buildout. Water infrastructure improvements are needed to be able to build and meet Fire supply requirements of the CA Fire Code.

A4-3 This project is located within current adopted time standards for our required resources. However as traffic demands increase on continued narrowed roadways, increased development, and massive pass through traffic on Willow Rd and other pass through roads to the Dumbarton Bridge, response times to this project area continue to diminish. Cumulative projects along with increased traffic and decreased road arteries and decreased road capacities will delay emergency response times.

A4-4 Meta/Facebook as the largest employer in Menlo Park is also one of our largest call volumes. Moving from warehouse buildings with very little occupancy, to a development of major business and residential component will draw increased daily work time emergency response, but also 24/7 response due to the housing element that did not exist before.

A4-5 The Willow Village project is also causing a demand for PGE to increase capacity in the area. This has an impact to our Urban Search and Rescue/Menlo Park Fire District Rescue Training Site located at the PGE station located near the Dumbarton Bridge.

The site has been in use since the late 1980's when location looking for a place to train an Urban Search and Rescue Team as part of our FEMA proposal package.
We would estimate that we over time have spent upwards of $250k for fencing, concrete and the construction of rescue and training props. The burn props cost $750,000 and the rest of the site is an estimated total of 1.5 million in total costs invested over time.
Per contract, Menlo Park Fire would need to return the site to original condition prior to PGE utilizing the site for growth.

The Menlo Park Fire District and USAR TF3 has trained people from all over the world, Country, State, Region and our own agency. From FDNY to Mexico, Japan, Taiwan, China, to every FEMA Task Force, State Task Force, every Bay Area Fire Department and the list goes on. The site trains multiple law enforcement agencies, FBI, Sheriff, local law enforcement including Menlo Park PD, various government agencies, fire investigations for the region and scientific research companies from both sides of the bay.
The site is used regularly for training with multiple fire agencies in San Mateo County as this is the only live fire props. Also the site has the only west coast dog training site for search and rescue.

A4-5 cont. The debris plies made of wood and concrete are some of the largest in the western United States. They provide a very specific real world training experience needed to practice and perfect critical search, rescue and recovery skills, joint operations and highly scarce and rare skills needed to train people and animals.

Other training props are designed to support shoring, lifting and moving of heavy objects, crane operations, technical rope rescue and other related specialized search and rescue skills needed for very specific specialized trainings for National Security and Response in support of Urban Search and Rescue Task Force's to be able to effectively operate on a National stage during a significant emergency like the collapse of the World Trade Center, or the Oklahoma City Bombing.

We are also central to the Bay Area, and being near the Bay for joint water or bridge operations and specifically removed from populated areas allows us to conduct burns and noisy operations like breaching and breaking of concrete that also can create some dust.

Recognized Monuments and historical pieces at this site.
We have a singular inspirational "monument" specifically made from the ruins of the Oklahoma City Bombing and dedicated to all the rescuers who come to be trained to deal with similar, horrific and unimaginable situations.
In addition, we have a concrete column from the Embarcadero Expressway that shot out during demolition. It's the last know piece of the SF Embarcadero Freeway and we also have the Missile prop that was located outside the Commanders Office at the Contra Costa Naval Weapons Station.

This site has provided a pivotal opportunity to simulate, train and test tens of thousands of first responders in specialized skills needed to ultimately save life and property under the most difficult of conditions.

Kyle Perata
Community Development, City of Menlo Park
701 Laurel Street
Menlo Park, CA 94025

Dear Kyle,

Thank you or the opportunity comment on the Draft Environmental Impact Report (EIR) for the Willow Village Master Plan Project. The City of Redwood City has reviewed the EIR and has the following comments to offer:

A5-1 We have reviewed the Traffic Impact Analysis (TIA) and EIR findings. No intersection within Redwood City were studied, with Marsh Road intersections being the closest ones to our jurisdiction. As mentioned in the recommended improvements (multiple locations in TIA including Table ES-6), the mitigation measure related to road widening to mitigate the traffic impact is not feasible. The recommendation for a contribution to TIF (Transportation Impact Fee) program for future alternative modes (bike and pedestrian) improvements would be our recommendation as well.

Sincerely,

Brandon Northart

**Re: Tamien Nation Comment Letter on Willow Village Master Plan Project Draft EIR**

Dear Mr. Perata:

I am writing to you on behalf of the Tamien Nation, a California Native American Tribe, in response to the Willow Village Master Plan Project ("Project") Draft Environmental Impact Report ("DEIR"). The Project is located on the ancestral and unceded aboriginal homeland of the Tamien Nation of the greater Santa Clara Valley. Tamien Nation has direct lineal descendancy to precontact Tamien speaking villages and districts including San Juan Bautista Rancheria, San Jose Cupertino Rancheria, San Carlos Rancheria, San Antonio Rancheria, Santa Ysabel Rancheria, Santa Clara Rancheria and San Francisco Solano Rancheria.

T1-1 Although the Tamien Nation has been engaged with the City of Menlo Park ("City") in the government to government consultation process to address impacts to tribal cultural resources as required by the California Environmental Quality Act ("CEQA") and Assembly Bill 52 (Gatto, 2014) ("AB 52"), we remain concerned because significant environmental impacts to tribal cultural resources are still unaddressed and unmitigated in the DEIR. We have provided substantial evidence of tribal cultural resources, a tribal cultural landscape, and the cultural significance of these resources to the City during consultation. We have also recommended appropriate mitigation measures, such as avoidance and preservation in place, which are preferred mitigation methods under AB 52. We hope that by providing this letter and continuing to engage with the City and the project applicant through the consultation process the final EIR will better address these concerns, but if not, we are prepared to take appropriate legal action against the Project to protect these significant tribal cultural resources, including the Tamien Nation's Ancestors and sacred sites.

T1-2 The Project is a major redevelopment of a 59-acre industrial site and three additional parcels west of Willow Road in Menlo Park. The Project is a multi-phase, mixed use development. The Project overlaps with and will substantially impact Tamien Nation tribal cultural resources

T1-2 cont. including sacred burial grounds and cultural sites, specifically, a Shellmound burial site referred to as the Hiller Mound (CA-SMA-160/H (P-41-000160)). The Tamien Nation submits this comment letter to request that the City ensure environmental impacts to the Hiller Mound are fully identified, analyzed, and mitigated as required by CEQA. The Project must also be consistent with the Menlo Park General Plan and ConnectMenlo FEIR.

T1-3 While the Tamien Nation is engaged in tribal consultation with the City pursuant to AB 52, the Tamien Nation's input has been ignored and not taken as a serious Project concern. The Tamien Nation wants to cooperate with the City, but the City's failure to reciprocate has resulted in this letter, which must be added to the administrative record for the Project. A key aspect of AB 52 is to enable California Native American tribes to manage and accept conveyances of, and act as caretakers of, tribal cultural resources. Further, it requires parties to act in good faith in developing mitigation measures. (Public Resources Code § 21080.3.2.) In passing AB 52, the legislature intended for lead agencies to recognize and respect that "California Native American prehistoric, historic, archaeological, cultural, and sacred places are essential elements in tribal cultural traditions, heritages, and identities." (AB 52 § 1.) Project proponents need to recognize and should give deference to California Native American tribes because they "have expertise with regard to their tribal history and practices, which concern the tribal cultural resources with which they are traditionally and culturally affiliated". Since CEQA "calls for a sufficient degree of analysis, tribal knowledge about the land and tribal cultural resources at issue should be included in environmental assessments for projects that may have a significant impact on those resources." (*Id.*)

The Tamien Nation has used, and continues to use, the natural setting of the Hiller Mound to conduct religious observances, ceremonies, and cultural practices; this sacred site ties the Tamien Nation to their native land and cultural heritage. The Tamien Nation has expertise and a deep connection with and understanding of the tribal cultural resources that are on the Project site. In order to comply with the legal requirements of AB 52 consultation, the City needs to engage in consultation in good faith and put forth reasonable effort to create effective mitigation measures – not dismiss, belittle, and disregard the concerns of the Tamien Nation in favor of the Project proponent's desire not to add appropriate mitigation measures, as has been done by City planning staff in consultation thus far. (See Public Resources Code § 21080.3.2.)

T1-4

**<u>Environmental Impacts and Current Inadequate Mitigation Measures</u>**

The Project will lead to significant environmental impacts to tribal cultural resources, specifically causing disturbance to Ancestral human remains of the Tamien Nation. Overall, the analysis is inadequate, and the mitigation measures disregard the Tamien Nation's culture, traditional uses, and the deep importance of the Hiller Mound as a significant tribal cultural resource. The mitigation measures proposed in the DEIR are inadequate and do not reduce the level of significance of the environmental impact to tribal cultural resources.

T1-4 cont. Before delving into the Project DEIR's proposed mitigation measures, we would like to point out that the mitigation measures discussed in the DEIR only focus on the core of the Hiller Mound.[1] Yet, CEQA requires an EIR to provide the information needed to alert the public and the decision makers of the significant impacts a project would create and to discuss feasible mitigation measures. (Public Resources Code § 21100; *Sierra Club v. County of Fresno* (2018) 6 Cal.5th 502, 523.) To fulfill the EIR's informational role, the discussion of the mitigation measures must contain facts and analysis, not bare conclusions and opinions. (*Golden Door Properties, LLC v. County of San Diego* (2020) 50 Cal.App.5th 467, 544 citing to *King & Gardiner Farms, LLC v. County of Kern* (2020) 45 Cal.App.5th 814, 869.) The level of detail CEQA required in the EIR's discussion of facts and analysis of the mitigation measures depends on "whether the EIR includes enough detail 'to enable those who did not participate in its preparation to understand and to consider meaningfully the issues raised by the proposed project.'" (*Ibid.*) Here, the mitigation measures are blatantly insufficient because the EIR fails to adequately address **<u>75%</u>** of the sacred site.[2] The DEIR inaccurately describes the Hiller Mound Core as "the most culturally sensitive" archeological component of Hiller Mound and the proceeds to only focus on the Hiller Mound Core. (DEIR p. 3.8-24.) First, the Hiller Mound Core is culturally sensitive, as is the *entire* Hiller Mound area. Second, even for argument's sake if the Hiller Mound Core was more culturally sensitive than another area, it does not give license for the Project to disregard the environmental impacts to the rest of the sacred site. The DEIR's mitigation measures are inadequate.

Mitigation measures must be feasible and minimize the Project's significant impacts. (Public Resources Code §§ 21002.1(a), 21100(b)(3); CEQA Guidelines § 15126.4(a).) The EIR must also analyze any significant effects of the measures it describes. (CEQA Guidelines § 15126.4(a); see also *Stevens v. City of Glendale,* 125 Cal.App.3d 986, 995 (1981).) Mitigation measures for impacts to tribal cultural resources must be enforceable, related to the significant impact and culturally appropriate. (Public Resources Code § 21084.3; CEQA Guidelines §§ 15126.4(a)(2); 15126.4(a)(4).) Pursuant to AB 52, public agencies shall, when feasible, avoid damaging effect to any tribal cultural resource. (Public Resources Code § 21084.3.) As acknowledged in the DEIR, "[a]voidance and preservation in place are the preferable forms of mitigation for archeological sites." (DEIR p. 3.8-24.) Measures that may be considered to avoid or minimize significant adverse impacts include planning and construction to <u>avoid</u> the tribal cultural resource and protect the cultural and natural context or planning open space to incorporate the resources with culturally appropriate protection. To comply with AB 52, the lead

[1] The only measure the DEIR applies to the entire Hiller Mound as a whole is a mitigation measure to "note on any plans that require ground-disturbing excavation that there is potential for exposing buried cultural resources" and that "site information supplied to the contractor shall be considered and marked confidential." (DEIR p. 3.8-25, ES-33.) As discussed further in the letter, this proposed measure is unclear and does nothing to mitigate environmental impacts.

[2] The DEIR only addressed the Hiller Mound Core, which is 1.77 acres, while the entire Hiller Mound (referred to as "revised site boundary") is 7.03 acres.] The Hiller Core Mound is only 25% of the entire site. (1.77 / 7.03 = 0.2518.) The DEIR must analyze the entire Hiller Mound, and avoid it if feasible, in order to comply with CEQA. The City should choose an alternative that avoids this sacred site.

T1-4 cont. agency must treat tribal cultural resources with culturally appropriate dignity and take tribal cultural values and the meaning of the resources into account. This can be done by protecting the cultural character and integrity, traditional use, and confidentiality of the resource. (Public Resources Code § 21084.3.) We recognize there is some effort to mitigate significant impacts in the DEIR, but the measures need to consider and give greater deference to avoidance, adequate measures to provide preservation in place, and our cultural values.

Mitigation measures cannot be developed without first achieving a full understanding of the extent of a tribal cultural resource so as to properly identify the impacts on tribal cultural resources from a project. (See *Save the Agoura Cornell Knoll v. City of Agoura Hills* (2020) 46 Cal.App.5th 665, 686-689 where the City lost in court because it failed to determine the extent of tribal cultural resources or if the entire site could be avoided, or that it was impractical or infeasible for the City to make this determination as part of its initial review.) Mitigation measures should be described specifically and not deferred for future formulation. (Guidelines § 15126.4(a)(1)(B); see generally *POET, LLC v. Cal. Air Resources Control Board,* 218 Cal.App.4th at 681, where lead agency stated it would implement a measure to mitigate significant impacts but failed to specify compliance and monitoring requirements.) Specific details of mitigation measures may be developed after project approval only "when it is impractical or infeasible to include those details during the project's environmental review," and the agency "adopts specific performance standards the mitigation will achieve." (CEQA Guidelines, § 15126. subd. (a)(1)(B).) Therefore, mitigation of post-construction uses of the land use needs to be analyzed now, and those impacts must be addressed in the DEIR.

T1-5 Here, the DEIR does not fully address mitigation measures related to the use of space above the Hiller Mound Core and only concludes that the Hiller Mound Core will be incorporated into open space to avoid construction of other structures. (DEIR p. 3.8-24.) While we recognize that the Project would incorporate the Hiller Mound Core into open space – the DEIR fails to specify how the open space will be used. (DEIR p. 3.8-24.) As already expressed, the entire Hiller Mound should be avoided, not just the core. If Hiller Mound is to be converted into open space, there must be additional restrictions regarding use of the open space above the Shellmound, which is a tribal cemetery and sacred site. It would be disrespectful and a complete divergence from our traditional cultural values if this open space is used for parks or recreational uses. The Hiller Mound meets the definition of a cemetery[3] – it would be difficult to fathom recreational activities taking place immediately above the graves of departed loved ones if those Ancestors were not Native American. This Project would not be allowed at Menlo Park's Holy Cross or Saint Patrick's Cemeteries, and we must ask why should Native American sacred places and Ancestral remains be treated any differently? The City would never contemplate designating these places as open space for the public to trample over their ancestors. Such cemeteries are only a few hundred years old as opposed to Shellmound, which date back over five thousand years. The Tamien

[3] See Health and Safety Code § 7003 which defines a cemetery as, "a place where six or more human bodies are buried." There are more than six human bodies in the Hiller Mound area and therefore the Hiller Mound is considered a cemetery.

T1-5 cont. Nation is merely asking for equality: for their Ancestors to be treated the same as those buried in other local cemeteries. The Hiller Mound is a Tamien Nation sacred site and anything other than complete avoidance preferably, or at a minimum non-destructive preservation in place, is unacceptable.

The DEIR must recognize and respect that the open space designation requires greater definition and use restrictions. We will not accept as consolation mere signage acknowledging the Tamien Nation's historical presence in the Hiller Mound area. This would be an unacceptable mitigation measure considering signage does nothing to mitigate the impacts to tribal cultural resources and only benefits and educates others who do not know the Tamien Nation's history. Therefore, we recommend establishment of a tribal cultural resources' conservation easement over the Hiller Mound. With the use of tribal cultural ecological knowledge and stewardship, the land could be landscaped with culturally relevant California Native plants and maintained by the Tamien Nation, creating a beautiful natural environment at the heart of the Project.

We recognize that the Project as proposed would add fill as a protective cover, thereby potentially preserving portions of the Hiller Mound in place. (Measure CR-2.1, DEIR p. 3.8-24.) However, the additional fill and concentrated pressure from compaction of the fill will damage and harm the Tamien Nation's Ancestors' remains and funerary and ceremonial objects. According to the DEIR, plans that require ground disturbing excavation note where there is the potential for exposing buried cultural resources and such information will be provided to the contractor and be marked confidential – yet it is unclear how this will prevent significant impacts to tribal cultural resources. (Mitigation Measure CR 2.1.) What does it mean for a contractor to *consider* the archeological site information? It is unclear how this measure will mitigate damage if the contractor merely *considers* location of human remains and proceeds anyway. Rather, a detailed and enforceable mitigation measure that includes tribal input and deference to tribal knowledge as expertise should be included as part of the Final EIR.

T1-6 Other standard mitigation measures include cultural sensitivity training for workers and construction superintendents and development of an Archeological Monitoring Plan. (Mitigation Measure CR 2.2.) The Archaeological Monitoring Plan should be a Tribal Cultural Resources and Archaeological Monitoring plan and include substantial input from the Tamien Nation.

T1-7 Furthermore, the Project and related construction activities will disturb known tribal cultural resources – specifically, the cumulative stresses induced by gravity load of construction of the estimated 40 scaffolding towers (for construction of a glass atrium within the Hiller Mound Core) along with the gravity load from the fill cap and existing soil. The DEIR notes that such concentrated pressure on the mound would be potentially significant. (DEIR pp. 3.8-24-25.) Additionally, there is anticipated leveling of the fill cap to install the scaffolding towers and potential for disturbance 12 inches <u>beneath the surface of the fill cap</u>. Construction activity above the Shellmound will cause destruction by crushing the Tamien Nation's Ancestors' remains and funerary objects, breaking them under the weight of compaction, thereby desecrating the Tamien Nation's sacred place.

T1-8 It does not matter that there will be an archeological consultant on site to determine if they think protective measures should be required prior to boring into the ground – any contact with Hiller Mound should be completely avoided. To protect the cultural integrity of the Hiller Mound Core, the Final EIR must include 15 feet of engineered fill above the Hiller Mound Core to function as a protective cover for our Ancestors and the Hiller Mound Core. With an increased depth of engineered fill, Ancestral remains, funerary, burial and ceremonial items will be better protected from disturbance.

T1-9 In addition, the DEIR recommends archeological data recovery when encountering archeological resources that cannot be avoided. This mitigation measure is inappropriate and fails to mitigate the significant impacts of the Project. It *worsens* the significant impact because it is culturally inappropriate and disrespectful to the Tamien Nation. (See Public Resources Code § 21084.3; CEQA Guidelines §§ 15126.4(a)(2); 15126.4(a)(4)).) Any form of archeological testing or data recovery fails to meet the standards of preservation with culturally appropriate dignity and consideration of tribal cultural values that are required by AB 52. In order to comply with the AB 52, any handling of human remains must include substantial input from the Tamien Nation. Mitigation measures must not themselves create environmental impacts. If mitigation measures do create additional impacts, those impacts must also be analyzed in CEQA. (See *Stevens v. City of Glendale* (1981) 125 Cal.App.3d 986.)

Because the Project will impact tribal cultural resources the City should consider how to support the tribal cultural preservation and restoration endeavors of California Native American Tribes whose tribal cultural resources are impacted by the Project. For example, this could include providing support for the Tamien Nation's goals of language preservation and land acquisition to protect our sacred sites, cultural resources, and manage the environment using tribal ecological knowledge.

T1-10 **<u>Inadequate Analysis of Cumulative Impacts</u>**

The DEIR does not adequately discuss the cumulative impacts of the Project on tribal cultural resources and provides a conclusory analysis. "An EIR shall discuss cumulative impacts of a project when the project's incremental effect is cumulatively considerable," which means "that the incremental effects of an individual project are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects." (14 C.C.R. § 15065; see also *Cleveland National Forest Foundation v. San Diego Assn. of Governments* (2017) 3 Cal.5th 497, 512.) It is improper for an EIR to conclude that a project's cumulative impacts are insignificant merely because the project contributes to an existing and unacceptable environmental condition. (See *Los Angeles Unified School District v. City of Los Angeles* (1997) 58 Cal.App.4th 1019, 1025-26; *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 718.) Rather, in assessing cumulative impacts, the determination of whether the project's contribution is cumulatively considerable should take into account both the project's incremental effect and the nature and severity of the pre-exiting

T1-10 cont. significant cumulative effect. (*Communities for a Better Environment v. Cal. Resources Agency* (2002) 103 Cal.App.4th 98, 119-20.)

First, the DEIR fails to identify other Shellmound and describe previous and potential future damage to shellmounds within the San Francisco Bay Area that will likely impact Tamien Nation and other tribes' tribal cultural resources and the greater tribal cultural landscape. (Refer to "Attachment 1" for a map of shellmound locations in the San Francisco Bay Area.) Many of these shellmounds are older than the Egyptian pyramids and are historically significant for all Californians. They also remain culturally significant to Indigenous people today. This historical damage and potential for future damage to these shellmounds need to be included in the cumulative impacts assessment of the DEIR. Second, the DEIR merely concludes that the Project would not be a cumulatively considerable contributor to a significant cumulative impact on cultural and tribal cultural resources because Project-level and applicable ConnectMenlo mitigation measures are in place and future projects would be required to comply with existing federal, state, and local regulations. As described above, the mitigation measures proposed in the DEIR *will themselves cause significant impacts.* If the same mitigation measures are repeated for other projects, the incremental effect of the cumulative impact over time will be cumulatively substantial.

It is important to note a cultural distinction, the Hiller Mound does not lose significance and value to the Tamien Nation even though the Hiller Mound was previously damaged and disturbed. The damage and disturbance to the Tamien Nation's Ancestors' remains is extremely painful. This burial site carries deep cultural and spiritual meaning. It may seem to other cultures that, once damaged, the Hiller Mound would lose value, but it is still a part of the Tamien Nation's culture, and we will continue to protect the area to the best of our abilities.

T1-11

**CalNAGPRA and Repatriation to Tamien Nation**

The Native American Graves Protection and Repatriation Act ("NAGPRA") provides a procedure for repatriation of human remains, funerary objects, sacred objects, or objects of cultural significance to the appropriate lineal descendant, Indian Tribe, or Native Hawaiian organization according to a statutory schedule of priority. (25 U.S.C. § 3002.) The California Native American Graves Protection and Repatriation Act of 2001 ("CalNAGPRA"), codified as Health & Safety Code section 8010, et. seq., requires agencies that have possession or control over Native American human remains to facilitate repatriation to the relevant Tribes. (Health and Safety Code § 8010 et. seq.) A lineal descendant or California Indian Tribe can claim relationship with Native American remains or cultural items and request repatriation (Health and Safety Code § 8014-8016.) Once applicable requirements are met, the agency must repatriate the requested human remains or cultural items to the requesting California Indian Tribe. (Health and Safety Code § 8016.) Disposition is according to the wishes of the lineal descendants or affiliated Tribe. The repatriation of human remains, funerary objects, sacred objects, or objects of cultural patrimony must be accomplished consulting with the Tribe to determine the place and manner of the repatriation. (43 C.F.R. § 10.10 (2015).)

T1-11 cont. Pursuant to NAGPRA and CalNAGPRA, we have the right to be consulted and decide the place and manner of repatriation of our ancestors' human remains, funerary objects, sacred objects, and objects of cultural significance. We strongly oppose excavated Native American human remains or associated funerary objects or ceremonial objects being curated and stored at Sonoma State University, or any other university or museum. We demand the Tamien Nation's Ancestors' remains, funerary objects, sacred objects, and objects of cultural significance be respectfully reinterred within the Hiller Mound area in a place not subject to further disturbance. The only culturally appropriate and acceptable option is to return the Tamien Nation's Ancestors back to their final and rightful resting place. The area shall not be subject to further disturbance and must be appropriately capped.

T1-12 In closing, Chairwoman Geary provided the following statement regarding the Project and its devastating impact on the Tamien Nation:

> *"Shellmounds are not trash heaps. They are sacred spaces interweaving thousands of years of Indigenous culture, history, and religion. Today, the Hiller Mound is a Tamien Nation sanctified cemetery - our place of prayer where we honor and provide offerings to our deities and ancestors. Shellmounds have physical features that are both above and below the ground surface level and the entire space they occupy is sacred. Even Shellmounds that have been previously impacted are of great significance and continue to have cultural integrity to Tamien Nation.*
>
> *Before colonial contact, there were thousands of Shellmounds in California. The Hiller Mound is one of the few Shellmounds left that are still visible. Therefore, the Hiller Mound is not only significant to the Tamien Nation, but its protection should be important to everyone."*

I sincerely hope that we can work together to protect this sacred site and Native American burial ground through the ongoing government to government consultation process.

Very truly yours,

H. Roberson

Willow Village Master Plan Project

*Dear Mr. Perata,*

T2-1 *I am writing to thank the City of Menlo Park for its consultation with The Amah Mutsun Tribal Band of Mission San Juan Bautista regarding Willow Village under AB 52. The Tribe has been involved with the project since 2015 when we were appointed as the Most Likely Descendant for Native American burials associated with the archaeological site within the project by the California Native American Heritage Commission. In addition, the Tribe has been consulted by the project proponent in regard to Native American concerns regarding the potential project for many years.*

*The Amah Mutsun Tribal Band of Mission San Juan Bautista have been appointed by the Native American Heritage Commission as Most Likely Descendants for CA-SMA-160/H. The Tribe has provided recommendations for Native American burials exposed during construction and have participated in their recovery and reburial since 2013. We have worked with the archaeologists and owner to excavate and analyze the burials and artifacts to develop our tribal history. The Tribe has selected reburial locations within the property and ceremonially reburied the remains.*

*Most importantly the Tribe has been consulted by Facebook during the development process since 2017. We have participated in both archaeological monitoring by providing Tribal Monitors and in reviewing proposed project plans to provide Tribal input regarding Native American cultural resources.*

# *Amah Mutsun Tribal Band of Mission San Juan Bautista*

T2-2 *We were also consulted formally by the City of Menlo Park under AB52 related to the Draft Environmental Impact report for Willow Village, including the proposed Mitigation Measures for the project. The Amah Mutsun Tribal Band of Mission San Juan Bautista approves of the proposed Mitigation Measures for Willow Village related to tribal cultural resources and looks forward to continued consultation with both the City of Menlo Park and Facebook to ensure that Tribal Cultural Resources are protected.*

*If you have any questions, please feel free to contact the Tribe at the below contact information.*

*Sincerely,*

RE: Willow Village

Horše Túuxi Mr. Perata:

T3-1

On behalf of the Muwekma Ohlone Tribe of the San Francisco Bay Area, I am following up on the City of Menlo Park's consultation with the Tribe on Willow Village. We appreciated the opportunity to consult with the City of Menlo Park and Signature Development Group following our request for consultation under AB52.

As you may know, the present-day Muwekma Ohlone Tribe is comprised of all of the known surviving American Indian lineages aboriginal to the San Francisco Bay Region who trace their ancestry through Missions Dolores, Santa Clara, and San Jose; and who were also members of the historic Federally Recognized Verona Band of Alameda County.

T3-2

The Tribe has consulted with both the City of Menlo Park and Signature Development Group on tribal cultural issues for Willow Village and on mitigation measures developed for the project. This includes avoidance, preservation and protection measures and requires archeological monitoring plans during construction and archeological treatment plans in the case where human remains, or artifacts are discovered during project excavations.

The Muwekma Ohlone Tribe supports the mitigation measures described in the Environmental Impact Report (EIR) for Willow Village to protect and respect Tribal cultural resources. We look forward to continued consultation, coordination, and collaboration with both the City of Menlo Park and Signature Development Group as the project continues into construction.

Please don't hesitate to contact me via email monicavarellano@gmail.com or on my cell phone at 408-205-9714 if you have questions or need additional information.

'Úni ~ Respectfully,

Monica V. Arellano, Vice Chairwoman and MLD Representative
Muwekma Ohlone Tribe of the San Francisco Bay Area

Menlo Park, CA 94025

**RE: Support for Willow Village Project**

Dear Chair Doran and Members of the Planning Commission,

O1-1 The Bay Area Council is a public policy advocacy organization working to support civic and business leaders in solving our regions most challenging issues. On behalf of the more than 300 members of the Council, I write in support of the proposed Willow Village development in Menlo Park.

California is experiencing an unprecedented housing crisis that will worsen without significant intervention. The California Department of Housing and Community Development estimates that the state must build 180,000 new units of housing annually by 2025 to address the state's housing affordability crisis - over 100,000 more units than we are currently creating. This shortage will disproportionately impact low-income communities and communities of color that are being priced out of Bay Area communities from the lack of affordable housing options. To combat this, every county and city must do its part to produce more housing.

The Willow Village project will create 1,729 units in total, of which 320 units will be BMR at low-income and very low-income rent levels. Facebook is expected to invest $75 million in amenities into Menlo Park and its surrounding communities, which goes far beyond what developers are typically able to contribute to a project. In addition to residential, retail, and office space, this project contains substantial open space – including a two-acre elevated park and dedicated pedestrian paths and bike lanes that link to surrounding and regional trails. This is a massive opportunity for housing, economic, and community development in Menlo Park that should not be missed.

Since more than 50% of Facebook employees walk, bike, rideshare, or take public or company transit, access to public transportation will be an important asset for new community members which in turn will promote low carbon emissions. In addition to reduced transportation emissions, the project will be one of the most sustainable communities of its kind thanks to its integration of LEED Gold standards: all-electric buildings, recycled water, highly sustainable office building materials, increased photovoltaics and other environmental measures.

This project is an excellent opportunity for dense, mixed-use development directly adjacent to transit and within a downtown context to grow the supply of housing and reduce dependence on cars. This is a clear example of sustainable and inclusive growth for future generations and we encourage you to support it.

Sincerely,

Matt Regan

Matt Regan
Senior Vice President, Bay Area Council

Menlo Park Planning Commission
701 Laurel St.
Menlo Park, CA 94025

planning.commission@menlopark.org
Via Email

Re: 1380 Willow Road

Dear Menlo Park Planning Commission,

O3-1 YIMBY Law is a 501(c)3 non-profit corporation, whose mission is to increase the accessibility and affordability of housing in California. YIMBY Law sues municipalities when they fail to comply with state housing laws, including the Housing Accountability Act (HAA). As you know, the Planning Commission has an obligation to abide by all relevant state housing laws when evaluating the above captioned proposal, including the HAA. Should the City fail to follow the law, YIMBY Law will not hesitate to file suit to ensure that the law is enforced.

Willow Village turns an inward-facing, 59-acre, 1970s low-density R&D site with endless surface parking into a community-serving, mixed-use project with parks, open-space, housing and affordable housing, and badly needed community-serving retail. The neighborhood of Belle Haven lacks basic amenities like a grocery store, pharmacy services and adequate open space. Willow Village delivers all of these amenities in one project. Moreover, once built, Willow Village will increase Menlo Park's existing rental affordable housing stock by more than 60%. Willow Village was designed around more than five years of neighbor and community input and shows what responsible, community-focused mixed-use development can look like.

California Government Code § 65589.5, the Housing Accountability Act, prohibits localities from denying housing development projects that are compliant with the locality's zoning ordinance or general plan at the time the application was deemed complete, unless the locality can make findings that the proposed housing development would be a threat to public health and safety.

The above captioned proposal is zoning compliant and general plan compliant, therefore, your local agency must approve the application, or else make findings to the effect that the proposed project would have an adverse impact on public health and safety, as described above. Should the City fail to comply with the law, YIMBY Law will not hesitate to take legal action to ensure that the law is enforced.

I am signing this letter both in my capacity as the Executive Director of YIMBY Law, and as a resident of California who is affected by the shortage of housing in our state.

Sincerely,

Sonja Trauss
Executive Director
YIMBY Law

SAN FRANCISCO FAIRFIELD SAN JOSE SANTA ROSA WALNUT CREEK

GREENBELT ALLIANCE

April 22, 2022

RE: Endorsement of Willow Village

Dear Menlo Park Planning Commission,

For over 60 years, Greenbelt Alliance has helped create cities and neighborhoods that make the Bay Area a better place to live - healthy places where people can walk and bike; communities with parks, shops, transportation options; homes that are affordable - and defend the Bay Area's natural and agricultural landscapes from sprawl development. Greenbelt Alliance's "Grow Smart Bay Area" goals call for fully protecting the Bay Area's greenbelt and directing growth into our existing communities, and accomplishing both in a way that equitably benefits all Bay Area residents. Our endorsement program helps further these goals by providing independent validation of smart infill housing (development of vacant land within urban areas) and mixed-use projects (allowing for various uses like office, commercial and residential).

O4-1 **Greenbelt Alliance is pleased to conceptually endorse Willow Village**

As a mixed-use development, Willow Village would bring housing, jobs, neighborhood-serving retail, and other community amenities including a 4.1 acre public park, 2.1 acre elevated park, dog park, plazas and 1.6 acre town square to a neighborhood without neighborhood-serving retail and service uses. This 1,735 unit, mixed-use development, proposed by Sunset Development will have a commitment for affordability. 18% of units across the project will be offered at Below-Market-Rate Rents (with 100 units reserved for very low income seniors) for households ranging from 30-120% of the Area Median Income (AMI).

This Project would reduce VMT by introducing neighborhood-serving retail, including a full-service grocery store and pharmacy, and other community amenities, to an existing neighborhood without such amenities. The addition of such amenities to the area would reduce the number and length of automobile retail trips of existing residents and employees. Willow Village is also located within 1/2 mile of Facebook's major employment center with bike, pedestrian and shuttle routes available so that employees do not have to drive. Similarly, the inclusion of retail in the Project causes the VMT from Project residents and employees to be lower than it would be if the Project did not include retail uses.

Approximately 1.25M square feet of traditional office space featuring next generation, LEED-Gold design and 500,000 square feet of accessory space that includes a public visitor center and flexible meeting, collaboration and conference space for employees and office guests. This is the kind of climate-smart development that we need in the Bay Area to meet our housing goals, reduce

O4-1 cont. greenhouse gas emissions, and make sure that local residents are able to grow and thrive in their own communities as housing costs rise.

This project will help the city of Menlo Park make significant progress towards its Regional Housing Needs Assessment (RHNA) goals. Every city in the Bay Area must play their part to increase their housing stock to make sure the local workforce can afford to live close to jobs, schools, and services — spending more time with family and friends and less time in traffic congestion — improving the social fabric of our communities and reducing the climate-damaging greenhouse gas emissions produced by driving.

We recommend the City of Menlo Park approve both of these projects. We hope its approval will resonate with other Bay Area cities, and encourage them to redouble their efforts to grow smartly.

Sincerely,
Zoe Siegel

Director of Climate Resilience, Greenbelt Alliance

MENLO TOGETHER

April 25, 2022

Re: Willow Village, items F1 and G1

Dear Planning Commission and City Staff,

Menlo Together is a group of Menlo Park and Peninsula residents who envision an integrated and diverse, multi-generational, and environmentally sustainable city. We advocate for an accessible and inviting Menlo Park with housing at all affordability levels, and with pedestrian and bike-friendly spaces, developed to be carbon-free. We value equity, sustainability, inclusion, health, and racial and economic justice.

We write with comments on the Willow Village project to inform your study session this evening.

O5-1 We appreciate that the Willow Village commercial office project has designed homes and community service amenities into the overall proposal, and that the community amenities are included in the first phase of development. We ask that the Planning Commission study ways to improve the project's jobs/housing balance and fit, increase confidence in the long term viability of the community serving grocery and pharmacy, and improve circulation, pedestrian, and bike safety.

O5-2 BMR Housing:

Menlo Together appreciates the plan for housing at all levels of affordability and ages in this proposal, and we would like to see a significantly higher number of affordable units at steeper affordability with preference for those most impacted by the project, who have greatest need.

1) **We value inclusion and feel strongly that the market rate apartment buildings should include at least 15% BMR homes at a range of affordability levels.** The city's BMR guidelines require market rate housing projects to provide 15% of the units at Below Market Rate (BMR) affordability. Specifically, the guidelines require all units to be affordable at low income, or a mix of affordability levels that is equivalent in terms of overall subsidy. We believe that the inclusionary BMR housing should include a relatively even

O5-2 cont.

distribution of Very Low, Low, and Moderate income affordable units and propose that Meta increase their investment in our community to achieve this outcome.

2) We are glad to see that city staff is open to explore, but is not yet supporting the proposal to eliminate the 75% cap on moderate income rents. We believe the cap is an important tool to ensure that our "Below Market Rate" units do in fact maintain below market rate rents.
3) **In addition to the integrated 15% BMR units above, we support the proposal to produce 100% affordable housing on-site, and encourage doing so by donating land and finances and partnering with a non-profit housing developer.** Stand-alone 100% affordable housing is able to draw upon county, state and federal financing, and as such can be more deeply affordable. When produced and managed by a mission-aligned non-profit, the units are managed to support tenant success and perpetual affordability. We are glad to see that the developer is working with Mercy Housing to establish such a partnership.
   a) **A portion of the stand-alone affordable units should follow Menlo Park BMR preferences.** County, State, and Federal financing comes with rules about who can apply as tenants. To ensure that Menlo Park has priority to fill a portion of these units, Menlo Park must contribute financing to the project. We propose that the developer make a land *and* financial contribution to ensure that a good portion (30%?) of units can receive Menlo Park preference.
   b) We support age-restricted senior housing, and would also support multi-generational homes for extremely low income families, and/or people with disabilities.
4) Consider converting some rental units (including some BMR units) into ownership units to diversify the type of housing, offer residential stability, and wealth-building opportunities.
5) **Although not proposed by the developer, we would encourage the use of the density bonus to produce an additional 200 units (according to the option studied in the EIR) for additional units that are affordable to ELI/VL/LI households.** Menlo Park has a multi-year debt to the region in terms of housing to support the new jobs we have created. This debt has been and continues to be most strongly felt in Belle Haven through eviction, homelessness, displacement, overcrowding, and extreme housing cost burden. The impacted demographic is 50% Black and Hispanic and has a median income of $50-60,000/year. In addition, Belle Haven has carried a disproportionate impact of our city's growth. That is why we propose that we use the density bonus to produce an additional 200 units but do so in a way that meets the affordability needs of those most impacted by the job/housing imbalance who need housing affordable to households with extremely low, very low, and low incomes.

Circulation, Pedestrian and Bike Safety

O5-3 We appreciate the focus of the project on improving circulation and safety, and have some concerns and suggestions.

Relating to circulation, the EIR identifies that the project will put pressure on the intersections of Willow and Bayfront and Willow and University. Would it be feasible to add a third entrance/exit to Bayfront from what is currently being proposed as a loop road? This could create a stronger "grid" with multiple options to enter and exit the area, relieving the pressure on the two other intersections.

The current proposal includes expanding the right of way to add a turn lane, which diminishes safety for people walking and bicycling.

With regard to Willow, we would like to see major improvements to pedestrian crossings at all of the intersections along the corridor, especially Hamilton as a major crossing for Belle Haven residents to access the services, and in addition, Park, Ivy, and O'Brien.

With regard to the details of pedestrian and bicycle circulation and safety, we would encourage the project to be reviewed by the Complete Streets Commission.

O5-4 With regard to trip caps and vehicle parking, we would like to see analysis that is based on goals for mode share - what is the number of people who are expected for the various uses, and what percentage of them are expected to be driving vs. using transit, walking and bicycling. Mountain View has used these methods in its transportation for mixed use developments in the North Bayshore developments around Google's headquarters.

We are concerned that a trip cap focused primarily on peak commute hours may be less relevant in a post-covid era that may have persistently less peak travel. And we are concerned that the all-day trip cap may be equivalent to supporting driving by a very large share of users of the development, which would be unsupportive of the city's goals for sustainable transportation.

Sincerely,

The Menlo Together Team

Hi Commissioners,

O6-1 **I'm writing on behalf of the Housing Action Coalition to express my support for a creative new project at Willow Village** that would bring over 1,730 much-needed homes to Menlo Park and **urge you to approve this worthy project.**

The HAC is a member-supported nonprofit that advocates for creating more housing for residents of all income levels to help alleviate the Bay Area and California's housing shortage, displacement, and affordability crisis.

**We have formally endorsed this project-- I have attached our letter of support for your reference.**

Additionally, I am attaching letters of support from Menlo Park residents, and housing advocates; I believe due to a technical error these letters only went to the chair.

In solidarity,

Ali Sapirman

To Whom It May Concern:

O6-2 The Housing Action Coalition is pleased to endorse Signature Development's exemplary mixed-use project at Willow Village in Menlo Park. After a detailed presentation, the committee determined the project exceeds our high standards in addressing the regional affordability and displacement crisis.

The committee commends the excellent land use of the project, which replaces a 59 acre site of warehouses and office space with 1,729 new homes, over 1.2 million square feet of office space, 200,000 square feet of retail space, and significant public space in the forms of parklands, a town square, and public plazas. At 99 units per acre, Willow Village will offer much-needed dense housing to the Peninsula and justifies increased spending on local public transportation. The committee recommended the project team work with local elected leaders to bring more transit options to Willow Village.

The project site sits between the Belle Haven neighborhood and East Palo Alto, two historically underserved communities with relatively minimal public transit. Willow Village will include over 2,000 bike spaces and 6,000 car spaces, and while the committee would prefer less car parking to encourage alternate transit use, we understand feasibility concerns for this area. Additionally, the Committee recognizes that a large portion of the parking is dedicated for the new office spaces. Beyond the environmental benefits that increased housing density will bring, all of Willow Village's buildings will be built with LEED Gold certification. Buildings will be equipped with 100% electric power, and use recycled water, sustainable materials, and increased photovoltaics. Using mass timber as the primary structure material will also substantially reduce carbon emissions. Included in the project is a community space covered by a glass canopy, which the committee thought innovative and beneficial to the public. The committee also admired the project team's dedication to sustainability, and believes that Willow Village will be a model of sustainable development in the future.

Approximately 20% of Willow Village's homes will be subsidized affordable, equalling 320 homes. Of these, 120 will be reserved for very-low and extremely low-income seniors. The affordable count has increased in response to community input, and goes above and beyond local standards. In totality, Willow Village will be the largest market rate and affordable home project in Menlo Park.

The project team has been communicating with neighbors for almost four years, and has been responsive to community feedback. This has included prioritizing a grocery store affordable for all residents, reserving retail space for local businesses, adding more affordable homes, and decreasing office space to create a more balanced ratio of homes and offices. In response to concerns about physical and economic separation between Belle Haven and Willow Village, the project introduced an elevated parkway that will cross Willow Road, a major thoroughfare, to connect with Belle Haven. The project will also construct a tunnel under Highway 84 to provide safe access to miles of bayside trails. The committee applauds Signature's commitment to engaging with the community. At the same time, we would like to see

O6-2 cont.

increased accessibility to the sky bridge, and also encourage additional connections on the south side of the site.

Overall, we appreciate the project team's commitment to alleviating the impact on the nearby community. The team has demonstrated continued community involvement by amending plans that achieve the best possible housing outcomes and community open space. We are excited that Signature has committed to union labor for a large portion of the project, and encourage them to continue conversations with labor groups.

The Housing Action Coalition applauds the project team for striving to achieve the best possible project for the community. Ultimately, we are proud to endorse Willow Village, which will provide well-designed and well-located homes that help address our region's ongoing affordability and displacement crisis.

Sincerely,

Todd David, *Executive Director*

RE: Endorsement of Willow Village

GREENBELT ALLIANCE ENDORSED

Dear Menlo Park City Council

O7-1 cont.

For over 60 years, Greenbelt Alliance has helped create cities and neighborhoods that make the Bay Area a better place to live - healthy places where people can walk and bike; communities with parks, shops, transportation options; homes that are affordable - and defend the Bay Area's natural and agricultural landscapes from sprawl development. Greenbelt Alliance's "Grow Smart Bay Area" goals call for fully protecting the Bay Area's greenbelt and directing growth into our existing communities, and accomplishing both in a way that equitably benefits all Bay Area residents. Our endorsement program helps further these goals by providing independent validation of smart infill housing (development of vacant land within urban areas) and mixed-use projects (allowing for various uses like office, commercial and residential).

**Greenbelt Alliance is pleased to conceptually endorse Willow Village**

As a mixed-use development, Willow Village would bring housing, jobs, neighborhood-serving retail, and other community amenities including a 4.1 acre public park, 2.1 acre elevated park, dog park, plazas and 1.6 acre town square to a neighborhood without neighborhood-serving retail and service uses. This 1,735 unit, mixed-use development, proposed by Sunset Development will have a commitment for affordability. 18% of units across the project will be offered at Below-Market-Rate Rents (with 100 units reserved for very low income seniors) for households ranging from 30-120% of the Area Median Income (AMI).

This Project would reduce VMT by introducing neighborhood-serving retail, including a full-service grocery store and pharmacy, and other community amenities, to an existing neighborhood without such amenities. The addition of such amenities to the area would reduce the number and length of automobile retail trips of existing residents and employees. Willow Village is also located within 1/2 mile of Facebook's major employment center with bike, pedestrian and shuttle routes available so that employees do not have to drive. Similarly, the inclusion of retail in the Project causes the VMT from Project residents and employees to be lower than it would be if the Project did not include retail uses.

Approximately 1.25M square feet of traditional office space featuring next generation, LEED-Gold design and 500,000 square feet of accessory space that includes a public visitor center and flexible meeting, collaboration and conference space for employees and office guests. This is the kind of climate-smart development that we need in the Bay Area to meet our housing goals, reduce

O7-1 cont. greenhouse gas emissions, and make sure that local residents are able to grow and thrive in their own communities as housing costs rise.

This project will help the city of Menlo Park make significant progress towards its Regional Housing Needs Assessment (RHNA) goals. Every city in the Bay Area must play their part to increase their housing stock to make sure the local workforce can afford to live close to jobs, schools, and services — spending more time with family and friends and less time in traffic congestion — improving the social fabric of our communities and reducing the climate-damaging greenhouse gas emissions produced by driving.

We recommend the City of Menlo Park approve both of these projects. We hope its approval will resonate with other Bay Area cities, and encourage them to redouble their efforts to grow smartly.

Sincerely,
Zoe Siegel

Director of Climate Resilience, Greenbelt Alliance

Letter O8

**CITIZENS COMMITTEE TO COMPLETE THE REFUGE**

P.O. Box 23957, San Jose, CA 95153 650 493-5540 cccrrefuge@gmail.com www.BayRefuge.org

May 23, 2022

Kyle Perata, Acting Planning Manager
City of Menlo Park
Community Development Department, Planning Division
701 Laurel Street
Menlo Park, CA 94025
**SUBMITTAL** by Email: ktperata@menlopark.org

Dear Mr. Perata:

O8-1 The Citizens Committee to Complete the Refuge respectfully submits the following comments regarding the Draft Environmental Impact Report (DEIR) of Willow Village Master Plan Project.

For decades the Citizens Committee has paid close attention to and submitted comments on projects in the ConnectMenlo area, including prior Meta projects. Always our intention is to seek the best outcomes for the environmental health of wildlife, their habitats, the Bay and the Don Edwards National Wildlife Refuge. Such is the thrust of our comments today.

In the discussion below, we address three areas of concern.

1. Issues of general concern about the DEIR.
2. Various Issues regarding Biological Resources specific to light pollution, bird safe design and shading.
3. The importance of and actions needed regarding the Willows Wetland.
4. Issues of Hydrology analysis that are significant to the Project's long term sustainability.

O8-2

## Issues of General Concern about the DEIR

The DEIR documents can be described as massive in size and extensive in detail, consistent with the size and complexity of the Project. While calling itself a "Master Plan", the Project is also described as tiering off the ConnectMenlo Update. As the document also describes phasing of its actions, time is then a factor in its decisions. Despite the depth of detail regarding the various aspects of development, time may uncover issues not anticipated and/or changes may occur in regulations. Such changes merit further environmental review and possible additional mitigation. As appropriate, public CEQA action, tiering off ConnectMenlo and, it appears, this "Master Plan" may be needed.  The DEIR should describe these potential actions that may affect outcomes of the Project.

O8-3

## Biological Resources

While the role of the Project EIR is to analyze and define mitigation of biological resource impacts, it relies on three Biological Resource Assessments (BRA)(Appdx 3.9) as its primary source. Doing so, as discussed below, we note that the DEIR discussion sometimes ignores certain BRA findings that may be significant, the BRA conclusions may ignore its own findings and finally the BRA findings may need updating or inclusion of additional information. We address such issues here to prompt reconsideration of certain biological resource impacts and mitigations of the DEIR.

O8-4

**Light Pollution**

<u>Night light pollution above and transmission out towards the Bay</u>**.**

While appreciating the specific attention given to bird-safe design in this document, It is a concern that issues raised in the Willow Village Master Plan are not addressed: "suggesting that increases in ambient light may interfere with these processes across a wide range of species, resulting in impacts on wildlife populations." (BSD BRA p. 47).

Artificial light at night (ALAN) from this Project and cumulatively may cause significant environmental impacts. Light disrupts the circadian rhythm and behavior of living beings which can impact mating, foraging, and migration behaviors, sometimes with lethal results.  Light at night also attracts some species (especially birds and insects), resulting in disorientation and disruption of critical behaviors. As stated in the DEIR,Indeed, Artificial Light at Night has been implicated in ecosystem-wide disruptions in terrestrial and aquatic ecosystems.  Light pollution

O8-4 cont.

has also been correlated with increased cancer risks and hormone disruption in humans.

A primary impact of ALAN is its attractivity to insects, which form the major basis of the avian food chain. Light has been implicated as one of the drivers of the loss of the numbers and species of insects worldwide, with ecosystem level impact."[1]

Special attention is given to the Atrium and other areas that "have a greater potential to (1) spill northwards into sensitive habitats along the San Francisco Bay, and (2) attract and/or disorient migrating birds during the spring and fall". (BSD BRA p. 57). The following must be included in the environmental review of impacts.

- The DEIR, in addition to the light pollution analysis, include recognition that night lighting negatively alters behaviors of animals and provide measures that reduce this impact on insect and wildlife populations.
- The DEIR must identify, analyze and mitigate direct and indirect impacts on all wetlands to the north and east of the site (willow wetlands, CalTran's salt marsh harvest mouse mitigation site, south of the Dumbarton Corridor) for impacts of trespass that may be exacerbated by the proposed project, ambient nigh lighting, vehicle traffic, loop road fixtures, etc.
- The DEIR should analyze and mitigate all night lighting inclusive the impact of lighting sourced from the entire Project, not only the areas closest to habitat. Trespass and impact analysis should address any light visible from outside or above the project. We recommend using the most recent International Dark Association Guidance (amended June 2021), reflecting state of the art science, Analysis should consider including the five principles of responsible lighting[2] of the Guidance and the recommended ordinance[3] . These provide feasible, achievable and environmentally responsible best practices that should be adopted by the Project.
- Light trespass toward all habitats and the Bay should be considered on both a Project and Cumulative impact, inclusive of prior Meta development as well

O8-4 cont.

as other shoreline development, proposed, in construction or completed along the City's Bay shoreline.

**Light trespass in existing Bird Safe Design guideline:**
Mitigation Measure 7 of the existing Bird Safe Design requirements states, " All lighting shall be fully shielded to block illumination from shining outward towards all Bay shoreline habitats to the north. No light trespass shall be permitted more than 80 feet beyond the site's northern property line (i.e., beyond the JPB rail corridor)." (BSD BRA p.58)

- As technology is available to limit light trespass so none escapes beyond a property. 80-ft trespass is unjustifiable, The DEIR analysis should be altered to prohibit light trespass toward habitats.
- The DEIR must include addition of a monitoring and management plan to ensure that light trespass performance is attained and maintained on an ongoing basis.

**Light Pollution, additional ways to reduce**

Given the significant biological resources that could be adversely impacted he DEIR should identify additional measures to improve light pollution impacts

- Analyze the effect of structure height and related light source elevation. Should higher standards (LZ-1) apply to floors above the first floor?
- Analyze timing for closing blinds. Why is 10 PM the standard for closing blinds? Given the large amount of glass and the height of the buildings a 9 PM closure of blinds would reduce light pollution. As the angle and time of sunset are in continuous change, can the standard for closing blinds adjust quarterly on dates of the solstices and.equinoxes?
- Revise the Visitor Center guideline which specifies 11 PM for blind closure.
- Evaluate night closure of the elevated park to help reduce light pollution
- Evaluate requiring use of motion-detected or other light avoidance technologies for exterior locations that have habitat impacts on the north and northeast wetlands.

O8-5 **Bird Nesting**

<u>Impacts of Design and Materials on nesting</u>

The DEIR does not address the likely possibility that birds, wasps and possibly other species may be attracted to the buildings as nesting locations. **The DEIR should discuss, provide guidelines and mitigation to manage nesting** on the structures consistent with the International Migratory Bird Act and other law and

O8-5 cont.

with the intention of not contributing an "ecological  sink" e.g. reducing the breeding success of a migratory bird species.

<u>Bird Safe Design Waivers</u>

Discussion in the Bird Safe Design BRA reveals that the Project requests waivers for some of the most hazardous architectural elements. These waivers will relax the requirements of the City's Bird-Safe Design Mitigation Measure BIO-1 of the ConnectMenlo EIR. Waivers requested apply to these BSD requirements (BSD BRA p. 44):

- E. Glass skyways or walkways, free-standing (see-through) glass walls and handrails, and transparent building corners shall not be allowed; and
- F. Transparent glass shall not be allowed at the rooflines of buildings, including in conjunction with roof decks, patios and roofs with landscape vegetation.

It is worthwhile to further consider this BRA's discussion of waiver alternatives it proposes.(BSD BRA p.45):

> "Specifically, all glazing on free-standing glass railings in exterior areas adjacent to the atrium shall have a **Threat Factor** (see footnote 1 above) **less than or equal to 15**. This Threat Factor is relatively low (and the effectiveness of the bird-safe treatment correspondingly high) due to the relatively high risk of bird collisions with free-standing glass railings."
>
> And:
> "The only untreated glazing on the atrium will be located on the vertical façade beneath the elevated park, which **does not create a collision hazard due to landscape vegetation on roofs**."

The first statement applies a calculated risk assessment. We oppose a waiver on this basis and, **if issued**, **require that the railings at issue have continuous monitoring that assesses and reports the actual level of impacts compared to the risk assessment value used.**

The second statement provides no justification for its assumption that rooftop vegetation will keep birds from flying beneath the elevated park. We oppose this waiver on this basis and, **if the waiver is issued, continuous monitoring of bird presence and collisions under the elevated park must be provided and reported.**

Monitoring and reporting of BSD waivers issued that incorporate any expectation of impacting birds need to be included as a mitigation measure in the DEIR.

O8-6 Trash pollution: Wind, trash and balloons

The elevated park is expected to attract people for many reasons. Given the exposure of its height and its location in Menlo Park's often windy shoreline area and deflection of winds by proposed taller buildings, the park could be a source of wind-scattered trash, food scraps, plastic bottles and any kind of balloon, Wind will be a concern anywhere in the project footprint but elevation will exacerbate it and impact habitats near and far, particularly helium balloons. Trash of all kinds, plastics and balloons are a known severe impact on habitat lands and on the species that use them.

- Mitigations/Measures that provide maximum control of all forms of trash for public areas should be provided.
- Helium-filled balloons be prohibited anywhere on the Project site including the elevated park and Hamilton North and South.

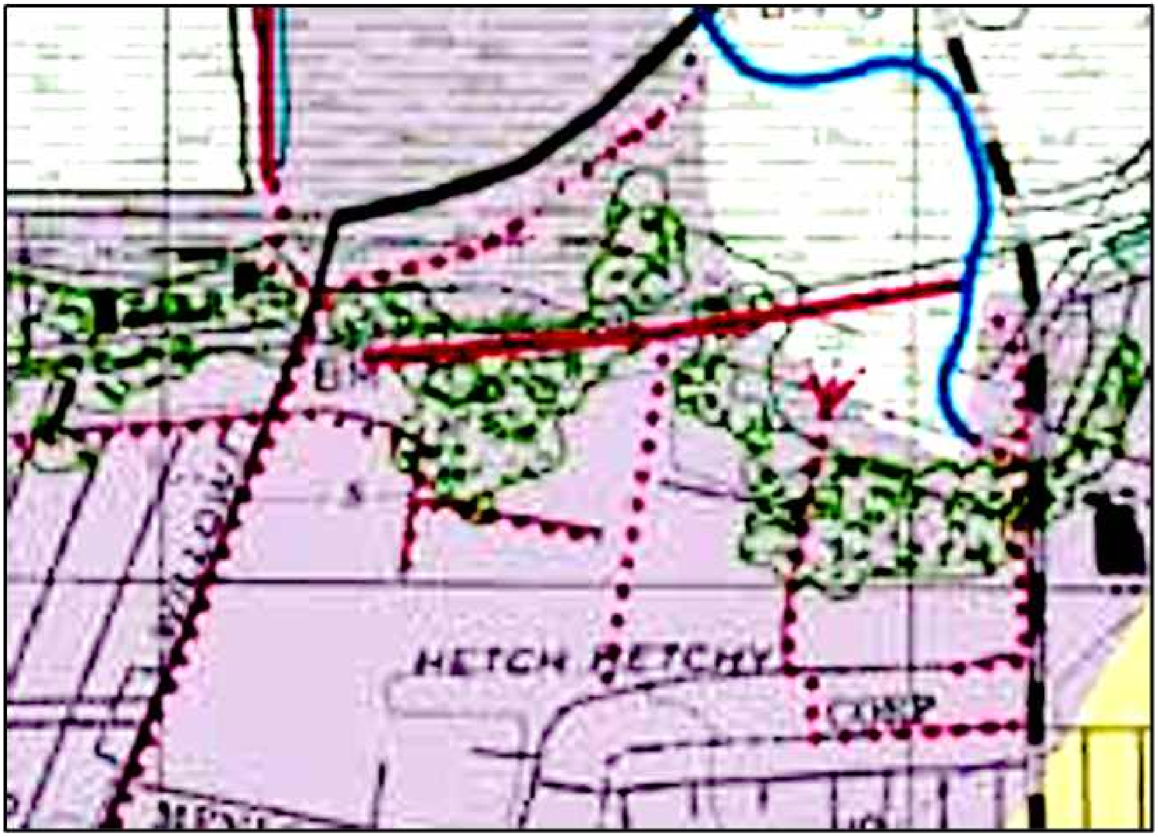
O8-7

## Willow Wetlands

Biological Resource Assessment of the WVMP identified an ecologically rare, isolated, forested habitat dominated by Arroyo willows on and adjoining the north edge of the main Project site that is discussed in the DEIR. Historically a major habitat at the Project site, recognized in the name "Willow Road", even its small footprint here calls for efforts to avoid all impacts that threaten its survival. The excerpted image just below from the Baylands & Creeks of South San Francisco Bay map of the Oakland Museum of California[4] demonstrates the willows habitat on the site circa 1850. The bold red-black line shows the drainage ditch running along the north edge, just outside the Project site.[5]

[4] Oakland Museum of California, Baylands & Creeks of South San Francisco Bay, 2005; http://explore.museumca.org/creeks/1460-OMEPA.html#
[5] http://explore.museumca.org/creeks/1460-OMEPA.html#

O8-7
cont.



From the Master Plan BRA, p. 50: "These wetlands are small and isolated, being in depressional areas, rather than having a surface connection to more extensive wetlands. Due to their small, isolated nature and lack of high-quality habitat for wildlife, these are not high-quality habitat features. Nevertheless, forested wetlands are relatively scarce along the edge of the bay, and seasonal wetlands along the edge of the bay have declined due to development and fill. Therefore, <u>we consider these wetlands to be sensitive habitat areas</u>." (emphasis added)

We agree that willow wetlands are sensitive habitat areas .Arroyo Willow is listed as a sensitive species by CDFW.[6] The fact that the habitat is "sensitive" and requires application of Menlo Park's a number of relevant BIO, LU, and OSC policies referenced in the ConnectMenlo EIR. We disagree with the DEIR finding (3.9-16) that "The wetlands are not associated with a stream and therefore would not constitute sensitive riparian habitat claimed by CDFW". The willows habitat, as a *unique* finding of this DEIR, requires substantive impact analysis of potential impacts and mitigations. Some of these issues are discussed in the WVMP BRA. Others are not or are insufficiently considered. We raise most such issues here:

---

[6] https://wildlife.ca.gov/Data/VegCAMP/Natural-Communities#natural%20communities%20lists

O8-7 cont.

- Improve DEIR impact analysis by describing and explaining ecological relevance of historic conditions in determination of potential impacts of the project and inclusive protection of the existing willow habitat.
- Analyze the cumulative impact of bayside development on willow habitats in the area e.g the Redwood City through Palo Alto Bay shoreline.
- Describe more fully how the north edge of the property will interface with the existingt willow grove habitat, identify potential impacts to avoid or mitigate..
- Apply all applicable City conservation policies inclusive of effects on sensitive species and impacts on adjoining properties.

O8-8 Shading by new construction should be considered an impact for the existing willows habitat. We ask for a more thorough analysis of this topic and calculation of the impacts from shading of the forested wetland:

> "The increased height of the proposed buildings is not expected to result in a substantial change in the ambient light reaching nearby wetlands. The isolated forested wetlands immediately north of the project boundary are currently bordered to the south by an area of tall trees that already provide some shade, and under the proposed project, regardless of the height of buildings that are constructed nearby, these wetlands would still have exposure to the eastern sky, unimpeded by new buildings. Thus, shading of this wetland under the proposed project is not expected to increase substantially over current levels." (WVMP BRA p.50)

The omitted analysis discussed here is how Project shading will affect the existing willows habitat. The Atrium dome that would be nearby would be ~120' tall, substantially taller than the existing trees. CalTrans studied the topic of shading and lists Arroyo willow (Salix lasiolepis) as Intolerant of shade.[7] The question is whether there is sufficient sunlight for Willow Habitat.

**We ask** that shading and other impacts of concern listed above are analyzed and avoided or mitigated.

O8-9 Potential hydrological impact on the willows wetland.

Photo 4. Willow dominated isolated forested wetland located in the northern potions of the study area.

Willow Village DEIR Appendix 3.9, p. 25

In these comments we turn to focus on the water sources that have allowed these willows to survive and are requirements of survival.

Locations where willows occur are sometimes called "willow marshes" alluding to the moist ground on which they depend. Wetlands of that characteristic, sausals, acquire their fresh water supply from seasonal and pooled surface water and also from underground flow that may or may not be continuous from upland-sourced, subsurface flow. Given repeated years of drought, lack of seasonal rain and proximity to saline marsh, it appears likely these willows are fed by unidentified, underground freshwater flows.

Our concern is: **will any action of the Project disrupt or terminate these flows?** That concern needs to be addressed by impact analysis that:

- Identifies the willows' underground freshwater source, delivery direction and path.
- Identifies all Project action along the northern boundary that may interrupt the flows to the willows, temporarily or permanently.
- To the northwest and if underground flow comes from that direction, analyze whether construction and installation of the 18' high by 42'-50' wide Willow Road Tunnel would temporarily or permanently interfere with flow to the willows.

O8-9 cont.

- If underground water is found to be sourced from ground saturation by nearby landscape irrigation that the Project will remove, identify options to replace that loss.
- Given that the Project site has a known history as a heavily-used site by local native people, it should be determined if willows have significant cultural meaning or value to them.
- Consult the Regional Water Quality Control Board, determine if this willow sausal qualifies as Waters of the State and requires State mitigation if disturbed.[8]

Willows Wetlands Summary

Where conditions allow, willows are a dominant, keystone species that creates a habitat that expands biodiversity wherever it occurs. Diverse species of wildlife benefit, providing foraging, nesting, resting, refuge for any species that depends on this kind of habitat. The Project has a significant ecological element present on its northern edge and beyond. It needs a dedicated effort to assure its survival and the possibility of expanding beyond its current edges as a historically important ecotone habitat along the South Bay edge.

**We ask the Project to address the willows wetland and its place in Menlo Park's shoreline ecology.**

## Interrelated impacts of Hydrology on Water Quality, Geology, Soils, Hazardous materials and Biological Resources

The DEIR provides a thorough discussion of city-mandated and regulated issues of hydrology including sea level rise. In discussion here, we bring your attention to issues that emerging science has identified and may be significant to the Project site. Under CEQA these issues are not required analysis but may nonetheless be in the best interest of the lead agency and/or the project proponent.

### Climate Challenge: Water above and below ground

Associated with climate change, meteorological shifts have already changed the local climate: extended periods of drought and less frequent but intense, major storms or sequenced storms such as last October's atmospheric river. Such storms test local stormwater systems and, by infiltration, sewer systems while producing surface ponding and localized flooding. Steadily, over the decades of usable life for

[8] Willow Village DEIR, Appendix 3.9, Sec. 5.3.3, p.38.

O8-10 cont. the Willow Village Project, rising groundwater (subsurface aquifers) will exacerbate the problem.

Sea level rise

While the DEIR fulfills City and FEMA requirements for sea level rise (SLR), it is a concern that the SLR standard used is already out of date especially for a Project that, at build-out, is expected to exist for 30 years or more. For SLR inundation, the DEIR uses 24" of SLR by 2050, common to data sourcing from the Ocean Protection Council's (OPC) 2018 Update of Sea-Level Rise Guidelines.[9] This document provides a range of risk-aversion data points from which jurisdictions can select. These data points are calculated from greenhouse gas emission levels based on data from 2014. In April 2020, the OPC published Principles for Aligned State Action[10] that proposed broad, regional planning using a standard of 3.5'(42") by 2050 and commitment to the "best available science". Those principles encourage regional commitment which is not binding but published due to increasingly serious SLR concerns. To our knowledge, One Shoreline, San Mateo County's regional SLR resilience agency, has not adopted the 3.5' by 2050 standard. **We would encourage the Project to take two actions: (1) Incorporate monitoring of the Principles and (2) adopt a dynamic updating standard that reassesses construction, operations and mitigation standards whenever the OPC releases updates of its Sea-Level Rise Guidance whether or not local jurisdiction requires it to do so**. The latter action is already used in Mountain View, embedded in its Public Works' North of Bayshore (shoreline) CIP requirements.

The OPC updates its documents periodically, after each release of new findings by the Intergovernmental Panel on Climate Change (IPCC), most recently earlier this year. Updates of these OPC documents are expected, date or dates TBD.

Subsurface Groundwater

Unfortunately neither of those documents nor current inundation maps of BCDC and FEMA include rising groundwater consideration or guidance. SLR's inundation effects have long been widely discussed, during which time scientists understood that SLR would also produce lowland risk of rising groundwater (subsurface aquifer) but the best science available on the issue simply did not exist.

Scientific studies take time but are finally producing verifiable information. For California and including the entire Bay Area shoreline, in 2020 Befus et al published groundwater studies including a Nature Climate Change article, "Increasing threat of coastal groundwater hazards from sea level rise in California"[11] and made a suite of data files available for local scientific study.[12][13][14] Those findings are not yet incorporated in risk assessment maps produced by BCDC, FEMA and others but they are incorporated in online risk evaluation tools published by the USGS[15] and Point Blue Conservation Science (ourcoastourfuture.org).

A revealing reference to consult is a technical addendum prepared by the San Francisco Estuary Institute (SFEI) and others for the City of Sunnyvale's upcoming Moffett Park Specific Plan Update DEIR: "Sea-level rise impacts on shallow groundwater in Moffett Park".[16] The addendum is specific to findings in Moffett Park but its analysis is useful, discussing potential impacts and adaptation action for development. As food for thought, we list the potential impacts of rising groundwater compiled in the Moffett Park report.

- Corrosion. Salinity impact on below-ground infrastructure due to age or materials use
- Buoyancy. Buoyant force impact on foundations, buried utilities and pipes, roads. Together corrosion and buoyancy pose risks onsite and to service delivery systems inbound to and outbound from the Project site.
- Seepage. Seepage into subsurface structures, floors, walls, construction weak points, flaws that destroyed the Surfside condominiums in Florida
- Infiltration: Infiltration into stormwater and sewage pipelines reducing capacity
- Liquefaction: Rising water tables can increase liquefaction risk
- Damage to vegetation: Saturated soils and/or higher salinity can impact vegetation

O8-10 cont.

- Contaminant mobilization: Varying by location and contaminant type, movement vertically or laterally of existing remediation or of unknown contaminant
- Emergence flooding. Surfacing of groundwater; even non-emergent levels can exacerbate surface flooding by reducing depth to surface.

The DEIR discussion in Hydrology and Water Quality describes certain groundwater studies but, as it is not required, the risk potential of rising groundwater is not studied. But with seas notably rising, the best time to assess a groundwater baseline is now. The site has a history of fill, masking groundwater conditions across the full Project. **We recommend that the Project assess the subsurface groundwater status throughout the full site, setting a baseline for operations monitoring and adaptations to come.**

# Increasing threat of coastal groundwater hazards from sea-level rise in California

K. M. Befus [1,2] ✉, P. L. Barnard [3], D. J. Hoover [3], J. A. Finzi Hart [3] and C. I. Voss [4]

**Projected sea-level rise will raise coastal water tables, resulting in groundwater hazards that threaten shallow infrastructure and coastal ecosystem resilience. Here we model a range of sea-level rise scenarios to assess the responses of water tables across the diverse topography and climates of the California coast. With 1 m of sea-level rise, areas flooded from below are predicted to expand ~50–130 m inland, and low-lying coastal communities such as those around San Francisco Bay are most at risk. Coastal topography is a controlling factor; long-term rising water tables will intercept low-elevation drainage features, allowing for groundwater discharge that damps the extent of shoaling in ~70% (68.9–82.2%) of California's coastal water tables. Ignoring these topography-limited responses increases flooded-area forecasts by ~20% and substantially underestimates saltwater intrusion. All scenarios estimate that areas with shallow coastal water tables will shrink as they are inundated by overland flooding or are topographically limited from rising inland.**

Over the next century, rising sea levels are predicted to cause widespread inundation of coastal terrestrial areas[1,2], wetland loss[3] and more severe nuisance flooding[4,5]. Relative sea levels are projected to increase for much of Earth's coastlines[6], presenting a wide range of coastal hazards for the ~1 billion people living in low-elevation coastal areas by 2050 (ref. [7]). Along with the increasing exposure of coastal communities to overland flood risk[1,8,9], rising sea levels will cause unconfined coastal groundwater levels (that is, water tables) to rise, leading to inland flooding hazards via subsurface connections to the sea[10]. An improved understanding of the physical controls on the severity of the groundwater hazards caused by sea-level rise (as opposed to human-induced controls, such as pumping causing saltwater intrusion) is therefore urgently needed.

Compared with the impacts of direct marine inundation, the responses of groundwater to sea-level rise may lead to earlier, more severe or longer-term[11] hazards to terrestrial water resources[1,12,13], ecosystems[14,15] and infrastructure[10,16–18] and could contribute substantially to the projected hundreds of millions of people displaced by climate change over the next century[19,20]. Coastal water tables are dynamically connected to sea levels, with inland spatio-temporal responses dictated by the frequency and magnitude of forcing events[21,22]. Unconfined aquifers in hydraulic connection with rising seas experience shoaling of water tables as the higher sea level and the intrusion of denser marine water force water tables higher[10,23]. As water tables rise, groundwater discharge to receiving drainage networks may initiate or intensify[24].

Groundwater systems respond hydraulically to sea-level rise over a continuum between two primary modes[12,13,23]: (1) water tables rise the same amount as sea levels where thick, overlying unsaturated zones can accommodate additional groundwater storage, termed the flux-controlled or recharge-limited mode; and (2) water tables rise less than sea levels and instead discharge some of the original storage to existing or new drainage networks as saline intrusion displaces the fresh groundwater, termed the topography-limited or head-controlled mode. The hydrogeologic setting, which combines geology and climate, controls the hydraulic mode[13] and the vulnerability of the aquifer to seawater intrusion[12,25], the amount of fresh groundwater flowing through the aquifer, and the rate of submarine groundwater discharge and its role in transporting terrestrial chemicals to marine waters[26]. At the global scale, it is estimated that 16–78% of coastal groundwater systems could be topography limited (using one-dimensional analytical solutions with coarse topographic and geologic data)[13], but these estimates have not been refined at smaller scales. Many analyses of coastal groundwater with future sea-level rise adopt the flux-controlled mode[10,16,27,28], but selecting one mode to represent all groundwater can bias the analysis[29], and the implications of this assumption have not been extensively tested.

Here, we use a numerical modelling approach to test how groundwater beneath diverse coastal landscapes responds to rising sea levels. In this initial application to coastal California, the first large-scale, high-resolution analysis of the groundwater hazards resulting from sea-level rise is presented. The extent of future groundwater shoaling along California's coast is forecast, and the prevalence of flux-controlled and topography-limited conditions is then identified. Finally, the relevance of these conditions for future coastal management decisions is discussed. The focus is on the California coast, but the modelling approach is flexible and can be applied to coastal settings worldwide.

## Approach

Modelled forecasts for present-day and future equilibrium water-table depth conditions used both present-day local mean sea level (LMSL) and mean higher high water (MHHW) tidal datums as end members for the long-term position of the water table at the coast, with sea-level rise added to these datums for the analysed scenarios. Model hydrogeology was conceptualized in a simple manner, with uniform aquifer thickness along the coastline, a horizontal impermeable bottom at −50 m NAVD88 and homogeneous hydraulic conductivity ($K$). Given unknown aquifer properties, a different value of $K$ (0.1, 1 and 10 m d$^{-1}$) was used for each of the models run for each tidal datum, allowing the generation of a

The loss of total area is caused by overland inundation with higher sea levels.

range of forecasts (see Methods for more details). Two modelling approaches were used to separate groundwater responses following the flux-controlled and topography-limited modes. MODFLOW (ref. [30]), a numerical model of groundwater flow, calculated the equilibrium water-table position for specific sea-level-rise scenarios, in a groundwater flow system that is in steady state with respect to the water budget enforced by present topography, present climate and a particular sea level. The base MODFLOW models

Percentages of present-day TIGER (ref. [31]) populated land areas in California exposed to emergent to shallow water tables (that is, 0–2 m depth) and flooding from below with sea-level rise within the model domains. Present-day populated land areas within the model domains varied by tidal datum (LMSL, 4,480 $km^2$; MHHW, 4,390 $km^2$).

were constructed independently of a groundwater response mode, thus allowing either mode to control the water-table position on the basis of the local hydrogeology. The second approach, referred to as the flux-controlled approach, strictly applied the flux-controlled mode by raising the MODFLOW water-table elevations modelled for present-day sea levels by a constant equalling the increase in sea level from the present day (Extended Data Fig. 1).

Seasonal, tidal and other high-frequency water-table fluctuations affect the annual and subannual coastal elevation patterns of water tables[21,22], but long-term groundwater-level responses are dominated by sea-level rise, climate change effects on recharge and human uses; steady-state analyses therefore provide a strong initial evaluation of these systems. In this analysis, the sea-level-rise-driven responses of groundwater were evaluated independently of other driving forces that may impact groundwater shoaling, such as future changes in recharge rates, ongoing human groundwater use (such as groundwater pumping) and replenishment operations. The approaches described here rely on a series of simplifying assumptions that estimate diagnostic ranges of groundwater shoaling and seawater intrusion. The differences between groundwater responses forecast by the two approaches indicate the local influences of coastal topography on the groundwater hazard resulting from sea-level rise, as only the MODFLOW simulations include the ability of groundwater to drain and adjust up-gradient water-table elevations.

## Water-table response

Rising sea levels cause pervasive water-table shoaling along coastal California. Limiting the analysis to areas within 1 km of the present-day coastline (that is, 1 km inland from LMSL (3,240 $km^2$) or MHHW (3,300 $km^2$)), shallow to emergent groundwater (that is, within 2 m of the ground surface; the definitions are in Fig. 1) already exists beneath 981–1,450 $km^2$ for all model scenarios of tidal datums and aquifer geologies (Supplementary Tables 2 and 3). Using 1,500 km as a representative length of California's coastline, shallow to emergent groundwater conditions would be expected to exist today from the coast to 650–970 m inland on average across all scenarios. With 1 m of sea-level rise, the flux-controlled models forecast the shoaling of 124–190 $km^2$ of moderate to deep water tables into shallow to emergent water tables, encroaching an additional 80–130 m inland. The MODFLOW models forecast 60–169 $km^2$ of new areas with shallow to emergent water tables (Supplementary Tables 2 and 3), equivalent to moving the subsurface flooding hazard 50–90 m inland. However, the inland extent of shallow to emergent groundwater was spatially variable, so the averages and equivalents for the whole California coastline could misrepresent a local hazard. For example, some locations would experience almost no inland migration with 1 m of sea-level rise, and in other areas, measuring the distances between the present-day coastline and shallow water tables forecast more inland areas exposed for the MODFLOW (170–250 m) and flux-controlled (20–350 m) models than evenly distributing the hazard along California's coast (Supplementary Table 4).

Focusing on locations along the California coast where people live, we find that 13.8–43.9% of the areas defined as "populated places" by the Topologically Integrated Geographic Encoding and Referencing (TIGER) database[31] within the modelling domain face the hazards associated with emergent to shallow groundwater conditions today (Table 1, Supplementary Fig. 6 and Supplementary Tables 5 and 6). These at-risk areas grow by 1.1–3.7% with 1 m of sea-level rise in the MODFLOW simulations and by 4.7–6.4% in the flux-controlled forecasts (Table 1). Water tables rising due to sea-level rise will threaten larger areas of communities that could be beginning to experience shallow groundwater hazards today. Constraining the properties of the unconfined aquifer (that is, $K$ and thickness) is critical for reducing the uncertainty of where these hazards will be the most severe.

Despite the net shoaling of water tables within the 1 km distance from the shoreline considered for this calculation, the modelled steady-state future water-table depths show a loss of areas with emergent to shallow coastal water tables (Fig. 1). This loss results from the inability of inland water tables to keep pace with sea-level rise across California (Supplementary Tables 7 and 8). This phenomenon is especially evident in the San Francisco Bay region (Fig. 1), where sea-level rise inundates low-lying areas with shallow water tables, and gentle topography with abundant topographic drainage features limits the rise of inland water tables that would create new shallow water tables. In Southern California, water tables shoal more consistently with sea-level rise, where water tables farther inland are more responsive and raise deep water tables to shallower categories, unlike in other regions (Fig. 1). Thus, areas with emergent to shallow groundwater today are the most sensitive to inundation with rising sea levels, as they occur most often in low-lying areas. In the MODFLOW forecasts, an additional ~10% of such areas along coastal California are lost to marine or tidal conditions with 1 m

**Table 2 | Loss of coastal area with emergent to shallow water tables within 1 km of the present-day shoreline for 1 m of sea-level rise**

| | Present day | MODFLOW + 1 m sea-level rise | | Flux controlled + 1 m sea-level rise | |
|---|---|---|---|---|---|
| Tidal datum | Total area (km²) | Area lost (km²) | Percentage lost (%) | Area lost (km²) | Percentage lost (%) |
| MHHW | 1,310–3,170 | 376–520 | 16.4–28.8 | 197–270 | 8.5–18.4 |
| LMSL | 1,467–3,467 | 229–384 | 11.1–15.6 | 24–119 | 1.6–3.4 |

The ranges show the results for the three $K$ scenarios.

higher seas compared with the flux-controlled results (Table 2). In fact, the flux-controlled scenarios indicate the growth of areas with emergent groundwater of up to 86% relative to present-day occurrence, but losses in shallow groundwater converting to emergent conditions and the inundation of low-lying emergent groundwater yield net losses of the combined areas (Supplementary Tables 7 and 8). Assuming flux-controlled water-table responses overpredicts the expansiveness of emergent water tables by not accounting for groundwater discharge to topographic lows, such as drainage networks (Extended Data Fig. 1).

The degrees to which unconfined coastal aquifer areas are forecast to be flux controlled or topography limited were calculated by comparing the MODFLOW-modelled water-table rise with the present-day water table increased by sea-level rise, which requires flux-controlled conditions (Fig. 2). First, areas with emergent groundwater in both modelling approaches were separated from the mode analysis, as water tables no longer respond to sea-level rise once they are emergent. Next, areas showing no notable difference (≤5%) between the two water-table responses were taken to represent where the flux-controlled mode was active, whereas greater differences identify increasingly topography-limited conditions. We find that <20% (15.0–19.2% with $K = 1\,\mathrm{m\,d^{-1}}$ for all sea levels and tidal datums) of the California groundwater systems within 1 km of the coastline operated in the flux-controlled mode, where the water table responded linearly to sea-level rise (Extended Data Figs. 2 and 3). If the value of $K$ for the California coastal aquifers was increased to $10\,\mathrm{m\,d^{-1}}$, at least an order of magnitude higher than most of the coastal bedrock[32], flux-controlled areas increased to ~40% (38.8–47.1% for all sea levels and tidal datums) of the land area for each sea level (Extended Data Fig. 2). Much more of California's coastal areas were topography limited, as was separately calculated in a binary groundwater response analysis finding that 97.8% of the California coastal unconfined aquifers are topography limited[13] (Extended Data Fig. 4 and Supplementary Table 9). In our analysis, topography-limited conditions ranged from 68.9 to 82.2% of the modelled land areas with $K = 1\,\mathrm{m\,d^{-1}}$ and 43.5 to 59.6% with $K = 10\,\mathrm{m\,d^{-1}}$ for all sea levels and tidal datums, following the expectation for higher-permeability aquifers to be more frequently flux controlled[13]. By assuming that groundwater responds to sea-level rise under the flux-controlled mode only, as is common practice[10,16,27,28], models will overpredict water-table rises for a majority of California's coastal regions.

## Saltwater intrusion

Water-table elevations represent the energy in an unconfined groundwater system, and higher water tables can provide a hydraulic defence against saline groundwater intrusion. By calculating the buoyancy of fresh groundwater overlying infiltrated seawater,

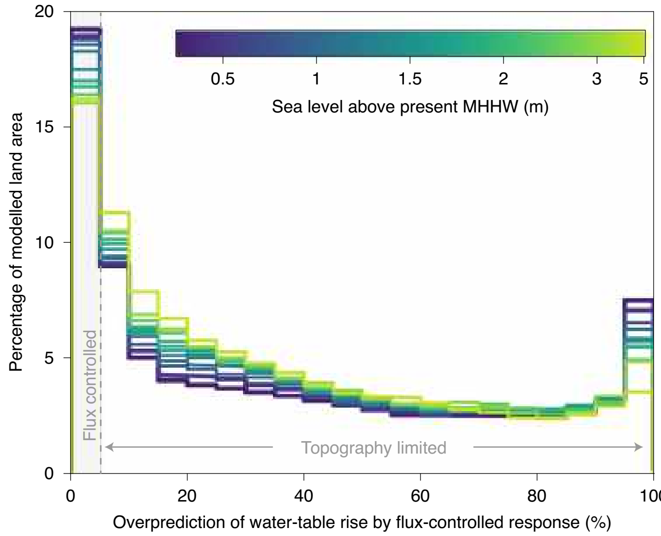

**Fig. 2 | Distribution of flux-controlled and topography-limited groundwater conditions along coastal California for higher sea levels.** The overprediction of the water-table rise by the flux-controlled response was calculated for the $K = 1\,\mathrm{m\,d^{-1}}$ MHHW datum model using equation (1) to 1 km inland from the present-day coastline. Additional model results are provided in Extended Data Figs. 2 and 3.

we predicted the evolution of the freshwater–saltwater interface with sea-level rise for coastal California (Methods). We define the saline groundwater wedge footprint as the inland area where the freshwater–saltwater interface exists at an elevation of −50 m NAVD88, at the base of the modelled portion of the geologic units in the coastal region (Extended Data Fig. 5). This gives a relative measure of the saltwater intrusion that can be expected as the footprint migrates inland. With 1 m of sea-level rise, saltwater intrusion in the flux-controlled models will expand the wedge footprint inland to underlie ~50 km² of new areas on average (7–142 km² with $10^{\pm1}$ $K$ and both datums, Supplementary Table 10), representing ~230–1,400 m of landward intrusion relative to the present-day wedge position. Allowing groundwater drainage at the land surface in the MODFLOW models resulted in 2.8–68 times more area of saltwater intrusion on average than the flux-controlled models predicted. In both models, the interface and footprint move inland, but the overall area of the footprint can shrink, as tidal and marine conditions may spatially outpace groundwater responses (Fig. 3b and Extended Data Fig. 6). The growth of the saline groundwater wedge footprint represents reductions in fresh groundwater storage, with topography-limited systems being the most vulnerable[13]. This analysis predicts conservative positions of the interface for the two tidal datums, as the groundwater flow models do not include the reduction in transmissivity created by a subsurface density interface that would push the interface farther seaward (Methods). Explicitly including the interface would lead to slightly higher water tables within the interface footprint and less saltwater intrusion, except where water tables are already forecast to be emergent, as water tables could not rise higher. In areas with emergent water tables, modelling the subsurface interface could result in more groundwater discharge to the coastal drainage network, raising the freshwater–saltwater interface and leading to more saltwater intrusion[33] and an even larger saline groundwater wedge footprint.

## Discussion

While prior work projects that climate-change-driven overland flooding over the next century could threaten over 600,000

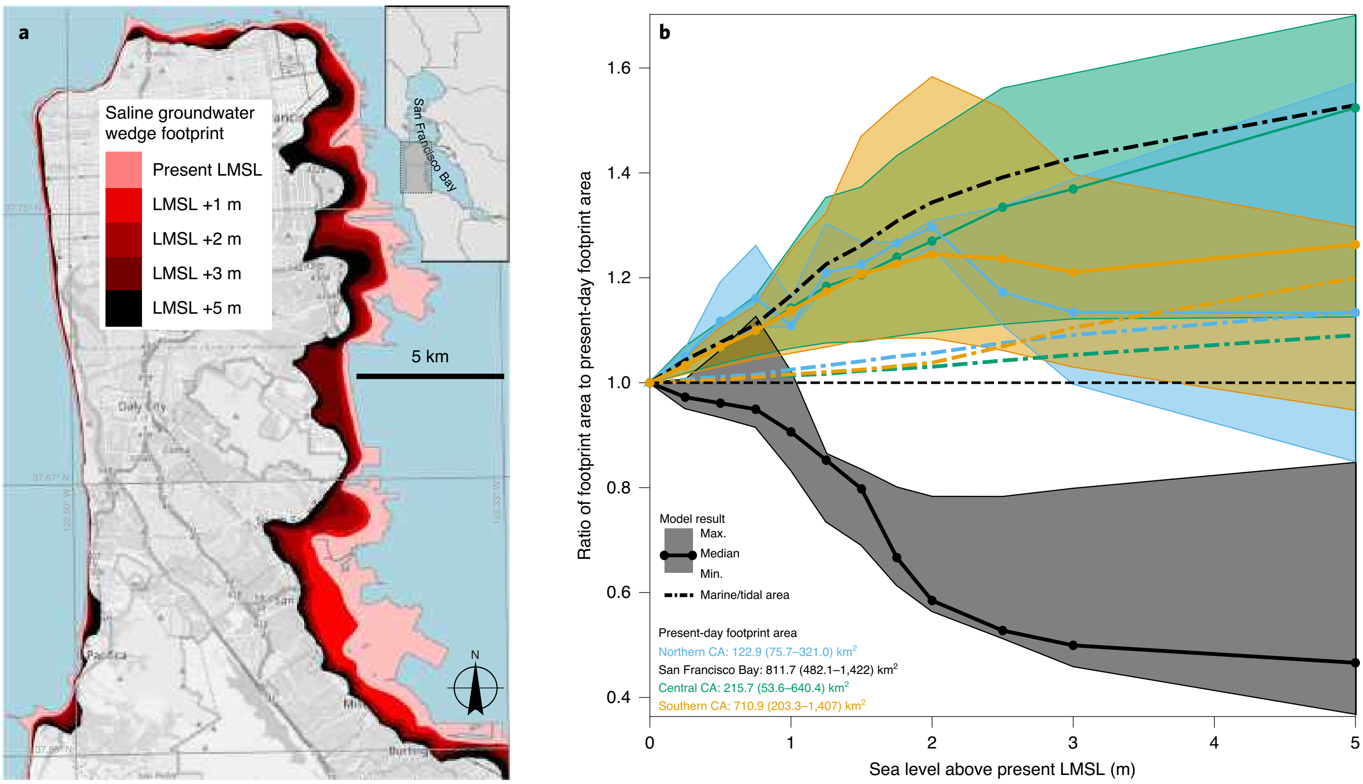

**Fig. 3 | Saline groundwater wedge footprint in shallow coastal California groundwater. a**, The groundwater saltwater–freshwater interface moves inland unevenly with water-table responses to sea-level rise in San Francisco and northern San Mateo counties. **b**, The growth of the saline groundwater wedge footprint across the coastal California regions (shown in Fig. 1) outpaces the growth of tidal and marine areas for all but the San Francisco Bay region until 3 m of sea-level rise. See Extended Data Fig. 6 for the MHHW datum and flux-controlled results. Credit for map in **a**: © OpenStreetMap contributors.

people and US$150 billion in infrastructure across the urbanized coast of California[9], our study focused on the complementary but as-yet unaccounted-for response of water tables to rising sea levels. Probabilistic predictions of median sea-level rise for California range from ~0.2 to 0.8 m by 2100 (66% likely range, 0.03 to 1.25 m across the state), with the variability driven primarily by tectonic setting and emission scenario, and with an extreme risk-aversion scenario (probability < 0.5%) of ~3 m (refs. [34–36]). While pervasive sea-level rise is expected for California, local areas of extreme tectonic uplift (such as Crescent City[36] and the Santa Ynez Mountains[37]) may lead to relative sea-level stability or a slight decrease by 2100. Therefore, our groundwater model projections in such areas would overpredict the rise of the water table. Nevertheless, ignoring vertical land motion, we project that >300 km$^2$ of land areas will be subjected to new groundwater emergence and on the order of 1 km of landward seawater intrusion (assuming 1 m of sea-level rise and aquifer geology represented by a $K$ of 1 m d$^{-1}$), which considerably expands the coastal hazards related to overland flooding alone.

Our findings suggest that, as water tables shoal with sea-level rise, overland inundation in low-lying areas reduces the overall extent of shallow and emergent water tables. In these areas, groundwater shoaling occurs ahead of the inland movement of overland inundation, such that flooding from below precedes inundation. While this inundation occurs progressively inland with higher sea levels, topography-limited conditions farther inland in some areas restrict the shoaling of water tables, leading to a loss of emergent conditions relative to today. Our models could overestimate the relative shoaling where the land surface is rising, because the topography used in the models was static and ignored the future effects of the physical and biological engines that created the present-day coastal lowlands as well as any future human activities or development. Erosion and deposition on land and in coastal waters, in combination with biologically driven wetland accretion, could drastically change the topographic profile of California's coast over the timescales represented in the water-table scenarios under sea-level rise[9,38–40]. However, creating space for these landscape evolution mechanisms that would accommodate shallower water tables may be difficult to achieve or undesirable along heavily urbanized coastlines.

The increasing occurrence of shallow and emergent groundwater tables inland with sea-level rise represents a substantial hazard to coastal infrastructure for the active tectonic and often high-relief setting of the California coast. Our results identify numerous locations with low-lying topography and poor surface drainage along the California coast that could face substantial local threats from groundwater hazards today or in the near future (such as the Port of Los Angeles, Santa Barbara and the San Francisco Airport). Increased roadway fatigue[41], reduced sewer and septic drainage[16,17], and the potential for mobilizing contaminants in soils currently above the water table will eventually be triggered farther inland as the water table rises with higher sea levels. Such hazards from groundwater shoaling may be most destructive where the flux-controlled groundwater mode is active and flooding from below is not a current threat to coastal infrastructure, mainly occurring in areas with steep coastal topography. Globally, present-day coastlines with gently sloping, low topography are more likely to experience daily marine and tidal flooding, with the groundwater hazard of saltwater intrusion presenting the main threat[13]. Oft-cited examples where groundwater hazards are a major, short-term threat include Honolulu, Hawaii[10,42], and Miami, Florida[43–45]. These areas are protected from overland flooding by coastal defences but are exposed to groundwater flooding today in locations characterized by low-lying topography and well-developed, high-$K$ subsurface drainage systems. Furthermore, while flood defences may be employed to protect many coastal communities from the projected overland flooding, groundwater emergence and shoaling will still threaten these low-lying areas with flooding from below, and alternative measures will need to be deployed (such as pumps and subsurface barriers).

Worldwide, the threat of groundwater hazards with sea-level rise is widely unknown, especially for developing nations and rural areas. Our simplified modelling approach can be extended to provide forecasts of groundwater hazards for coastal areas globally. Because of the importance of topography to how groundwater systems respond to sea-level rise, the reliability of such groundwater-hazard predictions will be limited by the spatial resolution of the available topographic data combined with the availability of accurate climatic and hydrogeologic information.

In unconfined coastal aquifers, rising sea levels will ultimately trigger some combination of the two hydrogeologic responses: groundwater shoaling and saltwater intrusion. Geology, climate and topography will then determine the mode by which the groundwater could present future hazards to coastal communities, requiring the development of new datasets to make accurate predictions of the groundwater hazards. Although the hazards created by aggravated overland coastal storm-driven flooding are more immediate and represent substantial socio-economic risk for the California coast[5,9], the groundwater hazards from sea-level rise pose eventual, geographically expansive risks to people by threatening coastal infrastructure[16] and agricultural activities[15], and the short-term risk may be far higher in some hydrogeologic settings. Human intervention through defensive or adaptive planning can shift the groundwater response towards either the topography-limited or the flux-controlled mode, but the alternate mode may then present new challenges. Therefore, by not addressing projections of groundwater shoaling and emergence, coastal communities around the world could overlook or exacerbate future hazards related to sea-level rise.

## Methods

**Groundwater model.** The equilibrium water-table responses to sea-level rise were modelled using the modular groundwater flow software MODFLOW (ref. [30]) controlled by the FloPy Python library[46]. The California coast was divided into 57 overlapping spatial domains for modelling groundwater flow in one-layer models, with the intention of combining the results into a continuous dataset. Each domain edge extended beyond a major surface-water drainage divide and overlapped the adjacent domain by 1–2 km. These smaller domains reduced the computational demand for the models and allowed the extremely fine model resolution of 10 m by 10 m, which was needed to represent details of the topography. Each model was run by solving the steady-state groundwater flow equation with spatially variable recharge rates prescribed by the annual average effective recharge for 2000–2013 (refs. [47,48]), where evapotranspirative fluxes were already removed from the recharge rate. A combined recharge-drain boundary condition was applied to the top of all terrestrial model cells. Using a high conductance value for the drain, this condition restricts the water table to levels at or below the land surface elevation (that is, exactly at the prescribed depth of the modelled drain), and the top of the cell serves as either a groundwater recharge or discharge feature for levels below or at the land surface, respectively. To isolate the hydrologic effects of changing sea level, we did not consider changes in recharge due to climate change, land-cover or land-use change, groundwater pumping, or managed recharge activities in surficial water-bearing units.

The three-dimensional hydrogeologic framework of coastal unconfined groundwater systems in California is poorly constrained. Calibrated groundwater flow models have been developed in a few populated regions[49–55], but the focus of these models has mainly been to determine the effects of pumping on deep, confined aquifers that supply the bulk of the water resources. Similarly, global hydrogeologic datasets on permeability and porosity describe the shallow bedrock geology[32,56,57] and do not currently have the vertical structure resolved for coastal California. Estimating unconsolidated coastal aquifer thicknesses with the assumption that coastal topography controls the basin thickness is most appropriate for passive tectonic margins and probably fails for much of coastal California[58]. Given the uncertainty in the coastal hydrogeologic framework, we used a range of values of $K$ (0.1, 1.0 and 10 m d$^{-1}$) to test the sensitivity of the sea-level-rise models to this parameter. These values span the more conductive end of permeability estimates for the study region[32,56,57] while also bounding the mean groundwater level measurements within the active model domains for the present-day mean conditions (Supplementary Discussion 1 and Supplementary Figs. 1–4). For simplicity due to the lack of consistent and comprehensive hydrogeologic data, the model bottom was set to a constant −50 m NAVD88 for all groundwater flow models (that is, a flat no-flow boundary), implying that groundwater flow is approximated to be horizontal at that elevation. The responsivity of the water table to sea-level rise would be set by integrating the thickness of the subsurface materials and $K$ (that is, transmissivity). The model thickness at the coast was 50 m plus the elevation of the tidal datum relative to NAVD88, but the aquifer thickness inland was determined by the local topography, leading to variable transmissivities depending on location. The values of $K$ set equivalent transmissivities that could also represent a three-order-of-magnitude change in model thickness rather than in $K$. By not keeping a constant aquifer thickness inland, the $K$ sensitivity testing did not directly test the model sensitivity to transmissivity.

Digital topography, tidal water levels and groundwater recharge rates, as described earlier, comprised the spatial data inputs for the groundwater models. Seamless topography–bathymetry models spanning the California coast[59–61] to elevations of at least 10 m NAVD88 set the primary inland extent of the groundwater models, but all models extended to at least 1 km inland from the present-day coastline. In the San Francisco Bay region, the elevation dataset extended much farther inland (Fig. 1), and the model domains were extended inland to encompass most watershed divides that would drain to the bay or the outer coast. These topographic datasets had a cell resolution of 2 m by 2 m and were optimized for modelling by filling closed depressions above mean sea level with TauDEM (ref. [62]). Closed depressions in the topography–bathymetry data were filled only on land to an elevation where no additional closed depressions existed for a clear path to the edge of the dataset. This filling allows water tables to rise in the closed depressions above the original surface elevations, forming groundwater-fed water features. The calculations of water-table depth used the original topography–bathymetry data, allowing groundwater levels to be above the land surface (that is, in the filled depressions). The topographic data were upscaled to the 10 m by 10 m groundwater model resolution using bilinear interpolation. Either the extent of the available topographic data or the approximate positions of surface hydrologic divides set the inland model boundary, which was conceptualized as a groundwater divide (that is, no-flow boundary conditions). Similarly, the shore-perpendicular edges of each groundwater model were also set as groundwater divides (that is, no flow). MHHW tide levels relative to NAVD88 were derived from the VDATUM vertical transformation database and software[63] for the open ocean at variable ~250–2,000 m point spacings and for San Francisco Bay at ~4,000 m point spacing[64,65]. The tidal datums data were assigned to marine and tidal groundwater model cells using nearest-neighbour interpolation. Coastal water depths were assigned using the MHHW (arithmetic mean, 1.71 m; minimum, 1.55 m; maximum, 2.31 m NAVD88) or LMSL (arithmetic mean, 0.888 m; minimum, 0.764 m; maximum, 1.29 m NAVD88) level added to the amount of sea-level rise in each model scenario, and these water levels were set as the tidal and marine boundary conditions as constant heads. A general head boundary with a freshwater equivalent conversion[66] based on local salinity data was tested in model development but led to unrealistic landward head gradients and negligibly higher water tables (<2 cm).

To merge the modelled groundwater heads from the 57 overlapping models for continuous predictions[67], the data farthest from the no-flow boundary of each model in the overlapping area were weighted the most in the blending algorithm. An error function based on the distance from the no-flow boundary defined the weights for linearly combining the results from each model, where 25% of the overlap area farthest from the no-flow boundary of a model was assigned values directly from that model. All merge operations were performed only on the groundwater head data, which are spatially smooth; the water-table depths were then calculated by subtracting the head from the unfilled land surface elevation. The merged model results were compiled to county boundaries for post-processing[67] and data publication[68,69].

The modelled hydraulic heads for present-day sea levels were validated against 3,775 mostly urban wells with unconfined water-table observations (Supplementary Fig. 1). The mean, minimum and maximum water-table positions were calculated for wells with more than one observation to constrain the range of recorded water-table variability (Supplementary Figs. 2–4). Because homogeneous $K$ values were used for the models, the aim of comparing the modelled and observed hydraulic heads was to test how well the $K$ scenarios encompassed the observations and not to adjust the $K$ values for specific regions, as is performed in the calibration of a model to observed data.

**Groundwater analyses.** In quantifying the degree to which coastal areas in California were topography limited or flux controlled, we compared the results of the numerical model, MODFLOW, with predictions of water-table responses under only flux-controlled conditions. The merged modelled water table for the present-day sea level using each model scenario (that is, each combination of tidal datum and $K$) separately for all of California served as the initial water tables for flux-controlled mode predictions. Thus, only the flux-controlled water tables for higher sea levels could be compared with the modelled water tables. At each higher sea level, the water table was raised by the same amount as the sea level, constant over the model domain (Extended Data Fig. 1), and areas where the water table exceeded the land surface were set as emergent (that is, water-table depth ≤ 0 m). Water-table depths increase as the water-table elevation lowers. The overprediction of the water-table rise by the flux-controlled mode was calculated for every active model cell as:

$$\text{Overprediction} = \frac{\text{Water-table depth}_{\text{MODFLOW}} - \text{Water-table depth}_{\text{flux-controlled}}}{\text{Sea level above present}} \times 100. \quad (1)$$

Model cells where the overprediction was ≤5% of the sea-level rise were assigned as flux controlled, and cells with an overprediction >5% were assigned as exhibiting some topography control. The choice of 5% as the boundary between the modes in the overprediction calculation allows very small differences (that is, ≤5%) in the modelled water-table depths in the numerator of equation (1) to be treated as representing a flux-controlled response. The uncertainty in water-table elevations introduced by the model convergence criterion set to be 0.01 m could lead to a maximum 8% overprediction in equation (1) for a sea-level rise of 0.25 m, reducing to 4% for 0.5 m. We therefore chose 5% instead of 0% as the overprediction threshold between flux-controlled and topography-limited conditions. Model cells with emergent groundwater no longer respond to sea-level rise until they become inundated and would yield an overprediction of 0%, suggesting flux-controlled conditions where water tables actually were limited by topography. Thus, all emergent groundwater cells were removed before calculating equation (1), as they would be erroneously considered flux controlled and can be interpreted alongside the two response modes (Extended Data Fig. 3). For Fig. 2, the areas of cells within each overprediction bin, representing 5% of the overprediction calculated in equation (1), were summed and represented as percentages of the total modelled land area, where the modelled land area decreases for models with higher sea levels as the tidal and marine areas grow.

For the saltwater intrusion analysis, the fresh–saline groundwater interface was calculated from the equilibrium groundwater models using the Ghyben–Herzberg relationship[70,71], whereby the interface depth, $z$, is:

$$z = \frac{h_f}{\delta} \quad (2)$$

where $h_f$ is the elevation of the water table above sea level, and $\delta$ is the dimensionless water-density-difference ratio between fresh, $\rho_f$, and saline, $\rho_s$, groundwater:

$$\delta = \frac{\rho_s - \rho_f}{\rho_f}. \quad (3)$$

This relationship arises by approximating the interface as a steady-state, sharp boundary between the two fluids, which neglects mixing at the interface due to both diffusion and dispersion. The groundwater modelling described earlier provided spatial predictions of $h_f$. Surface water salinity data were extracted from 10-m-depth salinity data gridded at a resolution of 0.25 decimal degrees (~28 km × 28 km) for the open ocean[64] and from observational data collected between 1968 and 2015 at 51 sites in San Francisco Bay[65]. The salinity was assigned to marine and tidal groundwater model cells using nearest-neighbour interpolation. The salinity of coastal waters was then converted to density using the Thermodynamic Equation of Seawater 2010 (ref. [72]). In our analysis, we approximate $z$ in equation (2) with the modelled $h_f$, a $\rho_f$ of 1,000 kg m$^{-3}$ and a $\rho_s$ based on the average density of coastal and marine waters from the salinities by county (1,008.1–1,025.2 kg m$^{-3}$; Supplementary Table 11). In equation (2), $h_f$ is the hydraulic head relative to sea level and not the NAVD88 datum, requiring the modelled heads to be converted to $h_f$ by accounting for the sea-level position on the basis of the average elevations of the respective tidal datums added to the amount of sea-level rise in each scenario. The interface slope and position in unconfined aquifers are controlled by the hydrogeology, climate and transient marine conditions[33,70,71,73,74]. The extent of the coastal area where a saline–fresh groundwater interface exists within this unconfined groundwater system is referred to as the saline groundwater wedge footprint and is limited to areas where $z$ is at or above −50 m NAVD88 (the lower boundary of the models). These footprints for specific sea levels overestimate the future encroachment of the saline–fresh interface with sea-level rise, as the steady-state assumption allows infinite time for inland migration of the interface. The true movement of the interface will depend on the rate of sea-level rise, and the degree to which the aquifer is confined or semiconfined will introduce additional time lags of years to decades[11]. Such relatively short transient effects will create impacts that will still manifest on management-decision timescales. Finally, the use of a homogeneous unconfined aquifer simplifies the location of the saline–fresh interface, as heterogeneity and anisotropy in $K$ will lead to more interface complexity[75–78] than can be accounted for in the homogeneous models.

## Data availability

Derived model outputs that were merged across overlapping model boundaries and compiled to county boundaries are available to download at https://doi.org/10.5066/P9H5PBXP. The available data include georeferenced rasters of hydraulic head (that is, water table elevation) and water table depth and georeferenced shapefiles of the water table depth categories. The saline groundwater wedge footprint shapefiles are available to download at https://doi.org/10.4211/hs.1c95059edcf041a0959e0b4a1f05478c. The other MODFLOW input, output and derived datasets are available upon request. All other input datasets are available from the original sources.

## Code availability

The relevant portions of the pre- and post-processing functions and scripts used to develop the figures and datasets in this study are available at https://doi.org/10.5281/zenodo.3897502. All other codes are available upon request at the discretion of the authors.

I1-1 I hope they will build whatever they want as long as they NEVER ask the city to pay for any climate change impact mitigation projects. The area is very low lying and very close to the water. Sea level rise will impact it. If there is any chance that Willow Village will ask for tax dollars to protect their project, nothing should ever be built. If they assume all the risk, I am all in favor.

SUB: Willow Village Master Plan Project - EIR

This submittal is in support of the Willow Village project and the EIR process, which will improve the final project as planned.

I have reviewed the EIR executive summary and significant-impacts summary.

Comments:

The modernization of this underutilized commercial area is an important move forward for the City of Menlo Park, especially for the neighbors who are immediately adjacent.

I am pleased with the response by the developer to the extensive community feedback:

Project goals include to minimize traffic, improve Willow Road transportation infrastructure, place all parking underground, and include connections to the Belle Haven neighborhood.
I2-1 A very important benefit to our region is the addition of 1730 units of housing, with over 300 affordable units. Other benefits include delivering needed neighborhood services in the first phase of the development, the creation of a 4-acre community park, and the use of 'mass timber' construction which greatly reduces climate impacts.

I note that the project will include an Impacts mitigating, monitoring, and reporting program.

The development team significantly improved the project design based on community feedback, following almost 170 meetings over the past half dozen years. This development also fits in with the Connect Menlo General Plan Amendment, which also was a very public process.

I am especially pleased to note the sustainability aspects of the project: 100% electrical, extensive use of solar and recycled water, and sustainable building materials.

This project is establishing a model for future construction projects for the development industry worldwide: human-scaled, modern, sustainable, cost-effective construction techniques.

We are lucky that the Meta Platforms company has decided to make this outstanding investment in community amenities and services in the Belle Haven neighborhood.

Thank you, Menlo Park, for working through all the details of the EIR and responses.

I3-1 Thank you. Even if the first floor is 2 ft above the current first floor, I'm assuming, that there's a basement. Is that just designed to flood? And what about things that are stored there? Will everything be designed for occasional soaking? And how will people get in and out of the raised first floor if it's surrounded by water? Or will they be stuck in or out?

Thanks!

Dear Planning Commissioners,

I4-1

I am writing to express my support for the Willow Village project. I urge you to advance the project through the EIR process and remaining steps toward approval.

I lived in East Palo Alto from 2015 - 2020 on Kavanaugh Dr. We loved being so close to Facebook, where I work, and our neighbors were wonderful. What was hard was not having a grocery store nearby, not having a nice park within walking distance, the sidewalks were awful (cracked, hard to walk with a stroller) and a closer movie theater would have been great. We had a dog and a toddler at the time and not having a park we felt safe enough to walk to was a real bummer.

I was so excited to hear about this project and cannot wait for it to get started. We ended up moving out of the neighborhood because it wasn't working for our family but we kept our property and rented it out. We would love to see this development continue as quickly as possible to improve the livability for future tenants.

Thank you for your consideration,
Kimberly Baller

Dear Planning Commissioners -

I5-1 I am writing to express my support for the Willow Village project. My wife Kimberly and I moved to East Palo Alto in 2014. Our son Jax was born in our home in 2016. We love the neighborhood in many ways, but community facilities, safe and aesthetic parks and commercial options are poor. Willow Village will provide both Menlo Park and East Palo Alto residents with what is missing from the area.

I urge you to advance the project through the EIR process and remaining steps toward approval.

Thanks for your time and consideration,

Estimated Planning Commissioners,

I6-1 I am a resident of East Palo Alto, living relatively close to the Willow Village project. As a nearby resident, I would like to express my support for the Willow Village project. The area it intends to be at, is currently only used for buildings, and this project would include not only that, but shared areas for community entertainment and housing, which should take some of the FB workers (And some other residents) out of the road, which would help traffic overall. Also, having retail and groceries nearby, will help the whole area East of 101, and bring some more tax revenue to MP, so everybody wins.

I urge you to advance the project through the EIR process and remaining steps toward approval.

Regards,

-Federico Andrade-Garcia

| **Subject:** | [Sent to Planning ]F1 & G1 Draft Environmental Impact Report Willow Village - 25 Apr 2022 Menlo Park Planning Commission |
| **Follow Up Flag:** | Follow up |
| **Flag Status:** | Completed |

Dear Menlo Park planning commissioners,

Nearby Kavanaugh East Palo Alto residents will benefit but also be affected by the new Willow Village/Meta Campus and we thank you for the opportunity to provide some feedback on the EIR and latest development proposal.

I9-1 With Menlo Park's current city ordinance prohibiting nearby overnight parking and with the Willow Campus parking on the eastern side and the O'Brien/Willow connection next to the East Palo Alto Kavanaugh/Gloria neighborhood, residents have expressed concerns about increasing parking issues, speed/safety and nonresidential cut-through traffic between University, Willow and Bay corridors which need to be addressed now before construction begins. Therefore,

I9-2 A. Nearby East Palo Alto city streets (Kavanaugh, Gloria, University, etc…) must be included in all current/future studies and some of the impact fees should go towards the city of East Palo Alto for safety and traffic mitigation measures such as:

1. To implement 2 new stop signs on Kavanaugh Drive at Gloria Way and Clarence Court.

2. To install digital driver's speed limit radar displays on Kavanaugh Drive and Gloria Way on both side of the street.

3. To perform an asphalt street resurfacing/reconstruction on Kavanaugh Drive with larger concrete sidewalks and rebuilt ADA compliant crosswalks/curbs/ramps, bury all overhead utility lines and install more lamp posts on all the electrical poles on Kavanaugh Drive, Gloria Way and all adjacent streets and courts to increase safety (Kirkwood, Clarence, Gertrude, Hazelwood, Farrington, Emmett, Ursula, Grace).

4. To conduct an engineering evaluation and implement the most appropriate and effective street traffic/speed calming devices (e.g. speed bumps, traffic circles at intersections, etc…) on Kavanaugh Drive (between O'Brien Dr and University Ave) and on Gloria Way (between Bay Rd and Kavanaugh Dr).

5. To include Notre Dame Ave / Kavanaugh Dr as a bike lane in the Bicycle Transportation Master Plan which would be a bicycle improvement/alternative to the busy Bay Rd / Newbridge St bike route to Willow Road.

6. To install lighting on University Avenue between Kavanaugh Drive and Bay Road either on the street side that has the existing sidewalk or on the median, lighting both side of the road like on the rest of University Avenue to increase safety (currently the side of the road that has lighting on this street portion is the one where there is no sidewalk).

7. To implement an all-red traffic light interval at the University/Kavanaugh/Notre Dame traffic light intersections.

8. To strengthen control and enforcement of speed/traffic/parking regulations.

I9-3 B. To limit vehicle traffic, the Willow/O'Brien/University area should be redeveloped with pedestrian/bicycle traffic in mind. As such, sidewalks with ADA compliant crosswalks/curbs/ramps, which at present are mostly nonexistent, should be constructed on both sides all along O'Brien Drive (as a continuation and similarly to what has been done at 1035

O'Brien Drive for example when it was rebuilt) and Kavanaugh Way in Menlo Park to connect with existing sidewalks on Kavanaugh Drive and University Avenue in East Palo Alto. Better lighting should be installed and bicycle lanes should be also developed on O'Brien Drive.

I9-4 C. Paseos and streets in the Willow Campus should better connect to O'Brien Drive. As such, we would like the developer to work with other nearby landowners and specifically CSBio (1075 O'Brien/Kelly Court), 1105-1165 O'Brien Drive, 1005 O'Brien Drive and 1320 Willow Road, and 1350 Adams Court which are currently redeveloping their properties and finalizing their designs. This would allow the possibility of new connections with O'Brien and the new Willow campus street/paseo grid proposal (for example utilizing the current drainage channel between 1075 and 1105 O'Brien Drive and the previous fenced off connections between 20 Kelly Court and 960/1350 Hamilton) and between Adams Court and Hamilton Court.

I9-5 D. Other more direct bus/street connections from Willow/University to Willow Village should be considered to limit residential traffic and avoid O'Brien Drive/Kavanaugh Drive.

I9-6 E. Meta should also consider the integration/planning of a Multi-Modal Transit Hub by the SamTrans corridor and keep pushing for the Dumbarton Rail Corridor to be reactivated. The plan should allow options to include and connect a future Dumbarton transit/commuting center to the Willow Village Campus.

I9-7 F. The redevelopment of Hetch Hetchy right of way should be included in the project to increase greenery and connect the proposed south park crescent between Ivy/Willow and O'Brien Parks. The developer of this project should work with relevant parties such as the city, nearby other landowners, and the SFPUC, to increase park/playground options on Hetch Hetchy such as secured children/toddlers areas and tennis/basketball/football/soccer/bocce courts, etc... This would create an additional south paseo and increase community park amenities serving both future employees and local residents.

I9-8 G. Re-including the initial proposal for a Community Center on ground level near the Ivy/Willow public park would be greatly beneficial. The Ivy/Willow park/open space should not be limited as a sport's/multi use field which will be only used by 1 or 2 leagues but should be planned as a full amenity community park such as the "awesome spot playground" (Modesto) or the "magical bridge playground" (Palo Alto). Hopefully the elevated park by the SamTrans corridor can also incorporate many great designs/features from the High Line New York city public park.

I9-9 H. To mitigate traffic issues on the Willow Road/O'Brien Drive corridor, please also find down below some additional feedback/improvements (#1 to #11) that should be implemented as soon as possible in coordination with the appropriate agencies (Caltrans, AC Transit, etc…) in advance of the Willow Village/Meta campus:

1. No parking request in front of 965-985 O'Brien Drive, Menlo Park to ease the flow of vehicles to Willow Road. This would allow vehicles on O'Brien to be in 2 lines, up to the traffic light (right now the 2 lines, no parking zone is not even barely from 965 O'Brien to the light but just a few feet from the corner Willow/O'Brien intersection). Vehicles that are parked on the street around 965-985 O'Brien make the congestion even worse and the 2hr parking zone is not even enforced in this area. This should be very easy and fast to implement (just relocating the existing "no parking here to curb" further down the street and extending the painting strip to divide the lane further).

2. Installation of a new sign on the far right of the large overhang Newbridge traffic light mast arm coming from US101 towards O'Brien Drive with "lane ends - through traffic merge left" would ease the traffic for locals who make a right on Willow Road to Alberni Street and O'Brien Drive. At present, through traffic on Willow Road stay on the very right lane from US101 overpass to O'Brien Drive, blocking the lane for local traffic turning right. Having a "warning" early posted sign ahead of time will help vehicles merge ahead of time instead of seeing the signs too late and blocking the lanes where local residents need to exit/enter.

3. The Willow Road and side street traffic light synchronization needs to account and take place also East of US101 right away, not just West of US101. Vehicle counts and traffic patterns on O'Brien/Ivy/Hamilton should be done/included on the on-going synchronization (also on side streets such as Kavanaugh Way (Menlo Park) and Kavanaugh Drive (East Palo Alto) in anticipation of the FaceBook Willow Campus).

4. As a complement to #2, going East on CA 114 towards the Dumbarton bridge, the sign next to the sidewalk indicating that Willow through traffic must merge left near the intersection of Willow Road and O'Brien Drive is too close to the intersection/traffic light. It does not give cars enough distance to move to the left if going straight. This gives the impression that there are 3 lanes instead of 2 and at peak commute hour creates a bottle neck for people who want to turn right on O'Brien Drive. The "Through traffic must merge left" sign should be moved before Alberni Street EPA to give enough time for drivers to get off the right lane and not block it. Again, having a "warning" early posted sign ahead of time

will help vehicles merge ahead of time instead of seeing the signs too late and blocking the lanes where local residents need to exit/enter. Some additional “Right arrows” should also be painted just after Alberni Street EPA on the right lane to reinforce the message.

5. Similarly to #2, a new sign can be installed on the far right of the horizontal large overhang Newbridge traffic light mast arm coming from O'Brien Drive towards US101 "Right lane must turn right - US101 North SF only".

6. As a complement to #5, going West on CA 114 towards US 101, the new Willow configuration at/after Newbridge is a very nice improvement (except for the Dumbarton express bus stop footprint/location, see #7). However, the signs on the right side indicating that through traffic must merge left and that the right lane is for San Francisco US 101 are not really well placed and from a driver perspective cannot be seen very well (maybe OK if you see them from a pedestrian’s perspective or inspect the intersection on foot, but they are partially hidden by traffic light/trees if you see them from a driver’s perspective on the right or middle lane before the traffic light). May be the placement of the various sidewalk signs between Newbridge and US 101 can be revisited and also some “Right arrows” can be painted just before or after the “SF North” white road marking on the right lane.

7. Going West on CA 114 towards US 101, the Dumbarton Express bus stop on Willow Road, right at the corner of Newbridge MP is badly posted and very dangerous. Unlike the bus stop on the other Willow/Newbridge EPA side going East, and despite the new large sidewalk just been redone, no footprint/easement was accommodated for the bus to pull out of the "turn right 101 North Only" lane. Therefore, drivers following the bus on Willow and who are unaware of the bus stop corner location, get stuck in the middle of the Willow/Newbridge intersection until the bus moves out. Some drivers will then try to get out by partially moving in the middle lane by sharing lanes with cars currently on the middle lane and get into near accidents. At the same time there are also vehicles trying to make a right turn (on red) on Willow from Newbridge MP which makes the situation worse. The bus stop sign should be relocated in a more visible location and a pull out space should be accommodated on the large sidewalk to make a real bus stop aside from trough traffic. Relocating it before the Willow/Newbridge traffic light on the side of Mi Tierra Linda would be best. There is more space and it would be almost at the same location of the other bus stop on the opposite direction/side of the street. This is not simply a problem of responsible drivers but really a poor location of the current bus stop location.

8. In addition to the already difficult situation described on #7, and to avoid people coming from Newbridge MP from blocking Pierce Road and also creating accident situations with drivers coming from Newbridge EPA or Willow Road, there should be a “do not turn right on red” for the light at Newbridge MP. Cars should be forced to stop before Pierce Road and wait for the green light to turn right on Willow Road West.

9. Maintenance wise, several light bulbs are burned off at the O'Brien/Ivy traffic lights and many round shape light covers are missing at several location which makes some lights hard to see depending on the sun exposure. The "Do not block the intersection" sign facing O'Brien Drive at Willow Road fell of the middle traffic light and is now missing. Also the island traffic light to make a left on O'Brien from Willow has been missing and not replaced for several months.

10. Implementation of an all-red interval for vehicle clearance and traffic safety at all the Willow intersections traffic lights between US101 and Bayfront expressway (Newbridge, O'Brien, Ivy, Hamilton) to increase safety and prevent such dangerous/accident prone situations that happened previously on Kavanaugh/University and Willow/O'Brien (see examples here:

https://vimeo.com/231583589

https://vimeo.com/231583590

https://vimeo.com/231583682 )

11. Repainting of all missing/faded directional doted lines at all the Willow intersections between US101 and Bayfront expressway (Newbridge, O'Brien, Ivy, Hamilton) to guide the vehicles turning.

Overall, we are very excited about this mixed used project with public access and amenities east of US101. We are looking forward for the city of Menlo Park, the planning commission and the developer to working together with the relevant stakeholders (e.g. the city of East Palo Alto, SFPUC, Meta, CSBio, etc...) to incorporate and implement these improvements so that this live/work/play development transforms the O’Brien business park area in a more lively community district integrated in the surrounding city neighborhoods and ultimately benefits everyone.

Thank you very much for your consideration.

Romain Taniere

East Palo Alto, Kavanaugh neighborhood resident.

Dear Planning Commissioners,

I10-1 As a Belle Haven resident, I am writing to express my support for the Willow Village project. I've been actively following and attending meetings regarding Willow Village and have been very impressed with the openness to feedback. The plans presented have been changed multiple times in order to accomodate our community's request and concerns.

I urge you to advance the project through the EIR process and remaining steps toward approval. Willow Village delivers to our neighborhood much needed amenities such as a full-service grocery store, pharmacy services, cafes and restaurants, publicly accessible park space, and community gathering spaces such as a town square. I look forward to having spaces that my neighbors and I can walk to.

Willow Village also delivers more than 300 units of affordable housing, which will help prevent displacement from our community. Affordable housing is needed more than ever, especially with the rising housing and ren prices. I urge you to support Willow Village as I do. This is a huge investment into the Belle Haven and neighboring communities and will add to the vibrancy of our beautiful community.

Thank you,
Bonnie Lam

Dear Planning Commissioners,

I12-1 As a Belle Haven resident, I am writing to express my support for the Willow Village project. I urge you to advance the project through the EIR process and remaining steps toward approval. Willow Village delivers to our neighborhood much needed amenities such as a full-service grocery store, pharmacy services, cafes and restaurants, publicly accessible park space, and community gathering spaces such as a town square. This is important so we do not have to cross the highway to shop for groceries or pick up a subscription. Willow Village also delivers more than 300 units of affordable housing, which will help prevent displacement from our community. I urge you to support Willow Village as I do.

Thank you,
Robert

Good evening Planning Commission,

I14-1 I am writing as a concerned resident of Belle Haven and the impact of traffic and pollution that will affect the air quality and safety of our residents. In addition, the following items I'm in opposition of due to its great impact on this tiny community.

I14-2 **Opposition to: Additional Hotel when there are already two large Hotels both off 101 ( The Nia and Four Seasons).**

**Opposition to: Tearing down established trees**

**Opposition to : 1,900 units of housing to be reduced to 1,000 or less**
**Opposition to : Tearing down so many functioning buildings, trees and many other existing structures.**

I14-3 **PROOF in writing that there will NOT be an impact on quality of air due to increase in cars, dust, dirt, noise.**

I14-4 **I would also like to request that the Commission consider limiting all entries to these sites " NOT" be directly off of Willow as to prevent traffic jams and buckle up traffic.**

Thank you,

Victoria Robledo

Thank you Kyle.

I15-1 I forgot to add if a red/no-parking zone could be also painted on both side of Kavanaugh Drive/Way and on both city sides at the curve junction between EPA and MP (from the Polytec driveway to the East Palo Alto city sign and from the 1395 Kavanaugh driveway where there is a bus stop sign to the Menlo Park city sign). With cars at high speed/low visibility, this curve is very dangerous when two cars are coming heads on as people almost drive on the middle of the road to avoid cars parked on the sides and at high speed most of the time.
See example here: https://vimeo.com/704367839 (if you just examine the section on foot you do not see what the problem may be).

I15-2 It would also be great to add some botts' dots and/or rumble strips on the double divider lines to provide tactile and auditory feedback to alert drivers starting from the Polytec driveway to the 1396 driveway.

**To:** _CCIN; Noce, Michael R; _Planning Commission
**Subject:** Willow Village, Parkline, and BMR Guidelines for future projects

Dear City Council, Planning Commission, Housing Commission, and City Staff,

When I joined the Housing Commission four years ago, I joined the BMR ad-hoc committee to update our Below Market Rate Housing Program guidelines and requirements. While we made some incremental progress, we have not yet made the leveraged changes needed to ensure that our BMR requirements serve the needs of our most impacted residents.

Today, we are experiencing the consequence of our inaction. So many large housing developments are getting through the approval process and meeting the terms of our BMR Program without meeting the needs of our community. We need to prioritize updating our requirements, and until we do, we need to be asking developers to exceed our requirements.

I16-1 For the Willow Village project, for example, I encourage the Housing Commission, Planning Commission and City Council to raise the bar for Below Market Rate Housing relative to what is being proposed. Specifically, our community needs more affordable homes, and deeper affordability, especially for people at the lowest incomes and most challenging circumstances (people with disabilities, with large families, extremely low income seniors, etc).

As a starting point for discussion, I encourage the city to ask the developer for:

- 15% inclusionary in the market rate developments
  - at a mix of Very Low, Low and Moderate Incomes, per our BMR guidelines.
  - *As a note for future BMR policy updates, a good example to follow is Redwood City, which uses a point system rather than an equivalent subsidy calculation to determine how many Very Low vs. Low vs. Moderate Income units are required.*
- In addition to the 15% inclusionary BMR homes, the developer of this nearly 70 acre property should donate 1-2 acres and partner with a nonprofit housing developer to produce 100% affordable homes on site (this should become part of our BMR policy going forward, for large-site projects, as a strategy to produce deeply affordable homes)
  - The population served could be seniors, or another high need group, such as large families, or people with disabilities.
  - Incomes served should align with other 100% affordable developments, and should include no income, acutely low income, extremely low income, very low income and low income (on a curious note, the

I16-1 cont.

current proposal sets a minimum income requirement of 25% AMI for the proposed senior housing, which is not a threshold used by the County to delineate income bands).

- The Willow Village developer should make a significant financial contribution to the 100% affordable project on behalf of Menlo Park in such a way that Menlo Park is able to apply our BMR preferences to a portion of the units in the development.

    - Financing for such a project will come from several sources, and each funder can apply conditions to their funding in terms of who qualifies to apply for the homes.
    - In the absence of significant Menlo Park financing of the project, preferences will be set by other funding sources and could fail to meet the needs of our most vulnerable Menlo Park households.
    - Note that this is a very large project, and the developer has access to vast resources. They can afford to invest in meeting the most urgent and costly needs in our community.

- Set rents for the inclusionary units at 30% of the mid-range income level. Mountain View does this, and we have found that it is necessary to address a structural problem with the Income Limits as defined by the State and County.

    - The problem is that households with incomes at the low end of the range do not qualify as earning enough to pay rents set at 30% of incomes set at the high end of the range.
    - In effect, our program, as designed, does not serve households with incomes in the lower range of the income bands.
    - Setting rents at 30% of the mid-range income could solve the problem.

- We should NOT eliminate our policy that BMR rents may never exceed 75% of market rate rents, as has been requested by the developer.

    - The 75% BMR rent cap policy has been effective! Without it, BMR rents would have exceeded market rate rents during COVID and at other times in the past.

Ideally, we will expeditiously create a BMR policy that meets the housing security needs of our city and region. Until that happens, we must negotiate with each developer of large projects in our city and ask them to step up to meet the dire need of our most deeply impacted residents.

I'm hopeful that we have the will and the ability to do so, because at the Planning Commission study session for SRI/Parkline, the Planning Commission significantly raised the bar for BMR housing, and the developer was amenable to their request. Let's apply that higher bar – a bar that actually acknowledges and seeks to address the dire need in our community – to the Willow Village project too. And let's update our BMR policy so that future projects that follow the public meeting constraints of SB330 better serve our housing needs.

Karen Grove (she/her)

resident of Menlo Park and former housing commissioner

**Subject:** Willow Village Draft EIR Comments

**Follow Up Flag:** Follow up
**Flag Status:** Flagged

Hi,

I would like to submit my public comments for the Willow Village Draft EIR below:

I17-1 My name is Chris Kao and I am a resident in East Palo Alto. I need to disclose that I am an employee at Meta, but my comments here are as a resident in East Palo Alto and do not consider that I am a Meta employee. I have read through the Willow Village Draft EIR and I am in support of this project. One of the things that I like the most about this project is that it connects the area that is the Willow Village campus to O'Brien Dr, hence creating a bike able pathway from East Palo Alto over to Belle Haven and the Bay Trail without having to take University Ave.

For context, I typically bike to work from the Ravenswood Business District to the Meta Menlo Park campus 5 days a week. I typically bike west along Bay Road and then north along University Avenue, then back southwest along the Bay Trail. This is an inefficient route because I am going further north and then biking back south. I had tried taking an alternative route north on University Ave, then west on O'Brien, but was disappointed to find that the former Prologis campus (where Willow Village is) is entirely separated from O'Brien Dr, so I ended up having to bike south west along O'Brien Dr and then back north east along Willow Road, which is an inefficient route.

I like how the Willow Village plan include bike lanes and I want to express support for bike lanes that would connect O'Brien Dr diagonally northwest up towards Willow Road.

Thanks,

Chris

Dear Council Members,

I, Pastor Arias from Eternal Life Church in Menlo Park.
I19-1 I`m writing to express my support for the Willow Village project.
This project will help bring our community together.
Our community is ready to embrace this project. The amenities and benefits the project brings will provide a safe haven for us all.
We need Willow Village in our community and city!
us a community faith leader for over 33 year here in menlo park.
I, urge you,  to advance the project's Community Amenities package and remaining steps toward approval.

Kindest Regards!

- Pastor Arias

**Subject:** Willow Village Draft EIR comments

I20-1 The Draft EIR for the Willow Village and office park appears to assume a worker intensity of 217 sf per worker (reference page 3.13-15) in the offices calculated at 1.6 million square feet and 7354 workers. This assumption seems to underestimate greatly the potential new number of workers and associated impacts.
Facebook and other tech companies have used a range of 50-150 sf/ worker, which could yield 40%-400% more workers and corresponding additional needs for housing, water, and other infrastructure.
I20-2 Also The DEIR compares the project population and housing impacts to area projections separately rather than comparing its impact of worsening the jobs/ housing ratio with no need for mitigation. Even with its questionable intensity assumptions, the DEIR states the project adds 4,332 employees and 1,730 housing units. That is a jobs:housing ratio of 2.5, much worse than the ConnectMenlo projection for Menlo Park's future. This Project with its enormous office park would worsen the jobs:housing balance unless approved with less non-residential space (or allowed through a General Plan change to add significantly more housing). The DEIR seems to ignore this and any related impacts.

**Subject:** Willow Village Draft EIR comments - water

I21-1 The draft EIR seems to imply that the city has plans for water in dry years. That skirts the issue of the impact of this project that on the potential shortage and of its need to provide more water to support its impact on the need for water.

**Subject: Willows Village Draft Environmental Impact Report**

Dear Mr. Perata:

I22-1 This letter is in response to the published 951-page Willows Village Draft Environmental Impact Report (EIR). I've been a civically engaged resident for almost 10 years and I submitted input into topics I wanted to see studied in the EIR. I wanted them recorded, read and responded to. My primary concerns pertain to the need to consider development in District 1 holistically, and to re-evaluate the ConnectMenlo Program Level EIR or Resolution 6356. My concerns were not addressed. I will attach my Sep 22, 2019 comments for the record.

I22-2 **The City should impose development phasing requirements or adopt a moratorium until the cumulative impacts can be studied.** The former City Attorney, Bill McClure, was quoted in a Nov 30, 2016 ("Menlo Park Adopts Big Changes to General Plan") *The Almanac* article as presenting this option (apparently to alleviate their concerns) to the then City Council.

I22-3 **The District 1 Development Cumulative Impacts Should be Considered.** The City lacks a long-range planning department and an in-house geologist. The proposed Willows Village is located in a flood zone. The District 1 construction needs a comprehensive review, which it is not getting. We especially need to prioritize the health and safety of the City of Menlo Park residents over development interests. What information exists varies. For example, your March 14, 2022 presentation (Bayfront Development Projects) to the Planning Commission varied in the information I found at the City's website and also from what I read in Table 3.0-1 in the Willows Village Draft EIR. To me, this illustrates the rapidly changing projects and the lack of the City's ability to keep up. The lack of including lot size is troubling as this is one way of evaluating density. Please see my attachment with my table of the projects.

I22-4 **The public lacks meaningful opportunities to be kept appraised and to raise concerns.** You told the Planning Commission, at their March 14, 2022 meeting, that your presentation was informational only. You clearly signaled that the meeting was not for the purpose of raising concerns about the pace of development. Instead, we need interactive forums where the public can ask questions and raise concerns. The City needs to provide a 3D model that depicts what District 1 will look like after construction of pipeline projects. Planning Commissioners, and others, have called for this model. A model should be on public display.

I22-5 **The ConnectMenlo program-level EIR (Resolution 6356) should be reviewed and updated.** The program-level EIR "green lights" individual District 1 projects because they can "tier-off" the program-level EIR. The program-level EIR also inadequately projected environmental impacts and the 2040 build-out phasing projections.

I22-6 **The Planning Commission's annual review of the City's Capital Improvement Projects <u>for consistency with the City's General Plan</u> represents inadequate oversight.** California State law (Government Code Section 65401) requires the City planning agency (Planning Commission) to review and determine that the projects are consistent with the City's General Plan. In the past, this reporting mechanism only included the CIPs that the City drives. However, it should include ALL development projects in District 1 allowed under ConnectMenlo. *After all, the City has positioned ConnectMenlo as its authentic General Plan Land Use Element*. Thus, all projects allowed due to ConnectMenlo should be on that report. The Planning Commission needs a complete list and the ability to meaningfully discuss the projects.

I22-7 **The City of Menlo Park should comply with legal requirements to annually report progress on ALL General Plan Elements, <u>not just the Housing Element</u>.** All California jurisdictions are required to provide the Governor's Office of Planning and Research (OPR)m and the Department of Housing and Community Development (HCD), with *separate* General Plan and Housing Element Annual Progress Reports (APRs) by April 1 each year, per Government Code Sections 65400 and 65700. The General Plan APR submitted to OPR should outline the status of the General Plan and progress in its implementation over the previous year's 12-month reporting period.

I22-8 **The ConnectMenlo Guiding Principles should be measured and reported.** The statements need revising into goals that can be measured. Then, they need metrics and an annual reporting. Right now, they are platitudes only.

I22-9 **The City's Environmental Justice Element should be completed *before* more District 1 development.** The District 1 development project pipeline pace has greatly accelerated. The City is working at cross purposes by aiming to prepare an Environmental Justice Element while also rapidly increasing development in District 1. Projects should be put on hold until the Environmental Justice Element is completed.

I22-10 **Other Recommendations:**

- **The City needs to provide training to residents on how to effectively respond to Environmental Impact Reports.** This training has been requested. The development should be slowed (or halted) until suitable training is provided. The pace should be slowed so that people have time to read the massive EIR reports and attend the meetings leading up to them (and after them).
- **The City should institute an annual report to the City Council for Developer Agreements**. The report should list each one, status of required mitigation, and the financial benefits. Council lacks adequate fiscal controls for developer agreements.
- **The City should post the Form 700s at a publicly accessible, and visible, section of its external website.** One can obtain a link, but one has to ask for the link. The Form 700s will show what gifts the City Staff, and the Council members, might be receiving from developers and other "special interests."

I22-11 **Broader changes, since the Willows Village project started, need to be considered.** Covid-19 led to a new model of working from home. This model reduces traffic and pollutants that increase global climate change. Employees like it and the proposed new office space may not be needed. Facebook, or Meta Platforms, has seen declining revenues due to the younger generation shifting to social media platforms other than Facebook. Facebook's existing massive footprint in Menlo Park is considerable already. The pace of global climate change has accelerated and rising seas includes rising ground water tables, which levees cannot stop. The project should reflect these changes.

I22-12 **Instead of Willows Village, consider a floodplain buyout.** According to the Cal OES My Hazards site, District 1 mostly lies in a flood plain and liquefaction zone. Flood buyouts can be funded by several federal programs. Buyouts reduce flood risk. A floodplain, in the form of a regional park, would be a nature-based solution to the increase in flooding risk due to global climate change and sea level rise.

Sincerely,

*Lynne Bramlett (electronically signed)*

Lynne Bramlett, District 3 Resident

To: Planning Commission

From: Lynne Bramlett

Date Sent: Sep 22, 2019 (date added on May 23, 2022)

Re: Environmental Impact Report for Willows Village

I22-13 I will be traveling and so unable to attend your scoping session on October 7, 2019. Thus, I'm sending in my input as to what topics should be studied in the EIR. I will put background information at the end.

**EIR Scoping Questions**

I22-14 In the Willows Village EIR, I would like it scoped so that it provides answers to the following questions. The relatively new Senate Bill 1000, Planning for Healthy Communities, act requires Cities such as Menlo Park to incorporate environmental justice into its General Plan when concurrently updating two or more elements. The idea of environmental justice is also included in Council's Resolution No. 6493, passed on Earth Day (April 22) 2019. I hope the Planning Commission will consider Council Resolution No. 6493 when considering topics to include in the Willows Village EIR as I did not have the time to do so before my trip.

**ConnectMenlo Program-Level EIR (Resolution 6356) Related Questions**

I22-15
1) For the Resolution 6356 environmental impacts that could be (at least partially) mitigated, what is the current status of each? Who monitors and measures these, and how are they reported?

I22-16
2) The program-level EIR based its 2040 build-out assumptions partly on the Plan Bay Area 2040 Regional Transportation/Sustainable Community Strategy assumptions. The latter plan's assumptions were not correct. What now needs revising in the ConnectMenlo Program-level EIR?

I22-17
3) ConnectMenlo Resolution No. 6356 detailed multiple significant environmental impacts for the "Project" with the project being the zoning changes that led to the development in District 1. However, the Resolution asserted that overriding economic, environmental, and social benefits justified the impact. For each benefit listed on pages 57-59 of Resolution No. 6356, what is the status of each? If not met, what are the City's plans to achieve the benefit and by when?

I22-18
4) What are the City's plans to revise the ConnectMenlo ordinances in light of Council's recent discussion of a development moratorium? What measures will the City institute so that development requires tangible transportation improvements before approving more development?

I22-19
5) What will be the price tag for road infrastructure improvements needed to mitigate the increased traffic coming from regional and local development? Of the amount needed, what has Facebook funded? What will taxpayers need to pay? What does Facebook consider its responsibilities to mitigate traffic caused directly by its employees and construction projects?

**Other Relevant Questions**

I22-20
1) What does Facebook plan to do should the U.S. Justice Department break up the company into smaller companies? (This could be an outcome of the Justice Department's investigation into tech monopolies.) Should this happen, how will the breakup impact Willows Village? Menlo Park?

I22-21
2) What is the City's plan for emergency services in District 1, especially during commute hours?

I22-22
3) What is the City's plan for disaster preparation for a major disaster, such as a major earthquake that also causes fire and flooding in District 1?

I22-23
4) What is the status of Facebook's required mitigations for its other projects? What is the total of these and how are they tracked, measured and reported? What assurances do the public have that Facebook is honoring its agreements, and held accountable as necessary?

I22-24
5) What is the sum total of Facebook's annual financial contributions to the City's annual revenue? That would include property taxes and annual amounts coming in via development agreements.

**Willows Village EIR Specific Questions**

I22-25
1. What new and more stringent requirements exist for measuring the impacts of traffic, such as including reverse commutes and average daily traffic? How will these be reflected in the Willows Village EIR?

I22-26
2. The number of birds in the air has also drastically declined as noted in a recent article in *Science* and also local newspapers. I've y heard from avid birdwatchers that there are fewer total birds and types of birds in Menlo Park's Bedwell Bayfront Park than the amount seen in the nearby Palo Alto Baylands. What is the impact of development on birdlife in Menlo Park's Bayfront? What will help to increase birdlife in the Menlo Park's Bayfront? How specifically will Willows Village impact birdlife?

I22-27
3. Fewer birds will also impact beneficial insects, flower pollination and other aspects of nature. What is the overall impact of development in District 1 on broader aspects of nature that also impact aesthetics?

I22-28
4. What will be the impact to the current occupants of the buildings that Facebook proposes to demolish? Where will these businesses re-locate to? What will be the impact to their clientele? Where will these non-profits and local governmental services go?

I22-29
5. What will be the impact of Willows Village to Menlo Park's goals of combatting global Climate Change as detailed in Council Resolution No. 6493?

I22-30
6. What is the decision-making process currently being used for deciding the public amenities such as the proposed Community Facility and Public Park? How is the process consistent, or not, with the ConnectMenlo Program-level EIR promised benefit of delivering environmental justice to District 1?

I22-31
7. What retail is being planned for the area? Specifically, what grocery store is being considered? What impact will a new grocery store have on the two existing grocery stores in District 1? What restaurants are being considered? What will be the impact of these restaurants on the existing restaurants in District 1?

I22-32 8. What retail is being proposed, if any? How will Facebook help to ensure that this retail is successful?

I22-33 9. What is the dollar value put on the proposed 10,000 community space? What is currently being discussed between Facebook and City Staff for this particular property? Please include all possibilities. Please also include anything that has been explicitly ruled out.

I22-34 10. For the community space, instead of setting aside land in Willows Village for this purpose, could more housing be added and instead the dollar amount set aside for District 1 residents to decide how and where it will be spent? If not, why not? If yes, what will be the process to ensure that the District 1 community makes the decisions?

I22-35 11. Where will trees be planted in District 1 to help provide a tree canopy to mitigate the overall impacts of development, and the additional impacts of Willows Village?

I22-36 12. Into which landfills will the parts from the demolished buildings go? What will be the impact to these landfills? What efforts will be made to reuse parts of the demolished buildings?

I22-37 13. Willows Village is proposed for a flood zone expected to be "under water" in perhaps as soon as 2060 due to global climate change. What are the justifications for building this project in a known flood zone? If built, when the flood occurs, what will be the plans to protect life and property?

I22-38 14. The draft Willows Village master plan includes the evaluation of constructing an underground water reservoir beneath the proposed park/sports field on Willow Road. How will this water reservoir be protected should a major flood occur?

I22-39 15. If the zoning map is changed, to accommodate Willows Village proposed site connections to the surrounding roadway network, what additional development might this trigger by property owners nearby? In other words, will adjacent property owners also be allowed to develop their properties into office complexes?

**Question Pertaining to Regional, cumulative impacts**

I22-40 1) What is the current overall jobs/housing imbalance in Menlo Park, and in Santa Clara and San Mateo Counties? If all currently proposed regional development gets approved, how will this worsen the jobs/housing imbalance? What are the plans to increase housing, especially affordable housing?

I22-41 2) What regional efforts exist, if any, to halt office development projects that

I22-42 3) What is the cumulative environmental impact of the region's current and likely jobs/housing imbalance? This would include: noise, pollution, species decline, including birds.

**Additional comments – Regional Impact**

I22-43 Willows Village, if ultimately approved, will be the largest development project ever in Menlo Park. The proposal also joins two other proposed large development projects nearby:

1) Stanford's proposal for a 3.5 million square feet expansion and
2) Los Angeles developer Lowe Enterprises which the *Daily News* reported "wants to build 1.6 million square feet of office space, 175,000 square feet of retail space and 440 apartments across three parcels… the jobs-to-housing ratio for the entire project is 12 jobs to one home" (9/22/19).

These three projects alone will significantly worsen the area's jobs-to-housing imbalance.

I22-44 The cumulative impacts of regional development should be considered in the Willows Village EIR. Tech companies continue to expand in cities from Burlingame to San Jose. For example, Facebook recently opened a new office complex in Sunnyvale with "enough space for potentially 5,300 employees" (Mercury News, Sep 20, 2019). The same article pointed out that Amazon and Google have also leased space nearby. Google has bought properties in San Jose for the purposes of expansion.

U**sing Descriptive Names**

I22-45 A village is traditionally defined as "a settlement usually larger than a hamlet and smaller than a town." The name Willows Village suggests a small settlement of mostly housing. However, Willows Village is mostly office with a little housing, retail and public spaces.

It's important that the public be aware of just what is being proposed. Can the Planning Commission request that the City use more descriptive names when describing projects such as Willows Village. For this one, I suggest adding a descriptive tag line such as "Willows Village Office Park" when publishing EIR-related notice.

I22-46 Below is a verbatim post to NextDoor by a resident in Vintage Oaks. He was alerting residents to what he considered a misleading Facebook sponsored poll designed to get answers that would help Facebook to demonstrate public support for Willows Village. I have no reason to doubt the veracity of the post. The general ethics of push-pull or misleading polls is very troubling to me and I think they should have no place in our City, or used by developers who want to build in our City. Would the Planning Commission consider adopting a general development code of ethics that would prohibit misleading or deceptive business practices such as described below?

Lynne Bramlett

*************************************************************************************

**NextDoor Post – Facebook Poll (from a Resident in Vintage Oaks)**

Facebook and Signature Development Company are trying to get a huge development project built in Menlo Park, and it will impact public schools. It's estimated that the 1700+ housing units (and most certainly the 6000 jobs created, presumably mostly for Facebook), could increase the student body at Menlo Atherton High School alone by at least 300 students. This concern was raised by former Sequoia Union High School District Superintendent Mary Streshly In 2018 (see Almanac articles and references).

I'm posting, because I just got off the phone with a marketing company. They were obviously paid to do this 'neutral' questionnaire on behalf of the Willow Village (aka Facebook). It was a very vague, very biased, and very shady questionnaire. They'll probably be calling you on your mobile phone too!

I never talk to telemarketers, solicitors, etc., but I'm glad that I did tonight because now I smell something rotten growing off of Willow Road.

Does anybody else have information on this project? I haven't followed it, but noticed that this Willow Village Master Plan project is entering the environmental review phase this Wednesday, September 18, 2019. The City will release the notice of preparation (NOP) for the environmental impact report (EIR) for the approximately 59-acre mixed use Willow Village Master Plan project https://menlopark.org/CivicSend/ViewMessage/message/94238

They have a very convincing pitch focusing on the housing crisis, pulling obvious heart strings and alarms etc., but they offer no details, no real numbers, solid research or statistics on how they're going to impact Menlo Park schools, traffic, housing, or anything else for that matter. They do have some mighty pretty mockups though! Facebook is spending a lot of money to get this built!! https://www.willowvillage.com, do your homework, and please share what you learn!

# # #

# XII. STATEMENT OF OVERRIDING CONSIDERATIONS

As set forth above, the City has found that the Project will result in project and cumulative significant adverse environmental impacts related to air quality, greenhouse gas emissions, population and housing, and traffic and circulation that cannot be avoided following adoption, incorporation into the Project, and implementation of mitigation measures described in the EIR. In addition, there are no feasible project alternatives that would mitigate or avoid all of the Project's significant environmental impacts. Section 15093(b) of the State CEQA Guidelines provides that when the decision of the public agency results in the occurrence of significant impacts that are not avoided or substantially lessened, the agency must state in writing the reasons to support its actions. See also Public Resources Code Section 21081(b). Having balanced the economic, legal, social, technological or other benefits of the Project, including region-wide or statewide environmental benefits, against its significant and unavoidable environmental impacts, the City finds that the Project benefits outweigh its unavoidable adverse environmental effects, and that the adverse environmental effects are therefore acceptable.

The following statement identifies the reasons why, in the City's judgment, specific benefits of the Project outweigh the significant and unavoidable effects. The City finds that each of the Project benefits discussed below is a separate and independent basis for these findings. The reasons set forth below are based on the Final EIR and other information in the administrative record.

## ECONOMIC BENEFITS

1. The Project would promote a vibrant economy by supporting a diversity of business and employment opportunities.
2. The Project provides for the greatest and most balanced economic growth alternative by creating 2.3 million square feet of new employment-related land uses and allowing the City greater opportunities to remain a competitive and innovative business destination in the regional development environment, which would support increased property and sales tax revenues.
3. The Project plans for 400 additional hotel rooms that will generate transient occupancy tax revenue for the City.
4. The Project updates the Transportation Impact Fee (TIF) program to guarantee funding for bicycle and pedestrian facilities and roadway and infrastructure improvements that are necessary to mitigate impacts from future projects.

## ENVIRONMENTAL BENEFITS

1. The Project is environmentally superior to the existing General Plan, as discussed in Draft EIR Chapter 5 and summarized above in Section VII(A).
2. The Project recognizes the importance of linking land use and transportation planning.
3. The Project concentrates growth in existing urbanized areas and thereby results in fewer impacts from the construction of new infrastructure, maximizes use of existing impervious surfaces, provides multi-modal transportation opportunities, and reduces vehicle miles traveled, which translates into air quality and greenhouse gas emissions benefits and increases in resources and energy efficiency.
4. The Project largely concentrates growth at locations with existing uses and, as a result, potential future development would consist largely of either redevelopment of existing buildings and/or sites, and selective demolition of existing structures and replacement with new construction.
5. The Project includes policies that encourage conservation of water and energy resources in conformance with the City's sustainability goals.
6. The Project includes policies and mitigation measures, enforceable through the MMRP, that protect the Don Edwards Bay National Wildlife Refuge and other sensitive habitat areas.
7. The Project is in conformance with the principles of planning sustainable communities by meeting both the present and future housing needs of the City.
8. The Project is consistent with Plan Bay Area, which is the Bay Area's Regional Transportation Plan (RTP)/Sustainable Community Strategy (SCS), as well as SB 375, the Sustainable Communities and Climate Protection Act.

## SOCIAL BENEFITS

1. The Project plans for citywide equity by providing the greatest job and housing opportunities in the M-2 Area to support a greater balance of land uses in this area of the City.
2. The Project includes up to 5,500 new residential units of which 4,500 would be in the M-2 Area, which represent significant new housing opportunities and include built in incentives for affordable housing.
3. The Project would result in reduced environmental justice inequities by facilitating and promoting the abatement of incompatible land uses and providing an equitable distribution of public amenities.

4. The Project would encourage mixed-use development in the M-2 Area to help improve walkability and quality of life for Menlo Park residents and the region by providing the opportunity for a better jobs/housing balance.
5. The Project provides opportunities for increased building heights and makes additional building height and residential density increases contingent on future development projects in Menlo Park providing the City with community benefits through corporate contributions.
6. The Project plans for M-2 Area residents to receive community benefits through corporate contributions as a result of the live/work/play environment envisioned.
7. The Project maintains investment backed expectations for the community at large.
8. The Project includes goals, policies, and programs that encourage social (and health) benefits associated with improved multi-modal transportation enhancements.

## XII. ADOPTION OF THE MMRP

The City Council hereby adopts the mitigation measures set forth for the Project in the Final EIR and the MMRP attached hereto as Exhibit A and incorporated herein by this reference.

## VI. SEVERABILITY

If any term, provision, or portion of these findings or the application of these findings to a particular situation is held by a court to be invalid, void or unenforceable, the remaining provisions of these findings, or their application to other actions related to the Project, shall continue in full force and effect unless amended or modified by the City.

I, Pamela Aguilar, City Clerk of Menlo Park, do hereby certify that the above and foregoing Council Resolution was duly and regularly passed and adopted at a meeting by said Council on the 6th day of December, 2016, by the following votes:

AYES: Carlton, Keith, Ohtaki

NOES: None

ABSENT: Cline, Mueller

ABSTAIN: None

IN WITNESS WHEREOF, I have hereunto set my hand and affixed the Official Seal of said City on this 6th day of December, 2016.

**CAUTION: This email originated from outside of the organization. Unless you recognize the sender's email address and know the content is safe, DO NOT click links, open attachments or reply.**

Dear Kyle,

I would like to comment on the provision that deals with feral cat management. (My comments are also included as an attachment.)

I'm a founding member of the Stanford Cat Network and helped negotiate an agreement with Stanford University on managing feral cats on the university campus. I'm on staff at Palo Alto Humane Society, where we operate a major spay/neuter support program for pets and feral cats.

I23-1 1. I suggest that the agency receiving trapped cats should be identified specifically as Peninsula Humane Society (instead of the string of unspecified agencies and groups), thereby to avoid confusion on the disposition of trapped cats; and that

I23-2 2. Peninsula Humane Society should be required to notify Palo Alto Humane Society of cats trapped in the area and brought to its facility for possible re-claim.

These provisions above will minimize the chances of accidental euthanasia of a pet or supervised cat. There are pets in the area (and there will be more pets after completion of the residential units), and there are cats under the management of the staff at the neighboring UPS facility as well as under the supervision of volunteers affiliated with Palo Alto Humane Society. Tame cats caught in traps are often indistinguishable from feral cats in their panic at being trapped.

I23-3 *I am proposing the following as a (slight) re-write:*

"Feral Cat Management Program. The Project sponsor shall implement a feral cat management program, similar to the program developed in conjunction with the Peninsula Humane Society and the Society for the Prevention of Cruelty to Animals for the East Campus in 2013 *and with the Stanford Cat Network/Stanford University in 1989*. For one week every three months (i.e., each quarter), three live trap cages, designed to trap cats, shall be placed around the perimeter of the main Project Site in locations where feral cats could prey upon native wildlife species.

Each trap cage shall be monitored *daily* and maintained on a daily basis during the week when traps have been set to determine whether a feral cat has been caught and whether the trap has inadvertently captured a non-target species. If a feral cat is caught, a representative from the trapping company shall be dispatched to transport the trapped cat *on the same day to Peninsula Humane Society*. If an animal other than a feral cat is caught in one of the traps, it shall be released immediately at the trap location."

Thank you, Kyle. I am available for discussion if that is helpful to you. I'm a Menlo Park resident (675 Roble Avenue).

Carole (650-504-5898)

PALO ALTO HUMANE SOCIETY

Find us on Facebook

I23-4 From Carole Hyde: I would like to add to the provision that deals with feral cat management.

I'm a founding member of the Stanford Cat Network and negotiated an agreement with Stanford University on managing feral cats on the university campus.

1. I suggest that the agency receiving trapped cats should be identified specifically as Peninsula Humane Society (instead of the string of unspecified agencies and groups), thereby to avoid confusion on the disposition of trapped cats; and that

2. Peninsula Humane Society should be required to notify Palo Alto Humane Society of cats trapped in the area and brought to its facility for possible re-claim.

   These provisions will minimize the chances of accidental euthanasia of a pet or supervised cat. There are pets in the area (and there will be more pets after completion of the residential units), and there are cats under the management of the staff at the neighboring UPS facility as well as under the supervision of volunteers affiliated with Palo Alto Humane Society. Tame cats caught in traps are often indistinguishable from feral cats in their panic at being trapped.

*Suggested re-write:*

Feral Cat Management Program. The Project sponsor shall implement a feral cat management program, similar to the program developed in conjunction with the Peninsula Humane Society and the Society for the Prevention of Cruelty to Animals for the East Campus in 2013 and with the Stanford Cat Network/Stanford University in 1989. For one week every three months (i.e., each quarter), three live trap cages, designed to trap cats, shall be placed around the perimeter of the main Project Site in locations where feral cats could prey upon native wildlife species.

Each trap cage shall be monitored daily and maintained on a daily basis during the week when traps have been set to determine whether a feral cat has been caught and whether the trap has inadvertently captured a non-target species. If a feral cat is caught, a representative from the trapping company shall be dispatched to transport the trapped cat on the same day to Peninsula Humane Society. If an animal other than a feral cat is caught in one of the traps, it shall be released immediately at the trap location.

Letter I24

RE: Willow Village Master Plan Project EIR

TO: Kyle Perata

FROM: Pam D Jones, Menlo Park resident

Here are my comments regarding Willow Village EIR:

I24-1
1. The Air Quality District is initiating an update to its current California Environment Quality Act Guidelines. *"There have been substantive changes to the data and assumptions underlying the analytical methodologies, thresholds, and mitigation strategies since the last update of the CEQA Guidelines in June 2010 (revised May 2017)."*

I24-2
2. There is has been no consistent monitoring or requirement to monitor air quality within the adjacent residential neighborhood of Belle Haven Menlo Park. Air quality monitoring be done on Willow Road and Hamilton Avenue MidPenisula School, Costano School, Willow Road and Ivy Drive

I24-3
3. Failure to ensure an environmental justice approach as outlined by the United States Environmental Protection Agency. Although this project is under the November 30, 2016 laws, SB 1000 was effective January 1, 2017.

I24-4
4. No publicly available count of the total number of Facebook and contract employees on their current fifteen (15) campuses in the Bayside area. Estimates run between 12,000 and 18,000 employees occupying over 3 million square feet of owned or leased property.

I24-5
5. No publicly available of the number of people who will be working in the 1.25 million square feet of office space. This number should be added to the probable 4,000 residents who will be living in the 1,730 housing units. The total number of employees and estimate residents must be used for the following:
    1. Traffic
    2. Air quality

I24-6
6. Failure to fully implement and assess current traffic congestion solutions for residents within District 1.

I24-7
7. Failure to conduct a current housing displacement study that includes property ownership and list of LLCs.

I24-8
8. Failure to conduct a current housing study that identifies number of apartments and homes unoccupied, reserved for Airbnb, reserved for corporations, or otherwise unavailable to the public.

I24-9
9. Failure to address remedy for displacement of neighboring residents. The companies used to prepare the reports for development in the M2 area have consistently minimized the effect for the past ten year.

I24-10
10. Failure to provide amenities other than what is part of the live/work/play as outlined in the General Plan. A town square and shopping district, dog park, elevated park, and other recreational areas are all part of the requirements to create a live/work/play "village."

**Sent:** Monday, May 23, 2022 3:08 PM
**To:** Perata, Kyle T
**Subject:** Willow Village EIR Impact

**CAUTION: This email originated from outside of the organization. Unless you recognize the sender's email address and know the content is safe, DO NOT click links, open attachments or reply.**

Good afternoon Kyle,

I25-1 As a resident of Belle Haven I would like to endorse and highly support the letter sent to you by Lynne Bramlett. As a resident, I have first hand experienced the impact currently of traffic, poor air quality, noise pollution and constant traffic as a result of these 18 wheeler trucks driving on Willow and Bayfront road.

I25-2 One of my greatest concerns is the upcoming project of many projects that require tearing down older buildings and the possibility of lead and asbestos being released into the air. I'm also very concerned about the impact of our marsh lands and our native birds and animal habitats.

Willows Village EIR Specific Questions

I25-3 1. What new and more stringent requirements exist for measuring the impacts of traffic, such as including reverse commutes and average daily traffic? How will these be reflected in the Willows Village EIR?

I25-4 2. The number of birds in the air has also drastically declined as noted in a recent article in Science and also local newspapers. I've heard from avid birdwatchers that there are fewer total birds and types of birds in Menlo Park's Bedwell Bayfront Park than the amount seen in the nearby Palo Alto Baylands. What is the impact of development on birdlife in Menlo Park's Bayfront? What will help to increase birdlife in the Menlo Park's Bayfront? How specifically will Willows Village impact birdlife?

I25-5 3. Fewer birds will also impact beneficial insects, flower pollination and other aspects of nature. What is the overall impact of development in District 1 on broader aspects of nature that also impact aesthetics?

I25-6 4. What will be the impact to the current occupants of the buildings that Facebook proposes to demolish? Where will these businesses re-locate to? What will be the impact to their clientele? Where will these non-profits and local governmental services go?

I25-7 5. What will be the impact of Willows Village to Menlo Park's goals of combatting global Climate Change as detailed in Council Resolution No. 6493?

I25-8 6. What is the decision-making process currently being used for deciding the public amenities such as the proposed Community Facility and Public Park? How is the process consistent, or not, with the ConnectMenlo Program-level EIR promised benefit of delivering environmental justice to District 1?

I25-9 7. What retail is being planned for the area? Specifically, what grocery store is being considered? What impact will a new grocery store have on the two existing grocery stores in District 1? What restaurants are being considered? What will be the impact of these restaurants on the existing restaurants in District 1?

3

I25-10 8. What retail is being proposed, if any? How will Facebook help to ensure that this retail is successful?

I2511 9. What is the dollar value put on the proposed 10,000 community space? What is currently being discussed between Facebook and City Staff for this particular property? Please include all possibilities. Please also include anything that has been explicitly ruled out.

I25-12 10. For the community space, instead of setting aside land in Willows Village for this purpose, could more housing be added and instead the dollar amount set aside for District 1 residents to decide how and where it will be spent? If not, why not? If yes, what will be the process to ensure that the District 1 community makes the decisions?

I25-13 11. Where will trees be planted in District 1 to help provide a tree canopy to mitigate the overall impacts of development, and the additional impacts of Willows Village?

I25-14 12. Into which landfills will the parts from the demolished buildings go? What will be the impact to these landfills? What efforts will be made to reuse parts of the demolished buildings?

I25-15 13. Willows Village is proposed for a flood zone expected to be "under water" in perhaps as soon as 2060 due to global climate change. What are the justifications for building this project in a known flood zone? If built, when the flood occurs, what will be the plans to protect life and property?

I25-16 14. The draft Willows Village master plan includes the evaluation of constructing an underground water reservoir beneath the proposed park/sports field on Willow Road. How will this water reservoir be protected should a major flood occur?

I25-17 15. If the zoning map is changed, to accommodate Willows Village proposed site connections to the surrounding roadway network, what additional development might this trigger by property owners nearby? In other words, will adjacent property owners also be allowed to develop their properties into office complexes?

Question Pertaining to Regional, cumulative impacts

I25-18 1) What is the current overall jobs/housing imbalance in Menlo Park, and in Santa Clara and San Mateo Counties? If all currently proposed regional development gets approved, how will this worsen the jobs/housing imbalance? What are the plans to increase housing, especially affordable housing?

2) What regional efforts exist, if any, to halt office development projects that

3) What is the cumulative environmental impact of the region's current and likely jobs/housing imbalance? This would include: noise, pollution, species decline, including birds.

Commission Questions and Comments

--o0o--

P R O C E E D I N G S

CHAIR DORAN: We'll move next to the public hearing portion of tonight's meeting. Item F1 and G1 associated, with a single staff report.

The description -- the title of -- yeah -- the item is lengthy. And I've been informed by our -- by our City Attorney that I don't have to read the entire title verbatim. Given that it's over a page, that's good news. So I have an abbreviated version, which I'm going to read to introduce item F1, and then we'll go to City staff for a combined report.

Give me one moment. So item F1 is a Draft EIR Public Hearing to the Planning Commission to receive and provide comments on the analysis of the Draft Environmental Impact Report for the proposed Willow Village Master Plan Project. The proposed project is located at 1350-1390 Willow Road, 925 to 1098 Hamilton Avenue, 1005 to 1275 Hamilton Court. And the Applicant is Signature Development Group and the Peninsula Innovation Partners, LLC, on behalf of Meta Platforms, Inc.

The proposed project consists of up to 1,730 dwelling units, up to 200,000 square feet of retail, 193 hotel rooms, publicly-accessible open spaces and parks, and an approximately 1,600,000 square feet office campus for Meta, formerly Facebook, up to 1.25 million square feet of office space, with the balance, EG space, for accessory uses, including meeting and collaboration space, totaling 350,000 square feet, if the office square footage is maximized, in multiple buildings.

This portion of the meeting is a public hearing in the Draft EIR. And comments during this item should be focused on the Draft EIR.

Following the close of the Draft EIR public hearing, commission will hold a study session on the proposed project. More details on the proposed project and the Draft EIR are in the Agenda title and the Project Staff Report.

Mr. Perata, you have a staff report on -- for both F1 and G1. And I believe you have a proposed Agenda for us as well.

MR. PERATA: Yes. Thank you, Chair Doran.

Members of the commission, staff tonight has a very brief presentation. So we'll start that in a moment. Excuse me. And let me just get this up.

In the meantime, one quick update for the commission. Since the publication of the staff report, we have received approximately 14 additional items of correspondence. Those have all now been attached to the Agenda or previously were forwarded to the commissioners.

And there we go.

So with that, I'll move into the presentation.

CHAIR DORAN: Mr. Perata, do you want to share with us your proposal for the order?

MR. PERATA: One -- one step ahead of me. Here we go.

CHAIR DORAN: Sorry.

MR. PERATA: Thank you, Chair.

So for tonight's meeting, staff does have a recommended format. We do have two items on the Agenda tonight for the Willow Village project. It's a Draft EIR public hearing and a study session. And so we'll take them as two items. There is one comprehensive staff report that does address both components; the Draft EIR, as well as the study session on the project more generally.

For the first part of the item tonight, Draft EIR public hearing will start after this brief overview by staff, a presentation by the Applicant on the master plan. So this is going to be a little unique and different than other projects that the commission has seen recently with EIRs and study sessions.

We're actually going to have two Applicant presentations tonight -- or that's our recommendation -- the first being an overview of the Master Plan more generally. And then, during the study session, allowing the Applicant team to present again on their Phase 1 Architectural Control Plan. So a little more detail on the buildings that would follow, after the entitlements with the Architectural Control Application. And I'll explain a little bit more about that in my presentation here.

Following the first presentation by the Applicant, we do have our EIR consultant, ICF, International, here tonight, to present on the CEQA, broadly, as well as the Draft EIR and the findings of the Draft EIR.

Following that, we can move into the public comments, and then commissioner questions and comments on the Draft EIR. We would recommend -- unless they're clarifying questions -- to hold them until after all public comment, since the questions can often lead to discussion and comments as well.

So then, following the close of the public hearing, we would move into the study session. Once again, as I mentioned earlier, an opportunity for the Applicant team to present more details on their Phase 1 Architectural Control Plans, and then taking public comment, and then -- as well as commissioner questions.

So with that, I'll just do a really brief introduction. The Applicant's presentation will go into more detail on the project components and design and the master plan.

But just to get a little bit of context here, the project -- the project itself does include two sites, roughly. There's the main project site, which is kind of the main master plan, the 1350 to 1390 Willow Road, and the Hamilton Avenue and Hamilton Court parcels. That's the former Menlo Science and Technology Park.

To the west of Willow Road, there are two parcels. Hamilton Avenue -- or two sites. Hamilton Avenue Parcels North. There's two legal parcels within that site, and then Hamilton Avenue Parcel South. Those would be modified, as part of the project, through the realignment of Hamilton Avenue for the access to the site. So that would include, then, a reconstruction in a future phase of the Chevron station on Hamilton Avenue Parcels South, and then a potential for an addition of a couple thousand square feet -- about 6,000 -- 6,700 square feet of retail on Hamilton Avenue Parcel North, as well as some modifications for the elevated park's access point across Willow Road.

And the Applicant will talk more about the overall design of the project, but just to set the context here.

And then one more slide of the existing site plan and main project site shown in red, with the existing conditions. To the west of Willow Road, in the black hatched, is Hamilton Avenue Parcel North and South; the existing Chevron station, existing Belle Haven neighborhood shopping center.

And then, really briefly, here's the proposed site plan. Just for the commission's benefit, I won't re-read the land uses that are proposed, since the Chair did that during the introduction. But as part of the master plan that you see here, the entitlements that are being requested include the environmental review in this form and EIR, and Environmental Impact Report, certification of the Final EIR, as well as a General Plan circulation element and zoning map amendments to modify on-site circulation for the public rights of ways, and paseos through the site, a rezoning to allow for an X-zoning district, combining district, which would allow for a Conditional Development Permit to develop the site using the Master Plan-provisioned zoning ordinance, and then -- as well as a development agreement, a vesting tentative map, and then future architecture control reviews for individual buildings, as well as associated heritage tree removal permits. And then, the entitlements do include a below market rate housing agreement.

And so tonight's meeting purpose -- as I mentioned early on, we have two public meetings. The Environmental Impact Report public hearing. This is an opportunity to comment on the Draft EIR for members of the public and the Planning Commission. Following that, there will be the study session; opportunity, again, for clarifying questions on the Master Plan, the Architectural Control packages associated with Phase 1, among other things, the below market rate housing proposal, and then the zoning ordinance modifications. These are discussed in more detail in the report, as well as the overall site layout and design.

And then the Applicant team's presentation will focus more on the Master Plan design, as well as the architectural control packages for Phase 1.

No actions will be taken tonight. We are in the public comment period on the Draft EIR. That ends on May 23rd, at 5:00 p.m. It's Monday, May 23rd.

Following the close of the EIR public comment period, staff and the City's consultant will review and respond to all substantial comments in what's called the "Final EIR," or Response to Comments document.

But, ultimately, the Planning Commission, in its capacity for this project, is a recommending body to the City Council for most land use entitlements and the certification of the Final EIR. The Planning Commission will be the acting body on the Architecture Control Permits. So through the Conditional Development Permit, it would set up the overall development parameters, and then individual buildings would come through for future architectural controls. And the Planning Commission will be charged for reviewing those designs.

And so that concludes my presentation. I'm going to turn it over to the Applicant team, unless there are any clarifying questions of the process or meeting format for staff.

CHAIR DORAN: I think your format, your order, makes a lot of sense. And I'm happy with it.

I did want to ask members of the public, if they would like to comment on this project, to raise their hands now, so we get an idea of how many people we have. I'm expecting -- based on the e-mail -- the volume of e-mails we received, I expect to have a great number of people wanting to talk. And I want to make sure that we're fair to everyone, and give everyone a chance to talk. But we also have to budget our time.

So during the Applicant's presentation, if members of the public, who wish to speak during the public comment period, could raise their hands, so we can get a count, that would be greatly appreciated.

And with that, I'll turn it over to the Applicant.

MR. NIETO: Good evening. This is Paul Nieto. Hopefully you can hear me.

CHAIR DORAN: Yes, we can hear you.

MR. NEITO: Perfect. Thank you. I'm going to see if I can get this to full-screen mode. Let's see. There we go. Try it here as well. This would be a lot easier for all of us to see. Perfect. Let's go back up.

Well, there we go. Thank you, Planning Commissioners and members of the -- of the community, City staff. My name is Paul Nieto. I'm with Signature Development Group. And we're going to go through a presentation that the commissioners and some members of the audience have seen much of before.

But for those who haven't, we're going to present this because it was what the integral part of the Environmental Impact Report has dealt with. So if you can see the screen, here's the existing site, and it is -- I guess, if I click on it, it advances. Got ya.

The existing site is a 1960s, 1970s concrete tilt-up site. There's really only one access point, which is the existing Hamilton Avenue, of no real connection to the neighbors to the -- to the west, or even neighbors to the east. There's no real access around. So it's somewhat limited. From the buildings that are on the site right now, you see that they are concrete tilt-up. They're not sustainable. They're not -- they're not renewable. They're not welcoming. There's nothing that creates a sense of community or feel in the existing community.

So we just wanted to step back and take a look at the timeline of how we got here as a city and as a development sponsor. ConnectMenlo started in 2014, and brought a couple of years of hearings. And then Facebook, in 2017, got some community feedback and made a proposal, and got a lot of feedback from the community. They felt it was -- it needed some improvements, in terms of feeling -- people felt that it might be a bit walled off.

So we came on with Meta in 2018; got more feedback at a number of community meetings and revised the village, the Willow Village plan. And we went through a Planning Commission's scoping hearings, as well as City Council, and we got more community feedback on our plan. So we revised the plan a little, reduced some office, and continued to get feedback throughout this and had more community meetings. We had one-on-one meetings. Some people don't feel comfortable in the large meetings, so we had a number of one-on-one and small group meetings with our neighbors. Particularly -- I mean, throughout the city, but in particular, in the Belle Haven area.

And then, in 2022, we continued our community feedback, and we gave this Planning Commission a presentation in January. We revised our plan a little bit again, and here we are, having released the EIR and having this session and, hopefully, public hearings.

So with that, I just wanted to recap the feedback we got through all of those meetings, and we grouped them. And, obviously, traffic was a big concern. So we have incorporated some things into the plan to try to distribute traffic and reduce that.

People always said, "We wanted a connection to Belle Haven. We need to feel like this isn't separate from us. How can you do that? Can you include the jobs and housing balance?" And in particular, we initially started off with 1,500 units. We've increased that to 1,730 units, which has also increased our affordable housing. We originally proposed to the do a lot of the services in Phase 3, but the community said, "We'd like you to deliver those things faster. And can you provide us more open space?"

So in response to that, we've reduced the office capacity by 30 percent, thereby reducing what we had originally proposed of our traffic. By increasing the housing, we get a better jobs-housing balance, based on the number of employees, and increase the housing.

We've created a couple direct connections to Belle Haven, which we think is really neat. And we're looking forward to that. And hopefully they will enjoy this community because we're trying to do something that's never been done before. We've increased the affordable housing. We've once again, as I mentioned before, we're accelerated the grocery store to Phase 1.

Getting more open space, we took a previously-planned parking garage, and we're putting that underground so that we can have more open space, and in particular, improve the town square, and we've added more open space in the form of the elevated park and some other trails and gardens.

This is kind of how we started thinking about the project, is how can we do something that's really never been done before? Most tech campuses have been almost military bases to themselves. And, frankly, the Menlo Science and Technology Park was built along those same lines. So how can we meld a tech campus with some really cool mixed use and residential? And we came up with the idea of centering it around a main street and a town square. And how can, then, we add other connections to it?

So just on a big scale, we said, "How can we get more access into Willow Road, but also diffuse traffic up to the east, the south of 80, and up here?" And so that's how the project started to form in our minds and with our design team.

We then -- I'm trying to advance this. There we go. So we came up with the plan like this that has -- divides this into some key areas. And I don't know why the screen -- there we go.

Let me back up. One more up. There we go.

So we've got the office campus. One of the ways that Meta reduced the amount of people on campus is creating a meeting and collaboration space. And this is -- because this site sits in the middle of a number of Meta facilities. This is a way that they can gather their employees together, without going on surface streets. We're planning a tunnel that will handle bikes, pedestrians, and their inner-company trams that are currently on the surface. So that can be useful and yet not add any more traffic to the site.

I don't know why the town square is not in a highlighted color, but it is a really key element, as is the main street and this elevated park that we'll be showing you later. We're mixing a hotel use, and a residential use, and parks, in a way that hasn't been tried before. And we are hoping that you will see that this is something that can be done in a very positive way to not have a silo of tech people in the community, but be a place where we can gather -- we can all gather together.

So this is that same plan, colored out. I'm getting a delay on my advancing. So it's jumping two at a time at times.

The one other thing I wanted to point out, I pointed out in our last meeting, is in particular, the edge along Willow Road that we spent a lot of attention to. Right now, I showed you just the single access point that was up here with Hamilton. We're proposing, if we realign Hamilton and bring it right into what is our main street and our town square, to draw in our neighbors. We've created an elevated park, much like the High Line in New York City. Also another way to -- and some really cool ways to get up to that park. You can ride your bike up there. You can walk. You could stroll. It will be heavily landscaped, and there will be many opportunities for people to enjoy that park and various community things.

Along Willow Road -- Willow Road is, at times, a little bit unfriendly because of the traffic. So we wanted to really provide a softer arrival experience for those coming this way from Belle Haven. We have -- we think -- a good arrival experience from our neighbors who are going to come across on Hamilton.

But coming more, we want to show off a really nice park. We've taken pains to really lower the architecture along Willow and give a variety of building massing, so that it feels warm, welcoming, at a human scale that is neighborly and isn't just an abrupt change.

Right now, across the street, Mid-Pen is doing four-story buildings. And so we think this is going -- our design is very complimentary to that.

And then, of course, we've got a combination of office -- on the east side, but along main street of the offices is retail that will match the retail along main street and in our town square to provide a real continuity of people enjoying food and beverage, shopping, banking. Whatever they need to do. A grocery right as you enter the community is a hallmark for it, and I'll describe that in a little bit more detail. And the whole thing is to have a vibrant, pedestrian, welcoming -- you know, biking as well -- environment.

If you notice, we have a slightly different color of road along main street. That will be pavers. We want to keep that very pedestrian friendly, slow down any cars that are in there, so that it is -- truly feels like a village, at that level of scale and pace.

So what I'm going to do is take you a little bit on a walking tour, where we talk about place making. Part of that is how people access the site, but also how they will experience it, and how all of us, hopefully, will experience it. And these are some buildings that you will actually get in more detail a little bit later in the evening, but take you -- kind of on the seat scale of it, a little walking tour.

Starting off with our market. This is coming along the realigned Hamilton and walking up into -- into the Willow Village, towards the town square.

And just a couple of things to note is our color scheme, the orientation of the buildings, the level of the ground floor retail. And the glass, and the exposure there, is to be designed to not be -- to be welcoming, to draw people in, heavily landscaped. And one thing you'll notice, if you can see the scale here of people on the street, is that we've got to raise this site about five feet to plan for future sea level rise. That's a City ordinance. And so we -- that's why you'll see there's a gradual incline as people will go up main street.

So our main grocery entrance for pedestrians will be up here. We have an entrance off of Willow Road, from a garage, and another one from the other side. So you can drive up Hamilton and turn and get into the supermarket parking, or you could come off Willow or walk or ride your bike -- however. But we wanted this to be a real arrival experience that was welcoming and have our neighbors feel cool and relaxed, as they're coming up the street to do their shopping or go to work, or however they're enjoying it. This is the idea of -- when we say, "a full service grocer," it's vegetables. It's really well lit. We think about that whole experience. We want that to feel welcoming and stimulating, actually. Inspirational, at times.

Continuing our walk up the street, this is the corner that I showed you before from a distance. Our next block is some retail. And Meta will likely have a bank here, some food and beverage, some entertainment.

To the left is the hotel site. And then on the left, this building is a retail building in the town square that is, if you will, kitty-corner to the grocery store. And directly across here, providing more retail experience, because we're going to take a stroll into the town square right now.

So this is at the corner from where -- you're basically looking from the grocery store to the northeast. And the hotel is on our left, a small retail pavilion with some food and beverage, perhaps a flower store and the like. This is a single-story building, but with a little added architecture and plantings to continue to create that green vibrancy. And you can see the landscaping. And then the elevated park helps frame the north part of the town square, with the Meta meeting and collaboration space in the background.

We're next going to go inside this retail building and see how the town square looks as -- oops. I went, once again, too far. There it is.

And so this is -- there it is. So imagine you're having a sandwich, a coffee, or something looking out from that pavilion to the town square. There'll be a retail that you'll see in the next slide. On the right, the elevated park. Key element in the elevated park that will be able to be shown in a little bit more detail in the next slide is how we're getting people up to it in a variety of ways. But there's staircases and a high-speed elevator that can handle bikes and a number of people. And that's one last (inaudible). There we go.

And so this is looking -- you're looking to the east, and the elevated park is just to the left. And this is one of those high-speed elevators, as well as the really wide staircase to get people up.

Underneath the town square is parking. So people can easily come off of Willow or into one of our other street's parking. There's an elevator and stairs right here in that little retail pavilion or right next to the retail pavilion. There's this -- and this is -- by the way -- so we have retail on the front. The back are Meta office buildings. But the idea is that the general public will not feel excluded, or this is to be a welcoming experience, where all people mingle and gather and do what they do every day.

We're going to look back across this amazing town square to the hotel and see how it frames the town square, also providing another access point to the elevated park, with one of the elevators with that transparent glass that -- we feel good. And then the architecture for the trellis and the flowers and the plantings continues to the porte-cochere for the hotel to give it a pretty cool, lush continuity that, hopefully, makes people feel good.

Then we're going to go up to the elevated park and just give you -- give everyone an idea of -- at least right at this section, what it will likely feel like. So lots of trees, lots of lush planting, but a bike path. There's walking paths and a number of what I call "outdoor rooms." And we'll see that on main street as well, where people can gather and feel comfortable, and you can get larger groups or small groups or just individuals who want to -- who want to grab a coffee and read a book or, most likely, text on their phones.

We're going to head back to main street right now, and then walk down and experience that. So going back to this diagram where you see our food and beverage, our entertainment. The bank will likely be in this block. And here's what a plaza -- okay. Oh. Here is the offerings that -- we're just trying to get people to imagine the kind of offerings that we may have in there, and the feel and the vibe that we're looking for.

And here's the plaza and how it could look. We're creating in a number of spots -- really wide sidewalks, outdoor seating. Outdoor dining has really become a premium. We've got such great weather in Menlo Park that, throughout the year, we expect a number of people will want to enjoy that.

Next slide is really the other side of this building and plaza that you can see across main street. On the right-hand side, this is retail that lines the office buildings which we're going to go to next, but this was -- on the left-hand side is the other side of this block and its large plaza and wide sidewalks. This main street is particularly wide. We've kept the actual car lanes limited to two lanes, but we have a full dedicated bike path, as well as extra-wide sidewalks on both sides of the street. It's pavered, if you notice that -- so we want to keep cars -- we say, at Signature, a lot, "How can we make it so that cars feel uncomfortable here?" -- to keep the pedestrian feel to be the primary and also bikes, because we have a bike path there, but the primary mode of how we want people to experience this.  And you can see the proximity with the town square in the background.

Next, we're going to move to more of a panoramic view of what the office campus looks like from that retail plaza I just showed you out in front of that one parcel.

So this is one of the main entrances to the Meta office campus.  You'll notice the buildings are CLT timber.  That gives it a real nice feel.  But I also wanted to point out, on the left is the retail of the town square.  This is town square retail right here.  Main street retail that people will continue to enjoy and, yet, it's beautifully -- at least -- I'm a little biased -- but beautifully integrated into a welcoming arrival experience with these CLT timber buildings.  And "CLT" stands for cross-laminated timber, and it allows for a really terrific -- we think a great Northern California feel of the campus.  The architects, in the study session, will be going into much better detail than I can show you here.

Next, we're just going to continue to go down main street to show you the different orientations of the buildings, the emphasis on, you know, some outdoor retail and dining, but also little rooms.  Once again, as I talked about on the elevated park -- little gathering spots for people to, you know, hang out.

There's going to be folks riding their bikes and just different experiences of what we're trying to -- opportunities for experiences, I should say, that we're trying to create in this human scale, and then moving further south, down main street, to the other office buildings. These two have to be connected via a sky bridge as well, for that feel.

We're going to turn a corner now and get into more of the residential areas. Well, first of all, I should -- I take that back. I'm going to tell you about sustainability. It -- the cool thing about the CLT stuff and, actually, the entire campus, all the buildings will be LEED Gold. We're 100 percent electric everywhere, except for an occasional -- not a Meta restaurant. But occasionally we're planning that if there's a good, vibrant restaurant that needs something besides all-electric cooking -- whether it's gas, whether it's some kind of pizza ovens, or things like that, that the City's reach code allows the flexibility for that. But mostly it's all electric. There will be a significant amount of photovoltaics for energy generation, recycled water. It will be one of the first recycled office campus and residential campuses. And we're working with West Bay to make that happen.

And then, of course, throughout it all, we've got a real program for sustainable building materials, recycling the concrete buildings and the roadways, and to reuse as much as possible, to be as green and ecologically sensitive as possible.

Just an example of going to CLT timber, the construction of the buildings will use much less carbon and, actually, the timber itself embodies carbon. So as you know, the trees take CO2 out of the air. And so we're proud of being able to do that.

Now, this is where we're going to go into the thinking that was behind our residential street overview. And I'm just going to give you -- reorient you to where I'm going to be talking about in our land plan.

So the residential is on the west side of the campus, in these buildings and around this community corner. So from there, we started to look at, okay. We've got a number of buildings. How should we think about connections to the office, to the parks, to the town square, and hotel? And can we create a different feel in these locations and highlight the good stuff about that and have good architecture to do that? And how did -- how will it feel at our street level?

So here's one of the ideas, on our center street of our design of the building, that had all that entertainment in it and the like.  It's on a street that's heavily residential, that we call "center street" right now in the plan to, in parts of it, step back the buildings.  We got rid of a lane of traffic in our thinking so that we can widen the sidewalks, add planting, and add stoops so that you had a real different feel in certain aspects of this development.  You'll know that you're on a residential street, versus the combination of a retail street.

Here's another side of that building as it comes to what we call our "west street."  So you have stoops transitioning to some higher densities to get to our jobs-housing balance.  There are parts that we needed to densify and do it in a way that still feels good on a human scale.

This is our senior building and its unique architecture that we like, with balconies and different form, as well as a really good ground floor experience for our residents that will give them a porte-co that will shelter them from the elements.

As you can see here -- and it's a real -- a real nice indoor/outdoor environment for the seniors.  There will not be any -- unlike the example I just showed for here, we want our seniors to feel safe and not have any ground floor residences here.  They're going to have a programming and activated spaces on the ground floor, and then they'll enjoy the upstairs.

On our next slide, this is just down the street, across from the community park, along park -- what we call "Park Boulevard," another street entrance that we're creating in this community, another vision and expression of some ground floor stoops, as well as some higher density, to create a good -- once again, a really friendly, warm, human scale, with greenery and landscaping and sidewalks that are usable.

The next slide is of -- another one of our residential buildings that abuts the community park and has slightly varied architecture.  It -- on the left-hand side, we have another row of what we call "stoops" along Park Street.  And there will also be ground floor residences on Park on the right here.  So once again, you can sort of feel that we're -- we want to create great experiences that don't always -- that don't all look alike and look like they may have shown up over time, even though we will likely be building these pretty quickly.

Lastly, I'm going to talk about another -- and I'm going to end with a little gushing of trails and parks.  This is our loop road.  That's one of the multiuse paths in the project.  And this is on the eastern edge and the northern edge of the project.

We also thought long and hard about -- and we really worked with our neighbors at Tarlton to design this to also be another thing that's a separate and distinct experience. So lushly landscaped, a little bit of a meandering trail, but safe enough to ride bikes and people to walk and really feel like you're not in an office campus. So that's the feel we're going for. And we want all members of the community to be able to enjoy this Monday through Sunday, every week.

Next is our community park. It is still evolving as a gathering spot. In our community meetings, we have -- we had a number of polls that were done, one of which was on the community park and the various activities and uses. And so this is a combination of those uses. People wanted areas where they could picnic, they could enjoy some special landscaping, walking trails, and the like. We'll have some -- a kids' play area and gathering pavilions, and things like that. This is still taking shape. This is not a fully-baked plan at all, but it's presented here as a depiction for us to continue to refine and get feedback from the community.

One thing also to point out here is you'll see a bike lane on this side. It's not shown on the -- for some reason, on the west side of Willow. But working with

CalTrans and the City of Menlo Park and us, we will be creating dedicated bike lanes that run on both sides of Willow that will ultimately lead to the Bayfront Parkway. We are creating a tunnel that will tie into -- right by the town square, that will tie into the tunnel that goes underneath the 84 right now, for bikes to go along that Bayfront bike lane.

And I will -- I am going to conclude with this last slide that you've seen of main street. But the highlight here, that I just wanted to talk about, is this bike path. It connects all the way -- there's a spot where the loop road and this will connect in the south part and will continue up around the town square and underneath the elevated park into that tunnel to take you up to the bayfront and go to Bedwell Park, or whoever -- wherever you want to go as you're biking. So bikes are a key part of the plan. Wide sidewalks. The human scale is what we've been trying to achieve in this multiple-use of office, hotel, town square, elevated park area to bring people together. And that's the extent of the presentation.

CHAIR DORAN: Thank you.

I think we have a presentation by the EIR consultant next.

MR. NIETO: Do I need to relinquish the control of this or can the City take...

UNIDENTIFIED SPEAKER:  No, you do not need to.

MR. NIETO:  Okay.  Great.  Well, thank you.

CHAIR DORAN:  Thank you.

MS. GARCIA:  I think I just need to be granted control.  Thank you.

Good evening, Chair Doran, members of the commission, and members of the public.  Thank you for joining us tonight to discuss the Willow Village Master Plan Project Environmental Impact Report.  My name is Claudia Garcia, and I'm a Senior Environmental Planner at ICF.  ICF was the lead consultant for the EIR for this project.

Also with us here tonight is Heidi.  She's the principal and Project Director for the project.  And we also have Ollie, from Hexagon, who is the lead transportation consultant.

Our presentation tonight will provide an overview of the project, describe the environmental review process, and identify next steps for the contents of the EIR.  And I think I clicked a little too fast, and now we're a slide ahead from what I am sharing with you today.  So forgive me for that.

At the end of the presentation, we'll also explain how to submit public comment on the contents of the EIR.

So as noted previously, the overall intent of tonight's meeting is to receive public comment on the contents of the EIR, Environmental Impact Report, specifically on the environmental impacts evaluated in the EIR, and the adequacy of the document, pursuant to the California Environmental Quality Act. As part of our presentation, we will provide a summary of the proposed project, conclusions in the EIR, and identify next steps.

So we just heard from the project Applicant, who provided great detail on the vision of the overall development. This project is just meant to provide a brief overview. As noted on the slide, the project would redevelop the 59-acre main project site to include housing, retail uses, office and accessory uses, a 193-room hotel, and 20 acres of open space, including 8 acres of publicly-accessible parks.

The project also proposes to redevelop Hamilton Avenue Parcels North and South, to realign Hamilton Avenue, reconstruct the existing Chevron gas station, and enable up to 6,700 square feet of retail uses. Offsite transportation and utility improvements are also proposed to service the project.

So for the environmental review process, as provided in the CEQA guidelines, an EIR, or Environmental

Impact Report, is an informational document that is intended to inform public agency decision makers, like the Planning Commission tonight, and the general public, of the significant and environmental effects of a project, identify possible ways to avoid or substantially lessen the significant effects, and describe reasonable alternatives to the project.

The overall purpose of the EIR is to provide detailed information about the environmental effects that could result from implementing the proposed project. CEQA is a public disclosure statute. It's also a way to examine and identify methods for mitigating any adverse impacts and consider -- as I mentioned, consider feasible alternatives.

Here on this slide -- apologies for the tiny print -- but it's the overall review process to date. So the Notice of Preparation, that's when -- the first document that's released to notify the public, "Hi. We're preparing an Environmental Impact Report. This is the project. These are the types of topics we're going to be evaluating. Do you have any comments? Should we include anything else?" And so that was out for a period of 30 days.

And the City also conducted a scoping meeting. And the overall purpose was to receive comments on the scope of the EIR; the content, the topics we should evaluate.

The Draft EIR was released for a public review for a period of 45 days, on April 8th. And as Kyle noted earlier, that 45-day period closes on Monday, May 23rd, at 5:00 p.m.

And today we are at the public hearing to receive comments on the contents of the EIR.

The next steps in the process will be -- are grayed out here because we're not there yet. And we'll discuss that on a later slide.

So the content of the Environmental Impact Report, as noted in Chapter 1 of the EIR and tonight's staff report, the project's location and development parameters are consistent with the ConnectMenlo General Plan update and was considered in the growth pattern evaluated in the ConnectMenlo EIR.

In accordance with CEQA, this EIR tiers from the ConnectMenlo EIR. What does that mean exactly? Well, where appropriate, our environmental analysis for this project relies on the evaluation, conclusions, and mitigation measures included in that ConnectMenlo EIR. However, given the scale of the project and the interest in the project, this EIR also includes project-level analysis, where appropriate, including disclosing --

including those adequately-addressed in the ConnectMenlo EIR.

So Consistent with the CEQA guidelines, this EIR provides a detailed project description, environmental setting, environmental impacts, including cumulative impacts, mitigation measures, and also incorporates the ConnectMenlo mitigation measures, where appropriate. It includes alternatives to the proposed project, and it also includes variants to the proposed project.

So what exactly is a variant, if it's not an alternative? Well, a variant is a slightly different version of the project that could occur based upon the action or inaction of an agency other than the City or property owners outside of the project. Because the variants could increase or reduce environmental impacts, the EIR analyzes those separately, at a project level.

So, for example, in order to construct the Willow Road tunnel, there will be outside agencies that would need to permit and allow for that construction other than the City. And so for those reasons, we included the No Willow Road Tunnel Variant of the project, which basically means that the tunnel would not be constructed, and the Meta trams would continue to use the public street network, Bayfront Expressway, and Willow Road access to the proposed campus district.

Another alternative we evaluated is the increased residential density alternative, which would increase the number of residential units by 200. So instead of 1,730 units, we would have 1,930 units.

The No Hamilton Avenue Realignment is exactly that. Instead of realigning the Hamilton parcels, the roadway would not be realigned. It would be -- it would remain as is, and the Master Plan would be adjusted so that it connects perfectly to the existing roadway as it is. And those parcels would not be redeveloped.

The On-Site Recycled Water Variant would provide recycled water to the main project site through on-site treatment of wastewater.

So here on your screen, we have a list of all the topics that were evaluated in the EIR. This is consistent of Appendix G of the CEQA guidelines. However, as shown here, we did not evaluate impacts related to agriculture and forestry resources, mineral resources, and wildfire. That's because those topics were scoped out as part of the scoping period.

And so we do briefly touch on those, but it was determined that these specific topics would not result in significant impacts due to the location of the project. And that information is included in the EIR.

Impacts and mitigation measures: As noted, the

Draft EIR identifies and classifies environmental impacts as "potentially significant, significant, less than significant," or "no impact."

For each impact identified as "potentially significant" or "significant," the EIR provides a mitigation measure or measures to reduce, eliminate, or avoid adverse impacts. If the mitigation measure would successfully reduce the impact to a less-than-significant level, it is stated in the EIR. However, if it cannot be reduced to a less-than-significant level, this impact is considered significant and unavoidable.

Really exciting stuff, I know. Super dry. Wall of text.

So let's get into the significant and unavoidable impacts identified in this EIR. Oh. And I skipped one. So I'm going to go back, if I can. There we go.

Impact Air Quality-1. The proposed project would conflict with or obstruct implementation of an applicable air quality plan. What does that mean? The ConnectMenlo EIR determined that emissions of criteria pollutants and precursors associated with operation of new developments would generate a substantial net increase in emissions.

Here, the proposed project determined that operations would disrupt or hinder implementation of the Bay Area Air Quality Management District's 2017 Clean Air

Plan.  Specifically, operation of the project would exceed the threshold for reactive organic gases.  And that's really the threshold that we're exceeding.

And so even though the project would implement Mitigation Measure Air Quality 1.1, by using diesel-powered equipment during construction, to control construction-related emissions and also limit the types of architectural coatings, the -- so AQ-1.2 Mitigation Measure would require the use of super compliant architectural coatings during operation at all buildings. However, the reactive organic gas emissions primarily are coming -- are resulting from consumer products, which is difficult to control.  So even though the project would require these special, super-compliant coatings, that threshold would still be exceeded.

For noise impacts, Impact 1a is related to construction noise.  So as noted earlier, the Willow Road tunnel is a component of the project and is slightly offsite and would require nighttime construction.  And that would result in also excessive vibrations, due to pile-driving needed in order to construct the tunnel.

So there's a series of mitigation measures, as noted on the screen, that would be implemented, including a modified mitigation measure from the ConnectMenlo EIR. Those impacts would still exceed the municipal code because, specific to noise, the municipal code states that construction impacts should occur during the day. However, because of the nature of the tunnel and because roadways would need to be shut down, that type of construction needs to occur at night.

So Alternatives Considered: The EIR also evaluated three alternatives, in addition to the required No Project Alternative. Alternative 1 is the No Willow Road Tunnel Alternative. Just as it states, the Willow Road Tunnel would not be constructed as part of this alternative. If this alternative were to be selected, the total emissions from construction would decrease, due to the overall decreasing construction. And so those air quality and noise impacts would be reduced.

Similarly, for the Base Level Intensity Alternative, the proposed -- it would be similar to the proposed project, but developed to be consistent with the base-level development standard, as noted in the RMU and office zoning district. So the Base Level Alternative would reduce the amount of office and non-office and retail development that would be included as part of the project. And the residential units would actually be reduced to 519, instead of 1,730. This alternative would also reduce impacts related to air quality and noise because of the reduced development pattern.

For the Reduced Intensity Alternative, that would also reduce the amount of office, slightly, to 1,225,000, compared to 1.6 million. And it would reduce the non-office commercial to 87 -- a little over 87,000, compared to 200,000, for the proposed project. And the units would only be reduced to 1,530. So a 200 unit difference. And that would also reduce the overall impacts -- significant impacts related to air quality and noise because the overall development pattern would be reduced.

And as noted in the alternative section of the EIR, the reduced intensity -- the Base Level Intensity Alternative was found to be the environmentally-superior alternative.

So back to our environmental review process chart, if I don't skip it. Our next steps in the process are to receive public comment tonight and through May 23rd, and prepare the Final EIR. So that requires us to respond to all comments received on the contents of the EIR. And following that, that document will be provided to you, the decision makers, in order to take action on the project and separately on the EIR.

So How to Comment on the Draft EIR: Well, there are multiple ways. You can provide comment tonight, by raising your hand via Zoom, as Chair Doran mentioned earlier at the start of this hearing. You'll be notified when it's your turn to speak.

After tonight, you can submit written comments at the address provided below. This information is also included on the City's website. You can send your comment via USPS mail or via electronic mail to Kyle's e-mail, as noted on the screen. And the comment period will be open until 5:00 p.m., on Monday, May 23rd.

That concludes my presentation. Thank you for listening to all things CEQA, and we're eager to hear your comments.

CHAIR DORAN: Thank you.

So I do want to open it up to public comment on the EIR now. I would, as I mentioned earlier in tonight's program, like to get an idea of how many speakers we have. So if you're interested in speaking, please raise your hand and let Mr. Pruter get a count of hands before we proceed.

Mr. Pruter, how many hands do we have raised so far?

VICE CHAIR DECARDY: Chair Doran, I have a clarifying question.

CHAIR DORAN: Sure.

VICE CHAIR DECARDY: This is Commissioner DeCardy.

Are you asking for public comment interest solely on the EIR, or in both public comment periods tonight, as you're asking that question, just to clarify?

CHAIR DORAN: Yeah. That's a good question.

I suppose just on the EIR for now, because we're only taking comments on the EIR. We may have separate time limits for comments on the study session.

So if you're interested in commenting on the EIR, please raise your hand.

Mr. Pruter, can you give us an idea of how many speakers we have?

MR. PRUTER: Chair Doran, sure thing. We have, at the moment, 14 hands that are raised. That number has decreased slightly, following your announcement of the EIR-specific comments. So that may be related to that, but we have 14 right now.

CHAIR DORAN: Okay. That is kind of consistent with what I was expecting. There's a number of comments -- a large number of comments. And we are going to have a separate public comment period for the study session. I'm sure there's going to be a lot of questions from the commission as well.

So I want to limit the speaking time on EIR comments to two minutes per person, so we can get to everyone that wants to speak on this tonight, both on this

section and on the study session section.
So with that, Mr. Pruter, if you could set the clock for two minutes for each speaker, I would like to get started with the first one.
MR. PRUTER: Sure thing, Chair Doran. Pardon me for setting that up. We'll have that up shortly. But to clarify, we have, at the moment now 12 attendees -- quick clarification. So I will begin now.
First commenter I see on my screen is someone by the name of Kelli Fallon. And I'm going to allow you to speak at this time. You can un-mute yourself. And if you could please state your name and your jurisdiction as well, when you begin your comment.
You have two minutes. Thank you.

PH-1

KELLI FALLON: Hi. My name is Kelli Fallon. I'm a Senior Policy Manager at the Bay Area Council, which is a public policy organization representing over 350 members of the Bay Area business community. And I'm calling in support of the proposed Willow Village development, which will build over 17 -- 1,730 new homes, which is nearly 60 percent of Menlo Park's Sixth Cycle RHNA obligation.
This project is a unique opportunity to not only build much-needed housing in Menlo Park, but to also provide significant economic and community development in a city, through the $75 million in amenities Facebook has

PH-1 cont.

committed to invest in Menlo Park and surrounding communities.

As I'm sure you know, this is far beyond what housing developers are typically able to contribute to a project, as this is an opportunity that should not be missed, on top of all of the great sustainability efforts that have been mentioned tonight.

So I just want to say, this site is an excellent candidate for dense, mixed-use development directly adjacent to transit to grow the supply of housing and reduce dependence on cars, and it's a clear example of sustainable and inclusive growth for future generations.

And I encourage you to support it.

Thank you for your time and consideration.

CHAIR DORAN: Thank you.

MR. PRUTER: Thank you for your comment.

Our next commenter has the name, "Chamber of San Mateo County." If you could please state your name and your jurisdiction.

You'll have two minutes to speak, starting now. You may un-mute yourself.

PH-2

AMY BUCKMASTER: Thank you. My name is Amy Buckmaster, Chamber of San Mateo County. Good evening, Chair Doran -- Doran [pronouncing]. Excuse me.

Members of the Planning Commission. I'm the CEO

PH-2 cont.

of Chamber of San Mateo County. Our members include over 1,500 businesses and organizations, including 60 nonprofit organizations and 40 educational institutions, representing 85,000-plus employees countywide.

I'm here tonight to speak on the Willow Village EIR study session. Chamber of San Mateo County Board of Directors is proud to be endorsing the Willow Village project. Silicon Valley headquarters and campuses can now expand responsibly and in a community-focused way. Willow Village exemplifies this by working closely with the community and putting them at the center of the plans.

Through the pandemic and the economic recovery, we saw firsthand the needs of the community, especially our small, first generation-owned, family business, hanging on day by day. This project will help support those small businesses with recovery, future growth, and entrepreneurship. It will deliver badly-needed amenities and services to the Belle Haven, such as a grocery store, pharmacy services, cafes, and restaurants. And on top, local businesses will be prioritized for retail and dining.

And, lastly, but critical to our organization, it will deliver more than 300 affordable homes, including badly-needed very low income units for our seniors.

Thank you for your time.

MR. PRUTER: Thank you for much.

Our next speaker has the name of Romain Taniere. Sorry for mispronunciation.

You have two minutes to speak. If you could please provide your name and jurisdiction at the beginning of your comment.

You may now un-mute yourself. Thank you.

PH-3

ROMAIN TANIERE: Hi. Good evening, Commissioners. My name is Romain Taniere. I'm an East Palo Alto resident. I've actually sent a more-detailed e-mail to the commission, but in two minutes, I just wanted to point out a couple of key points.

Basically, with Menlo Park's current City ordinance, prohibiting nearby overnight parking, residents have expressed concern about increasing parking issues, speed, traffic, and nonresidential cut-through traffic between University, Willow, and Bay corridors, which need to be addressed, in parallel with construction planning. Therefore, traffic and parking, on nearby EPA Kavanaugh neighborhood, must be included in mitigation measures.

And some of the impact project fees should go towards the City of East Palo Alto for safety and traffic mitigation measures, such as implementing street traffic speed scanning devices and installing digital radars, speed limit signs on Kavanaugh and Gloria, stop signs on

PH-3 cont.

Clarence and Gloria, implementing an all-red traffic light interval at the University/Kavanaugh/Notre Dame and Willow/O'Brien traffic light intersections, strengthening control and enforcement of speed/traffic/parking regulations.

Meta should consider the integration planning of a multi-modal transit hub by the central corridors, and keep pushing for the Dumbarton rail corridor to be reactivated.

Meta should work with the SFPUC on nearby owners' project to redevelop the Hetch Hetchy right of way and connect the proposed Ivy/Willow and O'Brien parks to increase park playground and green community amenities on Hetch Hetchy, also re-including the initial proposal for a community center on ground level, near Ivy/Willow public park would be greatly beneficial.

Overall, we are very excited about this mixed-use project, with public access and amenities east of US-101, and hope groundbreaking will start soon.

Thank you very much for your consideration.

MR. PRUTER: Thank you for your comment.

Our next commenter is someone named Brittani Baxter. Brittani, you'll be able to un-mute yourself now and can you please provide your name and jurisdiction as you beginning of your comment.

PH-4

You'll have two minutes. Thank you very much.

BRITTANI BAXTER: Hello. I'm Brittani Baxter, a District 3 resident. And I'll comment just on the EIR portions right now.

Really love how beautiful the project is. It was great to see how there is a focus of pedestrian and bike infrastructure, over car infrastructure and looking at, you know, some of the circulation impacts in the EIR -- really, just anything that we can do to help, you know, incentivize people to get out of cars and into transit or walking or biking would be extra fantastic.

And then, I also noticed, like was mentioned a little bit earlier, that there is a variant available that would have 200 additional units of affordable housing, if the project were to kind of max out its density bonus. And so I'm not quite sure exactly how that would work, but if it's possible to study those units tonight as well, that would be extra fantastic.

Thank you so much.

MR. PRUTER: Thank you for your comment.

We now have someone named Ali Sapirman. Ali, I'm going to let you un-mute yourself. If you could please provide your name and your jurisdiction at the start of your comment.

You'll have two minutes. Thank you.

PH-5

ALI SAPIRMAN: Hi. Good evening, Planning Commissioners. My name is Ali Sapirman, and I'm here on behalf of the Housing Action Coalition, a member-supported non-profit that advocates for creating more housing for residents of all income levels to help alleviate the Bay Area and California's housing shortage, displacement, and affordability crisis.

I am here to speak tonight in support of the Willow Village project, which the Housing Action Coalition enthusiastically endorsed. I've e-mailed the entire Planning Commission our formal letter of endorsement and forward you all letters of support from Menlo Park residents and housing advocates.

I'll now expand on three key elements on why the Willow Village project deserves your support. One, it transforms a space into a place for affordable homes. This project replaces 1970s, outdated office space, over 59 acres, with a mixed-use project that includes 1,730 homes. Approximately 18 percent will be subsidized affordable, which is more than 300 affordable homes. Of these, 120 homes will be reserved for seniors.

Two, it creates a community of resources. Willow Village will provide community amenities and benefits, such as a grocery store, pharmacy services, up to 200,000 square feet of retail space, significant public open

PH-5 cont.

space, and a town square.

Three, built using environmentally-friendly practices. This project is built to be LEED Gold certification, meaning the buildings will be equipped with 100 percent electric power and use recycled water, sustainable materials, and increase photovoltaics.

Please vote tonight in support of the Willow Village project.

Thank you so much.

MR. PRUTER: Thank you for your comment.

Our next commenter is someone with the name of Jorge S21 Ultra. I'm going to let you un-mute yourself at this time. If you could please provide your name and your jurisdiction at the beginning of your comment.

You'll have two minutes. Thank you.

I apologize. Chair Doran, I'm not sure if this person is available at the moment, but I will proceed with another commenter, if that is acceptable.

CHAIR DORAN: Yes, please.

MR. PRUTER: We'll move on. Okay. We'll move on to the commenter by the name of Vince Rocha.

I'm going to allow you to speak at this time. If you can please un-mute yourself and provide your name and jurisdiction at the start of your comment.

You'll have two minutes. Thank you.

PH-6

VINCE ROCHA: Good evening Planning Commissioners. My name is Vince Rocha. I'm the Vice President of Housing and Community Development with the Silicon Valley Leadership Group, representing over 350 of the regions' largest employers and universities. We're calling in support of this project.

Our members have endorsed this project because it meets our needs for both housing, jobs, and environmental sustainability. For the purposes of the EIR, it has really mitigated the traffic impacts, creating open space and shopping, not just for the folks who will live and work there, but for the surrounding communities as well, really creating an environment of live, work, play.

We believe this meets or exceeds all of the environmental standards of the city, and we look forward to seeing this project come to fruition. Thank you.

MR. PRUTER: Thank you for your comment.

Our next commenter has the name of Pam Jones. I'm going to let you un-mute yourself at this time. If you could please provide your name and jurisdiction at the start of your comment.

You'll have two minutes. Thank you.

PH-7

PAM JONES: Good evening, housing commissioners, Chair and Vice Chair, and staff. Pamela Jones, resident of the Belle Haven neighborhood of Menlo Park.

PH-7 cont.

In regards to the EIR, I continually do not understand the criteria of collecting data. The air quality, according to the report, is negligible. And yet, if you look at the California State EnviroScreen 4.0, it identifies Belle Haven and East Palo Alto as being significantly affected by air quality.

PH-8

The second piece is on the housing studies, which are done by the same company that has done the General Plan. So I expect them not to find anything other than no impact or minimal impact.

But let me give you some data on the Belle Haven neighborhood and the impact there. If the 2020 census is correct, we have lost 488 residents between 2020 and 2010. That's in the Belle Haven neighborhood alone. The high-density apartments were not in the 2010 census because they were not built. The high-density apartments have 991 residents.

So consider that there's been significant impact on the residents that were living here long before Meta came to town, long before the high rise, long before the General Plan.

Thank you.

MR. PRUTER: Thank you for your comment.

Our next commenter is someone with the Isabella Chu.

Isabella, I'm going to let you be able to un-mute yourself. If you could please provide your name and jurisdiction at the start of your comment.

You have two minutes. Thank you.

PH-9

ISABELLA CHU: Good evening, Planning Commission. My name is Isabella Chu. I live in Redwood City, and I work in Palo Alto. So I have to bike or take a train or a bus through Menlo Park, every time I go to work. So housing in Menlo Park and safe bike and walk infrastructure is of immediate practical interest to me.

Moreover, in my professional life, I study the interaction between land use policy and health. And when we're talking about the EIR, I think it's important to remember that the number one source of greenhouse gas emissions, air and noise pollution in cities, is cars. And the key driver of traffic in the Bay Area is people having to live far away and commute by car into jobs.

And so anything which reduces vehicle miles traveled is a powerful and important measure against climate change, against pollution, against morbidity and mortality. Cars happened to be -- car crashes happen to be the number one cause of death for people under the age of 22. So vehicle miles traveled have a lot of externalities.

But when we're talking about environment,

PH-9 cont.

anything we can do to reduce vehicle miles' traveled is of central importance. And so building dense, walkable, bikeable communities near jobs is the most powerful thing we can do to reduce VMT and, frankly, give people access to opportunities.

So, you know, I want to speak in support of this project. The more you can reduce sort of the convenience of drivers and provide space for people on foot and bike, the better the project will be for the environment and for human health and prosperity.

Thank you.

MR. PRUTER: Thank you for your comment.

Our next commenter is someone names Karen Eshoo.

Karen, I am going to let you be able to un-mute yourself. If you could please provide your name and jurisdiction at the start of your comment.

You'll have two minutes. Thank you.

PH-10

KAREN ESHOO: Hi. Thanks for the time. I appreciate it.

I am the Head of School at Mid-Peninsula High School, which is adjacent to the -- to what will be the public park. I'm also a resident of the Willows. And I wanted to come tonight and first applaud the City for holding this hearing, and let you know how impressed we are at Mid-Pen with the EIR.

PH-10 cont.

We appreciate all the mitigation efforts that are being made, especially because I know that, obviously, as construction gets started, we're certainly going to hear it. That's for sure. But we also know that it's worth it because of the outcome of this project.

Mid-Pen is a big supporter of the Willow Village project. And, in fact, I think it's just going to do amazing things for the Belle Haven neighborhood. You've already heard that from others in the neighborhood as well. We're proud to be a neighbor of Meta. We have been, I think, you know, obviously, for quite some time now.

And in particular, I am really happy to say that we have a wonderful relationship with the folks that are designing this project. They've been responsive to us. Whenever we've had questions or suggestions, they've reached right out to us and have been really willing to talk about how this project can also benefit Mid-Pen and make sure that our school continues to be able to thrive, as it always has.

So we are, once again, here to throw our support behind this project and those leading it. And appreciate your time tonight.

Thank you very much.

MR. PRUTER: Thank you for your comment.

Our next commenter has the name of Ken Chan.

Ken, I'm going to let you be able to un-mute yourself. If you could please provide your name and jurisdiction at the start of your comment.

You'll have two minutes. Thank you.

KEN CHAN: Hello. Can everyone hear me?

MR. PRUTER: We can hear you.

PH-11

KEN CHAN: Oh, I'm sorry. I didn't see -- well, hello members of the Menlo Park Planning Commission. My name is Ken Chan, and I'm an organizer with the Housing Leadership Council of San Mateo County. We work with our communities and their leaders to produce and preserve all the affordable homes, which is what has brought me to this moment.

I'd like to thank staff. I'd first like to thank staff for all of their hard work in putting together the report, and for their presentation tonight.

On behalf of HLC, I'd like to express our support for the Willow Village proposal under discussion tonight. Over 300 of these homes are proposed to be affordable, with 120 set at the very low, extremely low income levels for seniors. This means that as folks begin to transition into the next phase of their lives, at least 120 of the city's most vulnerable senior community members will have a safe and stable place to call home.

Thanks so much.

MR. PRUTER: Thank you for your comment.

Our next commenter is named Adina Levin.

Adina, I will give you the ability to un-mute yourself. Please state your name and your jurisdiction at the start of your comment.

You'll have two minutes. Thank you.

PH-12

ADINA LEVIN: There we go. Now successfully un-muted. Thank you very much.

My name is Adina Levin. I am a Menlo Park resident, and I'm a part of a group from Menlo Together that submitted a letter to the Planning Commission and will do some more detailed comments, probably, about the EIR.

And I, first of all, wanted to support the comments of some of the other speakers, in terms of having homes near jobs, and services is something that helps reduce vehicle miles traveled and which is the biggest source of greenhouse gas emissions. So that is an overall -- a good thing.

In terms of more comments relating to transportation, the proposal does have many features, that help reduce driving, associated with the project. And in order to maximize that, we would like to see very significant attention posed particularly to the crossings

PH-12 cont.

of Willow at Hamilton, and also Park and Ivy and O'Brien; all of the intersections that need to be optimized for pedestrian safety, as well as the -- there's great bicycle trails on the project, but bicycle access to the project also needs to be very safe, to help people not drive.

With regard to the trip caps and the amount of vehicle parking, which are really correlated to how much driving and VMT, we would like to see some analysis, based on goals from mode share, what number of people are expected to be driving, versus using other modes. This is a method that Mountain View used and can help to reduce the amount of driving and vehicle miles traveled.

Thank you.

MR. PRUTER: Thank you for your comment.

Our next commenter is names Harry Bims.

Harry, I am going to let you be able to un-mute yourself. And if you could please provide your name and jurisdiction at the start of your comment.

You'll have two minutes. And I believe -- yes. Sorry. The stopwatch is coming back up. You'll have two minutes, please. Thank you.

PH-13

HARRY BIMS: Hello. This is Harry Bims, District 1 resident. I'm here to speak in favor of the project and would like to say that this project is far from perfect, as I think we've seen some comments about that earlier

PH-13
cont.

tonight. Nonetheless, I think, given the complexity of the project, that it strikes the right balance in addressing the broad range of issues that concern this project.

And I would also, you know, mention that this project is yet another District 1 project that leads the way throughout Menlo Park, in terms of providing affordable housing options, providing high-density residential uses as well, which is why District 1 has more high-density housing than any other district in Menlo Park by far.

So I'm speaking in favor of this project, and hopefully this project will incentivize other districts to follow suit, with similar projects that address the need for affordable housing in the Bay Area, and also deliver a project with the kind of quality materials and attention to detail that this project exemplifies.

Thank you.

MR. PRUTER: Thank you for your comment.

Our next commenter is named "Colin."

Colin, if you could please provide your name -- full name and jurisdiction at the beginning. You'll be able to un-mute yourself at this time. If you could please provide those items.

You'll have two minutes to speak. Thank you.

PH-14

COLIN: Hi, Menlo Park City Council. I'm a resident living in the Kavanaugh neighborhood in East Palo Alto.

Meta and the Willow Village team really listened and worked with the local residents on their community feedback. The affordable housing is much needed for many low income East Palo Alto residents facing rent hikes.

The retail space and prioritization of local businesses is going to open so many opportunities for many East Palo Alto and Willow businesses that started during COVID, such as the many Mom and Pop restaurants currently operating with much success out of East Palo Alto and Willow residential homes.

Continually, East Palo Alto residents have asked for a local dog park and a full-service grocery store. It was Meta and this Willow Village development that delivered on those. The community -- this development will be the first in the Bay that is fully inclusive of workers and residents, with an open campus that invites all members of the community to take advantage.

The use of union labor is going to enrich many locals, tradespeople, and the LEED status will help reduce environmental impact.

Delaying this further will cause harm to local residents by delaying the great benefits of this

PH-14 cont.

development from being realized.

Thank you for your time.

MR. PRUTER: Thank you for your comment. Our next commenter is named Fran Dehn.

Fran, I'll be letting you un-mute yourself. If you could please provide your name and your jurisdiction at the start of your comment.

You'll have two minutes. Thank you.

FRAN DEHN: Thank you very much.

PH-15

Good evening, Commissioners. Fran Dehn, Menlo Park Chamber of Commerce. And on behalf of the Chamber of Commerce, thanks for the opportunity to comment this evening in support of the Willow Village Master Plan.

The project is a model of corporate citizenship and community-based planning. The developers have truly listened to the community and delivered, in response to the input. They have engaged in an open community process for years; public outreach unprecedented.

Several substantive project modifications are a direct result, including moving the grocery store and other services to first phase, reducing office footprint, increasing the amount of housing, in particular, affordable housing, also providing parks, trails, open space for the community, retail spaces for local business to proliferate. And to reiterate, much needed housing.

PH-15 cont.

The project would not look like it does today without Willow Village's team listening to and integrating the community's feedback into the project design.  Meta is and has always been a receptive, responsive neighbor in Menlo Park.

They've invested 10s of millions into the community, such as the community campus, Belle Haven Community Campus, which is under construction; support for Menlo Park small businesses, local food subsidy programs, and on and on and on.

In summary, Willow Village, which is before you tonight, is a model for community-based planning, delivering unprecedented community amenities and benefits to the neighborhood and to the city as a whole, while still meeting Meta's long-term goals:  Remain, contribute, and flourish in Menlo Park.

Every project that comes forward to the Planning Commission has merit and certainly, in particular, merit to the Applicant.  However, with Willow Village, the community is also a primary beneficiary.

Thank you very much for your review, consideration this evening, and thank you to Meta and to Signature Development for a forward-thinking, community-based plan.

MR. PRUTER:  Thank you for your comment.

What appears to be our final commenter is a person by the name of Karen Grove.

Karen, I'm going to allow you to un-mute yourself at this time. Can you please provide your name and jurisdiction.

You'll have two minutes to speak. Thank you.

PH-16

KAREN GROVE: Thank you. I'm Karen Grove. I'm a Menlo Park resident. I serve on the Housing Commission, but I'm speaking for myself.

And, ironically, the first thing I'm going to talk about is circulation. As a member of Menlo Together, I wanted to add to Adina's comment that the EIR identifies that the project will put pressure on the intersections of Willow and Bayfront, and Willow and University. And so we were wondering if it would be feasible to add a third entrance or exit to Bayfront from what is currently being proposed as the "loop road." That would create a stronger grid, so to speak, with multiple options to enter and exit the area and relieve pressure on the two other intersections.

PH-17

I also wanted to comment on the variation of adding another 200 units, which is, I understand, not being proposed by the developer, but has been studied in the EIR. And we would like to propose that if those additional units get built, they be designed to be

PH-17
cont.

affordable for extremely low, very low, and low income households.

Menlo Park has a multi-year debt to the region, in terms of deeply affordable housing to meet the need of the jobs that we have added to our community. And the debt has been felt most strongly and continues to be felt most strongly in Belle Haven and East Palo Alto through eviction, homelessness, displacement, overcrowding, and extreme housing cost burden.

The impacted demographic is 50 percent black and Hispanic, and has a median income of 50 to $60,000 a year.

In addition, Belle Haven and East Palo Alto have carried the disproportionate impact of our city's growth. So that is why we would propose that if we add the extra 200 houses, which is a great idea, that we meet -- make them meet the needs of those most impacted in the nearby communities.

Thank you.

MR. PRUTER: Thank you for your comment.

If I may, through the Chair --

CHAIR DORAN: Yes.

MR. PRUTER: I believe that is all of our commenters, in terms of hands raised, just to clarify. But we did have a member of the public who had their hand raised and is no longer raising their hand. I wasn't sure if we wanted to give another opportunity for them.  They were unable to speak earlier, when I had given them the opportunity.

CHAIR DORAN:  Sure.  We can leave the public comment open for a little bit, to see if they want to come back, or if there are any other people who wish to comment.

MR. PRUTER:  Okay.  Thank you.

I do see another hand raised at the moment. Someone else.  A person -- I can let them speak, if you'd like, Chair Doran.

CHAIR DORAN:  Yes, please.

MR. PRUTER:  Okay.  Thank you.

We have an additional commenter named Karen Rosenberg.

Karen, I'm going to allow you to speak.  And if you can please state your full name and your jurisdiction at the beginning of your comment.

You'll have two minutes to speak.  Thank you.

KAREN ROSENBERG:  Hi.  I'm so sorry.  I first just wanted to clarify whether or not this is for just the EIR, or if I can comment just on the Willow Village development in general.

CHAIR DORAN:  This is intended to be the EIR, but since there's considerable overlap, I'd say, go ahead.

KAREN ROSENBERG: Okay. Wonderful.

PH-18

Hello. My name is Karen Rosenberg, and I am a Resilience Associate at Greenbelt Alliance.

For those of you who are unfamiliar with Greenbelt, we are an environmental nonprofit, working to educate, advocate, and collaborate to ensure the Bay Area's lands and communities are resilient to a change in climate.

We are pleased to endorse Willow Village that would bring over 1,700 homes to the city of Menlo Park. As a mixed-use development, Willow Village would bring housing and jobs and neighborhood-serving retail, not to mention significant open space, as well as other amenities to help create an inclusive Menlo Park for all residents to enjoy.

One of the many benefits of this project is that the addition of such amenities to the area would reduce the number and length of automobile retail trips for existing residents and employees.

Additionally, Willow Village is located within half a mile of Facebook's major employment center, with bike, pedestrian, and shuttle routes available, so that employees do not have to drive.

Every city in the Bay Area must play their part to increase their housing stock to make sure the local

PH-18 cont.

workforce can afford to live close to jobs, schools, and services. This project serves to help the City of Menlo Park make significant progress towards its Regional Housing Needs Assessment goals and allows its residents more time with family and friends, and less time in traffic congestion, improving the social fabric of our communities and reducing the climate-damaging greenhouse gas emissions produced by driving.

We urge the Planning Commission to approve Willow Village, and we hope its approval will resinate with other Bay Area cities and encourage them to redouble their efforts to grow smartly.

Thank you.

MR. PRUTER: Thank you for your comment.

We do now have two additional commenters. So I'll proceed.

The next person is names Rick Solis.

Rick, I'll let you be able to un-mute yourself at this time. If you can please state your full name and jurisdiction at the start of your comment.

You'll have two minutes. Thank you.

RICK SOLIS: Hello. Can you hear me?

MR. PRUTER: Yes, we can.

RICK SOLIS: Hi. Thank you.

PH-19

Hi. My name is Rick Solis. I'm a Field

PH-19 cont.

Representative with Carpenters Local 217, based in Foster City, but we represent about 2,500 members in San Mateo County.

But I would like to express my support for the Willow Village project. And I don't want to waste your -- any further of your time with explaining on how this is going to -- you know, regarding how many units and how many square feet of everything. But the thing that we're happy with is, the Carpenters Union has always had a great relationship with Facebook, who is now Meta, and are partnering with Signature Development on the construction of this project.

And to let you know, I mean, just the thousands of construction -- and I'm not just saying regular construction jobs, but the union construction jobs that this project will generate is going to be a great thing for the area. So since the pandemic, there's been a big slow-down in people getting back to work, and a lot of construction workers are suffering.

But like I mentioned, this is -- these are union jobs that provide family-sustaining benefits for retirement, for health care, the wages that they will pay, and just everything that's going to help construction workers in the area and help -- help build the middle class construction work force.

PH-19 cont.

So, again, I would like to urge you to please move this project forward to passage.

Thank you very much.

CHAIR DORAN: Thank you. I realize that it's hard to segregate comments on the EIR, from comments on the project generally. But I would like to ask the remaining speaker to confine their comments to the EIR. That's the portion of the Agenda that we're on right now.

And if they don't have comments on the EIR, to save their comments for the study session.

MR. PRUTER: Okay. Thank you, Chair Doran. Sorry.

To clarify, we have one more commenter. And I believe they're keeping their hand up. Another one has lowered their hand. So I believe they do have an EIR comment.

This person is named Sergio Ramirez. You will be able to speak at this time. And if you can please provide your name and your jurisdiction at the start of your comment.

You'll have two minutes. Thank you.

PH-20

SERGIO RAMIREZ: Hi. Good evening, Commissioners. Thank you for the chance to speak tonight.

My name is Sergio Ramirez Herrera. I've been a Menlo Park resident for the past 13 years. So I am also

PH-20
cont.

an 8-year apprentice carpenter with Carpenters Local 217.

In addition, I am a job-trained graduate from the training center here in Menlo Park. My four-year career has afforded me the opportunity to continue to live here and allow me to work close to home and spend more time with my family. With the benefits I earn through my work, I am also looking forward to a respectable retirement, when the time comes.

This developer has committed to using a union signatory general contractor on this project, which, in turn, allows others in my situation to utilize these benefits and earn a liveable wage that they deserve.

This project also includes more than 300 affordable homes, which -- with the desperate opportunities to better themselves and our community.

I fully support this project and look forward to seeing it through completion, and urge you all to do the same.

Thank you again for the opportunity to speak.

CHAIR DORAN: Okay. I'd like to remind the speakers that we're on the EIR report now. If we have comments on the EIR report, this is the appropriate time.

Comments on the project in general should be saved for the study session.

MR. PRUTER: Thank you, Chair Doran.

At this time, I do not see any other hands raised. So I think, if you'd like --

CHAIR DORAN: Okay. I'm going to close public comment and bring the conversation back to the Commission for commissioner questions and comments. And I'm sure there are a lot of those...

Well, if no one wants to speak, Commissioner DeCardy -- Vice Chair DeCardy?

VICE CHAIR DECARDY: I'm also happy to defer to Commissioner Riggs.

But, first of all, thank you. Thank you to the members of the public who have come and for your comments. They are enormously helpful, and for your commitment to providing feedback. Overall, it's a great project. I'm really looking forward to this project coming to fruition. So thank you to the team for the presentations.

To the staff, I thought the staff report was excellent. The materials, there are a ton. I thought the staff report did a nice job walking us through. Thank you for that.

And, Ms. Garcia, thank you to you and your team for the EIR, and for your really clear presentation.

I have three quick things, in addition to some of the comments we've heard already from -- really well said from the public. The first one is a question. It might be for you, Ms. Garcia, or for staff.

PH-21

If we have an EIR -- and I really appreciate having the EIR look at 200 additional units of housing. If we decided that we wanted to do 400 more units of housing, would that mean we'd have to reopen the EIR?

Or does that not limit us, as a community, as this project continues?

MS. GARCIA: Thank you, Commissioner. I think that's a great question.

As noted in the Variance chapter of the EIR, we did have to evaluate that particular variant in detail. And Ramboll, who did the air quality technical reports, did provide additional modeling information for air quality impacts.

And so increasing the units from 200 to 400 would likely require additional evaluation that, depending on what the results would be, could be included as an errata to the EIR, or an additional memo.

But if it would worsen impacts, then we would have to think about recirculation, if it gets to that point.

VICE CHAIR DECARDY: Yes.

PH-22

If I could ask the same question through the Chair to Mr. Perata.

Just how much longer would that take, as staff,

PH-22
cont'd.

and what would that do for cost?

MR. PERATA: Thank you. So I don't have good answers for either of those on the fly this evening.

We certainly would have to look into the cost more and -- in terms of what the scope and budget would be to modify the EIR, and whether or not it's a -- an errata in the Final EIR, where there potentially doesn't need to be recirculation, versus recirculation of the Draft EIR.

So when you're asking about the schedule, you know, Final EIR could potentially be accommodated within the overall project schedule.

Recirculation would require recirculating the Draft EIR for a new 45-day minimum public comment period. Either way, you're looking at additional time for the analysis, not factoring in items, like, whether or not it needs to be recirculated.

So I just don't have a good answer right now. I do see our City Attorney here to maybe bail me out a little bit.

MS. SHIMKO: Hi. I'm Anna Shimko.

And, Kyle, you don't need bailing out. I think you said it absolutely correctly. And you're right. It depends on the outcome.

If we did have to recirculate the EIR, of course, we would have not only the 45-day review period, but the time to respond to comments on that recirculated EIR.

VICE CHAIR DECARDY: All right. Thank you to each of you.

In that case, I just applaud the -- at least the addition of the 200 units in that mix, and I think it's good for everybody to know, if we wanted to go higher, what those impacts might be.

So thank you.

PH-23

My second one, I hope is simple, which is, you know, the potential EIR and the impacts of the diesel generator for emergency energy use. This is more just a request to the Applicant.

You all, I think, did a fabulous job in finding an alternative to a diesel generator at the Community Center and would really support and love finding that alternative in this instance, so we don't have to have diesel generator as backup. It's not an extraordinary greenhouse gas emissions' problem, but it seems a real shame for a project, that you're rightly touting for the other environmental and climate benefits, to have that pimple on it.

So that's the second comment.

PH-24

And then the third one is -- actually, I have some questions around. And this is to the great points that were raised by numerous commenters, including

PH-24
cont'd.

Mr. Taniere, Ms. Jones, Ms. Chu, and others, around air quality and transportation.

So you mentioned, Ms. Garcia, in your presentation, that the reactive organic gases are essentially -- there's nothing we can do about it; there's no mitigation.

So I think reactive organic gases are non-methane hydrocarbons.

So what are the consumer products we're talking about, that nobody has any control over?

MS. GARCIA: That's a great question. And I can do my part and find that specific list of consumer products, but I don't have it off the top of my head at the moment.

Heidi, do you happen --

MS. MEKKELSON: Yeah. I can -- I can try to respond to that. This is Heidi Mekkelson, from ICF, from the people in charge of the project.

Consumer projects are -- or consumer products are stationary source emissions. So not to be cheeky, but Axe body spray would be an example. Spray paint -- anything that consumers are using on a daily basis that emit reactive organic gases.

This particular threshold, from the Air Quality Management District, which is a pounds-per-day threshold,

PH-25

is typically exceeded by large projects. It's just a difficult one to be under, if your project is of a certain size.

And moreover, because it is related to the actions of future project users, it's a difficult one to mitigate because you can only do so much to curb people from using aerosols, for example.

VICE CHAIR DECARDY: Okay. So -- yeah. Those are -- my question is, so there's nothing related to transportation or to traffic or to parking or to automobile use, or do those reactive organic gases actually end up intermingling with other stuff, and that's what gives you the air quality problems, like ground level ozone, and that kind of thing?

I'm not a scientist. So I'm not trying to -- I'm not trying to catch anybody out here. I truly am interested in this moment, trying to figure that out.

MS. MEKKELSON: Yeah. Yeah. That's a really good question. We looked at all of those things in the analysis.

So there are different criteria air pollutants that are measured in the analysis, including particulate matter; NOx, which Nox is primarily due to -- that's nitrogen oxide. Those are primarily related to vehicle traffic; ROGs, ozone, and methane for the greenhouse gas analysis.

So each of those pollutants comes primarily from a different source. But we look at stationary sources, and we look at mobile source emissions.

And for the criteria, air pollutant operational impact, the threshold that is being tripped -- there's definitely, you know, impacts happening from all of these different emission sources, but the one that is tripping the threshold established by the Air Quality Management District is the consumer products.

PH-26

VICE CHAIR DECARDY: Perfect. Thank you.

So my -- with that understanding, my question gets specifically to the alternatives proposed, and the traffic and air quality issues in that mix.

And so can -- I believe what you are looking at is a threshold that is around 6,000 trips -- car trips, ends up being what you were looking at for needing to avoid going over that level.

Can you just remind us, why 6,000 car trips? What's magic about that?

MS. MEKKELSON: That one, I will have to take a look at, or perhaps Ollie can weigh in on that one.

The 6,000 car trips threshold is not ringing a bell for me at the moment.

VICE CHAIR DECARDY: Mr. Perata came on. He's kind of used to me on this.

MR. PERATA:  I'll defer to Ollie, from Hexagon, the transportation sub-consultant under ICF.  And then happy to follow up, but I think Ollie has it.

MR. ZHOU:  Hi.  This is Ollie Zhou, from Hexagon Transportation Consultants.

Vice Chair DeCardy, we -- in terms of transportation mitigation, we are talking about requiring the project to do TDM reductions.  And those are expressed in percentages.  I'm not -- you know, I haven't done the calculation myself and, you know, maybe you're right. That's the way you put it to the 6,000 trips' limit.  I do not recall citing specifically anything about 6,000, but, you know, if you find it in the EIR, maybe, if you could point me to that, that would be great.

But the project is required to do TDM mitigations to reduce its residential VMT impact.  And, you know, it's 32 percent off of IT -- 32 or 36 percent off of the IT-generation rates.

PH-27

VICE CHAIR DECARDY:  Yeah.  It's the mitigation factor that I think you all identified as Mitigation TRA2. And you just said it was the equivalent of 6,000 trips. So that's what I was referring to.  So I appreciate the answer on that.

So what I'm wrestling with is if we have a

PH-27
cont'd.

request that we're going to look at later on this evening, from the Applicant, to actually ease the transportation demand management. But I believe the only mitigation that we really have is transportation demand management. And so how are we supposed to, as a community, as the Planning Commission, as the City Council, and as residents, understand these different impacts?

It is hard for me to wrestle with what you all have in the EIR and these impacts, off of what is the current transportation demand management. I guess regime or expectation off of what is the requested variants, and how are we supposed to understand that and the potential air quality impacts and other environmental impacts?

And whoever can best answer that.

MR. PERATA: So through the Chair, if I can start from a staff perspective, and then we can turn it over to another expert on the meeting tonight.

For the Environmental Impact Report, we did study the Applicant's requested adjustment to the City's standard practice for the transportation demand management. So our ordinance does include a requirement of 20 percent reduction for TDM, transportation demand management, in terms of trips.

We have historically taken that off of the net trips, after factoring into account the project site's land uses, mixture of land uses, complimentary land uses in the vicinity of the project. That includes some internalization for trips, passthrough capture trips that would have passed the site already.

The Applicant's request, through the Conditional Development Permit, is to that number off the gross trips. And so that was factored into the analysis. So what the Planning Commission and the community is reviewing in the EIR is based on the Applicant's request.

So there isn't a change from the analysis in the EIR to the Applicant's request. But there is a component of the project that includes that change from net trips to gross trips, factoring into account this project's significant internalization, compared to other, more stand-alone uses.

VICE CHAIR DECARDY: Yes. Super helpful. That's exactly what I wanted to know. So I appreciate that.

PH-28

So I will just say that, for me, I was really -- appreciated the alternatives. I get frustrated with EIRs that don't give a reasonable set so that it gives some sunshine for the community to be able to see the differences. But there is not one that has a massive reduction in parking and the potential opportunities on the massive reduction in parking. I just simply think we have to look at that, at all of these projects. I won't

PH-28 cont'd.

certify it as adequate without that. I realize I'm only one vote, so it doesn't particularly matter. But it's why I think it's that important. I think it is that important so that our community has sunshine in this.

Half of the comments we just had were related to circulation and traffic in some dimension. And without getting the incentive to actually build on the incredible work that Meta has led, on TDM and to keep on pressing -- and I really appreciated the comment in the presentation that Mr. Neito made about -- you know, we're trying to send the incentives to have fewer cars, he said. Something like that. I think that's terrific.

But the only incentive to do that is to either get rid of parking or else to increase the cost. And we need to more honestly look at that, and I wish that was included in the EIR.

So, thanks. Those are my comments on the EIR this evening.

CHAIR DORAN: Thank you.

Commissioner Riggs?

PH-29

COMMISSIONER RIGGS: Yes. Thank you. And thank you to my fellow commissioner for raising those four points.

I would like to ask a question similar to Mr. DeCardy's first question. And that has to do with, if

PH-29 cont'd.

we had an alternative project, which we don't, because we scoped this in 2019, I think, before we started pressing more firmly for it.

If we had an alternative that involved a reduced parking option, both for residential and for office, would this require a revisit to the EIR?

And I have a similar question to follow that.

MS. GARCIA: Thank you, Commissioner Riggs. I think that's an excellent question.

Primarily the alternatives to the proposed project are identified and put forth in order to identify ways to reduce the significant impacts identified in the EIR. As noted in our presentation, the significant and avoidable impacts were related to air quality and noise.

Parking, unfortunately, is no longer considered an impact, under CEQA. So for those reasons, it wasn't identified as significant.

And in connection to that, that's one of the reasons why we didn't evaluate an alternative to the project that would reduce the parking.

PH-30

COMMISSIONER RIGGS: Understood. But I raise parking as an indicator of VMT because, frankly, if you don't have a parking space when you go to work, then you don't drive, as anyone in San Francisco or Manhattan can tell you.

PH-30
cont'd.

So under those conditions -- I realize that this is presumably in the positive direction. But does it in any way effect the EIR, if, for example, Meta decided, during the process of the building permit two years from now, maybe they're going to reduce the scope of their parking structures?

Would this in any way have any sort of kickback to the EIR, or because it would logically reduce VMT, would this be a nonissue?

MS. GARCIA: Thank you.

Heidi, correct me if I'm wrong, but an overall reduction or a reduction in the type of development that was evaluated in the EIR would, for the most part, reduce the overall significant impacts that were identified.

So it's unlikely that by reducing the number of parking spaces included in the parking garages that it would require recirculation of the EIR or identify additional significant impacts that were not identified previously.

COMMISSIONER RIGGS: All right. Thank you

MS. SHIMKO: And just to piggyback, if you don't mind, on what Claudia has said. I want to make sure that you know we did know that this would be an area of concern. And we seriously discussed whether it made sense to build into the alternatives' analysis an option that had less parking.

And maybe Ollie is the best to opine on this topic, but because the transportation impacts are judged on the basis of vehicle miles traveled, and there's no correlation, in my understanding, between forecasting the vehicle miles traveled associated with the project and the parking that's provided, we would have no basis at this point to conclude that providing less parking really would reduce the vehicle miles traveled.

I mean, I understand your argument, and it may be correct.  But based on the way that the technical analyses are accomplished, parking just doesn't figure into that calculus.  So we concluded that it did not make sense at this point to include reduced parking ratios into one of the alternatives.  I believe that we do have a mention of that in the alternatives' analysis, at some point.

But like Claudia said, if -- if, down the road, so to speak, the Applicant decided that less parking was needed, I'm confident that that could be accommodated.

And I don't see that there would be additional CEQA impacts as a result of that.

Ollie, do you want to say something?

MR. ZHOU:  Yeah.  I just want to concur, Anna, that I -- it's highly unlikely that, you know, additional EIR, environmental review, will be needed.

A reduction in parking will only be able to be captured in the VMT analysis if it is tied to an -- increasing the TDM measures' effect or a reduction in the trip cap that is being proposed by the project.

So, you know, if it can be tied that way, then it will only lead to a reduction in the VMT impacts, not an increase.

COMMISSIONER RIGGS: All right. That makes sense, and I appreciate all of your comments.

PH-31

So the next question is perhaps a little more challenging.

If there were an additional connection between this campus and the expressway, a short connection between the north loop road, for example, and the expressway, would -- I expect that would alter the City's request for studies of level of service impact, at the least.

Although it may improve it, and that would certainly be the goal, is -- would an alteration to the traffic pattern require any revisit under CEQA, or is that similarly a small enough item and a potentially positive item that we wouldn't need to -- that it would not complicate the process?

MS. GARCIA: That would depend on the type of alteration -- if it's just re-striping lanes, adding bike ped, things like that.

PH-31 cont.

COMMISSIONER RIGGS:  No.  It would be a connection. It would be -- call it a "driveway."

MS. GARCIA:  It would be an actual -- yeah.

That may require additional study.  I'm not sure that it would rise to the level of identifying an additional significant impact, but it would be something that we would need to look at, in terms of air quality, in addition to transportation, circulation, because it would require ground-disturbing activity, and that's really what we're interested in, what we're -- the project, how it's modifying the existing conditions around.  And so we would need to take a look at that.

MR. ZHOU:  I also want to add on, in terms of VMT, which is the transportation CEQA threshold, I believe it will have a negligible effect on vehicle miles traveled because it's not looking at -- opening a new connection would, you know, lead to very minor changes in trip lines.

However, I do want to say that because this will be a new transportation facility, under CEQA, I believe this would also qualify as a transportation project, which would require its own CEQA clearance because you're building new roadway to the existing roadway network.

But, you know, Claudia or Heidi, feel free to correct me on that.

PH-32

COMMISSIONER RIGGS:  Could this be handled as a

PH-32
cont'd.

modification of the existing one, or do we actually have to open a new file?

Is that your implication? A new file, Mr. Zhou?

MR. ZHOU: I'm not sure how exactly this should be handled, from a CEQA prospective. You know, maybe Heidi --

MS. MEKKELSON: If it's part of the -- oh, sorry, Ollie.

If it's part of the project, then it can be included as a project -- as a component of the project, as other roadway facility improvements are already included as part of this project. It might require permits from other agencies, like CalTrans.

But an additional roadway or driveway, you know, could be theoretically added to this project and not be a separate project under CEQA.

What we would need to look at would be potential construction -- changes to construction, air quality and noise impacts, as Claudia mentioned, and also any potential changes to roadway hazards and safety. That is still something that we need to look at under CEQA, under transportation impacts.

So, you know, we would want to make sure that the driveway is located in an area that is safe and is not related -- is not resulting in conflicts with pedestrians or bicycles, or things like that. So it really depends on what the proposal is, and what types of impacts it might result in.

If it results in new LOS impacts, that's not a trigger for recirculation under CEQA. But we would still need to look at these other things. And depending on what the change and the impact is, it's, you know, something that could be added to the Final EIR, without recirculating.

Or if it results in new impacts or impacts increased severity or, you know, is large enough to be considered substantial new information to the public, then that could trigger recirculation.

PH-33

COMMISSIONER RIGGS: Pardon me for pushing back a little bit here, but if it's designed according to transportation standards, you're telling me that CEQA would want to re-examine it based as a safety issue, even if it's designed based on transportation standards?

MS. MIKKELSON: It's something we have to look at. It's something that we have to look at, no matter what.

If it's designed according to standards, then that's a good case that there's a less-than-significant safety impact, but it's definitely something that we need to look at.

COMMISSIONER RIGGS: Okay. Thank you very much. That's my questions.

CHAIR DORAN: Thank you. Other commissioners? Commissioner Harris?

COMMISSIONER HARRIS: Commission -- or Chair Doran, I think you called on me before my hand was even up. That's pretty good.

CHAIR DORAN: You were in the top left position. So I can read your mind.

PH-34

COMMISSIONER HARRIS: Okay. I really applaud both my fellow commissioners on discussing how we might take a look at a massive reduction in parking. And as we look at this in terms of reducing VMT, it's hard for me to understand that those two things are not connected. So -- but I do like the answer that later, an overall reduction in parking should not trigger a recirculation of the EIR.

A couple things were brought up by some of our -- residents were talking about a different way to look at trip caps. And I noticed that the analysis is always done based on the ITE methodology, which is -- my understanding is assumed to be an extremely car centric suburban area, which this is not. I mean, we're supposed to be a live, work, play development, with a large senior population. So it seems trips should be severely curtailed, both for office and residential. So -- and I was just surprised at

PH-34
cont'd.

how large they were.

Now I see that it's partly because we're looking at the gross, versus the net, and only taking a reduction of 20 percent. So if you take a pretty high average of trips, and then you reduce it by 20 percent, you're still kind of at a -- pretty high, for what I think we're trying to accomplish here.

And I'm just wondering. Ms. Levin talked about doing -- looking at this in modal share. And I'm just wondering why we don't utilize that analysis, versus looking -- versus the way we do it with the trip caps and looking at the ITE.

Would -- I'm not sure who could answer that question best.

MR. ZHOU: Yeah. I can answer that question.

IT trip generation are traditionally how us transportation engineers are -- it's the best resource that we have to estimate trip generation for any type of, I'll just say, project.

The mode share for Meta relates -- you know, would only relate to the Meta portion of the trip generation. And I believe that it is somewhat captured by the trip cap that they're proposing for their -- for their Meta van use specifically.

For other uses, you know, we can do it that way.

We -- it will be based on very shaky grounds. We have to make several other assumptions, in terms of, you know, vehicle occupancy, auto ownership -- you know, trip rates, on a person level.

So, you know, it will be a completely new study. And I just want to say that IT trip generation is, you know, the best resource that transportation engineers have, in terms of modeling trip generation.

PH-35

COMMISSIONER HARRIS: Okay. Thank you.

I -- like some of our residents, I'm having trouble deciding which items are purely EIR, and which items have to do with the general project. So I think -- I -- actually, I guess one more thing in this reducing of VMT.

I'd like to thank Ms. Chu for her comment and reminding us that the number one source of pollution is -- in air quality is cars. So the extent we can reduce them.

I'd like to thank Meta and Signature for all of the separated bike lanes and wide walkways and walking trails within the village, but, also, as Ms. Levin mentioned, it's just difficult to get to the village. So I'm interested in seeing how -- if we can work a little harder on the TDM, and we can also work on some of these intersections, which are pretty concerning.

And, also, on a circulation issue, again, I would

PH-35 cont'd.

really urge that this project go to Complete Streets Commission. They're really equipped with helping us try to, you know, improve some of these areas so that it's -- you know, so that it's a good place for the surrounding community, who is going to be the most impacted.

So I think those are all my questions and comments for now, on the EIR.

Thanks.

CHAIR DORAN: Thank you. I believe Commissioner Tate, you have your hand raised.

PH-36

COMMISSIONER TATE: I do. Thank you, Chair Doran.

So I'm not sure whether -- but I believe that putting a new road in would fall under this section and not the study session. And I would really like to see that evaluated, in putting a new road in to take out to Bayfront Expressway. I think that that would take a lot of the burden off of Willow Road and University, and just improve circulation as a whole, with getting out of the Willow Village community.

So what does it take for that to really be evaluated at this point? I know someone in the public mentioned it, a public commenter. And I actually have mentioned this before, in just other meetings, just in conversation and with Tarlton, actually, when his project

PH-36 cont'd.

was up, and hoping that maybe there can be some sort of a collaboration between the two major land owners -- or the two only land owners, I should say, within that park, that area over there, to study this and to actually put in a road that would relieve, again, the pressure.

And I know that it does consist of working with other agencies, but I'm sure that there is some sort of way to make it happen because I know that there's already relationship forming with CalTrans. And, of course, relationship with the two cities.

So is that something that we can make sure that it happens, to at least study it? That's a question.

MS. GARCIA: Commissioner Tate, I'm not sure -- I don't want to speak out of turn, but as the EIR consultant, we're tasked to impartially review the project as proposed. And so if there -- if the Applicant or the City wants to modify the plan to include another intersection, we're happy to evaluate it in the document, but we can't propose that alteration.

COMMISSIONER TATE: Okay. So, then, this goes on record as a comment and a request, then.

CHAIR DORAN: Commissioner Tate, did you have any other questions or comments?

COMMISSIONER TATE: No. No. I'm done.

CHAIR DORAN: Okay. Thank you.

COMMISSIONER TATE: Thank you.

CHAIR DORAN: Do we have anyone else that would like to speak?

Okay. I'm not seeing anything else from the Commission. So I will -- well, I guess I should ask Mr. Perata, before I close this matter, do you have the input you need on the EIR?

MR. PERATA: Thank you, Chair Doran.

Yes. This is -- thank you for the discussion this evening; the comments. I believe we have everything we need.

If there are no further commissioner comments or questions, we can certainly close the Draft EIR public hearing and move on to the study session.

CHAIR DORAN: Okay. So I will close the public hearing portion of tonight's meeting now.

(Whereupon, Agenda F1 ended.)

# Stormwater Management Compliance Memorandum

# WILLOW VILLAGE PROJECT

# STORMWATER MANAGEMENT

# COMPLIANCE MEMORANDUM

**March 9, 2021**

**Prepared by:**

SHERWOOD DESIGN ENGINEERS

2548 Mission Street
San Francisco, CA 94110
415.677.7300

## SECTION 1: Overview

Willow Village is a mixed development site located in Menlo Park, California. The project is being developed by Peninsula Innovation Properties with site plans currently in the Schematic Design phase of development.

The project is a 59.36-acre site located within the City of Menlo Park. The project is bounded by Willow Road to the west, the SFPUC's Hetch Hetchy parcel to the south, Life Sciences District to the east, and the inactive Dumbarton Rail Corridor along the north. The existing site is made up of 18 parcels that include approximately 1 million square feet of existing industrial, office, and warehouse land uses with surface parking.

The existing project site is a developed "office park" with 87% of the area covered with buildings and paved surfaces, the remaining 13% consists of scattered pockets of landscape. There are currently no stormwater management facilities in place. In general, the site slopes from the southeast towards the north at approximately a 0.5% slope. The existing storm infrastructure drains west and discharges to an existing 66-inch storm drain at the Hamilton Avenue and Willow Road intersection. The 66-inch storm drain travels north, increases in size to 78-inch, and ultimately outfalls to Ravenswood Slough via a Caltrans owned and operated pump station. Refer to Exhibit A for Willow Village existing conditions.

The drainage basin for this site is the San Francisco Bay which was identified from the storm drain system maps provided by the City of Menlo Park. Refer to Exhibit B for a compiled version of the provided maps.

Based on historic groundwater data from the California Geologic Survey, the geotechnical report (prepared by Cornerstone Earth Group, 2017) recommends the project use the historic high groundwater elevation 4' (NAVD88). Past industrial activities on the site have led to underlying shallow groundwater contamination that may require certain BMPs to be lined with impermeable materials. Based on preliminary results from additional infiltration testing, the site is underlaid with predominantly clayey deposits with infiltration rates ranging from 0.08 to 0.17 inches per hour. Due to this low in filtration rate, all stormwater treatment facilities are likely to be underdrained.

## SECTION 2: Proposed Site

The Proposed Project has been designed as a master plan to implement the guiding principles and policies adopted as part of ConnectMenlo, such as including new affordable and market-rate housing units, providing opportunities for future transit connections, and constructing a grocery store. The Proposed Project would develop the site with new infrastructure, housing, sustainability features, circulation elements, open spaces, office uses, commercial (retail, dining, entertainment, and hotel) uses, and bicycle and pedestrian infrastructure. The new housing and community-serving retail would include public spaces of various scales, restaurants, public gathering spaces. In addition, the Proposed Project would include a community-serving space adjacent to the approximately 4-acre publicly accessible park. The Proposed Project would also include a Town Square including ground floor retail, public gathering space, a visitors center, and 193 room hotel.

Specifically, the Project Sponsor would demolish the existing onsite buildings at the Project Site and construct a Residential/Shopping District, a Town Square District, and a Campus District. The Proposed Project would increase the area for commercial uses (excluding the hotel) by approximately 1 million sf, for a total of approximately 2 million sf of nonresidential uses at the Project Site. In addition, the Proposed Project would include up to 1,735 housing units, a limited-service hotel with up to 193 rooms, an approximate 5,000 sf community-serving space which may use used initially to accommodate a small general store, and approximately 24.8 acres of open space, of which approximately 11.6 acres would be publicly accessible. The proposed site plan would aggregate approximately 4.0 acres of the publicly accessible open space in a public park located at the southwestern corner of the Project Site. In total, the Proposed Project would construct approximately 3.5 million sf of uses at the Project Site. Refer to Exhibit C for the Proposed Parcel Map.

All proposed buildings will have a finished floor elevation (FFE) of at least 13' which will ensure that the site is above the base flood elevation of 11' per the current effective FEMA map dated 4/5/2019. The City of Menlo Park also requires that all new construction within the flood zone that is located in zones R-MU, LS, and O shall have an FFE 24" above base flood elevation to mitigate for sea level rise. The proposed project is located within both O and R-MU zones. The proposed minimum FFE of elevation 13' meets both requirements.

**Methodology**

The stormwater treatment volume was sized per the San Mateo Countywide Water Pollution Prevention Program (SMCWPPP) C.3 volume-based method. This method resulted in approximately 93,000 sf of green infrastructure (GI) required for stormwater treatment for the entire site (parcels and rights of way). See Appendix 1 for sizing sheet using the C.3 volume-base method.

All drainage management areas (DMAs) for the proposed site parcels are estimated to be between 80% and 95% impervious. The only exceptions are the community parks (Parcel A & B) which have an estimated impervious area of 15% each and the parcel E-A with an estimated impervious area of 60%. The DMAs on private and public right of ways are estimated to be between 75% and 100% impervious. The proposed project is a C.3 Regulated Project because it will replace more than 10,000 sq ft of impervious surface and is therefore required to comply with the Municipal Regional Stormwater Permit C.3 Provisions. See Exhibit D for the proposed DMAs in public roads, private roads and site parcels.

For this analysis, all landscape areas on site are considered to be self-treating. Stormwater GIs are required to treat runoff from all buildings and site hardscape.

Green infrastructure areas within parcels and streets were determined using the 4% rule of the contributing impervious area. The DMAs within street ROWs were provided with slightly larger areas to take into account into the potential variability of these spaces due to street trees, lighting, fire hydrants and utility crossings. See Table 1 for the summarized pre- versus post-construction imperviousness and Table 2 for the approximate required treatment areas for each DMA.

**Treatment Strategies**

Because the design project is still in progress, detailed stormwater BMP design has not yet been developed. Instead, the purpose of this report is to show intent and feasibility to meet the C.3 Provisions utilizing green stormwater infrastructure standard details as provided in the June 2019 City of Menlo Park Green Infrastructure Plan. The treatment measures are anticipated to vary depending on parcel designation and ultimate design approach.

Treatment strategies for office and mixed use parcels may include bioretention areas, flow-through planters, pervious paving, proprietary treatment systems such as Silva Cells and green roofs. Rainwater harvesting will not be considered on site as the Non-Potable Water Ordinance will require significant recycled water supplies which can only be met via municipally provided recycled water or on-site treatment of wastewater.

Publicly owned streets have been conceptually designed to treat road runoff using evenly spaced bioretention basins, bioretention planters, proprietary treatment systems such as Silva Cells or connected tree wells located at the back of curb. See Exhibit E for the street design concept, and Exhibits F & G for standard details. Planter widths vary per street, depending on the in-progress street section. These planters shall not limit pedestrian walkways or step-out zones for proposed parallel parking. Stormwater treatment will be located at low points within the proposed grading scheme to facilitate surface drainage and minimize required storm drain piping.

When managing stormwater runoff on private roads, the roads must be graded to maintain all private stormwater flows within the private DMAs. Private streets will utilize the same strategies as public streets for stormwater treatment.

## Tables/Supporting Data:

### Table 1: Summary of existing and proposed total pervious and impervious area on site

| EXISTING (SQFT) | | PROPOSED (SQFT) | |
|---|---|---|---|
| **PERVIOUS AREA** | **IMPERVIOUS AREA** | **PERVIOUS AREA** | **IMPERVIOUS AREA** |
| 332,597 | 2,253,195 | 430,818 | 2,154,974 |

## CONSTRUCTION NOTES:

1. AVOID COMPACTION OF EXISTING SUBGRADE BELOW BASIN.
2. SCARIFY SUBGRADE TO A DEPTH OF 3 INCHES (MIN) IMMEDIATELY PRIOR TO PLACEMENT OF AGGREGATE STORAGE AND BIORETENTION SOIL MATERIALS.
3. COMPACT BIORETENTION SOIL IMMEDIATELY BEHIND CURB TO 90% OF MAXIMUM DENSITY PER STANDARD PROCTOR TEST (ASTM D698).
4. UNDERDRAIN REQUIRED FOR ALL FACILITIES WITH IMPERMEABLE LINER.
5. PROVIDE ONE CLEANOUT PER PLANTER (MIN) FOR FACILITIES WITH UNDERDRAINS.
6. MINIMUM UTILITY SETBACKS AND PROTECTION MEASURES MUST CONFORM TO CURRENT SFPUC ASSET PROTECTION STANDARDS. COORDINATE WITH ENGINEER IN THE EVENT OF UTILITY CROSSING AND UTILITY CONFLICTS.
7. GEOTECHNICAL OR HYDRAULOGIST ENGINEER TO DETERMINE IF LINER SHALL BE USED.
8. ANGLE OF REPOSE MAY VARY BASED ON GEOTECHNICAL ENGINEER RECOMMENDATIONS.

NOT FOR CONSTRUCTION – REFER TO USER GUIDE

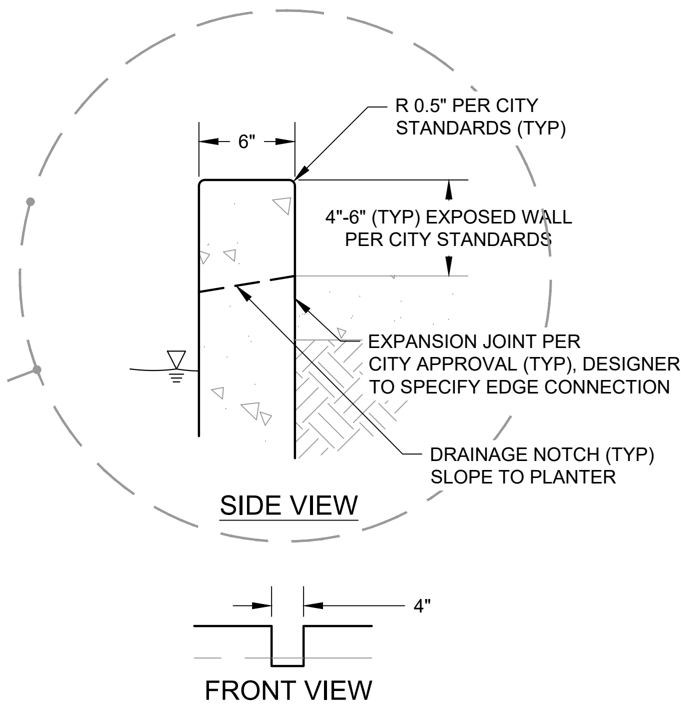
STORMWATER BARRIER PLANTER FOR CLASS 4 BIKEWAY (A)



TYPICAL DRAINAGE NOTCH DETAIL

## NOTES:

1. AVOID COMPACTION OF EXISTING SUBGRADE BELOW PLANTER DURING CONSTRUCTION.
2. SCARIFY SUBGRADE TO A DEPTH OF 3 INCHES (MIN) IMMEDIATELY PRIOR TO PLACEMENT OF AGGREGATE STORAGE AND BIORETENTION SOIL MATERIAL.
3. MAXIMUM DROP FROM TOP OF CURB TO TOP OF BIOTREATMENT SOIL SHALL INCLUDE CONSIDERATIONS FOR BIOTREATMENT SOIL SETTLEMENT.
4. DESIGNER TO SPECIFY PLANTER WIDTH AND IF TREES ARE DESIRED, PROVIDE ADDITIONAL TREE ROOT VOLUME USING STRUCTURAL SOIL OR SILVA CELLS UNDER ADJACENT BIKEWAY PAVEMENT.
5. OVERFLOW STRUCTURE TO HAVE SQUARE OR ATRIUM GRATE PER PROJECT DESIGN AND THE DISCRETION OF THE PUBLIC WORKS DEPARTMENT.

## NOTES:

1. PREFERRED TREE WELL SIZE IS 6 FEET BY 6 FEET, BUT CONSTRAINED SITES CAN REDUCE WIDTH TO 4 FEET PROVIDED THEY CAN ACCOMMODATE MINIMUM REQUIRED TREE ROOT VOLUME BY INCREASING LENGTH AND/OR USING STRUCTURAL SOIL, PERMEABLE PAVEMENT, AND/OR SILVA CELLS UNDER ADJACENT SIDEWALK.
2. DESIGNER TO SPECIFY MINIMUM SIDEWALK WIDTH BEHIND AND STEP-OUT ZONE IN FRONT OF TREE WELL THAT COMPLIES WITH ALL APPLICABLE AGENCY AND ADA REQUIREMENTS. STEP-OUT ZONE CAN BE ELIMINATED IF PARKING IS PROHIBITED ALONG CURB. SEE DESIGNER NOTES.
3. IF CURB DRAIN, I.E. SHALLOW PIPES, ARE USED TO CONVEY SURFACE WATER BETWEEN TREE WELLS, 3 INCH CAST IRON PIPES SHALL BE INSTALLED AND A MINIMUM COVER OF 1-1/2 INCHES OF CONCRETE OVER PIPES SHALL BE PROVIDED. IF TRENCH DRAIN IS USED, THE GRATE SHALL BE ADA COMPLIANT AND HAVE A NON-SLIP SURFACE.

NOT FOR CONSTRUCTION – REFER TO USER GUIDE

SECTION A

NOTES:

1. STEP-OUT WIDTH SHALL COMPLY WITH ALL APPLICABLE AGENCY AND ADA STANDARDS.
2. IF STRUCTURAL SOIL AND/OR OTHER METHODS ARE NOT USED TO EXPAND TREE ROOT VOLUME BEYOND TREE PLANTER, EDGE RESTRAINT SHALL BE EXTENDED TO BOTTOM OF BIOTREATMENT SOIL.
3. IF TREE WELL LENGTH EXCEEDS 6 FEET, LATERAL BRACING AND/OR FOOTINGS MAY BE REQUIRED. DESIGNER TO SPECIFY.
4. IF ADDITIONAL TREE ROOT VOLUME IS NEEDED, DESIGNER MAY SPECIFY THE USE OF ADDITIONAL STRUCTURAL SOIL OR SILVA CELLS UNDER THE SIDEWALK BASE IF ALLOWED BY PUBLIC WORKS.
5. ROOT BALL SIZE TO BE SPECIFIED BY THE DESIGNER AND APPROVED BY THE CITY ARBORIST IF WITHIN PUBLIC RIGHT-OF-WAY.
6. REFER TO DESIGNER NOTES FOR ADDITIONAL DESIGN GUIDANCE.

ISOMETRIC

## NOTES:

1. THIS DETAIL SHOWS ONE EXAMPLE OF A NON-PROPRIETARY TRASH CAPTURE DEVICE THAT CAN BE PROVIDED ON THE INLET SIDE OF ROADSIDE BIORETENTION PLANTERS TO MEET THE FULL TRASH CAPTURE SYSTEM REQUIREMENTS MANDATED BY THE STATE WATER BOARD. TRASH CAPTURE CAN ALSO BE PROVIDED AT THE OVERFLOW OR BYPASS OUTLET STRUCTURE BY TRAPPING PARTICLES 5 MM OR GREATER DURING THE DESIGN STORM EVENT. SEE THE STATE WATER BOARD SITE FOR MORE INFORMATION.
2. ALL MATERIAL AND WORKMANSHIP FOR TRENCH DRAIN AND TRASH CAPTURE ASSEMBLY SHALL CONFORM TO CITY OF SAN MATEO STANDARD SPECIFICATIONS AND APPLICABLE PUBLIC WORKS CODES.
3. PROVIDE AT LEAST 1 INCH DROP BETWEEN INLET ELEVATION AT GUTTER AND PONDING ELEVATION.
4. ALL TRENCH GRATES/TRASH CAPTURE STRUCTURE LIDS SHALL BE REMOVABLE, RATED PER THE ANTICIPATED LOADING (H-20 LOADING WITHIN PUBLIC STREETS), AND BOLTED IN PLACE OR OUTFITTED WITH APPROVED TAMPER-RESISTANT LOCKING MECHANISM, FLUSH OR RECESSED IN GRATE.
5. BOND NEW CURB AND GUTTER TO EXISTING CURB AND GUTTER WITH EPOXY AND DOWEL CONNECTION.
6. HORIZONTAL CONTROL JOINTS SHALL BE PROVIDED EVERY 10 LINEAR FEET, OR PER MANUFACTURER'S RECOMMENDATIONS.
7. APPLY EPOXY BONDING AGENT AT ALL TRENCH DRAIN CONSTRUCTION COLD JOINTS.

# Executive Summary

This report presents the results of the Transportation Impact Analysis (TIA) conducted for the proposed Willow Village Master Plan Project in Menlo Park, California. The Proposed Project would redevelop an approximately 59-acre industrial site plus two parcels north of Willow Road[1] (collectively, the Project Site) as a mixed-use development. The Proposed Project would demolish all existing onsite buildings and landscaping on the 59-acre portion of the Project Site and construct new buildings, provide open space areas, and install infrastructure within a new Residential/Shopping District, Town Square District, and Campus District. In addition, the Proposed Project would alter two parcels (Hamilton Avenue Parcels North and South[2]) to accommodate realignment of Hamilton Avenue at Willow Road for Project Site access.

The Proposed Project would provide up to 1.6 million sf of space for office and accessory use (consisting of up to 1.25 million sf of office uses and the balance (350,000 square if office use is maximized) of accessory uses[3]) and up to 200,000 sf of commercial/retail space. The Proposed Project would also include up to 1,730 multi-family housing units, an up to 193-room hotel, and open spaces, including publicly accessible parks (e.g. 3.5 acre publicly accessible park, elevated linear park, town square, and dog park).

The Project Site would be bisected by a new north–south street (Main Street) and an east–west street, which would provide access to all three districts. It would include a circulation network for vehicles, bicycles, and pedestrians, inclusive of both public rights-of-way and private streets, that would be generally aligned to an east-to-west and a north-to-south grid. The Proposed Project would also alter parcels north of the industrial site, across Willow Road, on both the east and west sides of Hamilton Avenue (Hamilton Avenue Parcels North and South) to support realignment of the Hamilton Avenue right-of-way and provide access to the new elevated park. This would require demolition and reconstruction of an existing service station (Chevron gas station) and potentially an increase in 1,000 sf on Hamilton Avenue Parcel South and enable the potential addition of up to 6,700 sf of retail uses at the existing neighborhood shopping center on the Hamilton Avenue Parcel North. A total of 7,700 sf could be added to the Hamilton Avenue Parcels.

[1] For transportation analysis, "North/South" is aligned to be parallel to US 101. Hence, Willow Road and University Avenue are considered east-west streets, whereas Hamilton Road and Bayfront Expressway are considered north-south streets.
[2] Hamilton Avenue Parcels North and South consider Hamilton Avenue an east to west street, which differs from the compass directions used for the transportation analysis discussion.
[3] Accessory uses could include the following types of spaces: meeting/collaboration space, orientation space, training space, event space, incubator space, a business partner center, an event building (including pre-function space, collaboration areas, and meeting/event rooms), a visitor center, product demonstration areas, film studio, gathering terraces and private gardens, and space for other Meta accessory uses. Accessory uses could occur in spaces located anywhere throughout the Campus District

## CEQA Vehicle-Miles Travelled Analysis

The most readily available long-range forecast year is the year-2040 conditions, which assumes the buildout of the City of Menlo Park General Plan and any pending General Plan Amendments, the buildout of the pending developments in the City of East Palo Alto (as of December 2020), and regional growth projected by the Association of Bay Area Governments (ABAG), modified by VTA/C/CAG for model land use inputs. Therefore, the project's VMT analysis was conducted under year-2040 conditions.

### Office VMT

According to the City's VMT guidelines, office land use is evaluated based on a daily VMT per employee metric. Using the model, this metric is calculated only for home-based work trips, per OPR's Technical Advisory on Evaluating Transportation Impacts in CEQA. Based on the latest citywide travel demand model, the regional average office VMT is 15.9 per employee. Therefore, City's office VMT impact threshold, at 15% below regional average, would be 13.6 daily VMT per employee. Office land use was evaluated using the model under the year 2040 plus project scenario. For the Campus District, the applicant proposed a daily trip cap of 18,237 trips, which would be 20% below the standard ITE trip generation estimate. The model was adjusted to account for the proposed trip cap. As shown in Table ES-1 below, the project's Campus District land use would generate VMT at the City's VMT impact threshold and would thus not have a VMT impact.

### Residential VMT

According to City VMT guidelines, the evaluation of residential land use is based on a daily VMT per capita metric. Using the model, this metric is calculated only for home-based trips, per OPR's technical advisory. Based on the latest citywide travel demand model, regional average residential VMT is 13.1 per capita. Therefore, the City's residential VMT impact threshold, at 15% below regional average, would be 11.2 daily VMT per capita.

For the residential land use, trip generation was adjusted to account for the Project's expected 2.03 people per unit compared to the ITE average of 2.46 people per unit. The VMT analysis also accounted for the applicant proposed TDM Plan for the mixed-use district. The TDM Plan proposed a 20% trip reduction from gross ITE trip generation through a combination of passive TDM measures and active TDM measures. Passive TDM measures include the project's proximity to complementary land uses, proximity to alternative transportation infrastructure, and the project's mixed-use nature. As discussed in Chapter 3 below, it is estimated that the passive TDM measures would achieve a 17% trip reduction from the gross ITE trip generation. Active TDM measures include TDM programs to be implemented to further promote alternative modes of travel. These TDM measures generally include providing transit, biking, and carpooling information to residents, assisting in ride-matching programs for residents, and could also include transit subsidies and other measures. To represent the applicant proposed 20% trip reduction goal and given that passive TDM measures are assumed to achieve a 17% trip reduction, the balance of 3% (20%-17%) trip reduction due to active TDM measures was assumed for the VMT analysis.

The Project's residential land use would require a 16% reduction in VMT to mitigate the significant VMT impact. The VMT analysis, as discussed above, already assumed 3% trip reduction due to active TDM measures. Therefore, mitigation of the VMT impact would require implementing a TDM Plan for the residential component that achieves at least 19% (3% + 16%) trip reduction via active TDM measures (see Figure 10 in Chapter 3 below) or increases the effectiveness of passive TDM measures. According to the Project's proposed TDM Plan dated July 2021 and attached in Appendix G, the proposed active TDM measures for the residential component could achieve at least a 19% reduction in trips, with an estimated reduction between between 11% and 36% [4]. This range represents the potential low to high range of effectiveness of the proposed TDM measures, as calculated by research data from the California Air Pollution Control Officers Association (CAPCOA). This range depends on how each TDM measure is eventually implemented. Therefore, it is feasible for the Project to mitigate its residential VMT impact by implementing its proposed TDM Plan.

**IMPACT (TRA-2 in Transportation Chapter)**: As shown in Table ES-1 below, the Proposed Project's residential land use VMT is estimated to be 13.3 daily miles per capita, which would exceed the VMT threshold and result in a VMT impact. The mitigation measure TRA-2 identified below would fully mitigate this impact.

**MITIGATION MEASURE (TRA 2 in Transportation Chapter)**: The residential land use of the Project Site will be required to implement a TDM Plan achieving a 36% reduction from gross ITE trip generation rates (for the Project, this reduction equals 6,023 daily trips). Should a different number of residential units be built, the total daily trips will be adjusted accordingly. The required residential TDM Plan will include annual monitoring and reporting requirements on the effectiveness of the TDM program. The Project applicant submitted a draft residential TDM Plan, which contained specific measures that would meet this trip reduction requirement. The draft TDM Plan is subject to City review and approval. If the annual monitoring finds that the TDM reduction is not met , the TDM coordinator will be required to work with City staff to detail next steps to achieve the TDM reduction. With the implementation of the required residential TDM Plan, the residential VMT impact would be **less than significant with mitigation (LTS/M)**.

**Table ES- 1**
**Office and Residential VMT Evaluation**

| Land Use | Regional Average | VMT Threshold | Project VMT | VMT Impact | Additional TDM Mitigation needed to eliminate VMT impact |
|---|---|---|---|---|---|
| Office [1] | 15.9 | 13.6 | 13.6 | No | - |
| Residential [2] | 13.1 | 11.2 | 13.3 | Yes | 16% |

Notes:
** All data referenced the latest Menlo Park citywide travel demand forecast model.*
1. VMT for office land use is reported in VMT per employee.
2. VMT for residential land use is reported in VMT per capita.

4 Willow Village TDM Plan. Prepared for Peninsula Innovation Partners. Fehr & Peers, Inc. July 2021

## Hotel VMT

Based on consultation with the City and applicant, the hotel is expected to have a service area of approximately three (3) miles in radius. This means that most of the destinations of hotel patrons are expected to be within three miles of the hotel. While some trips are expected to be longer than three miles, the majority of the change in VMT is expected to occur within this three-mile radius. The evaluated daily VMT includes the entire length of the trip even when it extends beyond the three-mile radius.

The total daily VMT generated by land uses within a three-mile radius was compared under the "no hotel" and "with project" scenarios. As shown in Table ES-2, the proposed hotel component of the project was shown to slightly reduce the total daily VMT generated by land uses within a three-mile radius of the Project Site. Since the proposed hotel would be located within very close proximity to major employment in the Bayfront area, hotel patrons would enjoy shorter travel distances to their business destinations. It's location within a mixed-use project, including complementary retail space, also would allow hotel patrons to shop/dine within walking distance.

Because the proposed hotel component of the Project would not cause an increase in total VMT generated within the analysis area, it is concluded that the proposed hotel component of the Project would have a less than significant impact on vehicle miles travelled.

**Table ES- 2**
**Hotel VMT Evaluation**

| | 3-Mile Radius Area of Project Site | | |
|---|---|---|---|
| | No Hotel Conditions [2] | With Project Conditions [2] | % Change |
| Total Daily VMT [1] | 6,656,914 | 6,629,443 | -0.4% |

Notes:
1. Total daily VMT includes VMT generated by all trips having at least one trip-end in the analysis area, as estimated by the citywide travel demand model.
2. "No hotel conditions" represent conditions with the Proposed Project except the hotel component. "With project conditions" represent conditions with the Proposed Project including the hotel component.

## Retail VMT

The project has two areas of retail development. The main Project Site includes up to 200,000 s.f. of retail space within a mixed use development. North of Willow Road, as a result of the proposed Hamilton Avenue realignment, the two retail parcels adjacent to Hamilton Avenue at the intersection with Willow Road ("Hamilton Avenue Parcels") would be reconfigured. The Project proposes to increase the total retail square footage at the Hamilton Avenue parcels by up to 7,700 s.f. to approximately 23,400 s.f. Because the retail at the Hamilton Avenue Parcels will require a separate use permit and would be operated as a separate retail use from the retail uses at the main Project Site, the Hamilton Avenue Parcels retail is evaluated separately from the retail component of the main Project Site. According to the City's VMT policy, local serving retail (defined as having total square footage less than 50,000 s.f.) would be exempt from a VMT analysis. The Project's proposed net 7,700 s.f. of potential retail development at the Hamilton Avenue Parcels would thus be exempt from VMT analysis. The discussion below is focused on the 200,000 s.f. of retail space at the main Project Site.

Based on the types of retail being proposed as well as nearby comparable retail stores, it is expected that the proposed retail would have a service area of approximately five (5) miles in radius. The 5-mile radius service area was selected based on engineering judgement, as it would cover most of Menlo Park, Palo Alto, as well as downtown Redwood City, and would include a mix of retail shops and restaurants comparable to the three cities. Assuming equal services, it is expected that people would patronize the closer store or restaurant. The five-mile radius service area also means that most of the destinations of the Project's retail patrons are expected to be within five miles of the project. While some trips are expected to be longer than five miles, the majority of the change in VMT is expected to occur within this five-mile radius.

The total daily VMT generated by land uses within a five-mile radius was compared under the "no retail" and "with project" scenarios. As shown in Table ES-3, the proposed retail component of the project was shown to slightly reduce the total daily VMT generated by land uses within a five-mile radius of the Project Site. Since the proposed retail space would be located in close proximity to the Belle Haven neighborhood, a large number of offices and life sciences buildings in the Bayfront area, as well as the project's proposed residential land uses, the proposed retail component would provide retail stores closer to homes for nearby residents and closer to jobs for nearby workers.

Because the proposed retail component of the Project would not cause an increase in total VMT generated by the analysis area, it is concluded that the proposed retail component of the Project would have a less than significant impact on vehicle miles travelled.

**Table ES- 3**
**Retail VMT Evaluation**

| | 5-Mile Radius Area of Project Site | | |
|---|---|---|---|
| | No Retail Conditions [2] | With Project Conditions [2] | % Change |
| Total Daily VMT [1] | 14,360,590 | 14,334,067 | -0.2% |

Notes:
1. Total daily VMT includes VMT generated by all trips having at least one trip-end in the analysis area, as estimated by the citywide travel demand model.
2. "No retail conditions" represent with the Proposed Project except the retail component. "With project conditions" represent with the Proposed Project including the retail component.

## Non-CEQA Levels of Service Transportation Analysis

Until July 1, 2020, the City's TIA Guidelines used roadway congestion, commonly referred to as level of service (LOS), as the primary study metric for evaluating transportation impacts under CEQA. LOS is no longer a CEQA threshold of significance; however, the City's TIA Guidelines require that the TIA also analyze LOS for planning purposes (per General Plan Program Circ-3.A Transportation Impact Metrics):

> Supplement Vehicle Miles Traveled (VMT) and greenhouse gas emissions per service population (or other efficiency metric) metrics with Level of Service (LOS) in the transportation impact review process, and utilize LOS for identification of potential operational improvements, such as traffic signal upgrades and coordination, as part of the Transportation Master Plan.

The LOS analysis would determine whether the project traffic would cause an intersection LOS to exceed the City's LOS thresholds or cause either the average delay or average critical delay to exceed the City's intersection delay thresholds under near term and cumulative conditions. The LOS and delay thresholds vary depending on the street classifications as well as whether the intersection is on a State route or not.

The City's TIA Guidelines further require an analysis of the Proposed Project in relation to relevant policies of the Circulation Element and consideration of specific measures to address noncompliance with local policies which may occur as a result of the addition of project traffic. The TIA identifies measures that could be applied as conditions of approval that would bring operations back to pre-Project levels. Although not included in the TIA for purposes of this EIR, an analysis may be prepared separately to determine if there are potential measures that could bring the Proposed Project into conformance with the LOS goals of Circulation Policy 3.4. Implementation of any such measures would require review and approval by City decision makers.

Intersection level of service non-compliance caused by the proposed project under near-term (2025[5]) with project, cumulative (2040) with project, and cumulative (2040) with Dumbarton rail with project conditions were analyzed. Both near-term (year 2025) with project, and cumulative (year 2040) with project scenario forecasts of intersection turning movements were completed using the latest Menlo Park travel demand forecast model. The base model structure was refined for application within Menlo Park to add more detail to the zone structure and transportation network.

The cumulative with Dumbarton Rail scenario assumed that the Dumbarton Rail would be built and there would be a shift in vehicular trips to transit trips near the Project Site[6] as well as along the Dumbarton Rail corridor. Cumulative plus project conditions with Dumbarton Rail were evaluated relative to cumulative conditions with the Dumbarton Rail. This analysis is speculative since there is no current approved plan or financing to provide any Dumbarton transit service and is provided for informational purposes in the transportation analysis.

[5] 2025 is the earliest year for expected occupancy when this analysis started.

[6] *Dumbarton Rail Corridor Update Public Meeting*, Prepared by Facebook for the San Mateo County Transit District. March 15, 2021

The following intersections were adversely affected under either near term plus project or cumulative plus project scenarios during at least one peak hour (see Table ES-4 and ES-5):

*City of Menlo Park:*

1. Marsh Road and Bayfront Expressway [CMP]
5. Marsh Road and Bohannon Drive/Florence Street
13. Chilco Street and Hamilton Avenue
16. Willow Road and Bayfront Expressway [CMP]
17. Willow Road and Hamilton Avenue
18. Willow Road and Park Street
19. Willow Road and Ivy Drive
21. Willow Road and Newbridge Street
24. Willow Road and Bay Road
25. Willow Road and Hospital Plaza/Durham Street
30. O'Brien Drive and Kavanaugh Drive
32. Adam's Drive and O'Brien Drive

*City of East Palo Alto:*

39. University Avenue and Bay Road
42. University Avenue and Donohoe Street
44. Cooley Avenue and Donohoe Street
46. University Avenue and Woodland Avenue
47. E. Bayshore Road and Donohoe Street
49. Saratoga Avenue and Newbridge Street
50. East Bayshore Road and Euclid Avenue

*Caltrans:*

23. Willow Road and US 101 Southbound Ramps (AM peak hour)
43. US 101 Northbound Off-Ramp and Donohoe Street (AM and PM peak hours)
45. University Avenue and US 101 Southbound Ramps (AM peak hour)

Since the Cumulative with Dumbarton Rail scenario was analyzed for information only, analysis summary is presented only in Chapter 3.

Notes:
* Denotes CMP Intersection
AWSC - All Way Stop Control; TWSC - Two Way Stop Control
[1] Average delay is reported for signalized and AWSC intersections. For TWSC intersections, the delay for the worst stop-controlled movement is reported
"OVERSAT" indicates that the SimTraffic microsimulation model indicates that the intersection would experience capacity issues where the demand cannot be served by the intersection. Oversaturated intersections would operate at LOS F.
[1]Intersections were analyzed using Synchro/SimTraffic software due to the close proximity of these intersections. Changes in average delay and critical delay calculated using Vistro.
[2]The intersection is not considered as non-compliant under cumulative plus project conditions because the critical movement of the local approach shifts with the addition of project traffic.
[3]Intersection operates as an AWSC under existing conditions. It would operate as signalized under background conditions.
[4]The intersection is not considered as non-compliant under background plus project and cumulative plus project conditions because the critical movement of the local approach shifts with the addition of project traffic.
**Bold** indicates substandard level of service
$\boxed{\textbf{Bold}}$ indicates noncompliance. The project exceeds thresholds in the City of Menlo Park's TIA Guidelines.

Note:
* Denotes a CMP interesection
AWSC - All Way Stop Control; TWSC - Two Way Stop Control
[1] Average delay is reported for signalized and AWSC intersections. For TWSC intersections, the delay for the worst stop-controlled movement is reported.
[2] Intersection is signalized under cumulative conditions.
"OVERSAT" indicates that the SimTraffic microsimulation model indicates that the intersection would experience capacity issues where the demand cannot be served by the intersection. Oversaturated intersections would operate at LOS F.
* Intersections were analyzed using Synchro/SimTraffic software due to the close proximity of these intersections. Changes in critical delay and v/c calculated using Traffix.
**Bold** indicates substandard level of service
$\boxed{\textbf{Bold}}$ indicates adverse effect

## Adverse Effects and Recommended Improvements

Improvement options were studied for each intersection that were found to be non-compliant under the near term plus project conditions, and cumulative plus project conditions, were compared to near term no project, and cumulative no project conditions, respectively. Potential improvement strategies are shown in Table ES-6.

**Table ES- 6**
**Recommended Improvements**

| # | Intersection | Potential Improvement | Notes |
|---|---|---|---|
| 1 | Marsh Road & Bayfront Expressway | Modify the southbound approach to include a shared left-through lane, shared through-right lane, and a right turn only lane. | This improvement is in Menlo Park's traffic impact fee (TIF) program. With implementation of these intersection modifications, the intersection would be in compliance with the TIA Guidelines and address the Proposed Project's share of the non- compliant operation. |
| 5 | Marsh Road & Bohannon Drive/Florence Street | Physical improvements at this intersection are considered infeasible due to right-of-way constraints and/or adverse effects on pedestrian and bicycle travel. | The City's TIF program includes multi-modal improvements along the Marsh Road corridor such as Class II buffered bike lanes along Marsh Road from Bay Road to Scott Road, and installing sidewalks along the north-side of Marsh Road between Page Street and Bohannon Drive/Florence Street. Implementing recommended multi-modal facilities along the corridor (from the City's TIF program) could shift some motor vehicle traffic to alternative modes of travel and reduce congestion. With implementation of these multi-modal improvements, the intersection deficiencies could be further reduced and partially address the Proposed Project's share of the non-compliant operations at this intersection. |
| 13 | Chilco Street & Hamilton Avenue | A traffic signal is not recommended until signal warrants conducted with a future year's actual counts have been met | The recommended improvement includes conducting a signal warrant analyses for a period of five years after full Project completion to determine if a signal would be warranted and if warranted, install a new signal. This improvement is included in the City's TIF program. With implementation of the intersection modifications, the intersection would be in compliance with the TIA Guidelines which would address the Proposed Project's share of the non- compliant operation. |
| 16<br>17<br>18<br>23 | Willow Road & Bayfront Expressway;<br>Willow Road & Hamilton Avenue;<br>Willow Road & Park Street;<br>Willow Road & US 101 southbound ramps | Physical improvements at thes intersection are considered infeasible due to right-of-way constraints and/or adverse effects on pedestrian and bicycle travel. | The TIF program also proposes multimodal improvements along this section of Willow Road. Implementing recommended multi-modal facilities along the corridor (from the City's TIF program) could shift some motor vehicle traffic to alternative modes of travel and reduce congestion. With implementation of these multi-modal improvements, the intersection deficiencies could be further reduced and partially address the Proposed Project's share of the non- compliant operations along Willow Road. |
| 19 | Willow Road & Ivy Drive | The Menlo Park TIF proposes to install a right-turn overlap phase on southbound Ivy Drive and restrict eastbound Willow Road U-turns. | This would improve the critical movement delay of the local approach to better than cumulative no project conditions. The Project is required to pay traffic impact fees according to the City's current TIF schedule. |

## Table ES-6 (Continued)
## Recommended Improvements

| # | Intersection | Potential Improvement | Notes |
|---|---|---|---|
| 21 | Willow Road & Newbridge Street | The TIF program proposes to modify the signal timing to a protected left-turn phasing operation on Newbridge Street, provide a leading left-turn phase on the southbound movement and a lagging left-turn phase on the northbound movement, and optimize signal timing. | With implementation of these intersection modifications under project conditions, the critical movement delay would be reduced for the northbound movement to lower than no project conditions. However, the improvement would not address the southbound deficiency. Further improvements to address the southbound deficiency are not feasible. |
| 24 | Willow Road & Bay Road | The TIF program proposes to modify the southbound approach at this intersection to two left-turn lanes and one right-turn lane and to modify the westbound approach to add a right-turn lane. With these improvements under project conditions, the critical movement delay at the local approach would be reduced to lower than no project conditions. | This improvement would address the adverse effect on the intersection due to Project traffic. With implementation of these intersection modifications, the Willow Road and Bay Road intersection would be in compliance with the TIA Guidelines which would address the Proposed Project's share of the non- compliant operation. With implementation of the recommended improvements from the TIF program for the Willow Road and Bay Road intersection the deficiency attributable to the Proposed Project would be addressed. |
| 25 | Willow Road & Hospital Plaza/Durham Street | The recommended improvement measure for this intersection is restriping northbound Durham Street as a shared left-through lane and right-turn lane, and adding a northbound right turn overlap phase. | With this improvement, the critical movement delay of the local approach would improve to better than cumulative no project conditions in the AM peak hour. The PM peak hour would continue to be non-compliant. If this recommended improvement measure is implemented, the Project should contribute its fair share (25%) towards the improvement. Fair share is calculated as the percentage of net project traffic generated of the overall cumulative traffic growth at this intersection. |
| 30 | O'Brien Drive & Kavanaugh Drive | The recommended improvement to bring this intersection back to pre-Project conditions is the installation of the new traffic signal and appropriate pedestrian and bicycle accommodation. Alternatively, traffic calming measures could be installed to discourage the use of Kavanaugh Drive, which is a residential street, and encourage vehicles to use O'Brien Drive and Adam's Drive instead. Other measures such as peak period turning movement restrictions could be considered to discourage traffic from using Kavanaugh Drive and improve intersection operations. | Monitoring of traffic operations at this intersection for a period of five years after full Project completion should be conducted to determine if signalization or alternative improvements are needed. If warranted, implementation of the new traffic signal would address the Proposed Project's share of the non-compliant operation and bring the intersection into compliance with the TIA Guidelines. If the alternative measures are implemented, the intersection may or may not be brought into compliance with the TIA Guidelines and address the Proposed Project's share of the non-compliant operation. |
| 32 | Adams Drive & O'Brien Drive | The recommended improvement to bring this intersection back to pre-Project conditions is the installation of the new traffic signal and appropriate pedestrian and bicycle accommodations at this intersection and within the vicinity.<br><br>The expected intersection operational issues would be due to the increased through traffic on O'Brien Drive between the Project Site and University Avenue. Menlo Park's TIF program identifies an improvement to signalize the nearby intersection at University Avenue and Adams Drive in East Palo Alto. This improvement may provide an alternative route for Project vehicles to access the Project Site via University Avenue. | Monitoring of traffic operations at this intersection for a period of five years after full Project completion should be conducted to determine if signalization or alternative improvements are needed. If warranted, implementation of the new traffic signal would address the Proposed Project's share of the non-compliant operation and bring the intersection into compliance with the TIA Guidelines. If the alternative measures are implemented, the intersection may or may not be brought into compliance with the TIA Guidelines and address the Proposed Project's share of the non-compliant operation. |

**Table ES-6 (Continued)**
**Recommended Improvements**

| # | Intersection | Potential Improvement | Notes |
|---|---|---|---|
| 39 | University Avenue & Bay Road | Potential modification to bring the intersection to pre-Project conditions would be to add an exclusive eastbound right-turn lane and a second eastbound left-turn lane on University Avenue, add a second northbound left-turn lane on Bay Road, add a second westbound left-turn lane on University Avenue, and modify signal phasing. | Since this intersection is located within the City of East Palo Alto, the recommended measure to bring the intersection back to pre-Project conditions and address the Project's share of the non-compliant operation would be to make a fair share (34%) contribution towards this improvement. Fair share is calculated as the percentage of net project traffic generated divided by the overall cumulative traffic growth at this intersection. The Menlo Park TIF includes improvements at the University Avenue and Bay Road intersection, but not sufficient improvements to bring the intersection back to pre-Project conditions, as described above. However, the Project's fair share contribution towards this intersection would be calculated considering credit from its TIF payment. |
| 42<br>43<br>44<br>45<br>46<br>47<br>50 | University Avenue & Donohoe Street;<br>US 101 Northbound Off-ramp & Donohoe Street;<br>Cooley Avenue & Donohoe Street;<br>University Avenue & US 101 Southbound Ramps;<br>University Avenue & Woodland Avenue;<br>E. Bayshore Road & Donohoe Street;<br>Donohoe Street & Euclid Avenue | East Palo Alto plans to widen the northbound approach on Donohoe Street at the US 101 northbound off-ramp to accommodate four through lanes to improve the vehicular throughput at this intersection. This improvement will require median modifications and narrowing the southbound Donohoe Street approach to Cooley Avenue to include two through lanes and a full length left-turn lane. In addition, the traffic signals will be coordinated with adjacent traffic signals on Donohoe Street.<br><br>East Palo Alto also plans to install a new traffic signal at the US 101 northbound on-ramp and Donohoe Street and Bayshore Road and Euclid Avenue to coordinate with other closely spaced traffic signals along Donohoe Street. Along with new traffic signals, appropriate pedestrian and bicycle accommodation will be provided. This includes pedestrian countdown timers, Americans with Disabilities Act (ADA) compliant curbs, and bicycle detection loops. In order to align with the proposed driveway for the University Plaza Phase II site on the north side of Donohoe Street, the US 101 on-ramp will be shifted approximately 30 feet to the south. In addition, the northbound approach on Donohoe Street will be restriped to accommodate a short exclusive left-turn pocket (approximately 60 feet in length), a shared left-through lane, and a shared through-right lane. These improvements would require widening of the US 101 northbound on-ramp to accommodate two lanes that taper down to a single lane before this ramp connects with the loop on-ramp from eastbound University Avenue. A northbound right turn only will also be added to Bayshore Road and Euclid Avenue. | Because the improvements in this corridor are all interconnected and dependent on each other to work, the recommended improvement measure would be for the Project sponsor to contribute its fair share to improvements at all six intersections in this corridor. Fair share is calculated as the percentage of net project traffic generated of the overall cumulative traffic growth at this intersection.<br>• Donohoe Street & Cooley Avenue: 10% fair share<br>• Donohoe Street & US 101 Northbound Off-Ramp: 24% fair share<br>• Donohoe Street & University Avenue: 31% fair share<br>• Donohoe Street & US 101 Northbound On-Ramp: 8% fair share<br>• Donohoe Street/Bayshore Road & Euclid Avenue: 2% fair share<br>• US 101 Southbound Ramps & University Avenue: 33% fair share<br><br>The Menlo Park TIF includes improvements at the University Avenue and Donohoe Street and University Avenue and US 101 southbound ramps intersections, which funding would go toward the planned coordinated system of intersections. The Project's fair share contribution towards these two intersections would be calculated considering credit from its TIF payment. |
| 49 | Saratoga Avenue & Newbridge Street | Physical improvements at this intersection are considered infeasible due to proximity to Willow Road. | |

## Intersection Queuing Analysis

The analysis of intersection levels of service was supplemented with a vehicle queuing analysis for intersection left-turning movements where the proposed project would add significant trips per lane in the vicinity of the Project Site and affect intersection operations. Locations where the estimated 95th percentile queues would exceed the available storage capacity for the movement are discussed below. Queuing issues are operational issues resulting from signal timing and queue storage provisions. Queuing issues are not considered a CEQA issue related to hazards.

**Eastbound Left-turn at Willow Road and Bayfront Expressway (#16)**

Under near-term conditions, the 95th percentile queue would exceed the storage length of the turn pocket by 15 vehicles during the AM peak hour and four vehicles during the PM peak hour. The Proposed Project would add three vehicles to the 95th percentile queue during the AM peak hour and PM peak hour. There is no room to extend the left turn pocket due to the emergency vehicle only lane cut in the median.

**Eastbound Left-turn at Willow Road and Ivy Drive (#19)**

Under near-term conditions, the 95th percentile queue exceeds the storage length of the turn pocket by three vehicles during the AM peak hour. The Proposed Project would add one vehicle to the 95th percentile queue during the AM peak hour and one vehicle during the PM peak hour. There is no room to further extend this left-turn.

**Southbound Left-turn at Willow Road and Bay Road (#24)**

Under near-term conditions, the 95th percentile queue exceeds the storage length of the turn pocket by 13 vehicles during the AM peak hour and one vehicle during the PM peak hour. The Proposed Project would add six vehicles to the 95th percentile queue during the AM peak hour and three vehicles during the PM peak hour. Menlo Park's TIF has a project to add a second left-turn lane to this intersection, which would add additional storage for left-turning vehicles. The exact length of the addition will be determined during the design phase for the intersection improvement. Construction of the recommended improvement would reduce the queuing deficiency created by the Proposed Project.

**Eastbound Left-turn and Southbound left-turn at University Avenue and O'Brien Drive (#36)**

The existing vehicle storage for the eastbound left turn pocket on University Avenue at O'Brien Drive is 125 feet, which provides enough spaces for about 5 vehicles. Under existing conditions, the 95th percentile queue exceeds the storage length of the turn pocket by 3 vehicles during the AM peak hour. The Proposed Project would add 22 vehicles to the 95th percentile queue during the AM peak hour. There is no room to lengthen the eastbound left turn pocket.

The existing vehicle storage for the southbound left turn pocket on O'Brien Drive at University Avenue is 60 feet, which provides enough spaces for 2 vehicles. Under existing conditions, the 95th percentile queue exceeds the storage length of the turn pocket by one vehicle during the AM peak hour and 11 vehicles during the PM peak hour. The Project would add one vehicle to the 95th percentile queue during the AM peak hour. There would be no increase to the 95th percentile queue length during the PM peak hour. There is room to extend the left turn pocket to accommodate the estimated 95$^{th}$ percentile queue of 325 feet.

Menlo Park's Traffic Impact Fee (TIF) program identifies an improvement to signalize the nearby intersection at University Avenue and Adams Drive in East Palo Alto. This improvement may provide an alternative route for Project vehicles to access the Project Site via University Avenue, and alleviate potential queuing issues at this intersection.

## Freeway Facilities Analysis

To determine the Proposed Project's potential freeway adverse effects, a select-zone analysis within the Menlo Park model was performed to estimate the increase in project traffic volume between existing conditions and near term with project conditions. Freeway segments that would experience a freeway adverse effect generated by the Proposed Project are identified below.

**San Mateo County**

The proposed project would add traffic greater than 1% capacity to the following study freeway segments operating below its LOS standard:

- SR 84 – from Willow Road to Alameda County Line – PM Peak Hour
- SR 84 – from Alameda County Line to Willow Road – AM Peak Hour
- US 101 – between Santa Clara County Line and Whipple Avenue – AM & PM Peak Hours
- US 101 – from Whipple Avenue to SR 92 – PM Peak Hour
- US 101 – from SR 92 to Whipple Avenue – AM Peak Hour

**Santa Clara County**

The proposed project would add traffic greater than 1% capacity to the following mixed-flow freeway segments operating below its LOS standard:

- US 101 – from SR 85 to Embarcadero Road – AM & PM Peak Hours
- US 101 – from Embarcadero Road to SR 85 – PM Peak hour

The proposed project would add traffic greater than 1% capacity to the following HOV freeway segment operating below its LOS standard:

- US 101 – from Oregon Expressway to Embarcadero Road – AM Peak Hour

## Freeway Improvements

It should be noted that the near term plus project conditions model run assumed the US 101 express lane project in San Mateo County. Improvements to eliminate the adverse freeway effects on US 101 and on SR 84 within San Mateo County would require additional capacity improvements and/or additional TDM measures that would reduce peak-hour vehicle trip-making by more than 70%. San Mateo County currently has no plans to further improve US 101 beyond the identified express lane projects. There are also no identified plans to improve the Bayfront Expressway (SR 84) corridor. Such an aggressive TDM plan would also not be feasible.

Within Santa Clara County, Valley Transportation Authority's Valley Transportation Plan 2040 identifies freeway express lane projects along US 101 that would convert the existing HOV lanes to express lanes and add a second express lane in each direction. This improvement would increase the capacity of the freeway and would adequately address the freeway impacts.

The potential Dumbarton Rail corridor would slightly reduce the Project contribution to the identified adverse effects but would not eliminate any. Therefore, the Project's adverse effects on US 101 and on SR 84 freeway segments in San Mateo County would remain.

## Freeway Ramp Analysis

A freeway ramp analysis is conducted under near term plus project conditions to determine whether freeway ramps would continue to have sufficient capacity to serve the forecasted traffic demand. Under near term plus project conditions, all study freeway ramps would continue to have sufficient capacity to serve the anticipated demand.

## Roadway ADT Analysis

The roadway ADT analysis was conducted under cumulative with project conditions. To determine net Project added traffic, a select zone analysis was conducted using the Menlo Park model under cumulative with project conditions and existing conditions. The proposed project would generate non-compliance at the following roadway segments:

- Willow Road, east of Durham Street
- Willow Road, east of Blackburn Avenue
- Middlefield Road, south of Willow Road
- Marsh Road, east of Bohannon Drive
- O'Brien Drive, south of Willow Road
- O'Brien Drive, north of University Avenue
- Bay Road, north of Willow Road

## Internal Site Access, Circulation, and Parking

Appendix H includes the analysis of the main Willow Village site as well as the Hamilton parcels. The site plan review evaluated the internal site's intersection operations, potential queuing issues, and general site access and circulation for the proposed seven new internal streets, 14 parking garage driveways, and 20 new intersections. The results of the level of service analysis show that the intersection of Driveway B & East Loop Road would operate at LOS D during the AM peak hour. Vehicles turning left out of Driveway B would be expected to experience an average delay of 31 seconds while waiting for a sufficient opening on East Loop Road. During the AM peak hour, approximately 101 vehicles (16 heading eastbound and 85 heading westbound) would be expected to exit the garage, which would be one to two vehicles per minute. Therefore, although exiting drivers would experience some wait time, operations at Driveway B are expected to be adequate. The results of the queuing analysis show that the intersection of Hamilton Avenue/Main Street & Willow Road is expected to have insufficient turn lane storage to accommodate the anticipated traffic volumes under near-term plus project conditions. However, it is assumed that vehicles would choose to instead enter the project site via Park Street. Hexagon recommends the following regarding the internal project circulation:

**Circulation Related Recommendations**

- To prevent southbound queues from spilling back onto Willow Road on Park Street and Main Street, Hexagon recommends coordinating the adjacent signals.

**Sight Distance Related Recommendations**

- As discussed under Mitigation Measure TRA-2 (see Transportation Chapter of the draft EIR), prior to issuance of the building permit for the North Garage, the applicant shall revise the access design to provide adequate sight distance for the eastern driveway or other design solutions to reduce hazards to a less than significant level, to the satisfaction of the Public Works Director. Potential solutions that would reduce hazards to a less than significant level include restricting the eastern driveway to inbound vehicles only or prohibiting exiting left turns, modifying landscaping or relocating the driveway to the west to allow for adequate sight distance for exiting vehicles, or installing an all-way stop or signal. If driveway A were restricted to inbound vehicles only, all outbound vehicles would use Driveway B, which would provide adequate sight distance for vehicles exiting the north office garage. Driveway B might need multiple exiting lanes to limit queuing inside the garage for exiting vehicles. Alternatively, Driveway A could be moved farther west on East Loop Road so that adequate sight distance could be provided.

- Prior to final design, the project applicant should ensure that landscaping and vegetation would not obstruct visibility at the parking garage driveways.
- Hexagon recommends including 30 feet of red curb on both sides of all garage driveways to prevent vehicles from parking and obstructing the vision of exiting drivers.
- If vehicles exiting the garages cannot see oncoming pedestrians on the sidewalk, Hexagon recommends installing warning signs to alert pedestrians when vehicles are exiting the garages.
- If any driveways are moved from their position on the current site plan, sight distance should be reevaluated.

**Parking Garage Circulation Related Recommendations**

- Prior to final design, it is recommended that all driveway widths meet the City's requirements.
- At garage driveways where gates and garage doors are proposed, Hexagon recommends conducting an operational analysis to ensure that gate opening and closing times would not create queuing issues or cause vehicles to spill onto the roadway network.
- Prior to final design, the residential parking on level P1 of building RS2 should be shown to be gated and separated from the retail parking on levels 1 and 2. In addition, the roll-up gate in building RS3 should be clearly shown to separate the retail parking in level B1 and the residential parking in level B2.
- It is recommended that all drive aisle and parking stall widths meet the City's requirements.
- It is recommended that adequate turnaround space is provided at all dead-end drive aisles.

**Parking Related Recommendations**

- If individual vehicles are not able to be retrieved in the tandem puzzle parking, the tandem spaces should be assigned to one residential unit.
- Prior to final design, Hexagon recommends that the required number of ADA and EV parking spaces be provided in all parking garages.

**Pedestrian Related Recommendations**

- Hexagon recommends that a crosswalk is provided at the intersection of Center Street & East Street and that midblock crosswalks are provided on Center Street and Park Street to reduce block size and improve pedestrian convenience.

**Hamilton Parcels Recommendations**

- The Hamilton Avenue Parcels are located within the C-2-S zoning district, which per Menlo Park Municipal Code Section 16.37(7), will have parking requirements established by the planning commission for each development. The Hamilton Avenue Parcel North proposes total potential development up to 22,402 square feet and 93 spaces. The Hamilton Avenue Parcel South proposes total development of 5,760 s.f. and 13 spaces. It is recommended that the project applicant confirm that sufficient parking is provided for the proposed total development as part of future architectural control and use permit applications with the City.

# 1. Introduction

This report presents the results of the Transportation Impact Analysis (TIA) conducted for the proposed Willow Village Master Plan Project in Menlo Park, California. Proposed Project would redevelop an approximately 59-acre industrial site plus two parcels north of Willow Road[7] (collectively, the Project Site) as a mixed-use development (Figure 1). The Proposed Project would demolish all existing onsite buildings and landscaping on the 59-acre portion of the Project Site and construct new buildings, provide open space areas, and install infrastructure within a new Residential/Shopping District, Town Square District, and Campus District. In addition, the Proposed Project would alter two parcels (Hamilton Avenue Parcels North and South[8]) to accommodate realignment of Hamilton Avenue at Willow Road for Project Site access.

The Proposed Project would provide up to 1.6 million sf of space for office and accessory use (consisting of up to 1.25 million sf of office uses and the balance (350,000 square if office use is maximized) of accessory uses[9]) and up to 200,000 sf of commercial/retail space. The Proposed Project would also include up to 1,730 multi-family housing units, an up to 193-room hotel, and open spaces, including publicly accessible parks (e.g. 3.5 acre publicly accessible park, elevated linear park, town square, and dog park).

The Project Site would be bisected by a new north–south street (Main Street) and an east–west street, which would provide access to all three districts. It would include a circulation network for vehicles, bicycles, and pedestrians, inclusive of both public rights-of-way and private streets, that would be generally aligned to an east-to-west and a north-to-south grid (Figure 2). The Proposed Project would also alter parcels north of the industrial site, across Willow Road, on both the east and west sides of Hamilton Avenue (Hamilton Avenue Parcels North and South) to support realignment of the Hamilton Avenue right-of-way and provide access to the new elevated park. This would require demolition and reconstruction of an existing service station (Chevron gas station) and potentially an increase in 1,000 sf on Hamilton Avenue Parcel South and enable the potential addition of up to 6,700 sf of retail uses at the existing neighborhood shopping center on the Hamilton Avenue Parcel North. A total of 7,700 sf could be added to the Hamilton Avenue Parcels (Figure 3).

---

[7] For transportation analysis, "North/South" is aligned to be parallel to US 101. Hence, Willow Road and University Avenue are considered east-west streets, whereas Hamilton Avenue and Bayfront Expressway are considered north-south streets.

[8] Hamilton Avenue Parcels North and South consider Hamilton Avenue an east to west street, which differs from the compass directions used for the transportation analysis discussion.

[9] Accessory uses could include the following types of spaces: meeting/collaboration space, orientation space, training space, event space, incubator space, a business partner center, an event building (including pre-function space, collaboration areas, and meeting/event rooms), a visitor center, product demonstration areas, film studio, gathering terraces and private gardens, and space for other Meta accessory uses. Accessory uses could occur in spaces located anywhere throughout the Campus District

## Scope of Study

The purpose of the transportation study is to identify any transportation operational issues in accordance with City of Menlo Park standards and procedures. This report includes a CEQA VMT analysis, non-CEQA level of service (LOS) analysis (or roadway congestion analysis) and on-site access and circulation review to inform local planning efforts per the City's TIA Guidelines.

## CEQA VMT Analysis

Per the City of Menlo Park VMT guidelines adopted in July 2020 and updated in January 2022, mixed-use projects will have each component analyzed independently against the appropriate thresholds. The Project proposes office, residential, hotel and retail land uses. OPR's *Technical Advisory on Evaluating Transportation Impacts in CEQA* recommends that VMT analysis for a mixed-use project should account for internal capture. Internal capture is defined as walking, bicycling, and tram trips between the various types of land use within the Project. By reducing external vehicle trips, internal capture reduces VMT for a mixed-use project in comparison to single-use developments. The project proposes office, residential, hotel and retail land uses. Each of the Project's land uses' VMT threshold of significance is listed below:

- An office project is considered to have a significant impact on VMT if the project's VMT exceeds a threshold of 15 percent below the regional average VMT per employee.
- A residential project is considered to have a significant impact on VMT if the project's VMT exceeds a threshold of 15 percent below the regional average VMT per capita.
- Hotel and retail projects are considered to have a significant impact on VMT if the project results in a net increase in total City VMT.

It should be noted that the City's VMT guidelines exempt local serving retail projects (defined as 50,000 square feet or less) from carrying out a VMT analysis. However, this project exceeds that size.[10]

## Non-CEQA Level of Service (Roadway Congestion Analysis)

An LOS analysis was conducted to identify whether the proposed project would comply with local policies.

The traffic analysis is based on the AM and PM peak-hour level of service for 42 signalized intersections and 10 unsignalized intersections in the vicinity of the Project Site as illustrated in Figure 1. Traffic conditions at the study intersections were analyzed for the weekday AM and PM peak hours of adjacent street traffic. The AM peak hour is expected to occur between 7:00 AM and 10:00 AM, and the PM peak hour between 4:00 PM and 7:00 PM on a typical weekday. These are the hours during which most traffic congestion occurs on the roadways. Intersections within the City of East Palo Alto are also studied due to Menlo Park's settlement agreement with the City of East Palo Alto.

The proposed project would generate greater than 100 peak-hour trips. The San Mateo County City/County Association of Governments (C/CAG) administers the CMP. Therefore, an analysis in accordance with the C/CAG CMP guidelines is included.

[10] The VMT for the main Project Site was evaluated. The reconstruction of the service station would not increase VMT, and the modest increase in retail square footage at Hamilton Avenue Parcel North would be operated as a separate project and would be substantially below the City's threshold. Therefore, VMT was not studied for the reconstruction of the service station and the potential increase in square footage at Hamilton Parcel North.

## Study Intersections

1. Marsh Road and Bayfront Expressway [Menlo Park]*
2. Marsh Road and US 101 Northbound Off-Ramp [Caltrans]
3. Marsh Road and US 101 Southbound Off-Ramp [Caltrans]
4. Marsh Road and Scott Drive [Menlo Park]
5. Marsh Road and Bohannon Drive/Florence Street [Menlo Park]
6. Marsh Road and Bay Road [Menlo Park]
7. Chrysler Drive and Bayfront Expressway [Menlo Park]
8. Chilco Street and Bayfront Expressway [Menlo Park]
9. MPK 21 Driveway and Bayfront Expressway [Menlo Park]
10. MPK 20 Driveway and Bayfront Expressway [Menlo Park]
11. Chrysler Drive and Constitution Drive [Menlo Park]
12. Chilco Street and Constitution Drive/MPK 22 Driveway (unsignalized) [Menlo Park]
13. Chilco Street and Hamilton Avenue (unsignalized) [Menlo Park]
14. Ravenswood Avenue and Middlefield Road [Menlo Park]
15. Ringwood Avenue and Middlefield Road [Menlo Park]
16. Willow Road and Bayfront Expressway [Menlo Park]*
17. Willow Road and Hamilton Avenue [Menlo Park]
18. Willow Road and Park Street (future intersection) [Menlo Park]
19. Willow Road and Ivy Drive [Menlo Park]
20. Willow Road and O’Brien Drive [Menlo Park]
21. Willow Road and Newbridge Street [Menlo Park]
22. Willow Road and US 101 Northbound Ramps [Caltrans]
23. Willow Road and US 101 Southbound Ramps [Caltrans]
24. Willow Road and Bay Road [Menlo Park]
25. Willow Road and Hospital Plaza/Durham Street [Menlo Park]
26. Willow Road and Coleman Avenue [Menlo Park]
27. Willow Road and Gilbert Avenue [Menlo Park]
28. Willow Road and Middlefield Road [Menlo Park]
29. O’Brien Drive/Loop Road and Main Street/O’Brien Drive (future intersection) [Menlo Park]
30. O’Brien Drive and Kavanaugh Drive (unsignalized) [Menlo Park]
31. Adams Drive and Adams Court (unsignalized) [Menlo Park]
32. Adams Drive and O’Brien Drive (unsignalized) [Menlo Park]
33. University Avenue and Bayfront Expressway [Menlo Park]*
34. University Avenue and Purdue Avenue (unsignalized) [East Palo Alto]
35. University Avenue and Adams Drive (unsignalized) [East Palo Alto]
36. University Avenue and O’Brien Drive [East Palo Alto]
37. University Avenue and Notre Dame Avenue [East Palo Alto]
38. University Avenue and Kavanaugh Drive [East Palo Alto]
39. University Avenue and Bay Road [East Palo Alto]
40. University Avenue and Runnymede Street [East Palo Alto]
41. University Avenue and Bell Street [East Palo Alto]
42. University Avenue and Donohoe Street [East Palo Alto]
43. US 101 Northbound Off-Ramp and Donohoe Street [Caltrans]
44. Cooley Avenue and Donohoe Street [East Palo Alto]
45. University Avenue and US 101 Southbound Ramps [Caltrans]
46. University Avenue and Woodland Avenue [East Palo Alto]
47. East Bayshore Road and Donohoe Street [East Palo Alto]
48. East Bayshore Road and Holland Street (unsignalized) [East Palo Alto]
49. Saratoga Avenue and Newbridge Street (unsignalized) [East Palo Alto]

50. East Bayshore Road and Euclid Avenue (unsignalized) [East Palo Alto]
51. Clarke Avenue and East Bayshore Road [East Palo Alto]
52. Puglas Avenue and East Bayshore Road [East Palo Alto]

## Freeway Segments

**San Mateo County**

- SR 84 – between US 101 and Alameda County Line
- US 101 – between Santa Clara County Line and SR 92
- SR 109 (University Avenue) – between Kavanaugh Drive and SR 84
- SR 114 (Willow Road) – between US 101 and SR 84

**Santa Clara County**

- US 101 – between SR 85 and Embarcadero Road

**Alameda County**

- SR 84 – between San Mateo County Line and I-880

## Freeway Ramps

**US 101 & Marsh Road Interchange**

- Southbound off-ramp to Marsh Road
- Northbound on-ramp from westbound Marsh Road

**US 101 & Willow Road Interchange**

- Northbound off-ramp to Willow Road
- Northbound on-ramp from westbound Willow Road
- Southbound on-ramp from westbound Willow Road
- Southbound off-ramp to Willow Road

**US 101 & University Avenue Interchange**

- Northbound off-ramp to Donohoe Street
- Southbound on-ramp from University Avenue

Traffic conditions were evaluated for the following scenarios:

**Scenario 1:** *Existing Conditions.* Existing traffic volumes at the study intersections are based on traffic counts obtained from the City of Menlo Park and/or previous studies for other nearby developments.

**Scenario 2:** *Near-term (2025) Conditions.* The near-term scenario assumed a year 2025 horizon[11] and was analyzed using the model. Traffic volumes were obtained from the Menlo Park Travel Demand Model and adjusted based on existing counts and model results. In addition, traffic and roadway improvements associated with the approved developments were assumed as directed by City Staff.

[11] 2025 is the earliest year for expected occupancy when this analysis started.

**Scenario 3:** *Near-term (2025) plus Project Conditions.* The near term plus project scenario was analyzed using the model. Traffic volumes were obtained from the Menlo Park Travel Demand Model and adjusted based on existing counts and model results. The near-term plus project scenario was evaluated relative to the near-term scenario.

**Scenario 4:** *Cumulative (2040) Conditions.* The cumulative scenario assumed a year 2040 horizon and represented the buildout of the adopted General Plan for the City of Menlo Park, including a pending General Plan Amendment for 123 Independence Drive. This scenario was analyzed using the model. Traffic volumes were obtained from the Menlo Park Travel Demand Model and adjusted based on existing counts and model results. In addition, traffic and roadway improvements associated with the approved developments were assumed as directed by City Staff.

**Scenario 5:** *Cumulative (2040) Plus Project Conditions.* The cumulative plus project scenario was analyzed using the model. Traffic volumes were obtained from the Menlo Park Travel Demand Model and adjusted based on existing counts and model results. The cumulative plus project scenario was evaluated relative to the cumulative scenario.

**Scenario 6:** *Cumulative (2040) with Dumbarton Rail.* The cumulative with Dumbarton Rail scenario assumed that the Dumbarton Rail would be built and there would be a shift in vehicular trips to transit trips near the Project Site[12] as well as along the Dumbarton Rail corridor. Cumulative plus project conditions with Dumbarton Rail were evaluated relative to cumulative conditions with the Dumbarton Rail. This analysis is speculative since there is no current approved plan or financing to provide any Dumbarton transit service and is provided for informational purposes in the transportation analysis.

## Methodology

This section presents the methods used to determine the traffic conditions at study intersections for each scenario described above. It includes descriptions of the data requirements, the analysis methodologies, and the applicable level of service standards and criteria used to determine if a project is compliant with local policies.

### Data Requirements

The data required for the analysis were obtained from the City of Menlo Park, field observations, and previous studies. The following data were obtained from these sources:

- existing peak-hour intersection turning-movement volumes,
- existing lane configurations,
- signal timing and phasing, and
- list of approved projects.

Existing counts and field observations were conducted prior to the COVID19 pandemic. No adjustments to the data were made based on pandemic conditions.

[12] *Dumbarton Rail Corridor Update Public Meeting*, Prepared by Facebook for the San Mateo County Transit District. March 15, 2021

## Intersection Level of Service Methodologies

Traffic conditions were evaluated using level of service (LOS). Level of service is a qualitative description of operating conditions ranging from LOS A, or free-flow conditions with little or no delay, to LOS F, or forced-flow conditions with extreme delays.

As stated above, LOS is no longer a CEQA threshold. However, the General Plan and City's TIA Guidelines require that the TIA also analyze LOS for local planning purposes (per General Plan Program Circ-3.A Transportation Impact Metrics):

> Supplement Vehicle Miles Traveled (VMT) and greenhouse gas emissions per service population (or other efficiency metric) metrics with Level of Service (LOS) in the transportation impact review process, and utilize LOS for identification of potential operational improvements, such as traffic signal upgrades and coordination, as part of the Transportation Master Plan.

The LOS analysis would determine whether the project traffic would cause an intersection LOS to exceed the City's LOS thresholds or cause either the average delay or average critical delay to exceed the City's intersection delay thresholds under near term and cumulative conditions. The LOS and delay thresholds vary depending on the street classifications as well as whether the intersection is on a State route or not.

The City's TIA Guidelines further require an analysis of the Proposed Project in relation to relevant policies of the Circulation Element and consideration of specific measures to address noncompliance with local policies which may occur as a result of the addition of project traffic. The TIA identifies measures that could be applied as conditions of approval that would bring operations back to pre-Project levels. Although not included in the TIA for purposes of this EIR, an analysis may be prepared separately to determine if there are potential measures that could bring the Proposed Project into conformance with the LOS goals of Circulation Policy 3.4. Implementation of any such measures would require review and approval by City decision makers.

The level of service standard for the City of East Palo Alto at the study intersections is LOS D or better.

## Microscopic Simulation of Study Intersections

Due to the close proximity of selected study intersections, six study intersections in the vicinity of the US 101/University Avenue interchange, and ten intersections along Willow Road, were analyzed using the Synchro/SimTraffic 9 software. Unlike macroscopic models of isolated intersection operations such as the Highway Capacity Manual methodology, SimTraffic is a microscopic model that measures the full impact of queuing and blocking of intersections. This software also provides a visual animation of the traffic operations. Simulated delay values were correlated to the level of service definitions set forth in the 2000 Highway Capacity Manual (HCM) methodology.

## Macroscopic Analysis of Signalized Intersections

Traffic operations at the signalized study intersections in the City of Menlo Park were evaluated using the VISTRO software based on the level of service method described in the Highway Capacity Manual (HCM) 6th Edition. The study intersections in the City of East Palo Alto and the City of Palo Alto were evaluated using the TRAFFIX software based on the 2000 HCM methodology. The study intersections in Atherton were evaluated using the SYNCHRO software based on the HCM 6th Edition methodology. The 2000 HCM and HCM 6th Edition evaluate signalized intersection operations on the basis of average control delay time for all vehicles at the intersection. Table 1 shows the level of service definitions for signalized intersections.

**Unsignalized Intersections**

Peak-hour levels of motor vehicle delay at the unsignalized study intersections in the City of Menlo Park were evaluated using the VISTRO software based on the HCM 6th Edition. The study intersections in the City of East Palo Alto were evaluated using the TRAFFIX software based on the 2000 HCM methodology. With these methods, operations are defined by the average control delay per vehicle (measured in seconds) for each movement that must yield the right-of-way. At side-street controlled intersections (two-way or one-way stop control), the control delay (and LOS) is reported for the approach with the highest delay. For all-way stop-controlled intersections, the average delay (and LOS) for all movements is reported. Table 2 summarizes the relationship between average control delay per vehicle and LOS for unsignalized intersections.

**Table 1**
**Signalized Intersection Level of Service Definitions Based on Control Delay**

| Level of Service | Description | Average Control Delay Per Vehicle (sec.) |
|---|---|---|
| A | Signal progression is extremely favorable. Most vehicles arrive during the green phase and do not stop at all. Short cycle lengths may also contribute to the very low vehicle delay. | 10.0 or less |
| B | Operations characterized by good signal progression and/or short cycle lengths. More vehicles stop than with LOS A, causing higher levels of average vehicle delay. | 10.1 to 20.0 |
| C | Higher delays may result from fair signal progression and/or longer cycle lengths. Individual cycle failures may begin to appear at this level. The number of vehicles stopping is significant, though some vehicles may still pass through the intersection without stopping. | 20.1 to 35.0 |
| D | The influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable signal progression, long cycle lengths, or high volume-to-capacity (V/C) ratios. Many vehicles stop and individual cycle failures are noticeable. | 35.1 to 55.0 |
| E | This is considered to be the limit of acceptable delay. These high delay values generally indicate poor signal progression, long cycle lengths, and high volume-to-capacity (V/C) ratios. Individual cycle failures occur frequently. | 55.1 to 80.0 |
| F | This level of delay is considered unacceptable by most drivers. This condition often occurs with oversaturation, that is, when arrival flow rates exceed the capacity of the intersection. Poor progression and long cycle lengths may also be major contributing causes of such delay levels. | greater than 80.0 |

**Table 2**
**Unsignalized Intersection Level of Service Definition Based on Average Delay**

| Level of Service | Description | Average Delay Per Vehicle (Sec.) |
|---|---|---|
| A | Little or no traffic delay | 10.0 or less |
| B | Short traffic delays | 10.1 to 15.0 |
| C | Average traffic delays | 15.1 to 25.0 |
| D | Long traffic delays | 25.1 to 35.0 |
| E | Very long traffic delays | 35.1 to 50.0 |
| F | Extreme traffic delays | greater than 50.0 |

## Freeway Segments

Freeway segments within the County of San Mateo are evaluated by using the volume-to-capacity (V/C) ratio method according to the City/County Association of Governments (C/CAG) CMP guidelines. The CMP specifies varying capacities be used based on the number of lanes and the free-flow travel speed. The County of San Mateo freeway segment V/C ratio is correlated to level of service as shown in Table 3.

Within Santa Clara County, freeway segments are analyzed as prescribed in the Santa Clara County CMP technical guidelines. The level of service for freeway segments is estimated based on vehicle density. Vehicle density on a segment is correlated to level of service as shown in Table 3. The CMP requires that mixed-flow lanes and auxiliary lanes be analyzed separately from high-occupancy vehicle (HOV) lanes. The CMP specifies that a capacity of 2,300 vehicles per hour per lane (vphpl) be used for segments three lanes or wider in one direction, and a capacity of 2,200 vphpl be used for segments two lanes wide in one direction. HOV lanes are specified as having a capacity of 1,650 vphpl.

Freeway segments within Alameda County are evaluated by using V/C ratios according to the Alameda County Transportation Commission (ACTC) guidelines. The CMP specifies that a capacity of 2,000 vehicles per hour per lane (vphpl) be used for all freeway segments. The Alameda County freeway segment V/C ratio is correlated to level of service as shown in Table 3.

## Freeway Ramps

A freeway ramp analysis was performed in order to verify that the freeway ramps would have sufficient capacity to serve the expected traffic volumes with and without the project. This analysis consisted of a volume-to-capacity ratio evaluation of the freeway ramps at the study interchanges. The ramp capacities were obtained from the *Highway Capacity Manual 2000,* and considered the free-flow speed, number of lanes on the ramp, and ramp metering.

**Table 3**
**Freeway Segment Level of Service Definition**

| Level of Service | Description | San Mateo County[1] Maximum V/C Ratio | Santa Clara County[2] Density (vehicles/mile/lane) | Alameda County[3] Maximum V/C Ratio |
|---|---|---|---|---|
| A | Average operating speeds at the free-flow speed generally prevail. Vehicles are almost completely unimpeded in their ability to maneuver within the traffic stream. | 0.28 | 11.0 or less | 0.35 |
| B | Speeds at the free-flow speed are generally maintained. The ability to maneuver within the traffic stream is only slightly restricted, and the general level of physical and psychological comfort provided to drivers is still high. | 0.46 | 11.0 to 18.0 | 0.58 |
| C | Speeds at or near the free-flow speed of the freeway prevail. Freedom to maneuver within the traffic stream is noticeably restricted, and lane changes require more vigilance on the part of the driver. | 0.67 | 18.0 to 26.0 | 0.75 |
| D | Speeds begin to decline slightly with increased flows at this level. Freedom to maneuver within the traffic stream is more noticeably limited, and the driver experiences reduced physical and psychological comfort levels. | 0.85 | 26.0 to 46.0 | 0.90 |
| E | At this level, the freeway operates at or near capacity. Operations in this level are volatile, because there are virtually no usable gaps in the traffic stream, leaving little room to maneuver within the traffic stream. | 1 | 46.0 to 58.0 | 1 |
| F | Vehicular flow breakdowns occurs. Large queues form behind breakdown points. | greater than 1 | greater than 58.0 | greater than 1 |

## Level of Service Standards and Adverse Effect Criteria

**City of Menlo Park Definition of Adverse Effect**

The following thresholds are from the City of Menlo Park's TIA Guidelines and the proposed project's compliance with local policies was evaluated based on these thresholds.

- A project is considered potentially noncompliant with local policies if the addition of project traffic causes an intersection on a collector street operating at LOS "A" through "C" to operate at an unacceptable level (LOS "D," "E" or "F") or have an increase of 23 seconds or greater in average vehicle delay, whichever comes first. Potential noncompliance shall also include a project that causes an intersection on arterial streets or local approaches to State controlled signalized intersections operating at LOS "A" through "D" to operate at an unacceptable level (LOS "E" or "F") or have an increase of 23 seconds or greater in average vehicle delay, whichever comes first.
- A project is also considered potentially noncompliant if the addition of project traffic causes an increase of more than 0.8 seconds of average delay to vehicles on all critical movements for intersections operating at a near-term LOS "D" through "F" for collector streets and at a near-term LOS "E" or "F" for arterial streets. For local approaches to State controlled signalized intersections, a project is considered to be potentially noncompliant if the addition of project traffic causes an increase of more than 0.8 seconds of delay to vehicles on the most critical movements for intersections operating at a near-term LOS "E" or "F."

**State (Caltrans) Controlled Intersections Definition of Adverse Effect**

For signalized intersections involving two state routes, the proposed project is considered potentially non-compliant with local policies if for any peak hour:

- The level of service degrades from an acceptable LOS D or better under existing conditions to an unacceptable LOS E or F under existing plus project conditions, and the average delay per vehicle increases by four seconds or more, or
- The level of service is an unacceptable LOS E or F under existing conditions and the addition of project trips causes an increase in the average control delay at the intersection by four seconds or more.

**City of East Palo Alto Definition of Adverse Effect**

The following thresholds are used in East Palo Alto, and the proposed project's compliance with local policies was evaluated based on these thresholds:

At a signalized intersection, the project is considered to have an adverse effect if it:

- Causes operations to degrade from LOS D (or better) to LOS E or F; or
- Exacerbates LOS E or F conditions by both increasing critical movement delay by four or more seconds and increasing volume-to-capacity ratio (V/C ratio) by 0.01 at an intersection evaluated using the TRAFFIX software; or
- Increases the V/C ratio by > 0.01 at an intersection that exhibits unacceptable operations, even if the calculated LOS is acceptable; or
- Causes planned future intersections to operate at LOS E or F.

At an unsignalized intersection, the proposed project is considered to have an adverse effect if it:

- Causes operations to degrade from LOS D or better to LOS E or F; or
- Exacerbates LOS E or F conditions by increasing control delay by five or more seconds; and
- Causes volumes under project conditions to exceed the Caltrans Peak-Hour Volume Warrant Criteria.

## Intersection Vehicle Queuing Analysis

For selected high-demand movements at the study intersections, the estimated maximum vehicle queues were compared to the existing or planned storage capacity. The queuing analysis is used to determine the appropriate storage lengths for the high-demand turn lanes where the proposed project would add a substantial number of trips to these movements. Vehicle queues were estimated using Vistro or Synchro for intersections analyzed with this software and a Poisson probability distribution for intersections analyzed in Traffix. Poisson probability distribution estimates the probability of "n" vehicles for a vehicle movement using the following formula:

$$\text{Probability } (X=n) = \frac{\lambda^n e^{-(\lambda)}}{n!}$$

Where:

Probability (X=n) = probability of "n" vehicles in queue per lane

n = number of vehicles in the queue per lane

$\lambda =$ Average number of vehicles in queue per lane (vehicles per hour per lane/signal cycles per hour)

The basis of the analysis is as follows: (1) the Poisson probability distribution, Vistro, or Synchro is used to estimate the 95th percentile maximum number of queued vehicles per signal cycle for a particular movement; (2) the estimated maximum number of vehicles in the queue is translated into a queue length, assuming 25 feet per vehicle; and (3) the estimated maximum queue length is compared to the existing or planned available storage capacity for the movement.

For signalized intersections, the 95th percentile queue length value indicates that during the peak hour, a queue of this length or less would occur on 95 percent of the signal cycles. In other words, a queue length larger than the 95th percentile queue would only occur on five percent of the signal cycles (about three cycles during the peak hour for a signal with a 60-second cycle length). Therefore, left-turn storage pocket designs based on the 95th percentile queue length would ensure that storage space would be exceeded only five percent of the time. The 95th percentile queue length is also known as the "design queue length."

# 2. CEQA VMT Analysis

Project VMT is defined as the total distance traveled by vehicles traveling to and from the Proposed Project over a typical day. In order to estimate VMT for the various land use components, the citywide travel demand forecast model was used. The citywide model is the best available model to represent travel within the City of Menlo Park, and serves as the primary forecasting tool for the City. The model is a mathematical representation of travel within the nine Bay Area counties, as well as the Santa Cruz, San Benito, Monterey and San Joaquin counties. The base model structure was developed by the Metropolitan Transportation Commission (MTC) and further refined by the City/County Association of Governments and Santa Clara Valley Transportation Authority for use within San Mateo County and Santa Clara County. The City further refined this model for application with Menlo Park to add more detail to the zone structure and transportation network. The model has a base year of year 2019 (see Appendix E, Transportation/Traffic, of this EIR for the model's calibration and validation memo).

There are four main components of the model: 1) trip generation, 2) trip distribution, 3) mode choice, and 4) trip assignment. The model uses socioeconomic inputs (i.e., population, income, employment) aggregated into geographic areas, called transportation analysis zones (TAZ) to estimate travel within the model area. There are 80 TAZs within the model to represent the City of Menlo Park. The model was used to estimate the Proposed Project's effect on VMT in accordance with the City's VMT guidelines.

## VMT Evaluation

The most readily available long-range forecast year is the year-2040 conditions, which assumes the buildout of the City of Menlo Park General Plan and any pending General Plan Amendments, the buildout of the pending developments in the City of East Palo Alto (as of December 2020), and regional growth projected by the Association of Bay Area Governments (ABAG), modified by VTA/C/CAG for model land use inputs. Therefore, the project's VMT analysis was conducted under year-2040 conditions.

### Office and Residential Land Uses

According to the City's VMT guidelines, office land use is evaluated based on a daily VMT per employee metric. Using the model, this metric is calculated only for home-based work trips, per OPR's Technical Advisory on Evaluating Transportation Impacts in CEQA. Based on the latest citywide travel demand model, the regional average office VMT is 15.9 per employee. Therefore, City's office VMT impact threshold, at 15% below regional average, would be 13.6 daily VMT per employee.

According to City VMT guidelines, the evaluation of residential land use is based on a daily VMT per capita metric. Using the model, this metric is calculated only for home-based trips, per OPR's technical advisory. Based on the latest citywide travel demand model, regional average residential VMT is 13.1

per capita. Therefore, the City's residential VMT impact threshold, at 15% below regional average, would be 11.2 daily VMT per capita.

Office and residential land uses were evaluated using the model under the year-2040 plus project scenario. For the Campus District, the applicant proposed a daily trip cap of 18,237 trips, which would be 20% below the standard ITE trip generation estimate. The model was adjusted to account for the proposed trip cap. As shown in Table 4 below, the project's Campus District land use would generate VMT at the City's VMT impact threshold and would thus not have a VMT impact.

For the residential land use, trip generation was adjusted to account for the Project's expected 2.03 people per unit compared to the ITE average of 2.46 people per unit. The VMT analysis also accounted for the applicant proposed TDM Plan for the mixed-use district. The TDM Plan proposed a 20% trip reduction from gross ITE trip generation through a combination of passive TDM measures and active TDM measures. Passive TDM measures include the project's proximity to complementary land uses, proximity to alternative transportation infrastructure, and the project's mixed-use nature. As discussed in Chapter 3 below, it is estimated that the passive TDM measures would achieve a 17% trip reduction from the gross ITE trip generation. Active TDM measures include TDM programs to be implemented to further promote alternative modes of travel. These TDM measures generally include providing transit, biking, and carpooling information to residents, assisting in ride-matching programs for residents, and could also include transit subsidies and other measures. To represent the applicant proposed 20% trip reduction goal and given that passive TDM measures are assumed to achieve a 17% trip reduction, the balance of 3% (20%-17%) trip reduction due to active TDM measures was assumed for the VMT analysis.

The Project's residential land use would require a 16% reduction in VMT to mitigate the significant VMT impact. The VMT analysis, as discussed above, already assumed 3% trip reduction due to active TDM measures. Therefore, mitigation of the VMT impact would require implementing a TDM Plan for the residential component that achieves at least 19% (3% + 16%) trip reduction via active TDM measures (see Figure 10 below in Chapter 3) or increases the effectiveness of passive TDM measures. According to the Project's proposed TDM Plan dated July 2021 and attached in Appendix G, the proposed active TDM measures for the residential component could achieve at least a 19% reduction in trips, with an estimated reduction between between 11% and 36% [13]. This range represents the potential low to high range of effectiveness of the proposed TDM measures, as calculated by research data from the California Air Pollution Control Officers Association (CAPCOA). This range depends on how each TDM measure is eventually implemented. Therefore, it is feasible for the Project to mitigate its residential VMT impact by implementing its proposed TDM Plan.

**Table 4**
**Office and Residential VMT Evaluation**

| Land Use | Regional Average | VMT Threshold | Project VMT | VMT Impact | Additional TDM Mitigation needed to eliminate VMT impact |
|---|---|---|---|---|---|
| Office [1] | 15.9 | 13.6 | 13.6 | No | - |
| Residential [2] | 13.1 | 11.2 | 13.3 | Yes | 16% |

Notes:
** All data referenced the latest Menlo Park citywide travel demand forecast model.*
1. VMT for office land use is reported in VMT per employee.
2. VMT for residential land use is reported in VMT per capita.

13 Willow Village TDM Plan. Prepared for Peninsula Innovation Partners. Fehr & Peers, Inc. July 2021

**IMPACT (TRA-2 in Transportation Chapter)**: As shown in Table 4 above, the Proposed Project's residential land use VMT is estimated to be 13.3 daily miles per capita, which would exceed the VMT threshold and result in a VMT impact. The mitigation measure TRA-2 identified below would fully mitigate this impact.

**MITIGATION MEASURE (TRA 2 in Transportation Chapter)**: The residential land use of the Project Site will be required to implement a TDM Plan achieving a 36% reduction from gross ITE trip generation rates (for the Proposed Project, this reduction equals 6,023 daily trips). Should a different number of residential units be built, the total daily trips will be adjusted accordingly. The required residential TDM Plan will include annual monitoring and reporting requirements on the effectiveness of the TDM program. The Project applicant submitted a draft residential TDM Plan, which contained specific measures that would meet this trip reduction requirement. The draft TDM Plan is subject to City review and approval . If the annual monitoring finds that the TDM reduction is not met, the TDM coordinator will be required to work with City staff to detail next steps to achieve the TDM reduction. With the implementation of the required residential TDM Plan, the residential VMT impact would be **less than significant with mitigation (LTS/M)**.

## Hotel

Hotel land uses are not explicitly represented in the model. Therefore, the hotel rooms and jobs expected for the Proposed Project are accounted for separately. Hotel employees are represented in the model by service employees. To reflect trips by hotel patrons, residential land use was used as a proxy, as it most closely resembles the behavior pattern of a hotel guest. Trip making characteristics for these proxy residential land uses were restricted to offices and restaurants/shops to mimic patron activities at a typical business hotel (home-based work and home-based shopping trips). Other types of trip-making typical to an actual home such as school trips generally are not applicable to hotel guests. Given the model would only explicitly represent hotel employee VMT without this adjustment, this proxy evaluation provides a conservative analysis as it attributes more VMT (hotel guest VMT) to the Proposed Project. This methodology is undertaken only for VMT purposes.

### Project Study Area

Based on consultation with the City and applicant, the hotel is expected to have a service area of approximately three (3) miles in radius. This means that most of the destinations of hotel patrons are expected to be within three miles of the hotel. While some trips are expected to be longer than three miles, the majority of the change in VMT is expected to occur within this three-mile radius. The evaluated daily VMT includes the entire length of the trip even when it extends beyond the three-mile radius.

### Scenario Evaluation

The hotel VMT analysis was conducted using the City's transportation model. To evaluate the effect of the hotel component on total daily VMT, the analysis compared two scenarios: 1) with project, and 2) with project without the hotel component (or the "no hotel" scenario).

It was assumed that new hotels would not increase trips overall but would reorient existing trips. Therefore, when hotel trips were added in one zone, they must be subtracted from other zones. This process was represented in the model by redistribution of the hotel attractions from nearby existing hotels. Eleven comparable hotels were found within the area for this redistribution effort (see Figure 4). The proposed hotel would be located within very close proximity to major employment in the Bayfront area, such that hotel patrons may enjoy shorter travel distances to their business destinations. Its location within a mixed-use project, including complementary retail space, also would allow hotel patrons to shop/dine within walking distance.

Service employees were coded in the model under “no hotel” conditions for the zones representing the eleven existing hotels. Under the “with-project” model run, service employees at these zones were shifted to the project zone. According to the project applicant, the hotel would have 210 employees. Thus, approximately 19 service employees were shifted from each of the existing zones to the project zone under the “with-project” model run.

The zones representing the eleven existing hotels do not include any residential land use as a proxy for hotel patrons under the “no hotel” scenario. Thus, residential dwelling units were first added to these zones under the “no hotel” model run, so that under the “with-project” model run, shifting these residential land uses to the project zone would still maintain the same model-wide total land uses. Approximately 270 households were needed at the project zone in addition to the 210 service employees under the “with-project” model run for the model to compute trip generation roughly equivalent to the daily trip generation estimated for the hotel component based on ITE rates. Therefore, under the “no hotel” model run, 270 households were evenly distributed to the eleven zones with existing hotels. It should be noted that the project’s proposed TDM plan is accounted for in the daily trip generation estimates.

**VMT Evaluation**

The total daily VMT generated by land uses within a three-mile radius was compared under the “no hotel” and “with project” scenarios. As shown in Table 5, the proposed hotel component of the project was shown to slightly reduce the total daily VMT generated by land uses within a three-mile radius of the Project Site. Since the proposed hotel would be located within very close proximity to major employment in the Bayfront area, hotel patrons would enjoy shorter travel distances to their business destinations. It’s location within a mixed-use project, including complementary retail space, also would allow hotel patrons to shop/dine within walking distance.

Because the proposed hotel component of the Project would not cause an increase in total VMT generated within the analysis area, it is concluded that the proposed hotel component of the Project would have a less than significant impact on vehicle miles travelled.

**Table 5**
**Hotel VMT Evaluation**

| | 3-Mile Radius Area of Project Site | | |
|---|---|---|---|
| | No Hotel Conditions [2] | With Project Conditions [2] | % Change |
| Total Daily VMT [1] | 6,656,914 | 6,629,443 | -0.4% |

Notes:
1. Total daily VMT includes VMT generated by all trips having at least one trip-end in the analysis area, as estimated by the citywide travel demand model.
2. "No hotel conditions" represent conditions with the Proposed Project except the hotel component. "With project conditions" represent conditions with the Proposed Project including the hotel component.

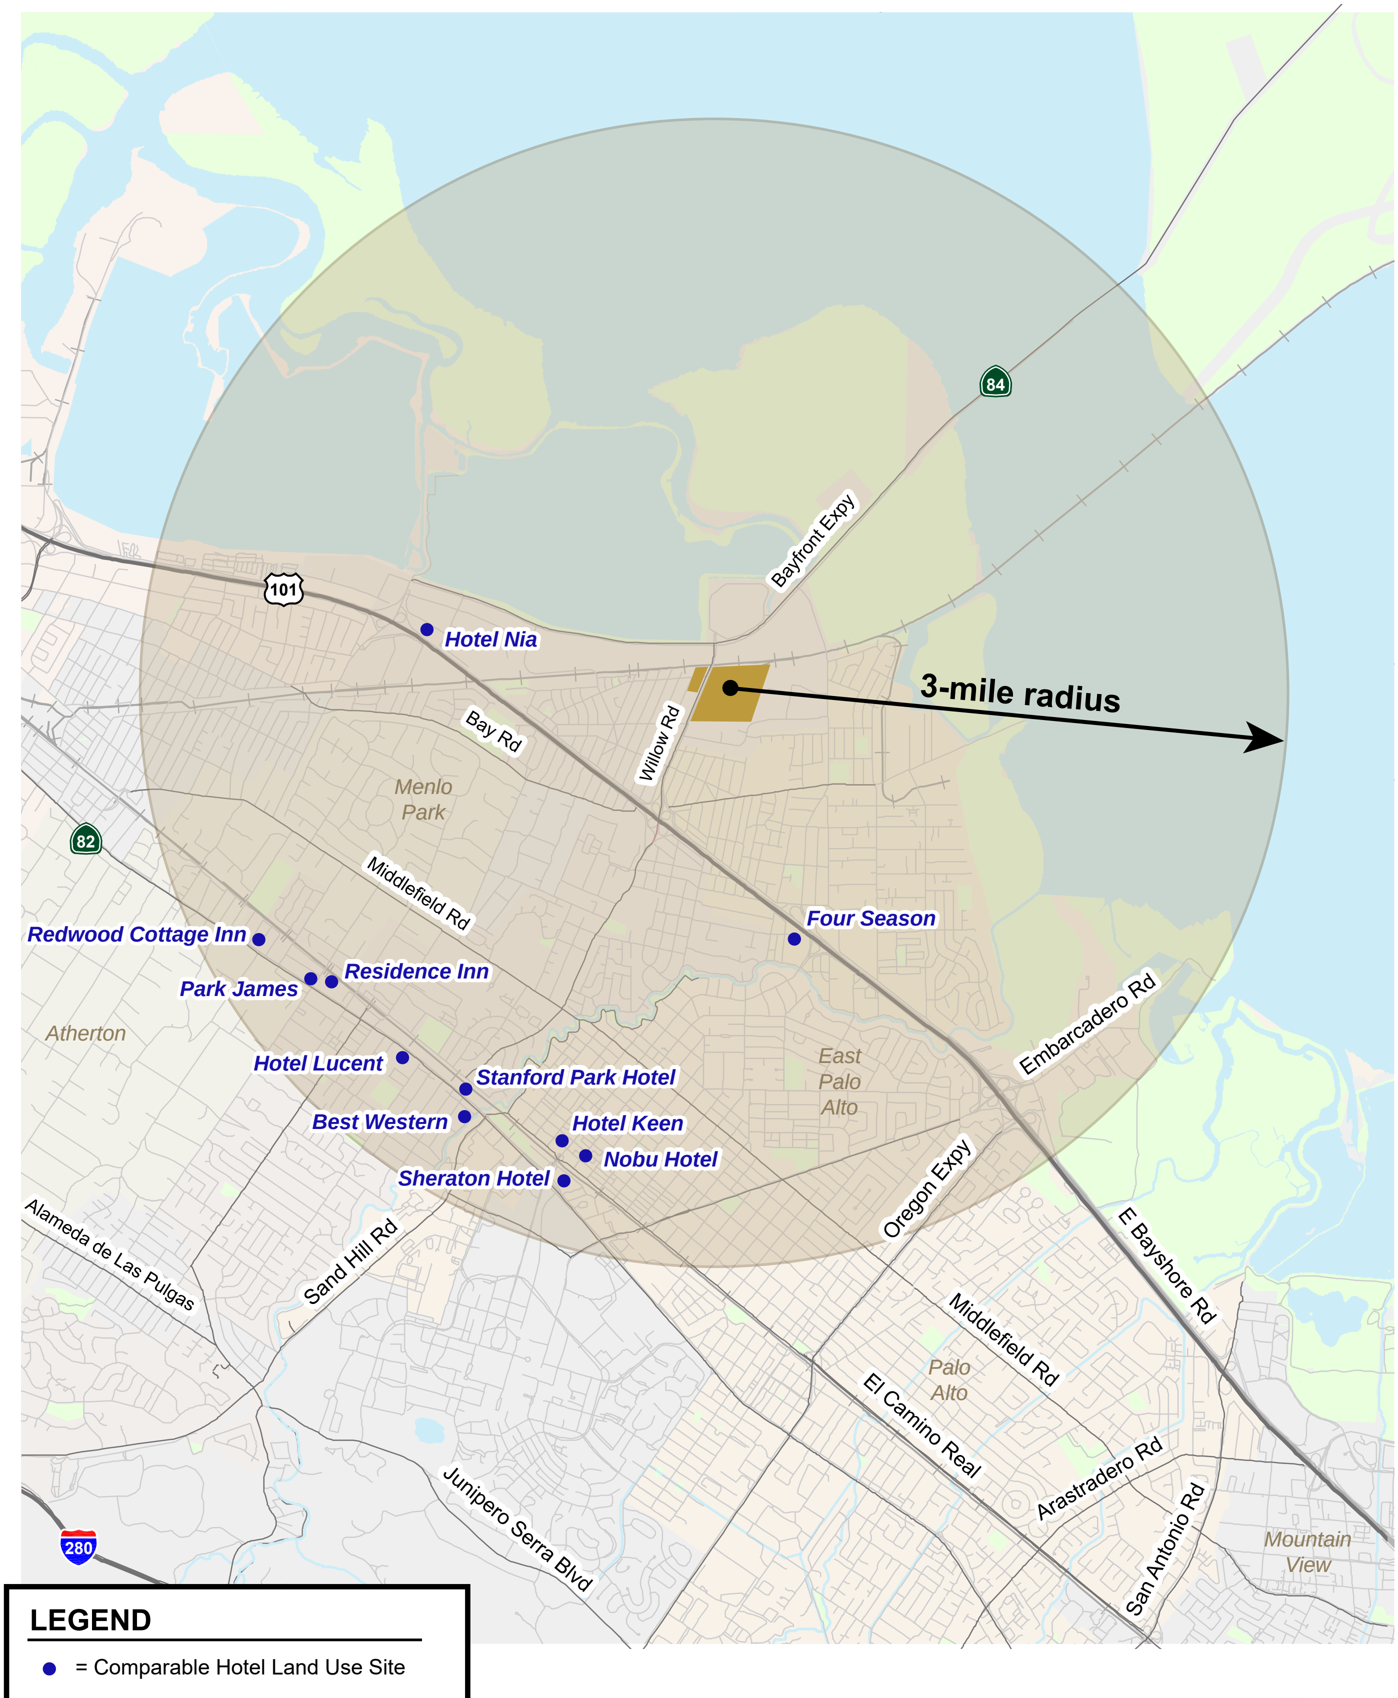

**Figure 4**
**Locations of Comparable Hotel Land Use**

## Retail

The project has two areas of retail development. The main Project Site includes up to 200,000 s.f. of retail space within a mixed use development. North of Willow Road, as a result of the proposed Hamilton Avenue realignment, the two retail parcels adjacent to Hamilton Avenue at the intersection with Willow Road ("Hamilton Avenue Parcels") would be reconfigured. The Project proposes to increase the total retail square footage at the Hamilton Avenue parcels by up to 7,700 s.f. to approximately 23,400 s.f. Because the retail at the Hamilton Avenue Parcels will require a separate use permit and would be operated as a separate retail use from the retail uses at the main Project Site, the Hamilton Avenue Parcels retail is evaluated separately from the retail component of the main Project Site. According to the City's VMT policy, local serving retail (defined as having total square footage less than 50,000 s.f.) would be exempt from a VMT analysis. The Project's proposed net 7,700 s.f. of potential retail development at the Hamilton Avenue Parcels would thus be exempt from VMT analysis. The discussion below is focused on the 200,000 s.f. of retail space at the main Project Site.

**Project Study Area**

Based on the types of retail being proposed as well as nearby comparable retail stores, it is expected that the proposed retail would have a service area of approximately five (5) miles in radius. The 5-mile radius service area was selected based on engineering judgement, as it would cover most of Menlo Park, Palo Alto, as well as downtown Redwood City, and would include a mix of retail shops and restaurants comparable to the three cities. Assuming equal services, it is expected that people would patronize the closer store or restaurant. The five-mile radius service area also means that most of the destinations of the Project's retail patrons are expected to be within five miles of the project. While some trips are expected to be longer than five miles, the majority of the change in VMT is expected to occur within this five-mile radius.

**Scenario Evaluation**

The retail VMT analysis was conducted using the City's transportation model. To evaluate the effect of the retail component on total daily VMT, the analysis compared two scenarios: 1) with project, and 2) with project without the retail component (or the "no retail" scenario).

Similar to the hotel evaluation methodology discussed above, retail employees were redistributed from existing retail locations for the purpose of the VMT analysis. Six (6) comparable retail sites were found within the area for this redistribution effort (see Figure 5).

Retail employees were coded in the model under "no retail" conditions for the zones representing the six existing retail sites. Under the "with-project" model run, retail employees at these zones were shifted to the project zone. The retail land use is expected to generate 571 employees based on the City's default retail employees-per-square-foot conversion rate (1 employee per 350 square feet). Retail employees were shifted from each of the existing zones to the project zone under the "with-project" model run. The number of retail employees shifted from each existing zone was proportionally based on each zone's existing retail employment size (see Figure 6).

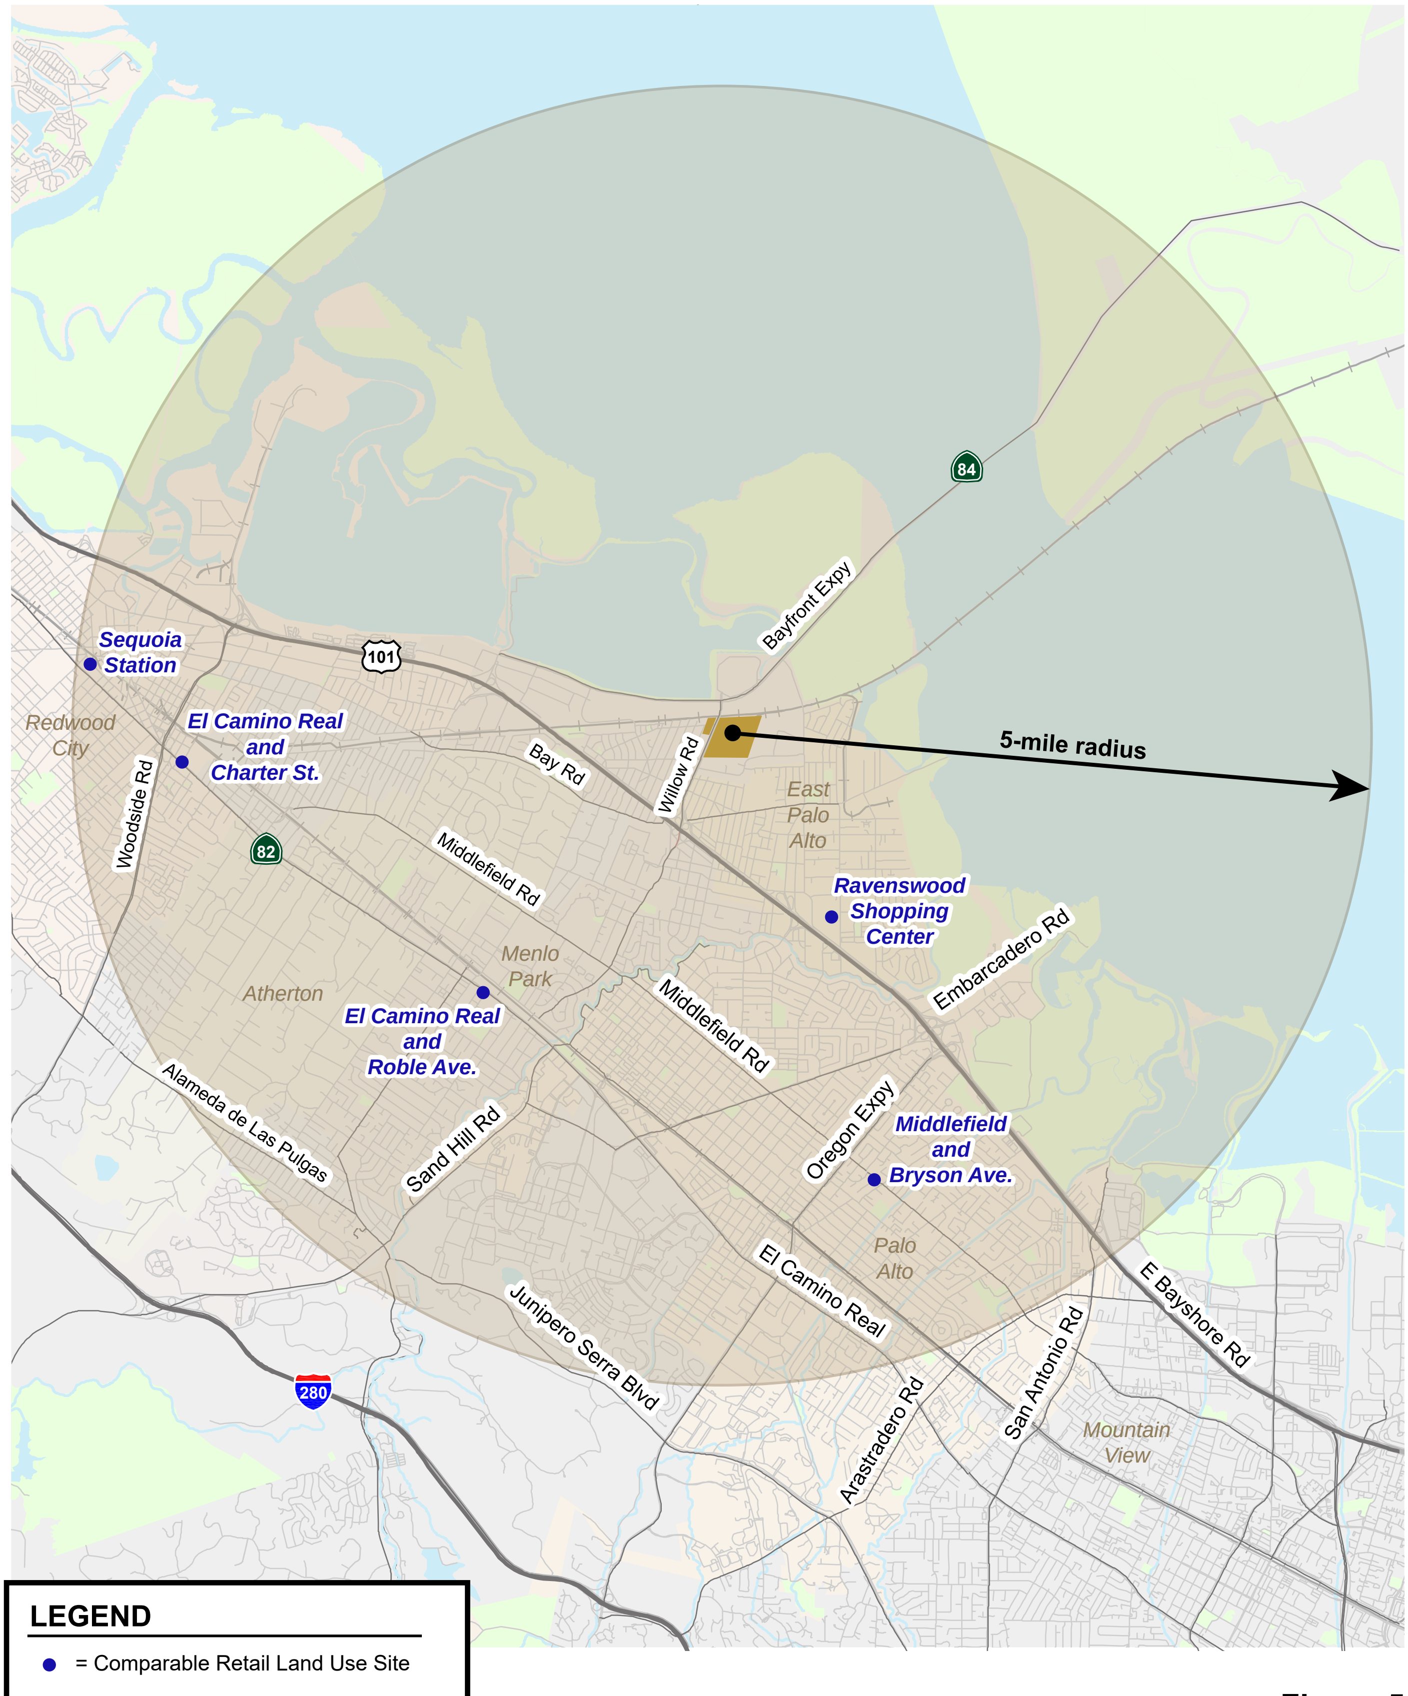

**Figure 5**
**Locations of Comparable Retail Land Use**

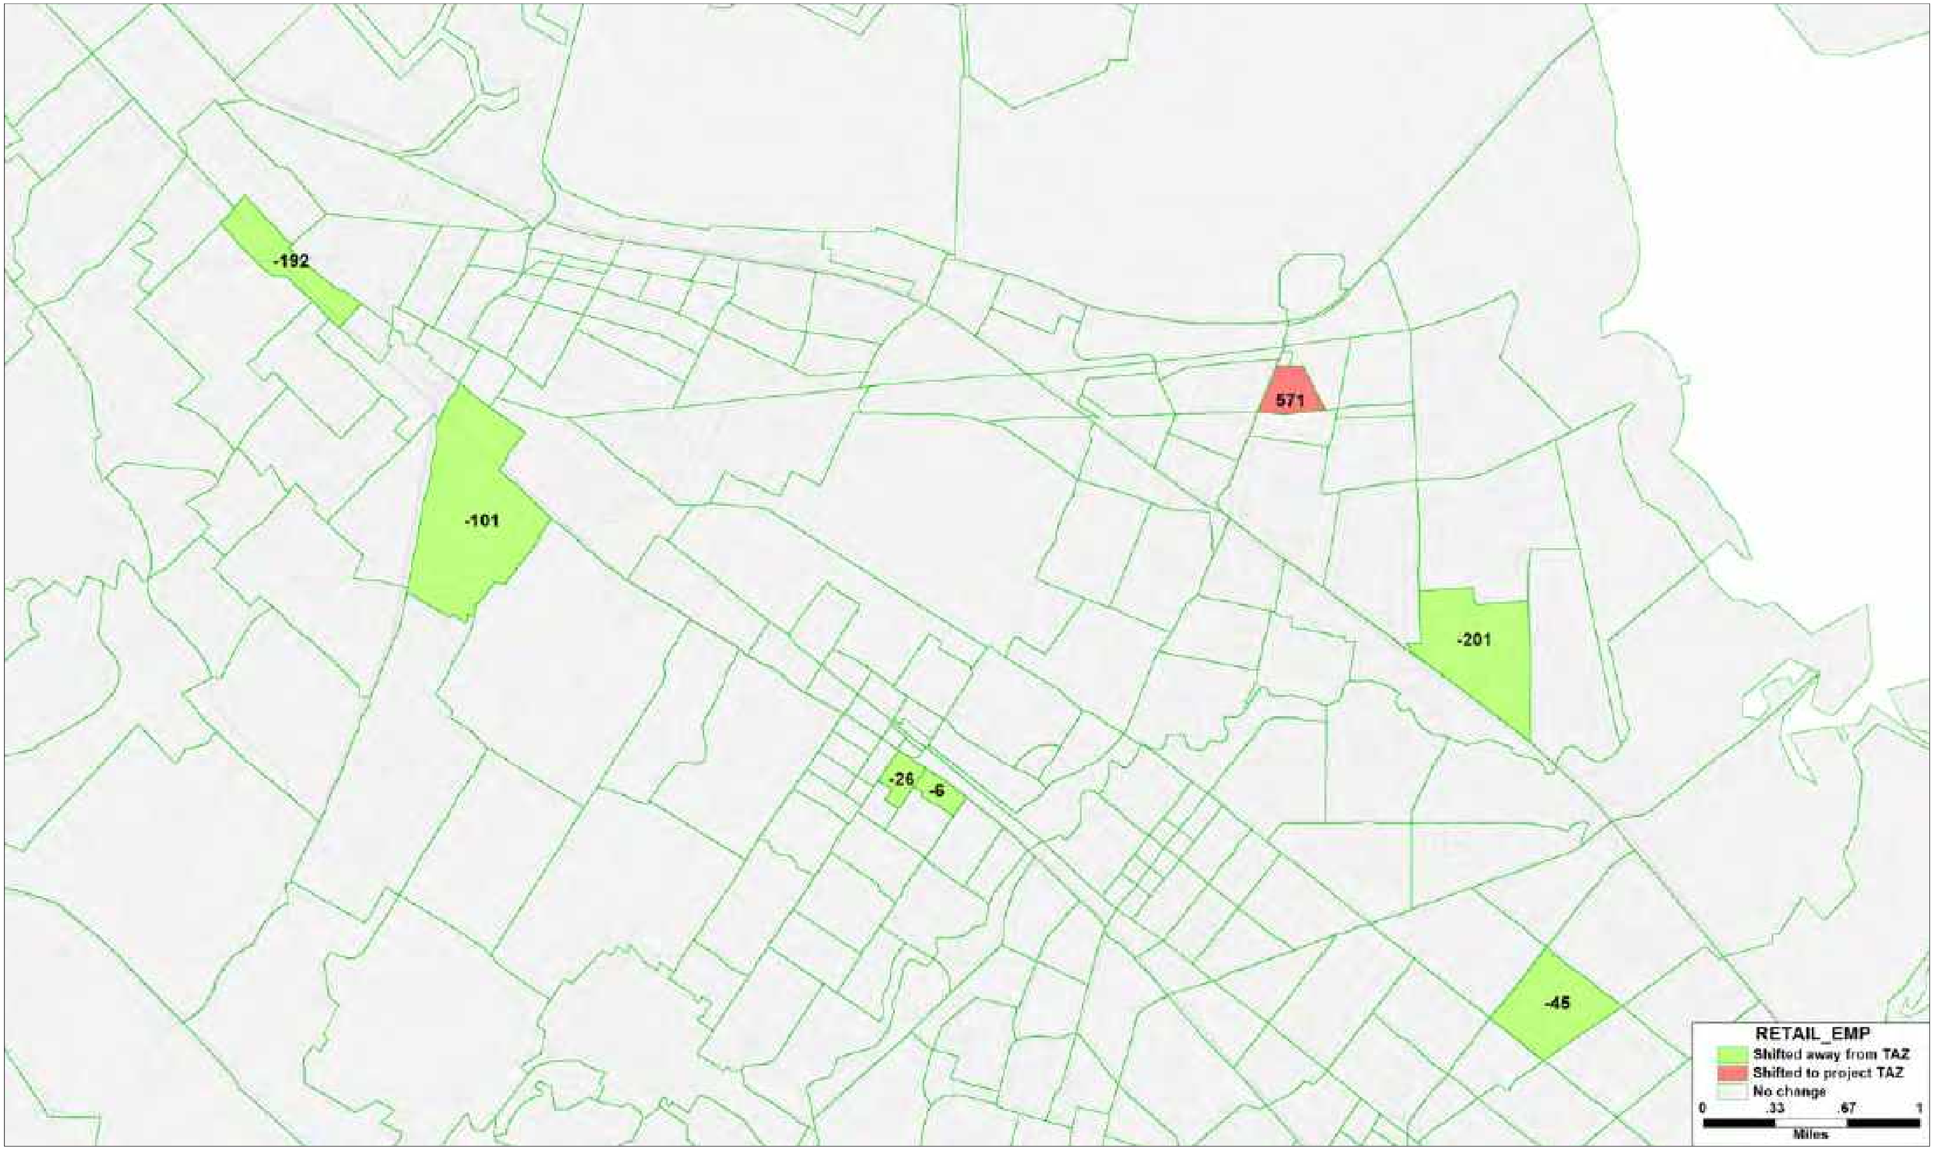

**Figure 6**
**Retail Employment Shifts for VMT Analysis**

**VMT Evaluation**

The total daily VMT generated by land uses within a five-mile radius was compared under the “no retail” and “with project” scenarios. As shown in Table 6, the proposed retail component of the project was shown to slightly reduce the total daily VMT generated by land uses within a five-mile radius of the Project Site. Since the proposed retail space would be located in close proximity to the Belle Haven neighborhood, a large number of offices and life sciences buildings in the Bayfront area, as well as the project’s proposed residential land uses, the proposed retail component would provide retail stores closer to homes for nearby residents and closer to jobs for nearby workers.

Because the proposed retail component of the Project would not cause an increase in total VMT generated by the analysis area, it is concluded that the proposed retail component of the Project would have a less than significant impact on vehicle miles travelled.

**Table 6**
**Retail VMT Evaluation**

| | 5-Mile Radius Area of Project Site | | |
|---|---|---|---|
| | No Retail Conditions [2] | With Project Conditions [2] | % Change |
| Total Daily VMT [1] | 14,360,590 | 14,334,067 | -0.2% |

Notes:
1. Total daily VMT includes VMT generated by all trips having at least one trip-end in the analysis area, as estimated by the citywide travel demand model.
2. "No retail conditions" represent with the Proposed Project except the retail component. "With project conditions" represent with the Proposed Project including the retail component.

## Event VMT

The Campus District would consist of up to 1.6 million square feet of space for office and accessory uses, consisting of up to 1.25 million sf of office uses and the balance (350,000 sf if office uses were maximized) of accessory uses[14]. In addition to serving as a gathering space for the surrounding campuses, the applicant proposes to host approximately 55 events per year, that would attract majority non-Menlo Park Meta workers and/or guests. Ten of these events are envisioned as large-sized events with attendance varying between 2,500 and 5,000 people. 15 of these events are envisioned as medium-sized events with attendance varying between 1,000 and 2,500 people. The remaining 30 events would be small-sized events with attendance lower than 1,000 people. It is anticipated that the small-sized events would generate a minimal number of trips that would not exceed the proposed Campus District trip cap. The Project is proposing an allowance of up to 25 exceptions to the trip cap for days when there are medium-size or large-size events. Due to the limited number of events that would exceed the proposed trip cap, it is deemed that such events are not typical conditions and do not require a VMT analysis for CEQA purposes. This impact would be ***less than significant***.

While some of these events could potentially generate substantial traffic that could affect intersection operations in the Project area, specific event details are not known. While congestion is not a CEQA impact, the Project would be required, as a condition of Project approval, to submit event traffic plans

[14] Accessory uses could include the following types of spaces: meeting/collaboration space, orientation space, training space, event space, incubator space, a business partner center, an event building (including pre-function space, collaboration areas, and meeting/event rooms), a visitor center, product demonstration areas, film studio, gathering terraces and private gardens, and space for other Meta accessory uses. Accessory uses could occur in spaces located anywhere throughout the Campus District.

for large events for City approval to demonstrate measures that would be taken to minimize the events' effect on roadway traffic conditions.

## Impacts on Pedestrian, Bicycle and Transit Facilities

The project is consistent with all applicable pedestrian, bicycle and transit related plans, ordinances and policies, as listed below:

- City of Menlo Park Circulation Element of the General Plan
- City of Menlo Park Municipal Code, Sections 16.43.100 and 16.45.090
- City of Menlo Park Transportation Master Plan
- City of Menlo Park Transportation Impact Fee

### Pedestrian and Bicycle Facilities

The Proposed Project would include multiple pedestrian and bicycle connections between the Project Site and the surrounding roadway network and within the Project Site. The planned bicycle and pedestrian facilities within the Project Site are discussed in Appendix H.

The proposed pedestrian connections to the surrounding roadway network include crosswalks at the proposed signalized intersections on Willow Road at Main Street and Park Street that would connect the Project Site to the Belle Haven neighborhood. The proposed bicycle connections include connections to the existing class II bike lane along Willow Road via Park Street and Main Street. In addition, the Proposed Project includes an elevated park that would provide grade separated pedestrian and bicycle access between the Project site and the Belle Haven neighborhood.

Menlo Park's TIF program also proposes the following bicycle and pedestrian facilities in the immediate vicinity of the Project Site which would improve connections between the Project Site and the surrounding neighborhoods:

- Bicycle signals, cross-bike markings, high visibility crosswalks, and pedestrian improvements at the eastbound right-turn channelizing island at Willow Road and Bayfront Expressway
- Class III bike routes, wider sidewalks, and narrower median on Ivy Drive
- Wider median on the west leg of Willow Road and Ivy Drive, increased pedestrian crossing time, and high visibility crosswalks at the intersection
- Curb ramps, high visibility crosswalks, increased pedestrian crossing times, and bulbouts on the southeast and southwest corners at Willow Road and O'Brien Drive
- Sidewalks and class II bike lanes on both sides of Adams Drive between O'Brien Drive and University Avenue
- Sidewalks and class II bike lanes on both sides of O'Brien Drive between Willow Road and University Avenue
- Install class IV protected bike lanes along Willow Road

The Proposed Project also includes a subgrade pedestrian, bicycle, and tram connection between the main Project Site and the Meta West Campus. This connection would be known as the Willow Road Tunnel. The Willow Road Tunnel would extend between Facebook Way in the Meta West Campus and North Loop Road in the Willow Village Campus underneath Willow Road. The proposed design of the tunnel includes a sidewalk along the eastern edge, a two-way class I bike path which would connect the Bay Trail to the Project Site, and a two-way tram connection between the West Campus and the Project Site. The tunnel would not allow vehicular traffic other than the trams and the bicycle and pedestrian access would be open to the public similar to the existing tunnel between the East and West Campuses.

**Pedestrian and Bicycle Access to Schools**

Schools in the immediate vicinity of the Project Site include Mid-Peninsula High School, Open Mind School, Cesar Chavez Ravenswood Middle School, San Francisco 49ers Academy, Creative Montessori learning, Belle Haven School, TIDE Academy, and Costano Elementary School. Bicycle and pedestrian access to each school is described below:

- **Mid-Peninsula High School.** This school is located immediately west of the Project Site. Pedestrian and bicycle access from the Project Site to the school would be via Willow Road, which has continuous sidewalks along the south side, and existing Class II bicycle facilities on both sides of the road.
- **Open Mind School.** This school is located immediately west of the Project Site on O'Brien Drive. There are currently no sidewalks or bicycle facilities on O'Brien Drive between the school and the Project Site. The Project proposes a sidewalk that would connect the Project Site with the school's driveway, as part of the Project proposed roundabout at the East Loop Road/O'Brien Drive location.
- **Cesar Chavez Ravenswood Middle School,** San Francisco 49ers Academy, Creative Montessori Learning. These schools are located on Bay Road between Willow Road and University Avenue. Pedestrian and bicycle access from the Project Site to these schools would be via Willow Road to Alberni Street and Ralmar Avenue. These streets have sidewalks along both sides. These are also residential streets with low vehicular speeds and volumes and therefore, bicycle friendly. Access to the San Francisco 49ers Academy and Creative Montessori is directly from Bay Road, which has sidewalks along both sides. Also, Bay Road has dedicated bicycle lanes.
- **Belle Haven School.** This school is located approximately 0.4 miles north of the Project Site. Pedestrian and bicycle access from the Project Site to this school would be via Ivy Drive or Hamilton Avenue. Pedestrian amenities include crosswalks and pedestrian push buttons at the intersections of Willow Road and Ivy Drive and Willow Road and Hamilton Avenue, a continuous sidewalk along the south side of Willow Road, a continuous sidewalk along both sides of Ivy Drive and Hamilton Avenue between the school and the Project Site, and bulbouts on Hamilton Avenue. However, there are no designated bicycle facilities on Ivy Drive or Hamilton Avenue.

- **Costano Elementary School.** The school is located 0.2 miles south of the Project Site on University Avenue at Adams Drive. Pedestrian and bicycle access from the Project Site is via Adams Drive or O'Brien Drive. There are limited pedestrian connections between the Project Site and the school. Sidewalk facilities are lacking along O'Brien Drive and Adams Drive, and there are no crosswalks at University Avenue and O'Brien Drive or University Avenue and Adams Drive. Class II bicycle lanes and sidewalks are proposed along O'Brien Drive and Adams Drive in Menlo Park's TIF, which would improve bicycle and pedestrian access to the school. Implementation of this improvement from the TIF Program would reduce this potential effect on bicyclists and pedestrians from the proposed project.
- **Tide Academy.** This school is located approximately 1.2 miles north of the Project Site. Pedestrian and bicycle access from the Project Site to this school would be via Ivy Drive or Hamilton Avenue. Chilco Street, and Jefferson Drive. Pedestrian amenities include crosswalks and pedestrian push buttons at the intersections of Willow Road and Ivy Drive and Willow Road and Hamilton Avenue, a continuous sidewalk along the south side of Willow Road, a continuous sidewalk along both sides of Ivy Drive, Hamilton Avenue, Chilco Street, and Jefferson Drive between the school and the Project Site, and bulbouts on Hamilton Avenue. There are also designated bicycle facilities on Chilco Street and Jefferson Drive, however, there are no designated bicycle facilities on Ivy Drive or Hamilton Avenue.

### Transit Facilities

The Proposed Project would provide tram stops and shuttle stops on the Project Site for use by Meta workers. A detailed description of the tram and shuttle services is provided in Appendix I.

The Proposed Project is expected to generate an increase in transit demand, which could be accommodated by the available capacity of the SamTrans bus service. The SamTrans routes 81, 281, 296, 397, Dumbarton Express Lines, M2 Belle Haven Shuttle, and M4 Willow Road shuttle serve the immediate vicinity of the project area with approximately 15 to 25-minute headways during the AM and PM peak commute hours. Bus stops are within a typical walking distance (one-quarter mile or 5 minutes) of the Project Site. The Proposed Project would make no change to existing public transit facilities. However, by adding vehicle trips and increasing delay at intersections along bus routes, it would increase bus travel time. Bus services that would be affected in the vicinity of the Project Site include bus routes (DB, M2 Belle Haven Shuttle, M4 Willow Road Shuttle, SamTrans Route 81) along Willow Road, University Avenue, and O'Brien Drive.

Proposed intersection improvements to reduce intersection delay include improvements at Willow Road and Ivy Drive, Willow Road and Hospital Plaza/Durham Street, Willow Road and Newbridge Street, Willow Road and Bay Road, O'Brien Drive and Kavanaugh Drive, and Adam's Drive and O'Brien Drive. These improvements would help to reduce some bus delay along these routes. The City's TIF includes installing Transit Signal Priority (TSP) for queue jumps by shoulder running buses on northbound and southbound Bayfront Expressway and allowing the use of the existing right turn lane for queue jump with TSP at Willow Road and O'Brien Drive. The timing and implementation of these TSP projects are not certain

The Caltrain electrification project would enable Caltrain to provide more frequent train service at the Menlo Park, Palo Alto, and Redwood City Caltrain stations. Caltrain predicts an initial capacity increase of over 30%. It is expected that the Caltrain electrification project would accommodate the potential increase in transit ridership generated by the Proposed Project.

# 3. Non-CEQA Level of Service Transportation Analysis

This chapter describes the existing conditions level of service and observed traffic conditions at roadway facilities in the vicinity of the site. It also describes the method by which project traffic is estimated and any adverse effects to intersection levels of service caused by the proposed project under existing, near-term (2025), cumulative (2040), and cumulative (2040) with Dumbarton rail conditions.

## Existing Intersection Lane Configurations and Traffic Volumes

The existing lane configurations at the study intersections were confirmed by observations in the field and are shown on Figure 7. Existing traffic volumes were obtained from new peak hour counts collected in year 2019 and year 2020. The existing AM and PM peak hour intersection volumes are shown in Figure 8. Intersection turning-movement count data are presented in Appendix A.

## Existing Intersection Levels of Service

The results of the intersection level-of-service analysis under existing conditions show that many of the study intersections currently operate at an unacceptable level (see Table 7 and 8). As noted in the ConnectMenlo DEIR, the counted traffic volumes at the Menlo Park study intersections along Willow Road did not appropriately reflect the actual traffic demand, and isolated intersection analysis fails to capture these results. Similarly, the counted traffic volumes at the East Palo Alto study intersections in the vicinity of the US 101/University Avenue interchange do not reflect actual traffic demand. Therefore, instead of calculated level of service, the existing level of service results are reported based on level of service as identified by field observations and microsimulation to reflect “unserved demand”. The microsimulation methodology and assumptions for Willow Road are documented in Appendix B. Hexagon has also developed a microsimulation model for intersections in the vicinity of the US 101/University Avenue interchange, which has been used for other studies in East Palo Alto. This microsimulation model was used to analyze level of service for intersections near the US 101/University Avenue interchange.

The intersection level of service calculation sheets are included in Appendix C. The following study intersections (See Figure 9) currently operate at an unacceptable level of service during at least one peak hour:

11. Chrysler Drive and Constitution Drive (AM peak hour)
12. Chilco Street and Constitution Drive/MPK 22 Driveway (AM and PM peak hours)
16. Willow Road and Bayfront Expressway (AM and PM peak hours)
17. Willow Road and Hamilton Avenue (AM and PM peak hours)
19. Willow Road and Ivy Drive (AM peak hour)
20. Willow Road and O'Brien Drive (AM and PM peak hours)
21. Willow Road and Newbridge Street (AM and PM peak hours)
22. Willow Road and US 101 Northbound Ramps (AM and PM peak hours)
23. Willow Road and US 101 Southbound Ramps (PM peak hour)
24. Willow Road and Bay Road (PM peak hour)
25. Willow Road and Hospital Plaza/Durham Street (PM peak hour)
28. Willow Road and Middlefield Road (AM peak hour)
32. Adam's Drive and O'Brien Drive (PM peak hour)
33. University Avenue and Bayfront Expressway (PM peak hour)
34. University Avenue and Purdue Avenue (PM peak hour)
35. University Avenue and Adams Drive (AM and PM peak hours)
42. University Avenue and Donohoe Street (AM and PM peak hours)
43. US 101 Northbound Off-Ramp and Donohoe Street (PM peak hour)
45. University Avenue and US 101 Southbound Ramps (AM and PM peak hours)
46. University Avenue and Woodland Avenue (AM and PM peak hours)
50. E. Bayshore Road & Euclid Avenue (AM peak hour)

**Existing Intersection Level of Service Summary**

## Existing Freeway Levels of Service

Existing weekday AM and PM peak hour traffic volumes on the study freeway segments were obtained from the *San Mateo County Congestion Management Program 2019* for segments within San Mateo County. The *Valley Transportation Authority 2018 CMP Monitoring Report* was referenced for segments within Santa Clara County. The *Alameda County Transportation Commission 2018 LOS Monitoring Report* was referenced for segments within Alameda County. As shown on Tables 9 to 11, the following freeway segments are currently operating below their respective level of service standards, or at LOS F:

**San Mateo County**

- SR 84 – between Willow Road and University Avenue, AM Peak Hour
- SR 84 – between University Avenue and Alameda County Line, AM & PM Peak Hours
- US 101 – between Santa Clara County Line and SR 92, AM & PM Peak Hours
- SR 109 – from SR 84 to Kavanaugh Drive, AM & PM Peak Hours

**Santa Clara County**

The following mixed-flow freeway segments are currently operating at LOS F:

- US 101 – from SR 85 to Rengstorff Avenue – AM & PM Peak Hours
- US 101 – from Rengstorff to San Antonio Avenue – PM Peak Hour
- US 101 – from San Antonio Avenue to Embarcadero Road – AM & PM Peak Hours
- US 101 – from Embarcadero Road to SR 85 – PM Peak Hour

The following HOV freeway segments are currently operating at LOS F:

- US 101 – from San Antonio Avenue to Embarcadero Road – PM Peak Hour
- US 101 – from Oregon Expressway to Embarcadero Road – AM Peak Hour

**Alameda County**

- SR 84 – Paseo Padre Parkway to San Mateo County Line – AM Peak Hour
- SR 84 – Newark Boulevard to I-880 – PM Peak Hour

**Table 9**

Notes:
HOV = high-occupancy vehicle; LOS = level of service
1. Capacity is based on the capacities cited in VTA's *Transportation Impact Analysis Guidelines* (2014).
2. Volume, and Level of service (LOS) on each segment are taken from VTA's *2018 CMP Monitoring Report*. VTA did not report volume and density for segments with speed above 75.2 mph.
**Bold** indicates a substandard level of service.

**Table 11**
**Existing Freeway LOS – Alameda County**

| CMP Facility | Roadway Segment | Dir. | Pk Hr | Capacity | Existing LOS |
|---|---|---|---|---|---|
| SR 84 | San Mateo County Line to Toll Plaza | EB | AM | 2,200 | A |
| | | EB | PM | 2,200 | C |
| SR 84 | Toll Plaza to San Mateo County Line | WB | AM | 2,200 | F |

Notes:

Data referenced the Alameda County Transportation Comission *2018 LOS Monitoring Report, Appendix B.*

## Existing Freeway Ramp Capacity Analysis

This analysis consists of a volume-to-capacity ratio evaluation of the study freeway ramps. The ramp capacities were obtained from the *Highway Capacity Manual 2000 (Chapter 25),* which considers both the free-flow speed and the number of lanes on the study ramps. It was assumed that if ramp meter equipment is present, on-ramps on northbound US 101 would be metered during the AM peak hour, and on-ramps on southbound US 101 would be metered during the PM peak hour. Metered ramps are analyzed with a capacity of 900 vehicles per hour for the mixed-flow lanes. As shown on Table 12, the existing ramps currently have sufficient capacity to serve the existing traffic volumes.

**Table 12**
**Freeway Ramp Capacity**

| Interchange | Ramp | Peak Hour | Lanes: Type | Mixed | HOV | Meter [1] | Capacity [2] | Existing Conditions: Volume [3] | V/C |
|---|---|---|---|---|---|---|---|---|---|
| US 101/Marsh Road | SB Off-ramp to Marsh Road | AM<br>PM | Diagonal | 2 | - | - | 3,800<br>3,800 | 1,332<br>1,156 | 0.35<br>0.30 |
| | NB on-ramp from WB Marsh Road | AM<br>PM | Diagonal | 2 | 1 | YES<br>- | 1,800<br>2,000 | 1,559<br>1,472 | 0.87<br>0.74 |
| US 101/Willow Road | NB off-ramp to Willow Road | AM<br>PM | Diagonal | 2 | - | - | 3,800<br>3,800 | 1,153<br>1,055 | 0.30<br>0.28 |

Notes:
*NB = Northbound; SB = Southbound; EB = Eastbound; WB = Westbound*
1. Northbound on-ramps are assumed metered during the AM peak hour. Southbound on-ramps are assumed metered during the PM peak hour.
2. Ramp capacities were obtained from *Highway Capacity Manual 2000* , and considered the free-flow speed, the number of lanes on the ramp, and ramp metering.
3. Existing volumes referenced intersection counts collected in 2019.

# Observed Existing Traffic Conditions

Traffic conditions were observed in the field at each study intersection in order to identify existing operational deficiencies and to confirm the accuracy of the calculated level of service. The purpose of this effort was (1) to identify any existing traffic problems that may not be directly related to level of service, (2) identify any locations where the level of service analysis does not accurately reflect existing traffic conditions. Hexagon conducted field observations on a regular weekday during the AM and PM peak hours in May, October, and November of 2019. Some of the study intersections had no significant operational issues, and vehicular queues on all approaches were mostly able to clear in one cycle. The observed operational issues at the remaining study intersections are identified below.

## Marsh Road between Bayfront Expressway and Bay Road

There were no operational deficiencies observed along this corridor during the AM peak hour.

During the PM peak hour, the eastbound traffic on Marsh Road queued from Bayfront Expressway past the 101 SB Off-Ramp. Most eastbound vehicles required more than one cycle to clear along this queue. The southbound left-turn movement at the Marsh Road/US 101 SB Off-Ramp intersection also received heavy demand. These vehicles usually waited through more than one queue to cross the intersection due to downstream spillback queues on eastbound Marsh Road.

## Middlefield Road between Marsh Road and University Avenue

During the AM peak hour, southbound traffic was heavy. The southbound left-turn queue at the Ringwood Avenue/Middlefield Road intersection occasionally exceeded the left-turn pocket as vehicles traveled to Menlo-Atherton High School. The northbound left-turn queue at the Ravenswood Avenue/Middlefield Road intersection frequently filled the entire block and occasionally impacted operations at Ringwood Avenue, as vehicles in the through lane waited to merge into the left-turn lane.

During the PM peak hour, the northbound left-turn queue at the Ravenswood Avenue/Middlefield Road intersection sometimes filled the entire block and occasionally impacted operations at Ringwood Avenue as vehicles in the through lane waited to merge into the left-turn lane. Vehicles making an eastbound right-turn from Ravenswood Avenue were observed to wait to merge to the southbound left-turn lane at the Ringwood Avenue/Middlefield Road intersection. The northbound right-turn movement at the Willow Road/Middlefield Road intersection received heavy demand but was often observed to be blocked by the northbound through queue.

### Bayfront Expressway between Marsh Road and University Avenue

Due to signal failures at the Bayfront Expressway and Marsh Road intersection during the day of observation, the observed AM peak hour conditions along this corridor were deemed atypical.

During the PM peak hour, the southbound traffic on Bayfront Expressway queued from University Avenue northward past upstream intersections. Most southbound vehicles required multiple cycles to clear intersections along this queue. The eastbound left-turn queue at the Chrysler Drive/Bayfront Expressway intersection extended past upstream intersections and required multiple cycles to clear. The southbound right-turn and northbound left-turn movements at the Chilco Street/Bayfront Expressway intersection sometimes required two signal cycles to clear due to eastbound spillback queues at the Chilco Street and Constitution Drive intersection. The eastbound left-turn movement frequently required two signal cycles to clear the Chilco Street/Bayfront Expressway intersection.

### Chilco Street & Constitution Drive/MPK 22 Driveway

During the AM peak hour, all approaches of this unsignalized intersection were busy. Vehicles frequently made left turns at all approaches. The two unsignalized pedestrian crosswalks were heavily utilized. The westbound through-right lane frequently queued towards Bayfront Expressway and was observed to take up to a minute to clear. The queue was observed to occasionally extend to the end of the southbound right-turn pocket on Bayfront Expressway.

During the PM peak hour, eastbound spillback queues from the Chilco Street and Bayfront Expressway intersection affected traffic operations at this intersection. At the Chilco Street and Constitution Drive intersection, the westbound vehicles frequently queued towards, and sometimes onto, Bayfront Expressway.

### Chrysler Drive & Constitution Drive

During the AM peak hour, there were no significant operational issues at this intersection.

During the PM peak hour, eastbound spillback queues from the Chrysler Drive and Bayfront Expressway intersection affected traffic operations at this intersection. At the Chrysler Drive and Constitution Drive intersection, the eastbound queues extended past upstream intersections. The westbound left-turn queue frequently extended into the southbound right-turn lane on Bayfront Expressway. The westbound left-turn queue was usually able to clear in one signal cycle, although it was observed to be sometimes blocked by the eastbound spillback queue. The northbound right-turn movement sometimes required multiple signal cycles to clear due to eastbound downstream queuing issues.

### Willow Road between Hamilton Avenue and Gilbert Avenue

During the AM peak hour, there was heavy demand on westbound Willow Road along this corridor. Westbound vehicles often required multiple cycles to clear an intersection. As a result, the southbound right-turn and northbound left-turn movements on the side streets turning onto westbound Willow Road also required multiple cycles to clear the intersection. The westbound queue was usually able to clear at the Willow Road/Durham Street intersection due to the long through phase. The eastbound left-turn movement at the Newbridge Street intersection received heavy demand and occasionally required two signal cycles to clear. Vehicles at the US 101 northbound off-ramp turning right onto eastbound Willow Road frequently queued onto the auxiliary lane on US 101 and required multiple cycles to clear.

During the PM peak hour, there was heavy demand on eastbound Willow Road along this corridor. Eastbound vehicles often required multiple cycles to clear an intersection. As a result, the northbound right-turn and southbound left-turn movements on the side street turning onto eastbound Willow Road also required multiple cycles to clear the intersection. The westbound left-turn movement at the Hamilton Avenue intersection received heavy demand that often required two signal cycles to clear. Vehicles at the US 101 northbound off-ramp turning right onto eastbound Willow Road frequently queued onto the auxiliary lane on US 101 and required multiple cycles to clear. Vehicles at the US 101 southbound off-ramp turning left onto eastbound Willow Road were often impacted by eastbound spillback queues and were observed to block the westbound through movement. The westbound left-turn queue extended onto US 101 southbound and impacted freeway operations. Vehicles were observed to utilize the parking lane to access the westbound right-turn movement at the Willow Road/Coleman Avenue intersection.

### University Avenue between Purdue Avenue and Woodland Avenue

During the AM peak hour, there was heavy demand on westbound University Avenue along this corridor. Westbound vehicles often required multiple cycles to clear an intersection between Adams Drive and Woodland Avenue. Eastbound traffic between Bay Road and the US 101 SB Ramps was also heavy and often required multiple cycles to clear. At the unsignalized intersection of University Avenue and Adams Drive, the eastbound and southbound left-turn movements occasionally had extended wait periods due to continuous westbound traffic. Protected signal phasing is recommended at the University Avenue and Runnymede Street intersection due to potentially hazardous interactions between vehicles performing permitted left-turns across heavy traffic and crossing pedestrians.

During the PM peak hour, there was heavy demand on eastbound University Avenue along this corridor. Eastbound vehicles often required multiple cycles to clear an intersection. As a result, the left-turn movements on the side streets also required multiple cycles or extended wait periods to clear the intersection. Eastbound traffic between Bay Road and Donohoe Street occasionally required more than one cycle to clear. At the unsignalized intersection of University Avenue and Purdue Avenue, vehicles were observed to make northbound right-turns, despite existing signage prohibiting that maneuver. At the University Avenue/Adams Drive intersection, vehicles were observed to pass through the intersection during a break in westbound traffic and wait in the median area until drivers allowed them to merge. The westbound left-turn movement at the University Avenue/Bay Road intersection sometimes required more than one cycle to clear. The eastbound left-turn movement at the University Avenue/Bell Street intersection frequently queued out of the turn pocket and required multiple cycles to clear.

### Donohoe Street between University Avenue and Cooley Avenue

During the AM peak hour, there was heavy demand on northbound Donohoe Street along this corridor. Northbound vehicles often required multiple cycles to the clear an intersection. As a result, the westbound right-turn and eastbound left-turn movements on the side streets turning onto northbound Donohoe Street also required multiple cycles to clear the intersection. At the Cooley Avenue/Donohoe Street intersection, there was high demand for the number 1 lane. The congestion was due to spillback from the downstream intersections at University Avenue/Donohoe Street and US 101 NB Off-Ramp/Donohoe Street.

During the PM peak hour, there was heavy demand on northbound Donohoe Street along this corridor. Northbound vehicles often required multiple cycles to the clear an intersection. The eastbound left-turn vehicles at the US 101 NB Off-Ramp/Donohoe Street intersection were observed to frequently fail to clear the intersection in one green cycle due to high volume and northbound spillback queues. At the Cooley Avenue/Donohoe Street intersection, there was high demand for the number 1 lane. The congestion was due to spillback from the downstream.

## Project Trips Estimates

Trip generation estimates for the mixed-use development are based on standard trip generation rates published in the Institute of Transportation Engineers (ITE) Trip Generation, 10th Edition manual. Below is a general discussion of the trip generation estimation methodology (see Table 13). Detailed trip generation analysis is provided in Appendix D.

### Gross Project Trip Generation

A description of the source of trip generation rates for each land-use is provided below:

- ***Office***. Initial trip estimates for office and accessory uses are based on “ITE Land Use code 710: General Office Building”.
- ***Residential.*** The trip estimate is based on the “ITE Land Use code 221: Multifamily Housing (Mid-Rise)”, which includes apartments, townhouses, and condominiums located within the same building with at least three other dwelling units and that have between three to ten levels. Some of the apartments are designated as senior housing, which could have a lower trip rate. Thus, the trip generation estimate for the apartments is conservative.
- ***Retail.*** Trip estimates are based on “ITE Land Use code 820: Shopping Center”, which includes several types of retail uses like restaurants, movie theaters, bowling alleys etc. that are typically present in shopping centers.
- ***Hotel.*** Trip estimates are based on “ITE Land Use code 310: Hotel”.
- ***Publicly Accessible Park.*** Trip estimates are based on “ITE Land Use code 488: Soccer Complex”. The programmatic design of the park has not been determined. In order to provide a conservative estimate of potential traffic generation and allow for flexible programming for the project through the project review process, it is assumed that the park will have play structures and open field areas for warm-ups or casual play.

## Transportation Demand Management (TDM)

The City of Menlo Park requires all new developments in the R-MU and O zoning districts to reduce their trip generation by 20 percent from standard trip generation rates via TDM strategies. The City has in practice applied the 20 percent reduction after crediting for any trip reductions based on a project's proximity to complimentary land uses, alternative transportation facilities, as well as reductions based on a project's mixed-use characteristics (see Appendix D for discussion on the project's trip reductions). As implemented by the City, this TDM ordinance is applied to daily trips, AM peak hour trips, and PM peak hour trips.

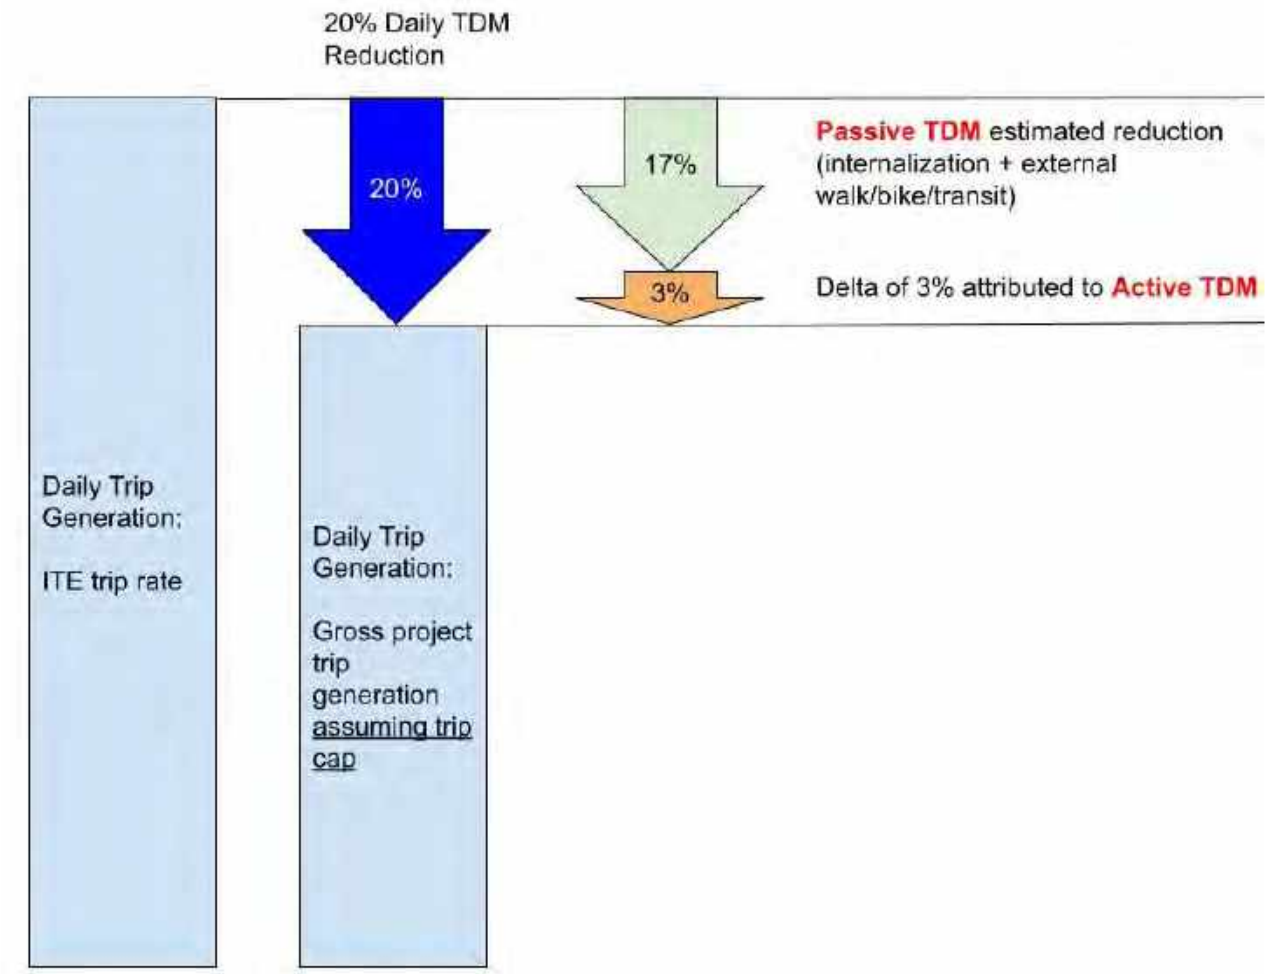
Per the Willow Village Adjustment Request: Transportation Demand Management, submitted by the applicant team, the applicant is proposing the following regarding TDM:

- For the Campus District, the applicant proposes a daily trip cap of 18,237 trips, and a trip cap of 1,670 trips during the AM and PM peak hours.
    - The daily trip cap represents a 20 percent reduction from gross ITE trip generation (see Figure 10).
    - The peak hour trip cap represents a 35-40 percent reduction from gross ITE trip generation.
- For the Residential/Shopping and Town Square Districts, the applicant proposes a 20 percent reduction from gross ITE trip generation for daily, and a 20 percent and 27 percent reduction from gross ITE trip generation during the AM and PM peak hours of commute, respectively.

**TDM Monitoring**

The City incorporates monitoring requirements into project conditions. The project's TDM plan is anticipated to be monitored annually to ensure effectiveness of the TDM plan. The details of the TDM monitoring plan will be developed as part of CDP, and will detail frequency and duration of monitoring for each land use, as well as the methodology to conduct monitoring. The monitoring plan will also specify corrective measures if the TDM plan is not achieving its stated effectiveness.

**Figure 10**
**Graphical Representation of How the Transportation Analysis Modeled Daily Trip Generation for All Land Uses**



*Note: the TDM program would achieve a higher reduction, but only a 3% reduction from active TDM measures is needed to achieve a 20% reduction off of gross trip generation estimated using ITE trip generation rates (see discussion above).*

## Net Project Trip Generation

The project trip generation assumes the applicant's proposed TDM plans for the Campus District as well as for the Residential/Shopping and Town Square Districts. It should be noted that the trip reductions due to the applicant proposed TDM plans already accounted for trip reductions due to the Proposed Project's location efficiency, as well as internal capture due to the Proposed Project's mixed use nature (see Appendix D for details).

As shown in Table 13, the proposed project trips generated by the proposed land uses after accounting for the proposed TDM plans at the main Project Site would be 33,263 daily trips, 2,396 AM peak hour trips, and 2,907 PM peak hour trips.

Net project trip generation represents the number of new project trips added to the surrounding roadway network. The following categories of trips are credited from the site-specific trip cap to derive the net project trip generation.

**Pass-By**

The retail uses would attract some of their customers from people who are passing by the site on Willow Road or Bayfront Expressway heading towards their destination. These customers would not need to make a separate vehicle trip to come to the Project Site. Such vehicle trips are categorized as pass-by trips as they are not new trips generated on the roadway network and should be credited from the project trip generation. A pass-by trip reduction for retail trips was applied based on the average pass-by reduction rate published in the ITE Trip Generation Handbook, 3rd Edition. Pass-by data are typically available only for the PM peak hour. Hexagon assumed no pass-by trip reduction for the AM peak hour and half of the PM peak pass-by trip reduction for daily trip generation.

**Existing Uses**

Trips associated with the existing uses on the Project Site were credited against the new trip generation. The trips generated by the existing buildings on the site were estimated based on driveway counts conducted over three days in September 2019 per Facebook Willow Traffic Counts Memorandum, Fehr & Peers, March 26, 2020. The existing uses on the site generated an average of 11,700 trips daily, including 985 trips in the AM peak hour (699 inbound and 286 outbound trips), and 805 trips in the PM peak hour (250 inbound and 555 outbound trips).

As shown in Table 13, the net Proposed Project trips generated by the main Project Site on the roadway network would be 20,537 daily trips, including 1,411 AM peak hour trips (939 inbound trips and 472 outbound trips), and 1,914 PM peak hour trips (719 inbound trips and 1,195 outbound trips).

As shown in Table 14, the net trips generated by the Hamilton Parcels are estimated to be 218 daily trips, including 6 AM peak hour trips (3 inbound trips and 3 outbound trips), and 18 PM peak hour trips (9 inbound trips and 9 outbound trips)[15].

[15] The Hamilton Parcels are located within C-2-S zoning, which does not require implementation of a TDM Plan. Therefore, no TDM reductions were applied.

## Table 13
## Project Trip Generation Estimates (Main Project Site)

| Land Use | ITE Land Use Code [1] | Size | Unit | Daily Rate [1] | Daily Total | AM Peak Hour Rate [1] | AM Peak Hour IN | AM Peak Hour OUT | AM Peak Hour Total | PM Peak Hour Rate [1] | PM Peak Hour IN | PM Peak Hour OUT | PM Peak Hour Total |

Notes
*d.u. = dwelling unit, ksf = 1,000 s.f.*
1. Daily, AM, and PM peak hour average rates published in ITE Trip Generation Manual, 10th Edition, 2017 were used for each land use.
2. Office trip generation and TDM reductions reflect the proposed daily, AM and PM peak hour trip caps.
3. The publicly accessibleThe programmatic design of the park has not been determined. In order to provide a conservative estimate of potential traffic generation, it is assumed that the park will have play structures and open field areas for warm-ups or casual play. The park is planned for approximately 3.5 acres. Number of soccer fields on 3.5 acres of land was estimated based on the size of a standard soccer field. park is assumed to be programmable. ITE Land Use "Soccer Field" is analyzed as a proxy. Number of soccer fields was estimated based on the size of a standard soccer field.
4. For the Residential/Shopping and Town Square Districts, the applicant proposes a 20 percent reduction from gross ITE trip generation for daily, and a 20 percent and 27 percent reduction from gross ITE trip generation during the AM and PM peak hours of commute, respectively.
5. Pass-by trip reduction is based on the average pass-by trip reduction rate published in the ITE Trip Generation Handbook, 3rd Edition. Hexagon assumes no pass-by trip reduction during the AM peak hour and half of the PM peak pass-by reduction for daily trip generation.
6. Existing Use trip estimates based on driveway counts conducted over three days in September 2019 per Facebook Willow Traffic Counts Memorandum, Fehr & Peers, March 26, 2020. 8-9 AM in the AM peak period and 4-5 PM in the PM peak period have been considered as peak hours since they have the highest trips.

## Table 14
## Project Trip Generation Estimates (Hamilton Parcel)

| Land Use | | Size | | Daily Rate | Daily Trips | AM Peak Hour Rate | AM Peak Hour In | AM Peak Hour Out | AM Peak Hour Total | PM Peak Hour Rate | PM Peak Hour In | PM Peak Hour Out | PM Peak Hour Total |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| **Proposed Use** | **ITE Code** [1] | | | | | | | | | | | | |
| General Retail | 820 | 7.7 | ksf | 37.75 | 291 | 0.94 | 4 | 3 | 7 | 3.81 | 14 | 15 | 29 |
| *External Walk, Bike, and Transit* [2] | | | | | *(28)* | | *(1)* | *0* | *(1)* | | *(1)* | *(1)* | *(2)* |
| *Retail Pass-By Reduction (34%)* [3] | | | | | *(45)* | | *0* | *0* | *0* | | *(4)* | *(5)* | *(9)* |
| **Net Project Trips on Project Network** | | | | | **218** | | **3** | **3** | **6** | | **9** | **9** | **18** |

Notes:
ksf = 1,000 square feet
[1] Daily, AM, and PM peak hour average rates published in *ITE Trip Generation Manual, 10th Edition, 2017* were used for each land use.
[2] External walk, bike, and transit reduction developed using *US EPA Mixed Use Trip Generation Model v.4, 2010* .
[3] Pass-by trip reduction is based on the average pass-by trip reduction rate published in the ITE Trip Generation Handbook, 3rd Edition. Hexagon assumes no pass-by trip reduction during the AM peak hour and half of the PM peak pass-by reduction for daily trip generation.

## Trip Distribution and Assignment

The trip distribution pattern and trip assignment for the proposed uses were estimated based on the Menlo Park Travel Demand Model. The model estimated trip distribution pattern is summarized below:

- Dumbarton Bridge: approximately 11%
- US 101 to the north, including Haven Avenue: approximately 28%
- US 101 to the south, including Embarcadero Road: approximately 31%
- Marsh Road west of US 101: approximately 4%
- Willow Road west of US 101: approximately 8%
- University Avenue west of US 101: approximately 6%
- Menlo Park and East Palo Alto east of US 101: approximately 12%

## Future Traffic Volumes

Both near-term (year 2025) and cumulative (year 2040) scenario forecasts of intersection turning movements, freeway traffic and ramp volumes were completed using the latest Menlo Park travel demand forecast model (citywide travel demand forecast model). The citywide model is the best available model to represent travel within the City of Menlo Park, and serves as the primary forecasting tool for the City. The model is a mathematical representation of travel within the nine Bay Area counties, as well as the Santa Cruz, San Benito, Monterey and San Joaquin counties. The base model structure was developed by the Metropolitan Transportation Commission (MTC) and further refined by the City/County Association of Governments and Santa Clara Valley Transportation Authority for use within San Mateo County and Santa Clara County. The City further refined this model for application with Menlo Park to add more detail to the zone structure and transportation network. There are 81 transportation analysis zones (TAZs) within the model to represent the City of Menlo Park.

### Near-Term and Cumulative Traffic Volumes

Land use growth assumptions for Bay Area regions outside of Menlo Park and East Palo Alto for the near-term scenario (year 2025) are provided by the Association of Bay Area Governments (ABAG) and refined by VTA/C/CAG. Approved developments within the City of Menlo Park and the City of East Palo Alto were added to the existing land use to represent the year-2025 land use. The following approved projects within the City of Menlo Park and the City of East Palo Alto as of December 2020 were included:

- Menlo Gateway
- 1285 El Camino Real
- 123 Encinal Avenue
- 1010-1026 Alma Street

For the cumulative scenario, the City of Menlo Park land use assumed the buildout of the General Plan, as well as the portion of the proposed 123 Independence Drive project that would exceed the unrestricted dwelling units studied in the ConnectMenlo EIR. Pending developments as of December 2020 within the City of East Palo Alto were added to the near-term land use to represent the year-2040 land use for the city. Land use growth for other Bay Area regions for year 2040 were taken from Association of Bay Area Governments (ABAG) projections and refined by VTA/C/CAG. Table 15 shows the socioeconomic model inputs for the entire Bay Area separated by counties.

The forecasted intersection turning movements under all future scenarios were adjusted based on existing volumes to generate traffic volumes for near-term conditions (see Figure 11), near-term plus project conditions (see Figure 12), cumulative conditions (see Figure 13), and cumulative plus project conditions (see Figure 14).

**Table 15**
**Socioeconomic Model Inputs for Bay Area**

| County | Year 2040 Project Conditions Model Land Use Data | | | |
|---|---|---|---|---|
| | Total Households | Total Population | Employed Residents | Total Jobs |

## Cumulative with Dumbarton Rail Scenario

Dumbarton rail service has not been designed, subjected to environmental review, approved, or funded. As a result, future Dumbarton rail service is speculative at this time and might or might not occur. If it does occur, capacity, frequency, ridership and other operational features are unknown at this time. As a result, any forecast of potential future traffic with Dumbarton rail service is speculative. The following analysis is provided for informational purposes to give the public and decision makers an idea of what impact Dumbarton rail might have on traffic based on a specific set of ridership assumptions. These impacts would occur instead of the impact identified above under Cumulative (2040) Plus Project Intersection Levels of Service.

A cumulative with Dumbarton rail scenario was evaluated where the model assumed the operation of potential Dumbarton Rail service. The purpose of this scenario was to provide information on the possible effects of future Dumbarton Rail on the transportation network based on the assumptions made herein about such future service. A cumulative plus project with Dumbarton Rail scenario was compared against the cumulative with Dumbarton Rail scenario to inform the potential effects of the Project-generated traffic assuming potential Dumbarton Rail service.

Based on the *Dumbarton Rail Corridor Update* in March 2021, preliminary forecasts suggest that under 2040 conditions, the high-end ridership projections for the highest-ridership alternative would be around 24,300 riders per day. In comparison, the low-end ridership projections for the lowest-ridership alternative would be around 14,600 riders per day. As shown on Figure 15, this highest ridership forecast would be realized over a potential corridor with 10 stations located between downtown Redwood City and the Union City BART station. It should be noted that this potential corridor includes a stop on Willow Road just north of the proposed Project Site. At the time of this study's initiation, the ability to park-and-ride at the stations along this potential corridor was not available.

This study assumed the highest ridership projections as well as no park-and-ride capability at the stations. More ridership along the Dumbarton Rail corridor would mean lower traffic volumes. Therefore, the assumptions of this study would equate to evaluating the largest potential reduction in traffic volumes assuming the operation of Dumbarton Rail service.

To represent the daily ridership in the model, daily travel between TAZs within a quarter-mile radius of the stations was reduced by 24,300 daily person-level driving trips, or roughly 19,000 daily vehicular-trips. During a one-hour peak hour, based on the highest ridership projections, the Dumbarton Rail corridor would reduce approximately 1,900 vehicular trips, of which approximately half of the trip reduction would occur within the study area. These trips are assumed to be between TAZ sets within a quarter-mile radius of different stations, as the stations are assumed to not contain park-and-ride capabilities. A quarter-mile radius from the stations represents walkable distances to the stations.

Figure 16 shows the model-adjusted intersection turning movement volumes for the cumulative with Dumbarton Rail scenario. Volumes under the cumulative plus project with Dumbarton Rail scenario are shown in Figure 17. The Dumbarton Rail was estimated to reduce the Proposed Project's vehicular trip generation by approximately 4%.

## Future Transportation Networks

### Near-term (2025) Conditions

The transportation network under near term conditions assumes a signal at Chilco Street and Constitution Drive/MPK 22 Driveway, consistent with the Menlo Gateway EIR and the Bayfront Campus Expansion EIR. The intersection would be restriped to include an eastbound left-turn lane and a shared through-right lane, two westbound left-turn lanes and a shared through-right lane, a northbound shared through-left lane and a right-turn lane, and a southbound shared left-through-right lane and right-turn lane. The roadway network for other study intersections is assumed to be the same as under existing conditions.

### Near-term (2025) plus Project Conditions

The following improvements are proposed to the Street network under plus project conditions:

- **Willow Road and Hamilton Avenue**: Hamilton Avenue would be realigned and a south leg that would provide access to the Project Site would be added to the intersection. The south leg is identified as Main Street. The proposed lane configuration for the intersection would be modified to a northbound left-turn lane and shared through-right lane, a southbound left-turn lane and shared through-right lane, an eastbound left-turn lane, through lane, and shared through-right lane, and two westbound left-turn lanes, a through lane, and a shared through-right turn lane.

- **Willow Road and Park Street**: This is a proposed new signalized intersection with Park Street providing access to the Project Site. The proposed lane configuration for the intersection would be a northbound left-turn lane and a shared left right lane, an eastbound through lane and shared through-right lane, and two westbound left-turn lanes and two through lanes.

- **O'Brien Drive/Loop Road and Main Street/O'Brien Drive**: This is a proposed new roundabout intersection. The proposed lane configuration for the intersection would be one shared left-through-right lane on all approaches.

### Cumulative (2040) Conditions

The transportation network under cumulative (2040) conditions and cumulative (2040) conditions with Dumbarton rail is assumed to include the improvements under near term conditions. The following additional road improvements in East Palo Alto identified in the Ravenswood/4 Corners TOD Specific Plan Environmental Impact Report (February 22, 2013) are also assumed:

- **University Avenue and Purdue Avenue (Mitigation Measure TRA-CUM-3)**: Install a traffic signal at this intersection. Along with a new traffic signal, appropriate pedestrian and bicycle accommodation will be provided.
- **University Avenue and Bay Road (Mitigation Measure TRA-CUM-4):** Add an exclusive eastbound right-turn lane and a second eastbound left-turn lane on University Avenue, add a second northbound left-turn lane on Bay Road, add a second westbound left-turn lane on University Avenue, and modify signal phasing.
- **University Avenue and Donohoe Street (Mitigation Measure TRA-CUM-5):** Add an exclusive westbound right-turn lane on University Avenue.

### Cumulative (2040) plus Project Conditions

The transportation network under cumulative (2040) plus project conditions and cumulative (2040) plus project conditions with Dumbarton rail is assumed to include the proposed project improvements described under the near term plus project conditions. The roadway network for other study intersections is assumed to be the same as under cumulative (2040) conditions.

## Near-Term (2025) Intersection Levels of Service

The results of the intersection level of service analysis under near-term conditions are summarized in Tables 16 and 17. The Willow Road corridor and 101/University Avenue interchange were analyzed using the Simtraffic microsimulation model as described Chapter 2. The microsimulation model indicates that the intersections would experience capacity issues where the demand cannot be served by the intersections. Oversaturated conditions would operate at LOS F and are indicated using ‘OVERSAT’ in the tables below. Vistro and Traffix were used to calculate critical delay and volume to capacity ratio at the Willow Road and 101/University Avenue intersections, respectively. The intersection LOS calculation sheets are included in Appendix C. The following study intersections (see Figure 18) would operate at an unacceptable level of service during at least one peak hour:

11. Chrysler Drive and Constitution Drive (AM peak hour)
12. Chilco Street and Constitution Drive/MPK 22 Driveway (PM peak hour)
16. Willow Road and Bayfront Expressway (AM and PM peak hours)
17. Willow Road and Hamilton Avenue (AM and PM peak hours)
19. Willow Road and Ivy Drive (AM and PM peak hours)
20. Willow Road and O’Brien Drive (AM and PM peak hours)
21. Willow Road and Newbridge Street (AM and PM peak hours)
22. Willow Road and US 101 Northbound Ramps (AM and PM peak hours)
23. Willow Road and US 101 Southbound Ramps (AM and PM peak hours)
24. Willow Road and Bay Road (AM and PM peak hours)
25. Willow Road and Hospital Plaza/Durham Street (AM and PM peak hours)
28. Willow Road and Middlefield Road (AM peak hour)
30. O’Brien Drive and Kavanaugh Drive (PM peak hour)
32. Adam’s Drive and O’Brien Drive (PM peak hour)
33. University Avenue and Bayfront Expressway (PM peak hour)
34. University Avenue and Purdue Avenue (PM peak hour)
35. University Avenue and Adams Drive (AM and PM peak hours)
39. University Avenue and Bay Road (PM peak hour)
42. University Avenue and Donohoe Street (AM and PM peak hours)
43. US 101 Northbound Off-Ramp and Donohoe Street (AM and PM peak hours)
44. Cooley Avenue and Donohoe Street (AM and PM peak hours)
45. University Avenue and US 101 Southbound Ramps (AM and PM peak hours)
46. University Avenue and Woodland Avenue (AM and PM peak hours)
47. East Bayshore Road and Donohoe Street (AM and PM peak hours)
50. East Bayshore Road and Euclid Avenue (AM and PM peak hours)

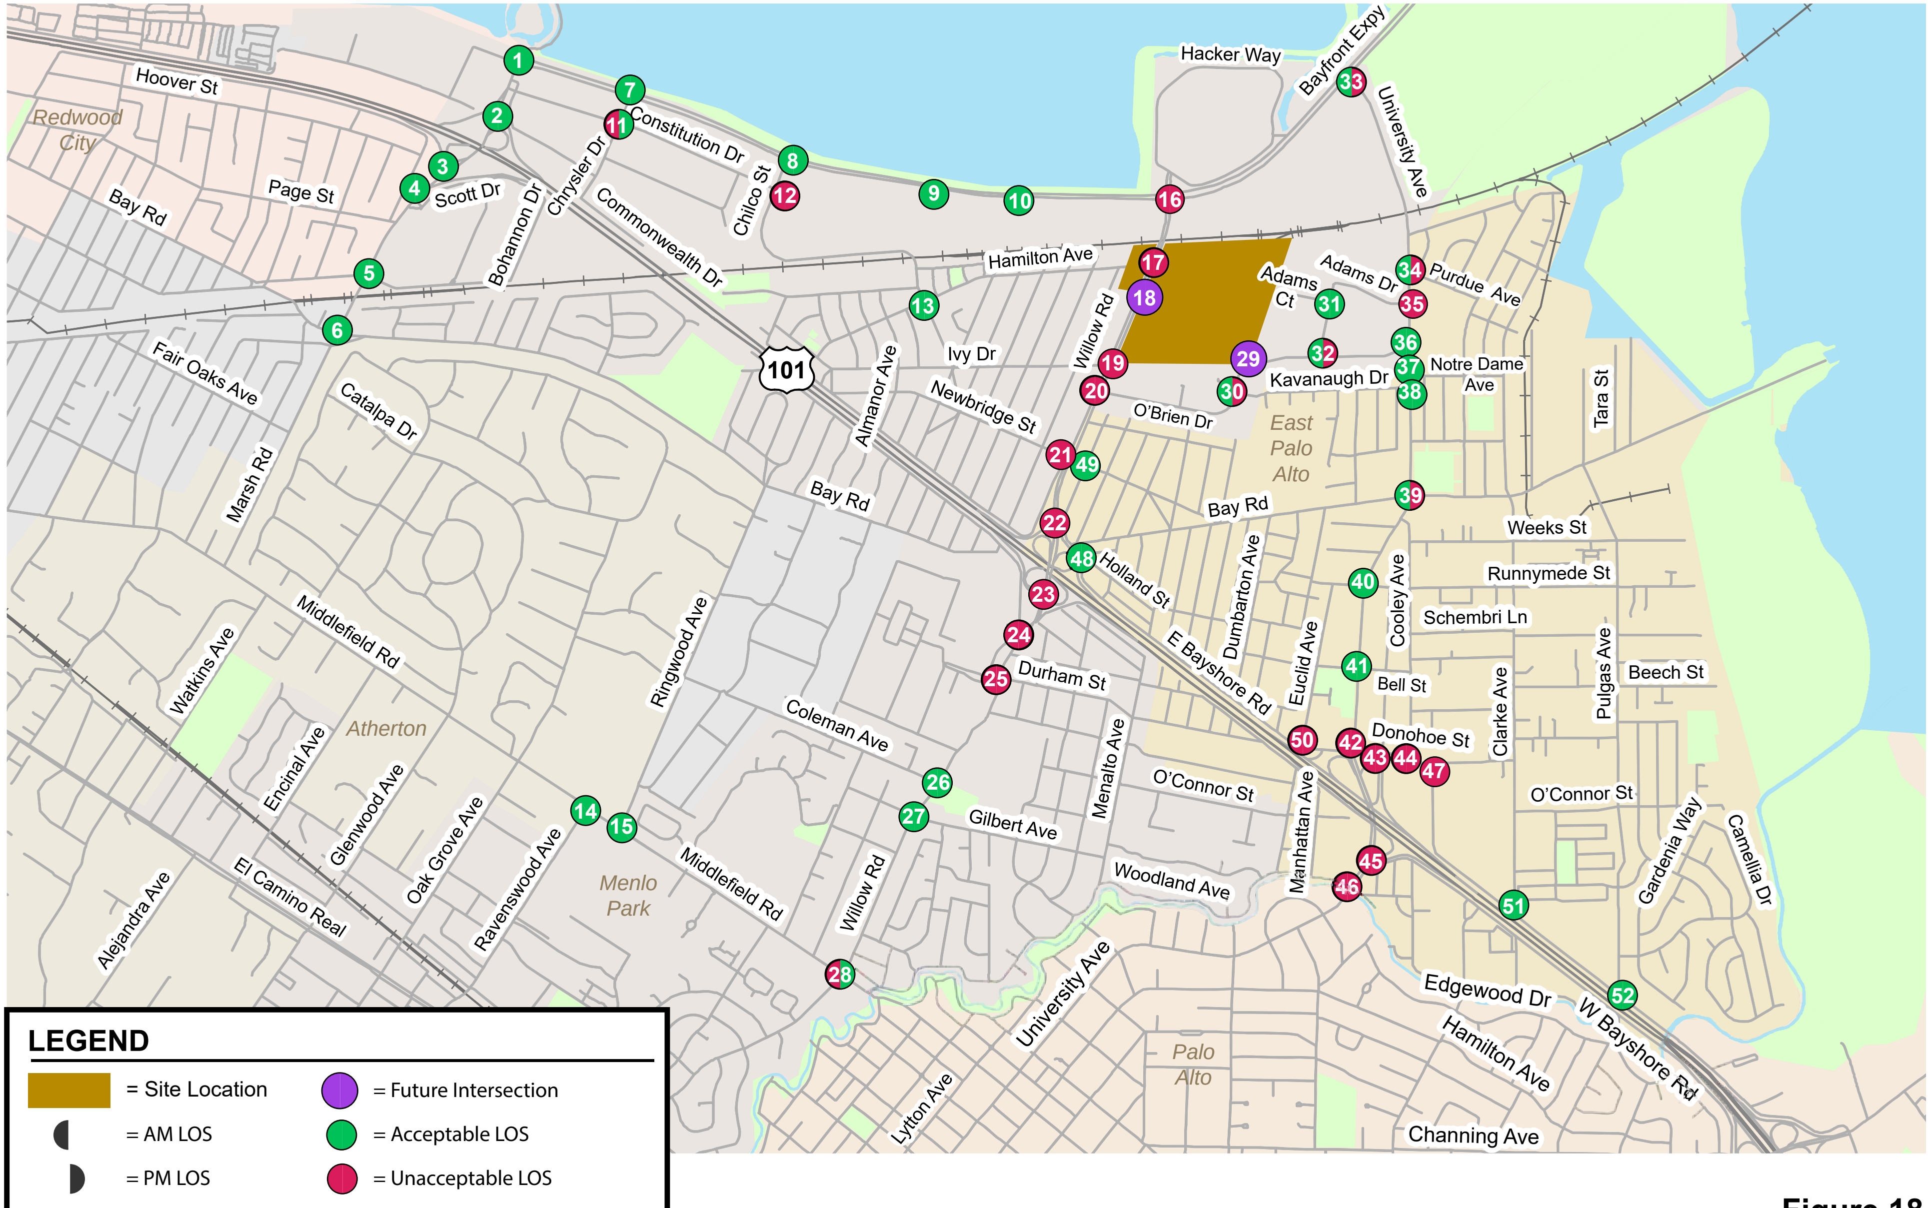

**Figure 18**
**Near-Term Intersection Level of Service**

## Near-Term (2025) Plus Project Intersection Levels of Service

The results of the intersection level of service analysis under near term (2025) plus project conditions are summarized in Table 16 and 17. The Willow Road corridor and 101/University Avenue interchange were analyzed using the Simtraffic microsimulation model as described Chapter 2. The microsimulation model indicates that the intersections would experience capacity issues where the demand cannot be served by the intersections. Oversaturated conditions would operate at LOS F and are indicated using 'OVERSAT' in the tables below. Vistro and Traffix were used to calculate critical delay and volume to capacity ratio at the Willow Road and 101/University Avenue intersections, respectively. The intersection LOS calculation sheets are included in Appendix C.

Under near-term plus project conditions, the following 16 intersections (see Figure 19) would be non-compliant with local policies and would be adversely affected during either the AM or the PM peak hour as compared to near term conditions:

1. Marsh Road and Bayfront Expressway (AM peak hour)
13. Chilco Street and Hamilton Avenue (PM peak hour)
**16. Willow Road and Bayfront Expressway (AM peak hour)**
**17. Willow Road and Hamilton Avenue (AM and PM peak hours)**
18. Willow Road and Park Street (AM and PM peak hours)
**21. Willow Road and Newbridge Street (AM and PM peak hours)**
**23. Willow Road and US 101 Southbound Ramps (AM peak hour)**
**24. Willow Road and Bay Road (AM peak hour)**
**30. O'Brien Drive and Kavanaugh Drive (AM and PM peak hours)**
**32. Adam's Drive and O'Brien Drive (AM and PM peak hours)**
**39. University Avenue and Bay Road (PM peak hour)**
**42. University Avenue and Donohoe Street (AM peak hour)**
**43. US 101 Northbound Off-Ramp and Donohoe Street (AM and PM peak hours)**
**44. Cooley Avenue and Donohoe Street (AM and PM peak hours)**
**45. University Avenue and US 101 Southbound Ramps (AM peak hour)**
**47. E. Bayshore Road and Donohoe Street (AM and PM peak hours)**

**Bold** indicates intersections that already operate unacceptably under near-term conditions.

It should be noted that at some intersections the average delay is shown to decrease with the addition of Project traffic. This occurs because the intersection delay is a weighted average of all intersection movements. When traffic is added to movements with delays lower than the average intersection delay, the average delay for the entire intersection can decrease. Furthermore, the congestion and queue spillback at an adjacent intersection can constrain the traffic volume at some intersections resulting in a small decrease in average delay.

## Adverse Effects and Recommended Improvements

The intersection effects and recommended modifications to improve the intersections to pre-Project conditions or better are described below. It should be noted that the intersection analysis accounts for the Project's proposed trip reductions from gross ITE trip generation. The residential component's required TDM reduction to eliminate the VMT impact is partially accounted for as well (peak-hour trip generation assumed 10% active TDM reduction). The additional residential TDM reduction during the peak-hour resulting from the VMT impact mitigation would have resulted in approximately 50 (13 inbound and 37 outbound) fewer trips during the AM peak hour and 56 (34 inbound and 22 outbound) fewer trips during the PM peak hour. This level of trip reduction would not address any intersection adverse effects alone.

**Marsh Road and Bayfront Expressway (#1)**

This intersection is expected to operate at an acceptable LOS D during the AM peak hour and LOS C during the PM peak hour under near term conditions. The addition of Project traffic would cause the level of service at the intersection to worsen to an unacceptable LOS E during the AM peak hour. The intersection would operate at an acceptable LOS D during the PM peak hour. The deterioration of LOS from D to E constitutes non-compliance during the AM peak hour according to the thresholds established by the City of Menlo Park.

The recommended modification for this location is to modify the southbound approach to a shared left-through lane, shared through-right lane, and a right turn only lane. With this improvement, the intersection would operate acceptably at LOS D during both peak hours under near-term plus project conditions. This improvement is in Menlo Park's traffic impact fee (TIF) program. With implementation of these intersection modifications, the intersection would be in compliance with the TIA Guidelines and address the Proposed Project's share of the non-compliant operation.

**Chilco Street and Hamilton Avenue (#13)**

This intersection is expected to operate at an acceptable LOS B during the AM peak hour and LOS C during the PM peak hour under near term conditions. The addition of Project traffic would cause the level of service at the intersection to worsen to an unacceptable LOS E during the PM peak hour. The intersection would operate at an acceptable LOS B during the AM peak hour. The deterioration of LOS from C to E constitutes non-compliance during the PM peak hour according to the thresholds established by the City of Menlo Park.

Since the intersection currently operates as all-way-stop-controlled, potential modification to bring the intersection to pre-project conditions would be to signalize it. However, the intersection does not meet the signal warrant during either peak hour under near term plus project conditions. A traffic signal is not recommended for construction until signal warrants conducted with a future year's actual counts have been met. The recommended improvement includes conducting a signal warrant analyses for a period of five years after full Project completion to determine if a signal would be warranted and if warranted, install a new signal. This improvement is included in the City's TIF program.

Should the City pursue implementation of this improvement, the improvement would include new traffic signal and appropriate pedestrian and bicycle accommodation at this intersection including pedestrian countdown timers, Americans with Disabilities Act (ADA) compliant curbs, and bicycle detection loops. Signalization of this intersection could also encourage cut-through traffic along Chilco Street and on Hamilton Avenue when regional routes such as Bayfront Expressway, Willow Road or US 101 become congested. Potential traffic calming measures should also be considered in conjunction with a traffic signal if signal warrants are met in a future year.

With implementation of these intersection modifications (e.g. signal warrant analysis, potential signal installation, and related bicycle and pedestrian accommodations), the intersection would be in compliance with the TIA Guidelines which would address the Proposed Project's share of the non-compliant operation.

**Willow Road Corridor (#16, #17, #18, #21, #23, #24)**

Willow Road between Bayfront Expressway and Hospital Plaza/Durham Street is expected to experience capacity issues due to unserved demand at the intersections. These intersections would operate unacceptably under near term conditions during both peak hours. With the addition of Project traffic, intersections along the corridor would continue to operate unacceptably during both peak hours.

The intersections of Willow Road and Bayfront Expressway and Willow Road and US 101 southbound ramps would experience an increase in delay of over four seconds with the addition of project traffic in the AM peak hour and PM peak hour, respectively, and would be non-compliant per Menlo Park's guidelines for state-controlled intersections.

The intersections of Hamilton Avenue and Newbridge Street at Willow Road would experience an increase in delay of over 0.8 seconds with the addition of project traffic on the local approach to the intersection in both peak hours and the intersection of Bay Road at Willow Road would experience an increase in delay of over 0.8 seconds with the addition of Project traffic on the local approach to the intersection during the AM peak hour and would be non-compliant per Menlo Park's guidelines. Willow Road and Park Street, which is a new intersection under project conditions is also assumed to be non-compliant during both peak hours due to unserved demand at this intersection as determined in the microsimulation model developed for this corridor and described in Chapter 3.

The City of Menlo Park is implementing an adaptive traffic signal coordination system on the Willow Road corridor to improve traffic flow. Adaptive traffic control is a technology that automatically adjusts traffic signal timing based on actual traffic demand at an intersection. This measure will improve the intersection operations and could reduce the intersection delay. The reduction in delay due to adaptive signal coordination is not expected to bring the corridor intersections into compliance with the City's TIA guidelines or to substantially reduce the delay caused by the Project.

Physical intersection improvements (identified in the City's TIF program) that would improve intersection operations at the non-compliant intersections are:

- **Willow Road and Newbridge Street (#21)**- The TIF program proposes to modify the signal timing to a protected left-turn phasing operation on Newbridge Street, provide a leading left-turn phase on the southbound movement and a lagging left-turn phase on the northbound movement, and optimize signal timing. With implementation of these intersection modifications under project conditions, the critical movement delay would be reduced for the northbound movement to lower than no project conditions. However, the improvement would not address the southbound deficiency. Further improvements to address the southbound deficiency are not feasible.

- **Willow Road and Bay Road (#24) –** The TIF program proposes to modify the southbound approach at this intersection to two left-turn lanes and one right-turn lane and to modify the westbound approach to add a right-turn lane. With these improvements under project conditions, the critical movement delay at the local approach would be reduced to lower than no project conditions. This improvement would address the adverse effect on the intersection due to Project traffic. With implementation of these intersection modifications, the Willow Road and Bay Road intersection would be in compliance with the TIA Guidelines which would address the Proposed Project's share of the non- compliant operation. With implementation of the recommended improvements from the TIF program for the Willow Road and Bay Road intersection the deficiency attributable to the Proposed Project would be addressed. As mentioned previously, these improvements are included in the City's TIF program.

The Metropolitan Transportation Commission (MTC) Dumbarton Forward project would restripe Bayfront Expressway to add bus-only lanes on the shoulders during peak periods and implement signal timing improvements. The bus-only lanes would generally help the progression of shuttles and buses along the corridor. The signal timing improvements are also assumed to help with the general progression along Bayfront. However, specific details are unknown at this time regarding the improvements at the Willow Road and Bayfront Expressway intersection. The improvements' effectiveness in addressing the Project traffic generated adverse effect on traffic operations at this intersection cannot be determined. Furthermore, since this project is not led by the City of Menlo Park, implementation cannot be guaranteed.

Physical improvements are considered infeasible due to right-of-way constraints and/or adverse effects on pedestrian and bicycle travel at the intersections of Willow Road and Bayfront Expressway, Willow Road and US 101 southbound ramps, Willow Road and Hamilton Avenue, and Willow Road and Park Street.

The TIF program also proposes multimodal improvements along this section of Willow Road. These include an eastbound Willow Road one-way Class IV separated bikeway between Hamilton Avenue and the US 101/Willow Road Interchange, a westbound Willow Road one-way Class IV separated bikeway between the Dumbarton Rail Corridor and the US 101/Willow Road Interchange, high-visibility crosswalks and pedestrian signals on all legs at the intersection of Willow Road and O'Brien Drive, Class II bicycle lanes on eastbound Willow Road from O'Keefe Street to Bay Road, and Class II bicycle lanes on westbound Willow Road from Bay Road to Durham Street.

Implementing recommended multi-modal facilities along the corridor (from the City's TIF program) could shift some motor vehicle traffic to alternative modes of travel and reduce congestion. With implementation of these multi-modal improvements, the intersection deficiencies could be further reduced and partially address the Proposed Project's share of the non- compliant operations along Willow Road.

**O'Brien Drive and Kavanaugh Drive (#30)**

This intersection is expected to operate at an acceptable LOS B during the AM peak hour and an unacceptable LOS D during the PM peak hour under near term conditions. With the addition of project traffic, the intersection would operate at an unacceptable LOS F during both peak hours. This constitutes non-compliance during both peak hours according to the thresholds established by the City of Menlo Park.

Since the intersection currently operates as all-way-stop-controlled, potential modification to bring the intersection to pre-project conditions would be to signalize it. The intersection would meet the MUTCD signal warrant during both peak hours under project conditions (See Appendix F). The intersection lane configuration would need to be modified to a westbound left-turn lane and through lane, northbound left turn lane and right turn lane, and eastbound shared through-right lane. With this improvement, the intersection would operate acceptably at LOS B during the AM peak hour and LOS C during the PM peak hour under near term plus project conditions.

The recommended improvement to bring this intersection back to pre-Project conditions is the installation of the new traffic signal and appropriate pedestrian and bicycle accommodation. This includes the proposed Class II bicycle lanes along O'Brien Drive between Willow Road and University Avenue, pedestrian countdown timers, Americans with Disabilities Act (ADA) compliant curbs, and bicycle detection loops. However, a decision for signalization should not be made until signal warrants conducted with a future year's actual counts have been met. It is important to note that the intersection would be located approximately 300 feet west of the proposed roundabout at O'Brien Drive and Loop Road. Prior to a decision for signalizing this intersection, further analysis should be conducted to ensure that queues resulting from the signal would not back into the roundabout and cause a gridlock situation.

Alternatively, traffic calming measures could be installed to discourage the use of Kavanaugh Drive, which is a residential street, and encourage vehicles to use O'Brien Drive and Adam's Drive instead. Kavanaugh Drive is located within the City of East Palo Alto, and the City of Menlo Park does not have jurisdiction to install traffic calming along this street. Other measures such as peak period turning movement restrictions could be considered to discourage traffic from using Kavanaugh Drive and improve intersection operations.

Monitoring of traffic operations at this intersection for a period of five years after full Project completion should be conducted to determine if signalization or alternative improvements are needed. If warranted, implementation of the new traffic signal would address the Proposed Project's share of the non-compliant operation and bring the intersection into compliance with the TIA Guidelines. If the alternative measures are implemented, the intersection may or may not be brought into compliance with the TIA Guidelines and address the Proposed Project's share of the non-compliant operation.

**Adams Drive and O'Brien Drive (#32)**

This intersection is expected to operate at an acceptable LOS C during the AM peak hour and an unacceptable LOS D during the PM peak hour under near term conditions. With the addition of Project traffic, the intersection would operate at an unacceptable LOS F during both peak hours. This constitutes non-compliance during both peak hours according to the thresholds established by the City of Menlo Park.

Since the intersection currently operates as two-way-stop-controlled, potential modification to bring the intersection to pre-project conditions would be to signalize it. The intersection would meet the MUTCD signal warrant during the PM peak hour under project conditions (see Appendix F). The intersection lane configuration would need to be modified to a westbound shared left-right lane, southbound left-turn lane and through lane, and northbound shared through-right lane. With this improvement, the intersection would operate acceptably at LOS B during the AM peak hour and LOS C during the PM peak hour under near term plus project conditions.

The recommended improvement to bring this intersection back to pre-Project conditions is the installation of the new traffic signal and appropriate pedestrian and bicycle accommodations at this intersection and within the vicinity. This includes the proposed Class II bicycle lanes along O'Brien Drive between Willow Road and University Avenue, pedestrian countdown timers, Americans with Disabilities Act (ADA) compliant curbs, and bicycle detection loops.

The expected intersection operational issues under background plus project conditions would be due to the increased through traffic on O'Brien Drive between the Project Site and University Avenue. Menlo Park's TIF program identifies an improvement to signalize the nearby intersection at University Avenue and Adams Drive in East Palo Alto. This improvement may provide an alternative route for Project vehicles to access the Project Site via University Avenue.

Monitoring of traffic operations at this intersection for a period of five years after full Project completion should be conducted to determine if signalization or alternative improvements are needed. If warranted, implementation of the new traffic signal would address the Proposed Project's share of the non-compliant operation and bring the intersection into compliance with the TIA Guidelines. If the alternative measures are implemented, the intersection may or may not be brought into compliance with the TIA Guidelines and address the Proposed Project's share of the non-compliant operation.

**University Avenue and Bay Road (#39)**

This intersection is expected to operate at an acceptable LOS D during the AM peak hour and an unacceptable LOS E during the PM peak hour under near term conditions. With the addition of Project traffic, the intersection would continue to operate acceptably in the AM peak hour. In the PM peak hour, the increase in the average critical delay would be greater than four seconds. This constitutes non-compliance during the PM peak hour according to the thresholds established by the City of East Palo Alto.

Potential modification to bring the intersection to pre-Project conditions would be to add an exclusive eastbound right-turn lane and a second eastbound left-turn lane on University Avenue, add a second northbound left-turn lane on Bay Road, add a second westbound left-turn lane on University Avenue, and modify signal phasing. This is also a mitigation measure identified in the Ravenswood/4 Corners TOD Specific Plan Environmental Impact Report (February 22, 2013), which would be implemented under cumulative conditions. With this improvement under project conditions, the average delay at the intersection would be better than under near term no project conditions. Since this intersection is located within the City of East Palo Alto, the recommended measure to bring the intersection back to pre-Project conditions and address the Project's share of the non-compliant operation would be to make a fair share (34%) contribution towards this improvement. Fair share is calculated as the percentage of net project traffic generated divided by the overall cumulative traffic growth at this intersection. The Menlo Park TIF includes improvements at the University Avenue and Bay Road intersection, but not sufficient improvements to bring the intersection back to pre-Project conditions, as described above. However, the Project's fair share contribution towards this intersection would be calculated considering credit from its TIF payment.

**US 101/University Avenue Interchange (#42, #43, #44, #45, #47)**

The US 101/University Avenue interchange is expected to experience capacity issues due to unserved demand at the intersections in its vicinity including University Avenue and Donohoe Street, US 101 northbound off-ramp and Donohoe Street, Cooley Avenue and Donohoe Street, University Avenue and US 101 southbound ramps, University Avenue and Woodland Avenue, E. Bayshore Road and Donohoe Street, and E. Bayshore Road and Euclid Avenue. These intersections would operate unacceptably under near term conditions during both peak hours. With the addition of Project traffic, these intersections would continue to operate unacceptably during both peak hours. The increase in delay is expected to be greater than four seconds, and the increase in the volume to capacity ratio is expected to be greater than 0.01 under project conditions at University Avenue and Donohoe Street in the AM peak hour, US 101 northbound off-ramp and Donohoe Street during both peak hours, Cooley Avenue and Donohoe Street during both peak hours, E. Bayshore Road and Donohoe Street during both peak hours, and University Avenue and US 101 southbound ramps in the AM peak hour. This constitutes non-compliance according to the thresholds established by the City of East Palo Alto.

East Palo Alto plans to widen the northbound approach on Donohoe Street at the US 101 northbound off-ramp to accommodate four through lanes to improve the vehicular throughput at this intersection. This improvement will require median modifications and narrowing the southbound Donohoe Street approach to Cooley Avenue to include two through lanes and a full length left-turn lane. In addition, the traffic signals will be coordinated with adjacent traffic signals on Donohoe Street.

East Palo Alto also plans to install a new traffic signal at the US 101 northbound on-ramp and Donohoe Street and Bayshore Road and Euclid Avenue to coordinate with other closely spaced traffic signals along Donohoe Street. Along with new traffic signals, appropriate pedestrian and bicycle accommodation will be provided. This includes pedestrian countdown timers, Americans with Disabilities Act (ADA) compliant curbs, and bicycle detection loops. In order to align with the proposed driveway for the University Plaza Phase II site on the north side of Donohoe Street, the US 101 on-ramp will be shifted approximately 30 feet to the south. In addition, the northbound approach on Donohoe Street will be restriped to accommodate a short exclusive left-turn pocket (approximately 60 feet in length), a shared left-through lane, and a shared through-right lane. These improvements would require widening of the US 101 northbound on-ramp to accommodate two lanes that taper down to a single lane before this ramp connects with the loop on-ramp from eastbound University Avenue. A northbound right turn only will also be added to Bayshore Road and Euclid Avenue. Planned Donohoe Street improvements are included in Appendix E.

With these improvements, average delay at these intersections would be below that under near term conditions without the Project. Since this intersection is located within the City of East Palo Alto, the recommended improvement measure to bring the intersection/interchange back to pre-Project conditions and address the Project's share of the non- compliant operation would be for the Project sponsor to make a fair share contribution towards these improvements. Because the improvements in this corridor are all interconnected and dependent on each other to work, the recommended improvement measure would be for the Project sponsor to contribute its fair share to improvements at all six intersections in this corridor. Fair share is calculated as the percentage of net project traffic generated of the overall cumulative traffic growth at this intersection.

- Donohoe Street & Cooley Avenue: 10% fair share
- Donohoe Street & US 101 Northbound Off-Ramp: 24% fair share
- Donohoe Street & University Avenue: 31% fair share
- Donohoe Street & US 101 Northbound On-Ramp: 8% fair share
- Donohoe Street/Bayshore Road & Euclid Avenue: 2% fair share
- US 101 Southbound Ramps & University Avenue: 33% fair share

The Menlo Park TIF includes improvements at the University Avenue and Donohoe Street and University Avenue and US 101 southbound ramps intersections, which funding would go toward the planned coordinated system of intersections. The Project's fair share contribution towards these two intersections would be calculated considering credit from its TIF payment.

## Cumulative (2040) Intersection Levels of Service

The results of the intersection level of service analysis under cumulative conditions are summarized in Tables 18 and 19. The Willow Road corridor and 101/University Avenue interchange were analyzed using the Simtraffic microsimulation model as described Chapter 2. The microsimulation model indicates that the intersections would experience capacity issues where the demand cannot be served by the intersections. Oversaturated conditions would operate at LOS F and are indicated using ‘OVERSAT’ in the tables below. Vistro and Traffix were used to calculate critical delay and volume to capacity ratio at the Willow Road and 101/University Avenue intersections, respectively. The intersection LOS calculation sheets are included in Appendix C. The following study intersections (see Figure 20) would operate at an unacceptable level of service during at least one peak hour:

1. Marsh Road and Bayfront Expressway (AM and PM peak hours)
2. Marsh Road and US 101 Northbound off-ramp (AM peak hour)
5. Marsh Road and Bohannon Drive/Florence Street (AM peak hour)
6. Marsh Road and Bay Road (AM peak hour)
8. Chilco Street and Bayfront Expressway (PM peak hour)
11. Chrysler Drive and Constitution Drive (AM and PM peak hours)
12. Chilco Street and Constitution Drive/MPK 22 Driveway (AM and PM peak hours)
13. Chilco Street and Hamilton Avenue (PM peak hour)
16. Willow Road and Bayfront Expressway (AM and PM peak hours)
17. Willow Road and Hamilton Avenue (AM and PM peak hours)
19. Willow Road and Ivy Drive (AM and PM peak hours)
20. Willow Road and O’Brien Drive (AM and PM peak hours)
21. Willow Road and Newbridge Street (AM and PM peak hours)
22. Willow Road and US 101 Northbound Ramps (AM and PM peak hours)
23. Willow Road and US 101 Southbound Ramps (AM and PM peak hours)
24. Willow Road and Bay Road (AM and PM peak hours)
25. Willow Road and Hospital Plaza/Durham Street (AM and PM peak hours)
28. Willow Road and Middlefield Road (AM peak hour)
30. O’Brien Drive and Kavanaugh Drive (AM and PM peak hours)
32. Adam’s Drive and O’Brien Drive (AM and PM peak hours)
33. University Avenue and Bayfront Expressway (PM peak hour)
35. University Avenue and Adams Drive (AM and PM peak hours)
39. University Avenue and Bay Road (PM peak hour)
42. University Avenue and Donohoe Street (AM and PM peak hours)
43. US 101 Northbound Off-Ramp and Donohoe Street (AM and PM peak hours)
44. Cooley Avenue and Donohoe Street (AM and PM peak hours)
45. University Avenue and US 101 Southbound Ramps (AM and PM peak hours)
46. University Avenue and Woodland Avenue (AM and PM peak hours)
47. E. Bayshore Road and Donohoe Street (AM and PM peak hour)
49. Saratoga Avenue and Newbridge Street (AM and PM peak hours)
50. East Bayshore Road and Euclid Avenue (AM and PM peak hours)

## Cumulative (2040) Plus Project Intersection Levels of Service

The results of the intersection level of service analysis under near cumulative (2040) plus project conditions are summarized in Tables 18 and 19. The intersection LOS calculation sheets are included in Appendix C. Under cumulative plus project conditions, the following 17 intersections (see Figure 21) would be non-compliant with local policies during either the AM or the PM peak hour as compared to cumulative conditions. All of these intersections would already be operating at unacceptable levels of service under cumulative conditions.

**5. Marsh Road and Bohannon Drive/Florence Street (AM peak hour)**
13. Chilco Street and Hamilton Avenue (AM and PM peak hours)
18. Willow Road and Park Street (AM and PM peak hours)
**19. Willow Road and Ivy Drive (PM peak hour)**
21. Willow Road and Newbridge Street (AM and PM peak hours)
24. Willow Road and Bay Road (AM and PM peak hours)
**25. Willow Road and Hospital Plaza/Durham Street (AM and PM peak hours)**
30. O'Brien Drive and Kavanaugh Drive (AM peak hour)
32. Adam's Drive and O'Brien Drive (AM and PM peak hours)
43. US 101 Northbound Off-Ramp and Donohoe Street (AM and PM peak hours)
44. Cooley Avenue and Donohoe Street (PM peak hour)
45. University Avenue and US 101 Southbound Ramps (PM peak hour)
**46. University Avenue and Woodland Avenue (AM and PM peak hours)**
**49. Saratoga Avenue and Newbridge Street (AM peak hour)**
**50. East Bayshore Road and Euclid Avenue (AM peak hour)**

**Bold** denotes intersections that would be non-compliant under cumulative plus project conditions during either AM or PM peak hours but are compliant under near-term plus project conditions during both peak hours.

It should be noted that at some intersections the average delay is shown to decrease with the addition of Project traffic. This occurs because the intersection delay is a weighted average of all intersection movements. When traffic is added to movements with delays lower than the average intersection delay, the average delay for the entire intersection can decrease. Furthermore, the congestion and queue spillback at an adjacent intersection can constrain the traffic volume at some intersections resulting in a small decrease in average delay.

Notes:
* Denotes CMP Intersection
AWSC - All Way Stop Control; TWSC - Two Way Stop Control
[1] Average delay is reported for signalized and AWSC intersections. For TWSC intersections, the delay for the worst stop-controlled movement is reported
"OVERSAT" indicates that the SimTraffic microsimulation model indicates that the intersection would experience capacity issues where the demand cannot be served by the intersection. Oversaturated intersections would operate at LOS F.
[1]Intersections were analyzed using Synchro/SimTraffic software due to the close proximity of these intersections. Changes in average delay and critical delay calculated using Vistro.

[2]The intersection is not considered as non-compliant under cumulative plus project conditions because the critical movement of the local approach shifts with the addition of project traffic.
**Bold** indicates substandard level of service
**Bold** (boxed) indicates noncompliance. The project exceeds thresholds in the City of Menlo Park's TIA Guidelines.

Note:
* Denotes a CMP interesection
AWSC - All Way Stop Control; TWSC - Two Way Stop Control
[1] Average delay is reported for signalized and AWSC intersections. For TWSC intersections, the delay for the worst stop-controlled movement is reported.
"OVERSAT" indicates that the SimTraffic microsimulation model indicates that the intersection would experience capacity issues where the demand cannot be served by the intersection. Oversaturated intersections would operate at LOS F.
[*] Intersections were analyzed using Synchro/SimTraffic software due to the close proximity of these intersections. Changes in critical delay and v/c calculated using Traffix.
**Bold** indicates substandard level of service
$\boxed{\textbf{Bold}}$ indicates adverse effect

## Adverse Effects and Recommended Improvements

For intersections that are non-compliant under both near-term plus project conditions and cumulative plus project conditions, the recommended improvements proposed under near term plus project conditions would be sufficient to address cumulative non-compliance. Improvements for intersections that are non-compliant only under cumulative plus project conditions are described below.

**Marsh Road and Bohannon Drive/Florence Street (#5)**

This intersection is expected to operate at an unacceptable LOS E during the AM peak hour and an acceptable LOS D during the PM peak hour under cumulative conditions. The addition of Project traffic would cause the average critical delay to increase by more than 0.8 during the AM peak hour. The intersection would continue to operate at an acceptable LOS D during the PM peak hour. This constitutes non-compliance during the AM peak hour according to the thresholds established by the City of Menlo Park.

Modification of the westbound approach at this intersection to a left-turn lane, two through lanes, and a right-turn lane would improve the average delay to better than cumulative no project conditions. Menlo Park's TIF program proposes Class II buffered bike lanes along Marsh Road from Bay Road to Scott Road in both directions and the removal of on-street parking in the eastbound direction. The restriping of the vehicle travel lanes to include a westbound right-turn only lane and the proposed Class II buffered bike lane would require narrowing the travel lanes to 11 feet and removal of the median. While this is possible, removal of the median would require removing at least one tree as well as the signal pole in the median. Upgrades to at least one mast arm would be required to replace the removed median signal. Physical improvements at this intersection are considered infeasible due to right-of-way constraints and/or adverse effects on pedestrian and bicycle travel. The City's TIF program includes multi-modal improvements along the Marsh Road corridor such as Class II buffered bike lanes along Marsh Road from Bay Road to Scott Road, and installing sidewalks along the north-side of Marsh Road between Page Street and Bohannon Drive/Florence Street. Implementing recommended multi-modal facilities along the corridor (from the City's TIF program) could shift some motor vehicle traffic to alternative modes of travel and reduce congestion. With implementation of these multi-modal improvements, the intersection deficiencies could be further reduced and partially address the Proposed Project's share of the non-compliant operations at this intersection.

**Willow Road and Ivy Drive (#19)**

Willow Road and Ivy Drive is an intersection on the Willow Road Corridor, which is expected to experience capacity issues due to unserved demand at the intersections. This intersection would operate unacceptably under cumulative conditions during both peak hours. With the addition of Project traffic, it would continue to operate unacceptable during both peak hours. In the PM peak hour, the increase in the critical movement delay of the local approach would be greater than 0.8 seconds. This constitutes non-compliance during the PM peak hour according to the thresholds established by the City of Menlo Park.

The Menlo Park TIF proposes to install a right-turn overlap phase on southbound Ivy Drive and restrict eastbound Willow Road U-turns. This would improve the critical movement delay of the local approach to better than cumulative no project conditions. The Project is required to pay traffic impact fees according to the City's current TIF schedule.

**Willow Road and Hospital Plaza/Durham Street (#25)**

Willow Road and Hospital Plaza/Durham Street is an intersection on the Willow Road Corridor, which is expected to experience capacity issues due to unserved demand at the intersections. This intersection would operate unacceptably under cumulative conditions during both peak hours. With the addition of Project traffic, it would continue to operate unacceptably during both peak hours. In the AM and PM peak hour, the increase in the critical movement delay of the local approach would be greater than 0.8 seconds. This constitutes non-compliance during both peak hours according to the thresholds established by the City of Menlo Park.

The recommended improvement measure for this intersection is restriping northbound Durham Street as a shared left-through lane and right-turn lane, and adding a northbound right turn overlap phase. With this improvement, the critical movement delay of the local approach would improve to better than cumulative no project conditions in the AM peak hour. The PM peak hour would continue to be non-compliant. If this recommended improvement measure is implemented, the Project should contribute its fair share (25%) towards the improvement. Fair share is calculated as the percentage of net project traffic generated of the overall cumulative traffic growth at this intersection.

**University Avenue and Woodland Avenue (#46)**

University Avenue and Woodland Avenue is in the vicinity of the US 101/University Avenue interchange and is expected to experience capacity issues due to unserved demand at the intersections. This intersection would operate unacceptably under cumulative conditions during both peak hours. With the addition of Project traffic, it would continue to operate unacceptably during both peak hours. In the AM and PM peak hour, the increase in the average critical delay would be greater than four seconds and the increase in the volume to capacity ratio would be greater than 0.01. This constitutes non-compliance during both peak hours according to the thresholds established by the City of East Palo Alto.

The recommended Donohoe Street improvements (see Appendix E) at Euclid Avenue and at the US 101 northbound on-ramp would improve traffic flow on University Avenue and eliminate the queue spillback that extends from Donohoe Street past Woodland Avenue. While the University Avenue and Woodland Avenue intersection is expected to continue to operate at LOS F during both peak hours, the Donohoe Street improvements would reduce the average delay at the intersection below cumulative conditions without the Project. With these improvements, the intersection would comply with the City of East Palo Alto's level of service policy. As discussed under the background plus Project discussion above, the project would pay its fair share costs towards the intersection improvements at the 6 intersections of the University Avenue/Donohoe Street/US 101 corridor.

**Saratoga Avenue and Newbridge Street (#49)**

This intersection is expected to operate at an acceptable LOS F during the AM peak hour and an unacceptable LOS E during the PM peak hour under cumulative conditions. With the addition of Project traffic, the intersection average critical delay at the intersection would increase by four seconds and the volume to capacity ratio would increase by 0.01 during the AM peak hour. This constitutes as non-compliance during the AM peak hour according to the thresholds established by the City of East Palo Alto.

Since the intersection currently operates as two-way-stop-controlled, potential modification to bring the intersection to pre-project conditions would be to signalize it. The intersection would meet the MUTCD signal warrant during both peak hours under project conditions (see Appendix F). With this improvement, the intersection would operate acceptably at LOS C during the AM peak hour and LOS B during the PM peak hour under cumulative plus project conditions. However, since the intersection is located only 200 feet south of Willow Road, signalization is not recommended. Short of signalization, no other improvements are feasible. Furthermore, given this intersection is located outside of the City of Menlo Park, the City cannot ensure implementation of any improvements. This intersection is also not listed with improvements in the City of East Palo Alto TIF.

**Bayshore Road and Euclid Avenue (#50)**

Bayshore Road and Euclid Avenue is in the vicinity of the US 101/University Avenue interchange and is expected to experience capacity issues due to unserved demand at the intersections. This intersection would operate unacceptably under cumulative conditions during both peak hours. With the addition of Project traffic, it would continue to operate unacceptably during both peak hours. In the AM peak hour, the increase in the average critical delay would be greater than four seconds and the increase in the volume to capacity ratio would be greater than 0.01. This constitutes non-compliance during the AM peak hour according to the thresholds established by the City of East Palo Alto.

Since the intersection currently operates as all-way-stop-controlled, potential modification to bring the intersection to pre-project conditions would be to signalize it and add a westbound right turn only lane. This improvement is included in the recommended Donohoe Street improvements (see Appendix E, Transportation/Traffic, of this EIR). The proposed improvements at Euclid Avenue and at the US 101 northbound on-ramp would improve traffic flow on University Avenue and eliminate the queue spillback that extends from Donohoe Street past Woodland Avenue. This would reduce the average delay at the intersection below cumulative conditions without the project. With these improvements, the intersection would be in compliance with the City of East Palo Alto's level of service policy. As discussed under the background plus project discussion above, the Project would pay its fair share costs towards the intersection improvements at the 6 intersections of the University Avenue/Donohoe Street/US 101 corridor, which includes the intersection at Bayshore Road and Euclid Avenue.

## Cumulative (2040) Plus Dumbarton Rail Intersection Levels of Service

The results of the intersection level of service analysis under cumulative conditions with the Dumbarton Rail are summarized in Table 20 and 21. All study intersections are expected to operate better cumulative conditions with the Dumbarton rail than without the Dumbarton rail. The intersection LOS calculation sheets are included in Appendix C. The following study intersection would improve to acceptable LOS with the Dumbarton Rail during at least one peak hour:

6. Marsh Road and Bay Road (AM peak hour)

## Cumulative (2040) Plus Project with Dumbarton Rail Intersection Levels of Service

The results of the intersection level of service analysis under cumulative (2040) plus project conditions with the Dumbarton rail are summarized in Tables 20 and 21. Compared to cumulative plus project conditions without the Dumbarton Rail, the delay at all of the intersections would improve with Dumbarton Rail. While the overall motor vehicle operations would experience reduced delay with Dumbarton Rail, when evaluating for intersection LOS compliance, the determination is based on the relative increase in delay due to the Project compared to no project conditions (cumulative conditions with Dumbarton Rail). Comparing "cumulative plus project with Dumbarton Rail" conditions to "cumulative plus project without Dumbarton Rail" conditions, the following study intersection would no longer be non-compliant:

25. Willow Road & Durham Street

The following additional study intersections would be non-compliant under cumulative plus project conditions with the Dumbarton rail as compared to cumulative plus project conditions without the Dumbarton Rail:

6. Marsh Road and Bay Road (AM peak hour)
11. Chrysler Drive and Constitution Drive (AM peak hour)
16. Willow Road and Bayfront Expressway (AM peak hour)

Under cumulative conditions with or without the Project, the road network is over saturated. Since the Dumbarton rail would reduce vehicular traffic in the area due to the increase in transit mode share, the Menlo Park Travel Demand model assigns more Project-generated traffic at some intersections where vehicular capacity is now available. Menlo Park's level of service standards and adverse effect criteria are very stringent where a small change in traffic can trigger a non-compliance at an intersection. Therefore, the relative increase in delay due to the Project at some intersections between "cumulative with Dumbarton Rail" and "cumulative plus project with Dumbarton Rail" would be greater than the Menlo Park's threshold, causing additional intersections to be non-compliant under cumulative plus project conditions with the Dumbarton rail.

## Adverse Effects and Recommended Improvements

For intersections that are non-compliant under cumulative plus project conditions and cumulative plus project with Dumbarton rail conditions, the improvements proposed under cumulative plus project conditions would be sufficient to address cumulative non-compliance. Improvements for intersections that are non-compliant only under cumulative plus project with Dumbarton rail conditions are described below. As noted below, no additional feasible improvements are identified and the improvement measures identified below are for informational purposes only.

**Marsh Road and Bay Road (#6)**

This intersection is expected to operate at an acceptable LOS D during both peak hours under cumulative conditions with the Dumbarton rail. The addition of Project traffic would cause the intersection to operate at LOS E during the AM peak hour. The intersection would continue to operate at an acceptable LOS D during the PM peak hour. This constitutes non-compliance during the AM peak hour according to the thresholds established by the City of Menlo Park.

Physical improvements at this intersection are considered infeasible due to right-of-way constraints and/or adverse effects on pedestrian and bicycle travel. Menlo Park's TIF program proposes Class II buffered bike lanes along Marsh Road from Bay Road to Scott Road in both directions. The improvement may lead to an overall increase in bicycle mode share but would not offset the Project traffic.

**Chrysler Drive and Constitution Drive (#11)**

This intersection is expected to operate at an unacceptable LOS F during both peak hours under cumulative conditions with Dumbarton rail. With the addition of Project traffic, the average critical delay would increase by more than 0.8 seconds during the AM peak hour. The intersection would continue to operate acceptably during the PM peak hour. This constitutes non-compliance during the AM peak hour according to the thresholds established by the City of Menlo Park.

Physical improvements at this intersection are considered infeasible due to right-of-way constraints and/or adverse effects on pedestrian and bicycle travel.

**Willow Road and Bayfront Expressway 9#16)**

Improvements for this intersection are discussed under the near term plus project section as part of the Willow Road corridor improvements, and is not repeated here.

Notes:
* Denotes CMP Intersection
AWSC - All Way Stop Control; TWSC - Two Way Stop Control
[1] Average delay is reported for signalized and AWSC intersections. For TWSC intersections, the delay for the worst stop-controlled movement is reported
"OVERSAT" indicates that the SimTraffic microsimulation model indicates that the intersection would experience capacity issues where the demand cannot be served by the intersection. Oversaturated intersections would operate at LOS F.
[1]Intersections were analyzed using Synchro/SimTraffic software due to the close proximity of these intersections. Changes in average delay and critical delay calculated using Vistro.
[2]The intersection is not considered as non-compliant under cumulative plus project conditions because the critical movement of the local approach shifts with the addition of project traffic.
**Bold** indicates substandard level of service
$\boxed{\textbf{Bold}}$ indicates noncompliance. The project exceeds thresholds in the City of Menlo Park's TIA Guidelines.

Note:
* Denotes a CMP interesection
AWSC - All Way Stop Control; TWSC - Two Way Stop Control
[1] Average delay is reported for signalized and AWSC intersections. For TWSC intersections, the delay for the worst stop-controlled movement is reported.
"OVERSAT" indicates that the SimTraffic microsimulation model indicates that the intersection would experience capacity issues where the demand cannot be served by the intersection. Oversaturated intersections would operate at LOS F.
[*] Intersections were analyzed using Synchro/SimTraffic software due to the close proximity of these intersections. Changes in critical delay and v/c calculated using Traffix.
**Bold** indicates substandard level of service
$\boxed{\textbf{Bold}}$ indicates adverse effect

## Intersection Vehicle Queuing

The analysis of intersection levels of service was supplemented with a vehicle queuing analysis for intersection left-turning movements where the proposed project would add significant trips per lane in the vicinity of the Project Site and affect intersection operations (see Figure 22). This analysis provides a basis for estimating future storage requirements at these intersections (see Table 22). Vehicle queues were estimated using the methodology described in Chapter 1. The following turn movements were selected for evaluation:

- Northbound left-turn at Marsh Road and Bayfront Expressway
- Eastbound left-turn at Willow Road and Bayfront Expressway
- Eastbound left-turn and Southbound left-turn at Willow Road and Ivy Drive
- Southbound left-turn at Willow Road and US 101 southbound ramps
- Southbound left-turn at Willow Road and Bay Road
- Westbound shared left-through lane and Eastbound shared through-right lane at O’Brien Drive and Kavanaugh Drive
- Southbound shared left/through lane at Adams Drive and O’Brien Drive
- Eastbound left-turn and Southbound left-turn at University Avenue and O’Brien Drive
- Eastbound left-turn at University Avenue and Kavanaugh Drive

Locations where the estimated 95th percentile queues would exceed the available storage capacity for the movement are discussed below. Queuing issues are operational issues resulting from signal timing and queue storage provisions. Queuing issues are not considered a CEQA issue related to hazards.

### Eastbound Left-turn at Willow Road and Bayfront Expressway (#16)

The existing vehicle storage for the eastbound left turn pocket on Willow Road at Bayfront Expressway is 300 feet, which provides enough space for about 12 vehicles. Under existing conditions, the 95th percentile queue would exceed the storage of the left turn pocket by 12 vehicles in the AM peak hour. Under near-term conditions, the 95th percentile queue would exceed the storage length of the turn pocket by 15 vehicles during the AM peak hour and four vehicles during the PM peak hour. The Proposed Project would add three vehicles to the 95th percentile queue during the AM peak hour and PM peak hour. There is no room to extend the left turn pocket due to the emergency vehicle only lane cut in the median.

### Eastbound Left-turn at Willow Road and Ivy Drive (#19)

The existing vehicle storage for the eastbound left turn pocket on Willow Road at Ivy Drive is 125 feet, which provides enough space for about 5 vehicles. Under existing conditions, the 95th percentile queue would be accommodated by the left turn pocket. Under near-term conditions, the 95th percentile queue exceeds the storage length of the turn pocket by three vehicles during the AM peak hour. The Proposed Project would add one vehicle to the 95th percentile queue during the AM peak hour and one vehicle during the PM peak hour. There is no room to further extend this left-turn.

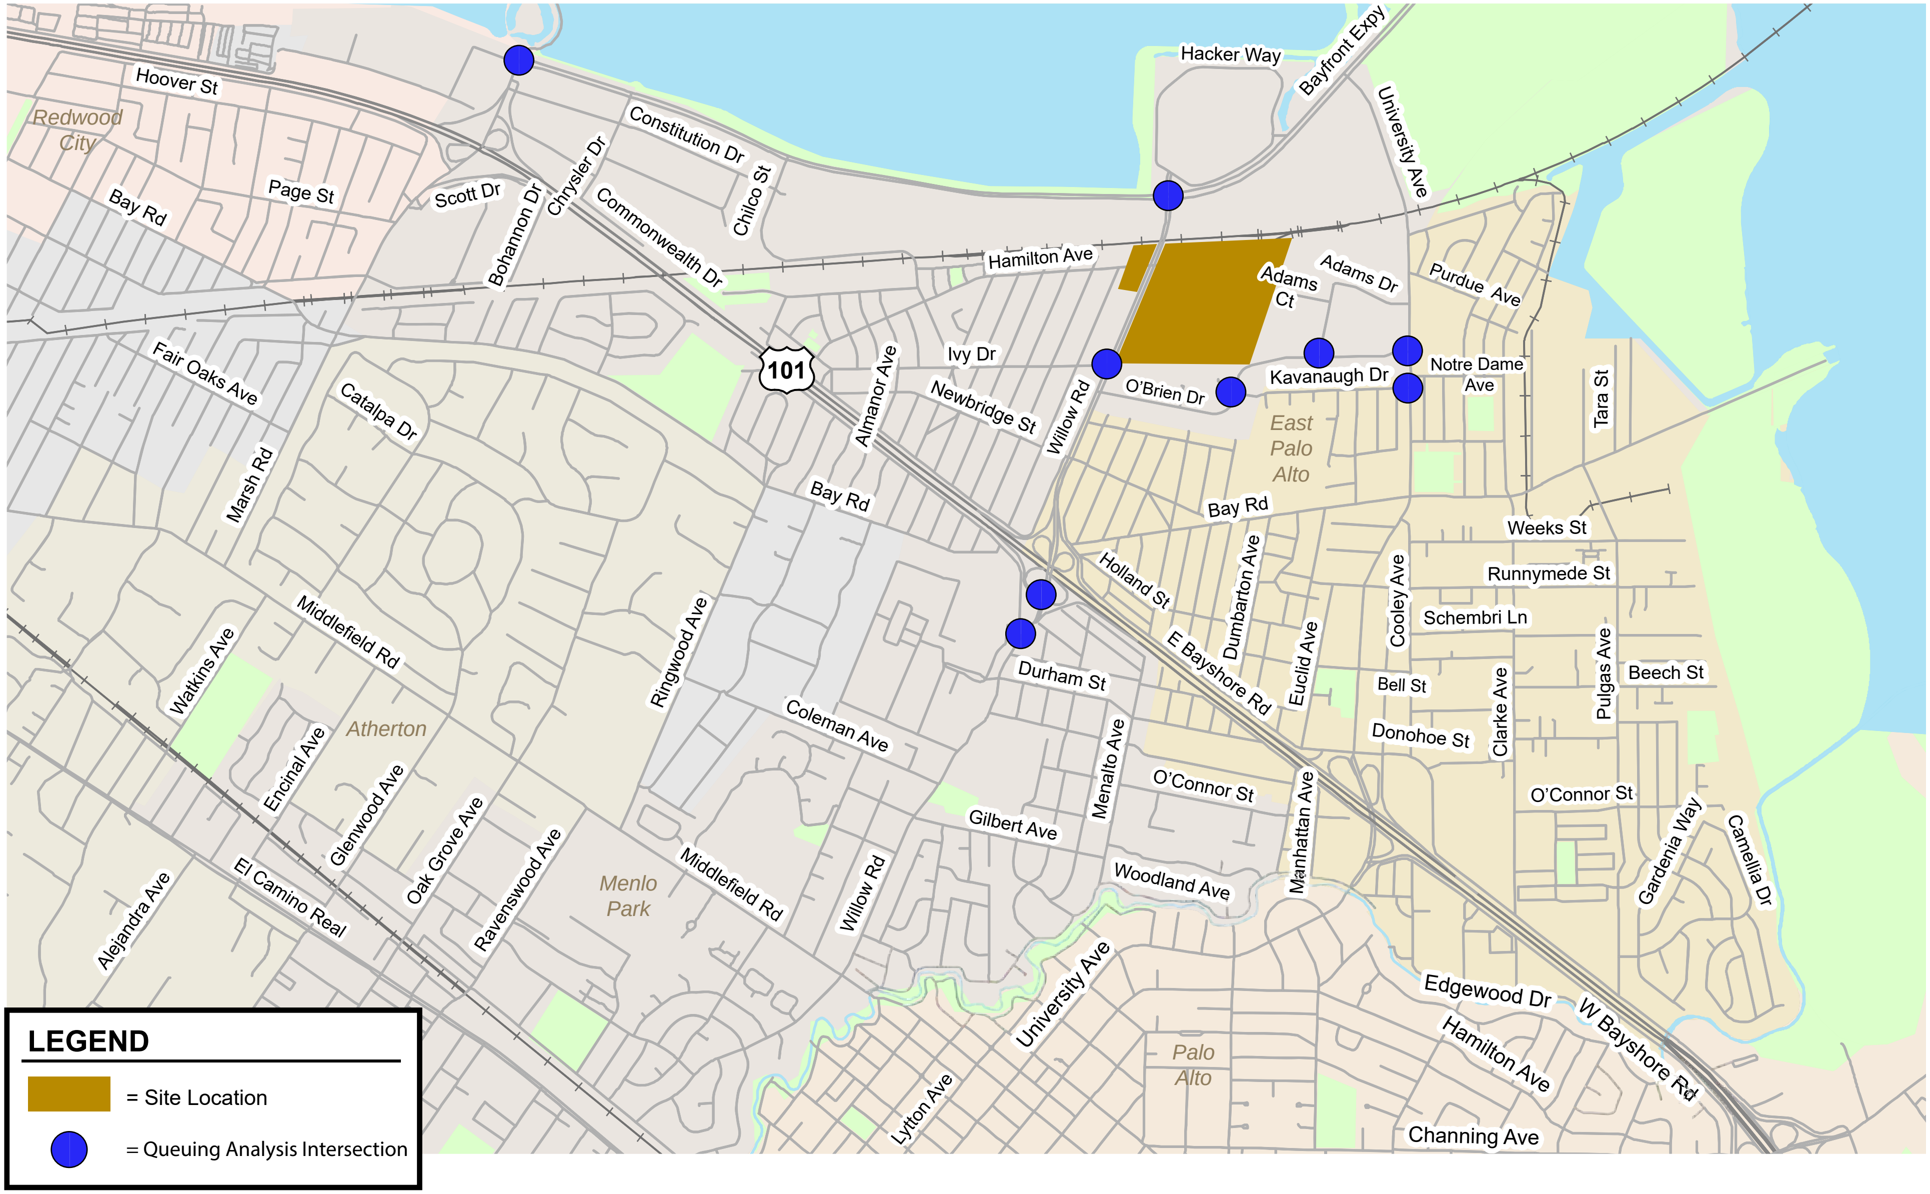

**Figure 22**
**Queuing Analysis Locations**

HEXAGON

NORTH
Not to Scale

### Southbound Left-turn at Willow Road and Bay Road (#24)

The existing vehicle storage for the southbound left turn pocket on Willow Road at Bay Road is 250 feet, which provides enough space for about 10 vehicles. Under existing conditions, the 95th percentile queue would exceed the storage length of the left turn pocket by 6 vehicles. Under near-term conditions, the 95th percentile queue exceeds the storage length of the turn pocket by 13 vehicles during the AM peak hour and one vehicle during the PM peak hour. The Proposed Project would add six vehicles to the 95th percentile queue during the AM peak hour and three vehicles during the PM peak hour. Menlo Park's TIF has a project to add a second left-turn lane to this intersection, which would add additional storage for left-turning vehicles. The exact length of the addition will be determined during the design phase for the intersection improvement. Construction of the recommended improvement would reduce the queuing deficiency created by the Proposed Project.

### Eastbound Left-turn and Southbound left-turn at University Avenue and O'Brien Drive (#36)

The existing vehicle storage for the eastbound left turn pocket on University Avenue at O'Brien Drive is 125 feet, which provides enough spaces for about 5 vehicles. Under existing conditions, the 95th percentile queue exceeds the storage length of the turn pocket by 3 vehicles during the AM peak hour. The Proposed Project would add 22 vehicles to the 95th percentile queue during the AM peak hour. There is no room to lengthen the eastbound left turn pocket.

The existing vehicle storage for the southbound left turn pocket on O'Brien Drive at University Avenue is 60 feet, which provides enough spaces for 2 vehicles. Under existing conditions, the 95th percentile queue exceeds the storage length of the turn pocket by one vehicle during the AM peak hour and 11 vehicles during the PM peak hour. The Project would add one vehicle to the 95th percentile queue during the AM peak hour. There would be no increase to the 95th percentile queue length during the PM peak hour. There is room to extend the left turn pocket to accommodate the estimated 95$^{th}$ percentile queue of 325 feet.

Menlo Park's Traffic Impact Fee (TIF) program identifies an improvement to signalize the nearby intersection at University Avenue and Adams Drive in East Palo Alto. This improvement may provide an alternative route for Project vehicles to access the Project Site via University Avenue, and alleviate potential queuing issues at this intersection.

[1] Vehicle queue calculations based on cycle length for signalized intersections and delay for the approach for unsignalized intersections.
[2] Assumes 25 feet per vehicle queued.
[3] Intersection is all-way-stop-controlled under existing conditions and signalized under background condiitions.
[4] 95th Percentile queue length used from Vistro software.
[5] 95th Percentile queue length developed using Poisson Distribution.

## Freeway Facilities Analysis

In analyzing the freeway segments, the citywide travel demand forecast model was used to forecast the increase in traffic volumes between existing and near term plus project conditions. For the purpose of this study, freeway levels of service under cumulative conditions are calculated based on volume to capacity (V/C) ratio. A freeway segment is assumed to operate at LOS F under future conditions if,

- The freeway segment already operates at LOS F under existing conditions, or
- The ConnectMenlo model forecasts the freeway segment to operate at a V/C ratio above 1 under future conditions.

### Definition of Adverse Freeway Effects

**San Mateo County**

Within San Mateo County, the project is said to create an adverse effect on traffic conditions on a freeway segment if for either peak hour:

1. The analysis indicates that the combination of the proposed project and future traffic demand will result in the freeway segment operating at a level of service that exceeds the standard adopted by the current CMP and the proposed project increases traffic demand on the freeway segment by an amount equal to one percent (1%) or more of the segment capacity, or
2. The project will add traffic demand equal to one percent (1%) or more of the segment capacity if the freeway segment is currently not in compliance with the adopted LOS standard.

**Santa Clara County**

VTA CMP guidelines define that a project would cause an adverse effect on freeway operations if for either peak hour:

1. The project would deteriorate freeway levels of service from an acceptable level to an unacceptable level, or
2. If the freeway already operates at an unacceptable level under existing conditions, and the project would add traffic exceeding one percent (1%) of the freeway capacity.

**Alameda County**

The Alameda County CMP does not have a policy for determining a threshold of significance for CMP requirements. The freeway segment analysis (see Table 25 below) is provided only for information.

### Freeway Analysis

To determine the Proposed Project's potential freeway adverse effects, a select-zone analysis within the Menlo Park model was performed to estimate the increase in project traffic volume between existing conditions and near term with project conditions. Freeway segments that would experience a freeway adverse effect generated by the Proposed Project are identified below.

**San Mateo County**

As shown on Table 23, the proposed project would add traffic greater than 1% capacity to the following study freeway segments operating below its LOS standard:

- SR 84 – from Willow Road to Alameda County Line – PM Peak Hour
- SR 84 – from Alameda County Line to Willow Road – AM Peak Hour
- US 101 – between Santa Clara County Line and Whipple Avenue – AM & PM Peak Hours
- US 101 – from Whipple Avenue to SR 92 – PM Peak Hour
- US 101 – from SR 92 to Whipple Avenue – AM Peak Hour

**Santa Clara County**

As shown on Table 24, the proposed project would add traffic greater than 1% capacity to the following mixed-flow freeway segments operating below its LOS standard:

- US 101 – from SR 85 to Embarcadero Road – AM & PM Peak Hours
- US 101 – from Embarcadero Road to SR 85 – PM Peak hour

The proposed project would add traffic greater than 1% capacity to the following HOV freeway segment operating below its LOS standard:

- US 101 – from Oregon Expressway to Embarcadero Road – AM Peak Hour

## Freeway Improvements

It should be noted that the near term plus project conditions model run assumed the US 101 express lane project in San Mateo County. Improvements to eliminate the adverse freeway effects on US 101 and on SR 84 within San Mateo County would require additional capacity improvements and/or additional TDM measures that would reduce peak-hour vehicle trip-making by more than 70%. San Mateo County currently has no plans to further improve US 101 beyond the identified express lane projects. There are also no identified plans to improve the Bayfront Expressway (SR 84) corridor. Such an aggressive TDM plan would also not be feasible.

Within Santa Clara County, Valley Transportation Authority's Valley Transportation Plan 2040 identifies freeway express lane projects along US 101 that would convert the existing HOV lanes to express lanes and add a second express lane in each direction. This improvement would increase the capacity of the freeway and would adequately address the freeway impacts.

The potential Dumbarton Rail corridor would slightly reduce the Project contribution to the identified adverse effects but would not eliminate any. Therefore, the Project's adverse effects on US 101 and on SR 84 freeway segments in San Mateo County would remain.

**Table 23**

## Freeway Ramp Analysis

A freeway ramp analysis is conducted under near term plus project conditions to determine whether freeway ramps would continue to have sufficient capacity to serve the forecasted traffic demand. For the purpose of this study, the project is said to create an adverse effect on a freeway ramp if:

- The project would cause the volume-to-capacity (V/C) ratio of the freeway ramp to exceed 1.0; or
- The project would increase the amount of traffic on a freeway ramp that is already exceeding its capacity by more than one percent (1%) of the ramp's capacity.

As shown on Table 26, under near term plus project conditions, all study freeway ramps would continue to have sufficient capacity to serve the anticipated demand.

**Table 26**
**Freeway Ramp Capacity Analysis**

| Interchange | Ramp | Peak Hour | Lanes Type | Mixed | HOV | Meter [1] | Capacity [2] | Existing Conditions Volume [3] | Existing Conditions V/C | Near Term + Project Conditions Volume | Near Term + Project Conditions V/C |

| | | PM | | | | YES | 900 | 744 | 0.83 | 810 | 0.90 |

Notes:
*NB = Northbound; SB = Southbound; EB = Eastbound; WB = Westbound*
1. Northbound on-ramps are assumed metered during the AM peak hour. Southbound on-ramps are assumed metered during the PM peak hour.
2. Ramp capacities were obtained from *Highway Capacity Manual 2000* , and considered the free-flow speed, the number of lanes on the ramp, and ramp metering.
3. Existing volumes referenced intersection counts collected in 2019.

## Roadway ADT Analysis

This analysis included the evaluation of roadway average daily traffic (ADT) for 10 roadway segments (see Table 27 below) to determine the project's effect on City street segments. According to the City of Menlo Park *Transportation Impact Analysis Guidelines* published in July 2020, a project-generated traffic impact on City street segments would be considered potentially noncompliant if:

1. On Main Street, Avenue-Mixed Use, and Avenue-Neighborhood, a traffic impact may be considered potentially noncompliant if the existing ADT is:
    1) Greater than 19,000, and there is a net increase of 100 trips or more in ADT due to project related traffic;
    2) The ADT is greater than 10,000 but less than 18,000, and the project related traffic increases the ADT by 12.5%, or the ADT becomes 18,000 or more; or
    3) The ADT is less than 10,000, and the project related traffic increases the ADT by 25%.
2. On Mixed-Use Collector, and Neighborhood Collector, a traffic impact may be considered potentially noncompliant if the existing ADT is:
    1) Greater than 9,000, and there is a net increase of 50 trips or more in ADT due to project related traffic;
    2) The ADT is greater than 5,000 but less than 9,000, and the project related traffic increases the ADT by 12.5% or the ADT becomes 9,000 or more; or
    3) The ADT is less than 5,000, and the project related traffic increases the ADT by 25%.
3. On Neighborhood Connector, Bicycle Boulevard, and Local Access, a traffic impact may be considered potentially noncompliant if the existing ADT is:
    1) Greater than 1,350, and there is a net increase of 25 trips or more in ADT due to project related traffic;
    2) The ADT is greater than 750 but less than 1,350, and the project related traffic increases the ADT by 12.5% or the ADT becomes 1,350; or
    3) The ADT is less than 740, and the project related traffic increases the ADT by 25%.

The roadway ADT analysis was conducted under cumulative with project conditions. To determine net Project added traffic, a select zone analysis was conducted using the Menlo Park model under cumulative with project conditions and existing conditions. As shown on Table 27, the Project would generate non-compliance at the following roadway segments:

- Willow Road, east of Durham Street
- Willow Road, east of Blackburn Avenue
- Middlefield Road, south of Willow Road
- Marsh Road, east of Bohannon Drive
- O'Brien Drive, south of Willow Road
- O'Brien Drive, north of University Avenue
- Bay Road, north of Willow Road

**Table 27**
**Roadway ADT Analysis**

| Roadway | Classification | Average Daily Traffic | | | Compliance Analysis | |
|---|---|---|---|---|---|---|
| | | Existing [1] | Cumulative with Project | Net Increase in Project Traffic | Applicable Criteria | Compliant? |
| Willow Road, east of Durham Street | Avenue - Mixed Use | 28,875 | 31,400 | 550 | 7.B.1(1) | **No** |
| Willow Road, east of Blackburn Avenue | Avenue - Mixed Use | 22,962 | 24,050 | 410 | 7.B.1(1) | **No** |

| Bay Road, north of Willow Road | Neighborhood Collector | 6,362 | 12,637 | 841 | 7.B.2(2) | **No** |

Notes:
[1] Average Daily Traffic data was obtained from the City of Menlo Park
[2] Average Daily Traffic was estimated using factors derived from ADT data and peak hour counts
**Bold** indicates a project-generated non-compliance for study roadway

## Internal Site Access, Circulation, and Parking

Appendix H includes the analysis of the main Willow Village site as well as the Hamilton parcels. The site plan review evaluated the internal site's intersection operations, potential queuing issues, and general site access and circulation for the proposed seven new internal streets, 14 parking garage driveways, and 20 new intersections. The results of the level of service analysis show that the intersection of Driveway B & East Loop Road would operate at LOS D during the AM peak hour. Vehicles turning left out of Driveway B would be expected to experience an average delay of 31 seconds while waiting for a sufficient opening on East Loop Road. During the AM peak hour, approximately 101 vehicles (16 heading eastbound and 85 heading westbound) would be expected to exit the garage, which would be one to two vehicles per minute. Therefore, although exiting drivers would experience some wait time, operations at Driveway B are expected to be adequate. The results of the queuing analysis show that the intersection of Hamilton Avenue/Main Street & Willow Road is expected to have insufficient turn lane storage to accommodate the anticipated traffic volumes under near-term plus project conditions. However, it is assumed that vehicles would choose to instead enter the project site via Park Street. Hexagon recommends the following regarding the internal project circulation:

**Circulation Related Recommendations**

- To prevent southbound queues from spilling back onto Willow Road on Park Street and Main Street, Hexagon recommends coordinating the adjacent signals.

**Sight Distance Related Recommendations**

- As discussed under Mitigation Measure TRA-3 (see Transportation Chapter of the draft EIR), prior to issuance of the building permit for the North Garage, the applicant shall revise the access design to provide adequate sight distance for the eastern driveway or other design solutions to reduce hazards to a less than significant level, to the satisfaction of the Public Works Director. Potential solutions that would reduce hazards to a less than significant level include restricting the eastern driveway to inbound vehicles only or prohibiting exiting left turns, modifying landscaping or relocating the driveway to the west to allow for adequate sight distance for exiting vehicles, or installing an all-way stop or signal. If driveway A were restricted to inbound vehicles only, all outbound vehicles would use Driveway B, which would provide adequate sight distance for vehicles exiting the north office garage. Driveway B might need multiple exiting lanes to limit queuing inside the garage for exiting vehicles. Alternatively, Driveway A could be moved farther west on East Loop Road so that adequate sight distance could be provided.
- Prior to final design, the project applicant should ensure that landscaping and vegetation would not obstruct visibility at the parking garage driveways.
- Hexagon recommends including 30 feet of red curb on both sides of all garage driveways to prevent vehicles from parking and obstructing the vision of exiting drivers.
- If vehicles exiting the garages cannot see oncoming pedestrians on the sidewalk, Hexagon recommends installing warning signs to alert pedestrians when vehicles are exiting the garages.
- If any driveways are moved from their position on the current site plan, sight distance should be reevaluated.

**Parking Garage Circulation Related Recommendations**

- Prior to final design, it is recommended that all driveway widths meet the City's requirements.
- At garage driveways where gates and garage doors are proposed, Hexagon recommends conducting an operational analysis to ensure that gate opening and closing times would not create queuing issues or cause vehicles to spill onto the roadway network.
- Prior to final design, the residential parking on level P1 of building RS2 should be shown to be gated and separated from the retail parking on levels 1 and 2. In addition, the roll-up gate in building RS3 should be clearly shown to separate the retail parking in level B1 and the residential parking in level B2.
- It is recommended that all drive aisle and parking stall widths meet the City's requirements.
- It is recommended that adequate turnaround space is provided at all dead-end drive aisles.

**Parking Related Recommendations**

- If individual vehicles are not able to be retrieved in the tandem puzzle parking, the tandem spaces should be assigned to one residential unit.
- Prior to final design, Hexagon recommends that the required number of ADA and EV parking spaces be provided in all parking garages.

**Pedestrian Related Recommendations**

- Hexagon recommends that a crosswalk is provided at the intersection of Center Street & East Street and that midblock crosswalks are provided on Center Street and Park Street to reduce block size and improve pedestrian convenience.

**Hamilton Parcels Recommendations**

- The Hamilton Avenue Parcels are located within the C-2-S zoning district, which per Menlo Park Municipal Code Section 16.37(7), will have parking requirements established by the planning commission for each development. The Hamilton Avenue Parcel North proposes total potential development up to 22,402 square feet and 93 spaces. The Hamilton Avenue Parcel South proposes total development of 5,760 s.f. and 13 spaces. It is recommended that the project applicant confirm that sufficient parking is provided for the proposed total development as part of future architectural control and use permit applications with the City.

## Memorandum

**Date:** September 16, 2020

**To:** Kirsten Chapman, ICF International

**From:** Trisha Dudala, Ollie Zhou

**Subject:** Willow Village – Willow Road Traffic Operations Analysis

## Introduction

This report presents the results of the corridor study conducted along Willow Road between Bayfront Expressway to the north and Durham Road to the south in the City of Menlo Park, California. The objective of the study was to quantify peak hour intersection operations taking into consideration the effect of vehicular queueing on Willow Road. Presented in this report are the results of a detailed analysis of the existing traffic operations at intersections along Willow Road. A map of the study area is shown on Figure 1.

## Scope of Study

This study was conducted for the purpose of documenting existing traffic operations along Willow Road. This corridor study includes an analysis of weekday AM (7-10 AM) and PM (4-7 PM) peak hour traffic conditions for the following nine signalized intersections along Willow Road. These intersections are shown on Figure 1.

### Study Intersections

1. Bayfront Expressway & Willow Road
2. Hamilton Avenue & Willow Road
3. Ivy Drive & Willow Road
4. O'Brien Drive & Willow Road
5. Newbridge Street & Willow Road
6. US 101 NB Ramps & Willow Road
7. US 101 SB Ramps & Willow Road
8. Bay Road & Willow Road
9. Hospital Plaza/Durham Street & Willow Road

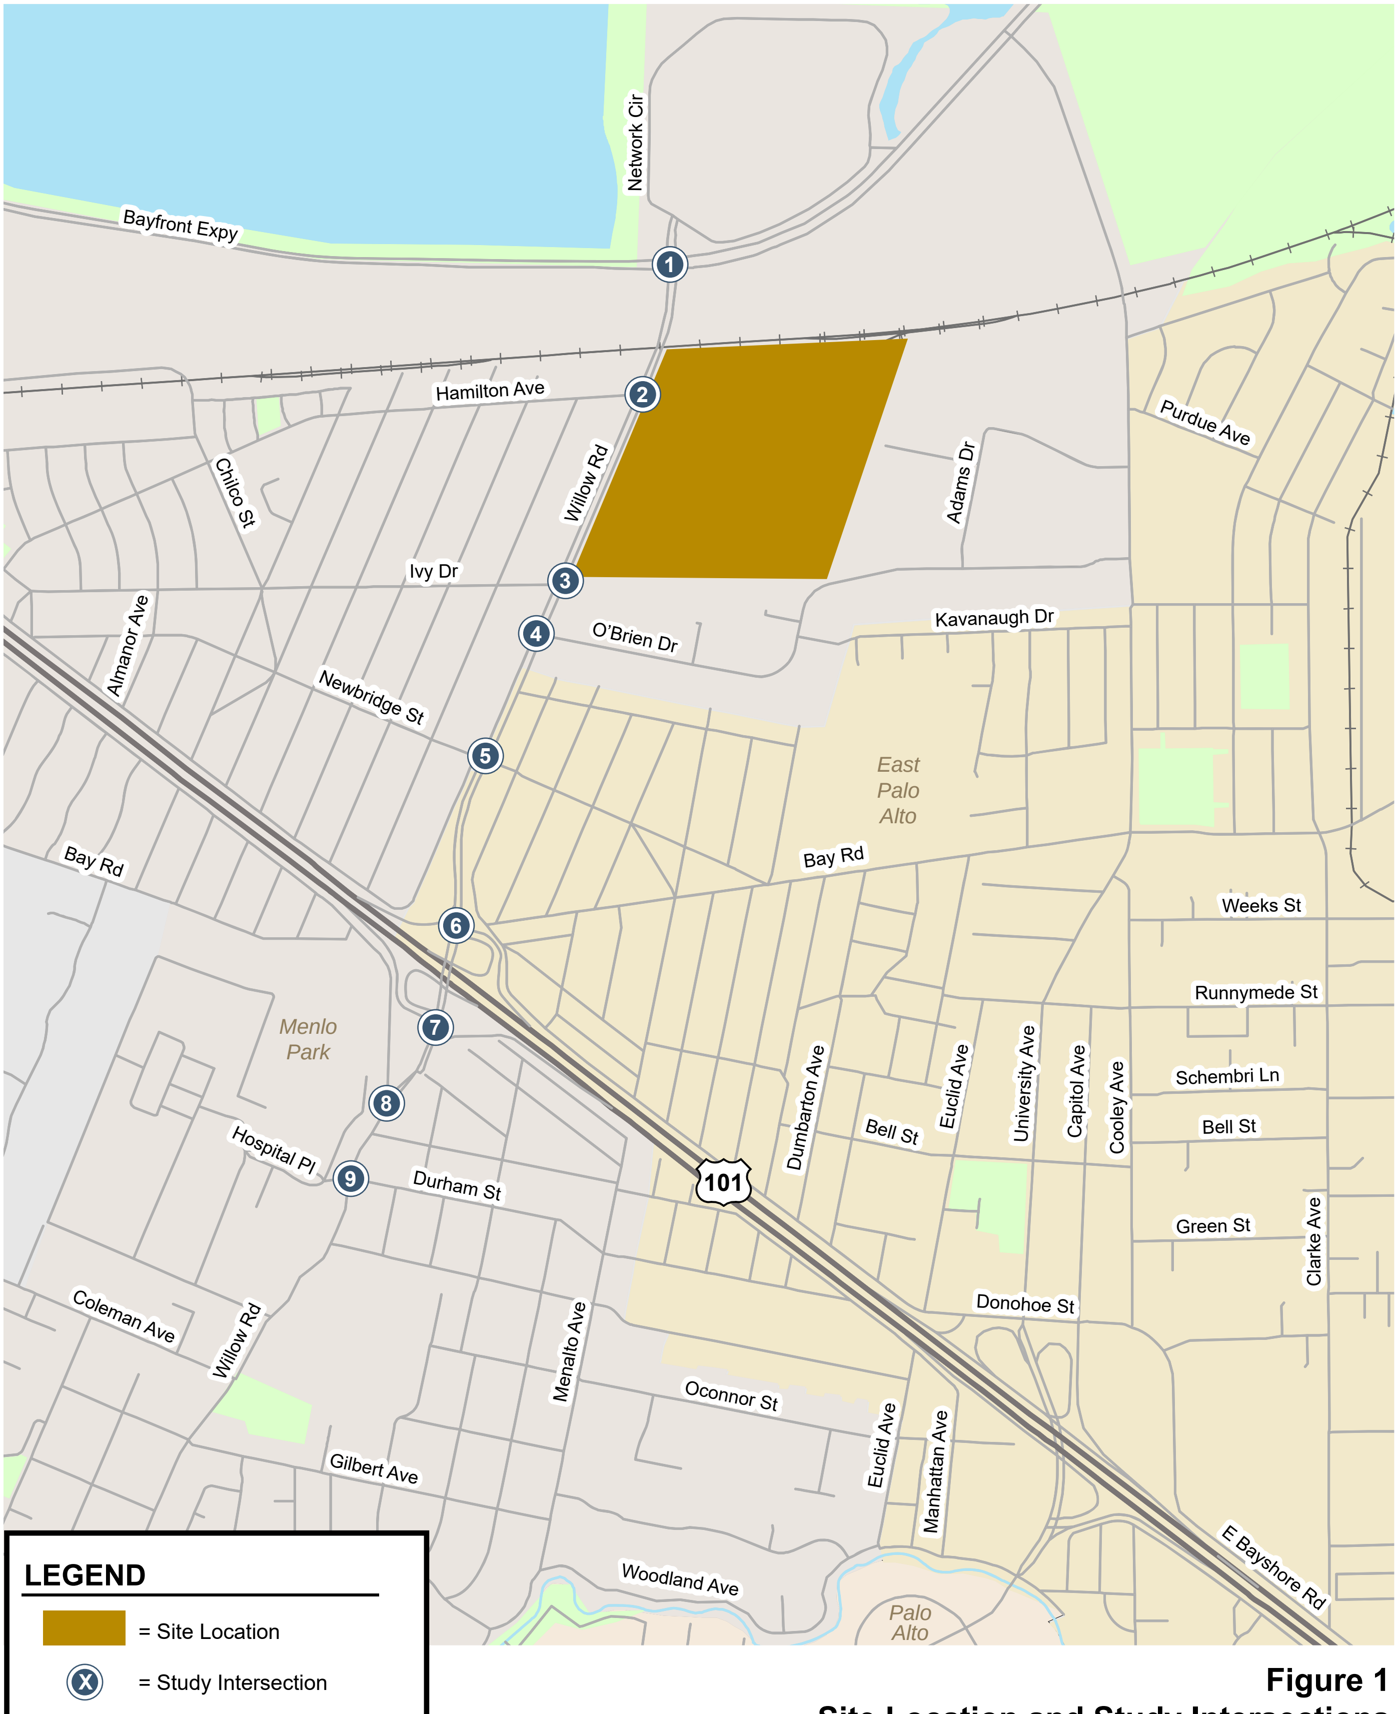

**Figure 1**
**Site Location and Study Intersections**

# Data Collection

Hexagon collected existing roadway geometry, peak hour intersection turning movement volumes, travel time runs and intersection queuing characteristics within the study area during March and April 2019. Most traffic congestion in the study area was observed to occur during the morning (7:00 – 10:00 AM) and evening (4:00 – 7:00 PM) peak commute hours. It is noted that during the time when the traffic counts were conducted, the US 101 improvements at the Willow Road interchange were not fully constructed. The existing conditions analysis was calibrated and validated based on the March/April 2019 lane geometry, traffic counts and field observations of queueing in the study area, when the US 101 interchange improvements were still under construction. Since then, US 101 interchange improvements at Willow Road have been completed. The lane geometry at the study intersections are shown on Figure 2.

## Intersection Turning Movements Counts

Traffic counts at the study intersections were not all conducted on the same day. Intersection turning movements counts at the intersections of Bayfront/Willow and Bay/Willow were conducted on April 23, 2019 for both the AM and PM peak hour durations. AM and PM peak hour turning movement counts for intersections at Hamilton/Willow, Ivy/Willow, O'Brien/Willow and Newbridge/Willow were conducted on March 21st, 2019. AM and PM peak hour turning movement counts at the US 101 NB/Willow and US 101/SB Willow intersections were conducted on March 13, 2019. AM and PM peak hour traffic counts at the Durham/Willow intersection were conducted on April 16, 2019.

The AM peak hour turning movement vehicular volumes at all study intersections are shown on Figure 3 and the PM peak hour turning movement vehicular volumes (occurring between 5:00 – 6:00pm) are shown on Figure 4 for all study intersections.

## Demand Volumes

As discussed below, field observations showed that queuing occurs for some turning movements, particularly during the PM peak period along the Willow Road corridor. The vehicles in queue represent unserved demand during the peak hour periods. In order to account for the unserved demand, turning movements counts at all study intersections along the corridor were balanced, and the turning movement volumes were adjusted by adding the number of queued vehicles to the count volumes. The number of queued vehicles were calculated based on how far vehicular queues extended on the roadways during some cycles observed during the peak hour. The demand volumes are also shown on Figure 3 and Figure 4.

# Field Observations

Hexagon conducted field observations of traffic congestion and vehicle queuing at the study intersections during the AM and PM peak periods in March 2019. Field observations showed that some operational problems currently occur during the peak commute hours. These problems are described below.

## Willow Road and Bayfront Expressway

During the AM peak hour, the eastbound left-turn queue exceeded the storage length. The eastbound left-turn traffic encroached into the closest eastbound through lane. The eastbound left-turn traffic required more than one cycle to clear the intersection. The northbound left-turn was observed to back up traffic (possibly) due to the westbound red light at the Willow Road/Hamilton Avenue intersection. This backup caused the westbound through lane to wait to clear the Willow

Road/Bayfront Expressway intersection until there was room to clear the intersection. The westbound through lane occasionally required more than one cycle to clear the intersection.

During the PM peak hour, the eastbound right-turn queue exceeded the storage length and spilled into the nearest through lane. The eastbound right-turn lane occasionally required more than one cycle to clear the intersection.

## Willow Road between Hamilton Avenue and Hospital Plaza/Durham Street

During the AM peak hour, there was heavy demand on westbound Willow Road along this corridor. Westbound vehicles often required multiple cycles to clear an intersection. As a result, the southbound right-turn and northbound left-turn movements on the side streets turning onto westbound Willow Road also required multiple cycles to clear the intersection. The westbound queue was usually able to clear at the Willow Road/Durham Street intersection due to the long through phase. The eastbound left-turn movement at the Newbridge Street intersection received heavy demand and occasionally required two signal cycles to clear. Vehicles at the US 101 northbound off-ramp turning right onto eastbound Willow Road frequently queued onto the auxiliary lane on US 101 and required multiple cycles to clear.

During the PM peak hour, there was heavy demand on eastbound Willow Road along this corridor. Eastbound vehicles often required multiple cycles to clear an intersection. As a result, the northbound right-turn and southbound left-turn movements on the side streets turning onto eastbound Willow Road also required multiple cycles to clear the intersection. The westbound left-turn movement at the Hamilton Avenue intersection received heavy demand that often required two signal cycles to clear. Vehicles at the US 101 northbound off-ramp turning right onto eastbound Willow Road frequently queued onto the auxiliary lane on US 101 and required multiple cycles to clear. Vehicles at the US 101 southbound off-ramp turning left onto eastbound Willow Road were often impacted by eastbound spillback queues and were observed to block the westbound through movement. The southbound left-turn queue extended onto US 101 southbound and impacted freeway operations.

## Travel Time Runs

Hexagon collected Bluetooth travel time data on May 22, 2019 to determine the AM and PM peak hour travel time on eastbound and westbound Willow Road between Bayfront Expressway and Coleman Avenue. Bluetooth sensors were placed at nine locations along the study corridor. Two sensors were placed south of Bayfront Expressway to capture eastbound and westbound traffic on Willow Road near the intersection. Sensors capturing both directions of traffic were placed along Willow Road at the intersections of Hamilton Avenue, Ivy Drive, O'Brien Drive, Newbridge Street, Bay Road, Durham Street, and Coleman Avenue. These sensors anonymously record timestamps when vehicles with Bluetooth-capable devices pass them. In order to deem the data as valid, two requirements were applied to the data: a) sampled travel time cannot be lower than the free-flow travel time resulting from a speed of 40 mph, and b) sampled travel time cannot be longer than 3 signal cycles unless justified by field observations. Using these requirements, valid Bluetooth data at the intersections varied from 0.4% to 22% of the existing traffic counts. AM and PM peak hour travel times on eastbound and westbound Willow Road are summarized in Table 1.

As shown in Table 1, the travel time on eastbound Willow Road varied between 3 minutes and 26 minutes during the AM peak hour, with an average travel time of 9 minutes. During the PM peak hour, the travel varied between 8 minutes and 38 minutes, with an average travel time of 18 minutes. The travel time on westbound Willow Road varied between 4 minutes and 35 minutes with an average of 12 minutes during the AM peak hour and between 2 minutes and 31 minutes with an average travel time of 9 minutes during the PM peak hour. Field observations conducted during the PM peak hour indicated that the high demand for traffic on eastbound Willow Road to turn onto southbound Bayfront Expressway caused vehicular queues to extend through the upstream intersections affecting traffic progression on eastbound Willow Road.

## Table 1
## Willow Road Travel Time Runs

| Segments Along Willow Road | | | AM Peak Hour | | | | PM Peak Hour | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | | | Travel Time Statistics (secs) | | Valid Samples Statistics [1] | | Travel Time Statistics (secs) | | Valid Samples Statistics [1] | |

Notes:
WB = Westbound, EB = Eastbound
[1] Two validity requirements were applied: a) sampled travel time cannot be lower than a free-flow travel time resulting from a speed of 40 mph, and b) sampled travel time cannot be longer than 3 signal cycles unless justified by field observations.

# Analysis Methodology

This section describes the methods and performance criteria use to evaluate traffic operations along the Willow Road corridor between Bayfront Expressway and Durham Street.

## Analysis Method

Due to the close spacing of the study intersections, the intersection analysis was conducted using the SimTraffic (version 10) software, using methodologies consistent with the *Highway Capacity Manual 2010* (Transportation Research Board, 2011). Unlike macroscopic models of isolated intersection operations, such as the *Highway Capacity Manual* intersection level of service methodology, SimTraffic is a microscopic model that measures the full impact of queuing and blocking attributed to closely spaced intersections. In addition to reporting statistics such as average vehicle delay, the simulation software produces visual animation files that depict traffic operations.

Per Caltrans guidelines, the simulation analysis reflects pent-up traffic demand that is unable to be served during the peak hour and thus is not reflected in existing intersection turning-movement counts. The existing traffic demand was estimated based on the turning-movement count volumes and the observed queue lengths. The existing conditions SimTraffic model was calibrated and validated to existing conditions based on existing lane geometry (as of March 2019), existing AM and PM peak hour traffic counts, observed peak-hour vehicular queues, and the observed signal timings. The procedures used are consistent with *Traffic Analysis Toolbox Volume III" Guidelines for Applying Traffic Microsimulation Modeling Software (*FHWA, 2004).

## Level of Service Criteria

The average delay time (measured in seconds per vehicle) calculated by the simulation model was correlated to Level of Service (LOS) based on the thresholds contained in the *2010 Highway Capacity Manual*. Level of Service is a qualitative description of operating conditions ranging from LOS A, or free-flow conditions with little or no delay, to LOS F, or jammed conditions with excessive delays. The correlation between delay and level of service is shown on Table 2 for signalized intersections. All study intersections along Willow Road between Bayfront Expressway and US 101 interchange are under the jurisdiction of Caltrans. Caltrans maintains a minimum level of service (LOS) at the transition between LOS C and LOS D for all of its facilities. Where an existing facility is operating at less than the LOS C/D threshold, the existing LOS should be maintained. The study intersections of Willow/Bay and Willow/Hospital Plaza-Durham Street are under the jurisdiction of the City. The City of Menlo Park level of service standard is LOS D or better for all signalized study intersections.

## Measures of Effectiveness

The following Measures of Effectiveness (MOEs) computed with the SimTraffic model are used to quantify and validate traffic operations along Willow Road between Bayfront Expressway and Durham Street:

- Volume Served – The number of vehicles that can be served by the corridor during the analysis period. At locations where the demand exceeds capacity, the volume served will be less than the demand volume.
- Total Travel Time – The average time taken by all vehicles to travel through the corridor during the peak hour. It includes the average delay through the corridor, vehicles queues, and impedance caused by merging vehicles.

- LOS - The weighted average delay (measured in seconds per vehicle) calculated by the microscopic simulation model was correlated to LOS based on the thresholds contained in the *2010 Highway Capacity Manual*.

**Table 2**
**Signalized Intersection Level of Service Definitions Based on Control Delay**

| Level of Service | Description | Average Control Delay Per Vehicle (Sec.) |
|---|---|---|
| A | Signal progression is extremely favorable. Most vehicles arrive during the green phase and do not stop at all. Short cycle lengths may also contribute to the very low vehicle delay. | 10.0 or less |
| B | Operations characterized by good signal progression and/or short cycle lengths. More vehicles stop than with LOS A, causing higher levels of average vehicle delay. | 10.1 to 20.0 |
| C | Higher delays may result from fair signal progression and/or longer cycle lengths. Individual cycle failures may begin to appear at this level. The number of vehicles stopping is significant, though may still pass through the intersection without stopping. | 20.1 to 35.0 |
| D | The influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable signal progression, long cycle lenghts, or high volume-to-capacity (V/C) ratios. Many vehicles stop and individual cycle failures are noticeable. | 35.1 to 55.0 |
| E | This is considered to be the limit of acceptable delay. These high delay values generally indicate poor signal progression, long cycle lengths, and high volume-to-capacity (V/C) ratios. Individual cycle failures occur frequently. | 55.1 to 80.0 |
| F | This level of delay is considered unacceptable by most drivers. This condition often occurs with oversaturation, that is, when arrival flow rates exceed the capacity of the intersection. Poor progression and long cycle lengths may also be major contributing causes of such delay levels. | greater than 80.0 |

## Existing Conditions Traffic Operations Analysis

This section describes the development, calibration and validation of the Synchro model that was used to evaluate existing peak hour conditions along Willow Road.

### Model Development and Calibration

The Synchro model was developed by drawing the roadway network using an aerial photo of the study area as a background image. Geometric information such as number of lanes, curvature, turn restrictions, and location of lane drops, and lane additions were based on aerial photographs and field observations conducted in March 2019. Intersection signal operations were based on signal timing information that was provided by the City. Adjustments were made to the signal timing based on measuring the cycle lengths and splits at each of the study intersections in the field. Where unsignalized driveways with heavy traffic turning into and out of the driveways are located on Willow

Road between the signalized intersections, saturation flow rates for Willow Road were adjusted. The existing AM and PM peak hour demand volumes were used as input volumes to develop the existing conditions model. It is noted that the Willow Road/US 101 interchange improvements were not completed when the traffic counts were done in March/April 2019. As a result, existing AM and PM peak hour conditions were calibrated and validated based on the lane geometry, traffic volumes, travel time runs and field observations that were conducted in 2019. Since then, the US 101/Willow Road interchange improvements have been completed. At both the US 101 off-ramps, no right-turn-on red was assumed.

The Synchro model was validated to existing conditions using the criteria described in *Traffic Analysis Toolbox Volume III: Guidelines for Applying Traffic Microsimulation Modeling Software* (FHWA Department of Transportation, 2004). The software's default data on vehicle and driver characteristics were used. A number of iterations were required to successfully validate the existing conditions model to observed conditions. Further refinements were made at specific locations during the model calibration process. For example, for the eastbound Willow Road segment between Hamilton and Ivy Drive, the model showed a higher throughput for the eastbound traffic compared to the traffic counts during the PM peak hour. The headway factors for the eastbound through lanes were adjusted (to account for traffic turning in and out of the unsignalized driveways between Hamilton Avenue and Ivy Drive) so that the model served volume matched the traffic counts at this intersection. Increasing the headway factor for the eastbound approach on Willow Road caused vehicles to slow down resulting in longer travel time for eastbound Willow Road attributed to traffic slow down due to traffic turning into and out of the unsignalized driveways between Hamilton Avenue and Ivy Drive.

## Model Validation

During the validation process, the model estimates were compared to the field data to measure the model's accuracy. The following criteria were used:

- Turning movement volumes for more than 85% of the cases should have a GEH (Geoffrey E. Havers) statistic of less than 5. The GEH statistic is a measure of goodness of fit named after the statistician who developed it. The model served volume at each of the five study intersections was compared to the raw turning movement counts. The GEH statistic for the individual turning movements was calculated to be less than 5 at most of the locations, and the GEH statistic for the total volume through the intersection was also calculated to be less than 5 (see Table 3). The formula for GEH statistic is shown below:

$$GEH = \sqrt{\frac{2(M-C)^2}{M+C}}$$

  - Where *M* is the hourly traffic volume from the Synchro model and *C* is the real-world hourly traffic count.

- Average travel time runs should fall within the range observed in the field. The model estimated average travel time on eastbound Willow Road was approximately 8 minutes during the AM peak hour and 23 minutes during the PM peak hour (see Table 4 and Table 6). The blue tooth travel time runs on eastbound Willow Road showed that the average travel time was approximately 9 minutes during the AM peak hour and 18 minutes during the PM peak hour. The model estimated average travel time on westbound Willow Road was approximately 13 minutes during the AM peak hour and 9 minutes during the PM peak hour (see Table 5 and Table 7). The Bluetooth travel time runs on westbound Willow Road showed that the travel time averaged approximately 12 minutes during the AM peak hour and 9 minutes during the PM peak hour. Although the average travel times between intersections varied widely between the model data and the Bluetooth data, the overall average travel time on eastbound and westbound Willow Road between Bayfront Expressway and Durham Road matched well during both the peak hours.

- The visual queuing shown in the model should match queues observed in the field. Queues shown in the model matched field observations. The model showed long queues on westbound Willow Road during the AM peak hour and on eastbound Willow Road during the PM peak hour in the study area. The queues extended from the Bayfront Expressway past Durham Road during the PM peak hour. The model queues matched the queues observed in the field.

## Existing Conditions Level of Service Analysis

The calibrated and validated SimTraffic model was used to analyze traffic operations at the nine study intersections along the corridor. Table 8 shows the average weighted delay and the corresponding LOS during the AM and PM peak hour periods under existing conditions. The weighted average delay (measured in seconds per vehicle) calculated by the microscopic simulation model was correlated to LOS based on the thresholds contained in the *2010 Highway Capacity Manual*. Also provided in the table is the delay and LOS at the study intersections that were reported in previous studies using Vistro software. The large variance in the delay and LOS is primarily because the Vistro model did not take into account the delay caused by downstream queues on Willow Road during the AM and PM peak hours. The simulation analysis showed that all study intersections along Willow Road between Bayfront Expressway and Durham Street operate at unacceptable levels of service during at least one of the peak hours.

The analysis showed that during the AM peak hour, all study intersection along Willow Road between Bayfront Expressway and US 101 northbound off-ramp currently operate at unacceptable LOS E or F. During the PM peak hour, the analysis showed that all study intersections along Willow Road currently operate at unacceptable LOS E or F except for the intersection of Willow Road and Ivy Drive. During the PM peak hour, the poor levels of service along Willow Road is attributed to the heavy demand on eastbound Willow Road. Due to the close proximity of the traffic signal at Ivy Drive to the traffic signal at O'Brien Drive, the queues on eastbound Willow Road at Ivy Drive spill over into the upstream intersection at O'Brien Drive. The delay caused by this spill over queue is reflected in the delay reported for the Willow Road/O'Brien Drive intersection. The delay reported for the Willow Road/Ivy Drive intersection reflects delay for the eastbound approach only between Ivy Drive and O'Brien Drive, which is a short segment that measures approximately 270 feet in length.

**Table 8**

Notes:
Avg Delay = Average Delay in seconds; LOS = Level of Service
[1] Average delay was obtained from the Vistro files provided by Kittleson & Associates.
[2] At signalized intersections, delay shown is the weighted average delay for all vehicles entering the intersection.
**Bold** indicates a substandard level of service.
