This Report contains certain information obtained from a variety of public and other sources reasonably available to Environmental Data Resources, Inc. It cannot be concluded from this Report that coverage information for the target and surrounding properties does not exist from other sources. **NO WARRANTY EXPRESSED OR IMPLIED, IS MADE WHATSOEVER IN CONNECTION WITH THIS REPORT. ENVIRONMENTAL DATA RESOURCES, INC. SPECIFICALLY DISCLAIMS THE MAKING OF ANY SUCH WARRANTIES, INCLUDING WITHOUT LIMITATION, MERCHANTABILITY OR FITNESS FOR A PARTICULAR USE OR PURPOSE. ALL RISK IS ASSUMED BY THE USER. IN NO EVENT SHALL ENVIRONMENTAL DATA RESOURCES, INC. BE LIABLE TO ANYONE, WHETHER ARISING OUT OF ERRORS OR OMISSIONS, NEGLIGENCE, ACCIDENT OR ANY OTHER CAUSE, FOR ANY LOSS OF DAMAGE, INCLUDING, WITHOUT LIMITATION, SPECIAL, INCIDENTAL, CONSEQUENTIAL, OR EXEMPLARY DAMAGES. ANY LIABILITY ON THE PART OF ENVIRONMENTAL DATA RESOURCES, INC. IS STRICTLY LIMITED TO A REFUND OF THE AMOUNT PAID FOR THIS REPORT.** Purchaser accepts this Report "AS IS". Any analyses, estimates, ratings, environmental risk levels or risk codes provided in this Report are provided for illustrative purposes only, and are not intended to provide, nor should they be interpreted as providing any facts regarding, or prediction or forecast of, any environmental risk for any property. Only a Phase I Environmental Site Assessment performed by an environmental professional can provide information regarding the environmental risk for any property. Additionally, the information provided in this Report is not to be construed as legal advice.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

TARGET PROPERTY INFORMATION

ADDRESS

3705 HAVEN AVENUE
REDWOOD CITY, CA 94063

COORDINATES

Latitude (North):	37.4855990 - 37° 29' 8.15''
Longitude (West):	122.1822500 - 122° 10' 56.10''
Universal Tranverse Mercator:	Zone 10
UTM X (Meters):	572297.3
UTM Y (Meters):	4148853.2
Elevation:	10 ft. above sea level

EXECUTIVE SUMMARY

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

A review of the SEMS-ARCHIVE list, as provided by EDR, and dated 12/11/2017 has revealed that there are 2 SEMS-ARCHIVE sites within approximately 0.5 miles of the target property.

Federal RCRA CORRACTS facilities list

CORRACTS: CORRACTS is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

A review of the CORRACTS list, as provided by EDR, and dated 12/11/2017 has revealed that there are 3 CORRACTS sites within approximately 1 mile of the target property.

EXECUTIVE SUMMARY

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

A review of the RCRA-TSDF list, as provided by EDR, and dated 12/11/2017 has revealed that there is 1 RCRA-TSDF site within approximately 0.5 miles of the target property.

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 12/11/2017 has revealed that there is 1 RCRA-LQG site within approximately 0.25 miles of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page
NANOSYN	3760 HAVEN AVE.	NE 0 - 1/8 (0.014 mi.)	B23	34

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 12/11/2017 has revealed that there are 16 RCRA-SQG sites within approximately 0.25 miles of the target property.

State- and tribal - equivalent CERCLIS

CA ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the CA ENVIROSTOR list, as provided by EDR, and dated 10/30/2017 has revealed that there are 9 CA ENVIROSTOR sites within approximately 1 mile of the target property.

Local Lists of Registered Storage Tanks

CA SWEEPS UST: Statewide Environmental Evaluation and Planning System. This underground storage tank listing was updated and maintained by a company contacted by the SWRCB in the early 1990's. The listing is no longer updated or maintained. The local agency is the contact for more information on a site on the SWEEPS list.

A review of the CA SWEEPS UST list, as provided by EDR, and dated 06/01/1994 has revealed that there are 4 CA SWEEPS UST sites within approximately 0.25 miles of the target property.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 12/11/2017 has revealed that there are 2 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

KOB AUTO INC Facility Id: 9026	3717 HAVEN AVENUE	0 - 1/8 (0.000 mi.)	B9	13

CA HAZNET: The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000-1,000,000 annually, representing approximately 350,000-500,000 shipments. Data from non-California manifests & continuation sheets are not included at the present time. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, & disposal method. The source is the Department of Toxic Substance Control is the agency. This database begins with calendar year 1993.

A review of the CA HAZNET list, as provided by EDR, and dated 12/31/2016 has revealed that there are 2 CA HAZNET sites within approximately 0.001 miles of the target property.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Site History:	Extracted from Geologica's October 2, 2013 Supplemental Soil Sampling and Remedial Excavation Completion Report. San Mateo County does not take responsibility for the accuracy of the statements made or any professional interpretations made in the referenced report. In April 2013, GEOLOGICA completed a supplemental soil quality sampling investigation of the former CT International site at 3645 Haven Avenue in Menlo Park, CA. The investigation was conducted to evaluate soil quality conditions relative to the current Residential Environmental Screening Levels (ESLs) established by the San

CT INTERNATIONAL SALES (Continued) **S102445197**

Francisco Bay Regional Water Quality Control Board (RWQCB). Between June and August 2013, GEOLOGICA conducted a focused soil excavation program to remove soil containing petroleum hydrocarbons and/or lead at concentrations greater than the RWQCBs Residential ESLs. This scope of work was developed by GEOLOGICA based on discussion with Mr. Charles Ice of the San Mateo County Environmental Health System (SMCEHS). The purpose of the investigation and excavation was to remove the no-residential use deed restriction on the property.

FINDS:

Registry ID: 110002673483

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

. Waste name: THE FOLLOWING SPENT HALOGENATED SOLVENTS USED IN DEGREASING: TETRACHLOROETHYLENE, TRICHLORETHYLENE, METHYLENE CHLORIDE, 1,1,1-TRICHLOROETHANE, CARBON TETRACHLORIDE AND CHLORINATED FLUOROCARBONS; ALL SPENT SOLVENT MIXTURES/BLENDS USED IN DEGREASING CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F002, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

. Waste code: F002
. Waste name: THE FOLLOWING SPENT HALOGENATED SOLVENTS: TETRACHLOROETHYLENE, METHYLENE CHLORIDE, TRICHLOROETHYLENE, 1,1,1-TRICHLOROETHANE, CHLOROBENZENE, 1,1,2-TRICHLORO-1,2,2-TRIFLUOROETHANE, ORTHO-DICHLOROBENZENE, TRICHLOROFLUOROMETHANE, AND 1,1,2, TRICHLOROETHANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Violation Status: No violations found

FINDS:

Registry ID: 110012546487

Environmental Interest/Information System
California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART)

LANDEC CORPORATION (Continued) **1000818864**

provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

HAZARDOUS AIR POLLUTANT MAJOR

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

FINDS:

Registry ID: 110002711691

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA

SCALE MODELS UNLIMITED (Continued) **1000279317**

program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Region:	STATE
Facility Status:	**Completed - Case Closed**
Status Date:	07/24/2014
Global Id:	T10000004645
Lead Agency:	SAN MATEO COUNTY LOP
Lead Agency Case Number:	449088
Latitude:	37.4865732879897
Longitude:	-122.184340953827
Case Type:	Cleanup Program Site
Case Worker:	BG
Local Agency:	SAN MATEO COUNTY LOP
RB Case Number:	Not reported
File Location:	Not reported
Potential Media Affected:	Contaminated Surface / Structure, Other Groundwater (uses other than drinking water), Soil
Potential Contaminants of Concern:	Other Chlorinated Hydrocarbons, Chlordane, DDD / DDE / DDT, Other Insecticides / Pesticide / Fumigants / Herbicides, Copper, Mercury (elemental), Other Metal, Diesel, Ethylbenzene, Gasoline, Naphthalene, Waste Oil / Motor / Hydraulic / Lubricating
Site History:	Extrated from AMEC's July 24, 2013 Site Management Plan. San Mateo County does not take responsibility for the accuracy of the statements made or any professional interpretations made in the referenced report. The site is located in an industrial portion of Menlo Park, San Mateo County, California, between Highway 101 and the San Francisco Bay (Figure 1). The overall site is bounded by Haven Avenue to the south, 3585 Haven Avenue to the west, 3645 Haven Avenue to the east, and 3641 Haven Avenue and salt ponds to the north. The site is relatively flat, sloping gently to the north toward San Francisco Bay. AMEC understands that SAP intends to develop the site for multi-unit rental housing. Figure 2 presents an initial proposed layout for the residential complex. In addition, AMEC understands that SAP intends to raise the site elevation by approximately 2.5 to 3 feet through the import of clean fill material to be compacted on site prior to development. In general, approximately 2 to 3 feet of fill is distributed across the site. The fill material is of varying quality and includes debris such as wood, rubber material, concrete, brick, and ceramics. The results of the Phase II ESA activities indicate that the general character of chemical impacts to the fill material are likely insignificant relative to residential human health screening criteria1, with the exception of the following locations: h At the northwestern portion of the site, impacted soil was identified at boring location SB-13 (Figure 3), which may be associated with the historical operation of an automotive salvage

ANTON MENLO (Continued) **S113186828**

facility. h At one boring location (SB-10) within an enclosed yard north of the 3611 Haven Avenue building, several pesticides were detected at concentrations exceeding their respective residential Environmental Screening Levels (ESLs) in the soil sample collected at 1 foot bgs. h One polychlorinated biphenyl (PCB) congener (PCB-1260) was detected above its residential ESL in the surface soil sample (SB-19-SUR) collected adjacent to a transformer located west of the 3611 Haven Avenue building. Concrete samples were collected from the pad around the transformer and the swale directly adjacent to the pad to evaluate whether the materials will require special handling during demolition activities. PCBs were not detected in any concrete samples, indicating that the concrete may be disposed of as part of the building demolition.

FINDS:

Registry ID: 110002690534

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

File Location:	Not reported
Potential Media Affected:	Not reported
Potential Contaminants of Concern:	Dichloroethene (DCE), Trichloroethylene (TCE), Vinyl chloride, Arsenic, Benzene, Diesel, Gasoline, Total Petroleum Hydrocarbons (TPH)
Site History:	The site is located in Bohannon Industrial Park Unit 3. The parcel area is 39,650 sf. Prior to construction of the building around 1966, the site was used for agriculture. The building was used for component manufacturing by Electro Nuclear Laboratories from 1974 to approx. 1975. The bldg. had been occupied by semiconductor manufacturing companies, including Raychem Corporation from 1983 to 1994. The 1989 Phase I &II Site Investigation results showed TCE up to 610 ug/l and above MCL concentrations of Cd, Cr, and Ag in GW sample from MW-2. No source of contamination confirmed on-site. Raychem also formerly occupied the adjoining property at 119 Independence GW sample from the MMW-1 in 1997contained up to 420 ug/l TCE, 35 ug/l DCE, and 35,000 ug/l chlorobenzene.

Treat To Water: Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity: Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

FINDS:

Registry ID: 110009530766

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

FINDS:

Registry ID: 110002900139

Environmental Interest/Information System
California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Handler Activities Summary:
U.S. importer of hazardous waste: No
Mixed waste (haz. and radioactive): No
Recycler of hazardous waste: No
Transporter of hazardous waste: No
Treater, storer or disposer of HW: No
Underground injection activity: No
On-site burner exemption: No
Furnace exemption: No
Used oil fuel burner: No
Used oil processor: No
User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

Biennial Reports:

Last Biennial Reporting Year: 2017

Annual Waste Handled:

Waste code:	D001
Waste name:	IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.
Amount (Lbs):	10272
Waste code:	D002
Waste name:	A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.
Amount (Lbs):	700

Completed Info:
Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Preliminary Endangerment Assessment Report
Completed Date: 06/20/1991
Comments: Raychem Corporation submitted a PEA to the Dept on 5/17/91. Results of the PEA indicate PCB in soil above extremely hazardous ttlc. Contaminated GW under site. A residential neighborhood and a school are located less than 200' to the South of site. A tidal slough and sensitive wetland are adjacent to the north boundary of the site. High-tech chemical, plastics and materials manufacturer operated at site since 1965. PEA submitted in May 1991 indicates that nickel and cadmium may be present in soils above their respective TTLC and/or STLC. Elevated levels of solvents found in GW under the site. PCB found in soils at levels above the extremely hazardous waste TTLC. PCB has also migrated off-site via surface runoff. Draft ISE determination and RAO sent to TLO for review on June 11, 1991.

Environmental Interest/Information System

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.

AIR SYNTHETIC MINOR

TSCA SUBMITTER

AIR EMISSIONS CLASSIFICATION UNKNOWN

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that

TYCO ELECTRONICS CORPORATION (Continued) **1000170323**

these facilities release directly to air, water, land, or that are transported off-site.

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

HAZARDOUS AIR POLLUTANT MAJOR

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Treat To Water:	Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.

TYCO ELECTRONICS CORPORATION (Continued) **1000170323**

Complexity: Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 12/11/2017

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 12/11/2017

Federal CERCLIS list

FEDERAL FACILITY: Federal Facility Site Information listing

A listing of National Priority List (NPL) and Base Realignment and Closure (BRAC) sites found in the Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) Database where EPA Federal Facilities Restoration and Reuse Office is involved in cleanup activities.

Date of Government Version: 11/07/2016

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

RCRA-CESQG: RCRA - Conditionally Exempt Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

State- and tribal - equivalent CERCLIS

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

Data Release Frequency: Quarterly

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites
Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006
Date Data Arrived at EDR: 03/01/2007

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

WASTEWATER PITS: Oil Wastewater Pits Listing
Water officials discovered that oil producers have been dumping chemical-laden wastewater into hundreds of unlined pits that are operating without proper permits. Inspections completed by the Central Valley Regional Water Quality Control Board revealed the existence of previously unidentified waste sites. The water board?s review found that more than one-third of the region?s active disposal pits are operating without permission.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

EDR Hist Cleaner: EDR Exclusive Historical Cleaners

EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:

Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing

Source: Centers for Medicare & Medicaid Services

North Map:	5640622 REDWOOD POINT, CA
Version Date:	2012

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principal investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

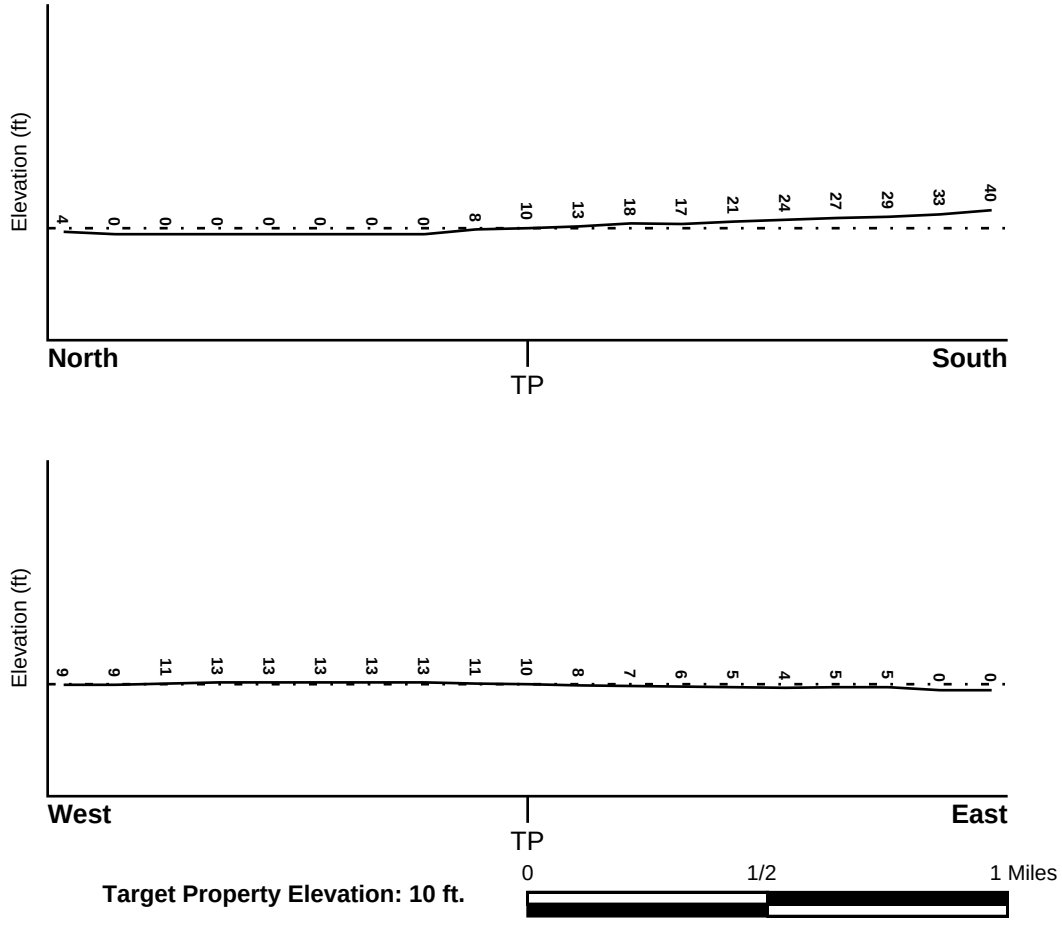
TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General NNE

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES



Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
06081C0306E	FEMA FIRM Flood data

Additional Panels in search area:	FEMA Source Type
06081C0195E	FEMA FIRM Flood data
06081C0302E	FEMA FIRM Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
PALO ALTO	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: Urban land

Soil Surface Texture:
Hydrologic Group: Class D - Very slow infiltration rates. Soils are clayey, have a high water table, or are shallow to an impervious layer.

Soil Drainage Class:
Hydric Status: Partially hydric

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	5 inches		Not reported	Not reported	Max: 0.01 Min: 0	Max: Min:

Soil Map ID: 2

Soil Component Name: Novato

Soil Surface Texture: clay

Hydrologic Group: Class D - Very slow infiltration rates. Soils are clayey, have a high water table, or are shallow to an impervious layer.

Soil Drainage Class: Very poorly drained

Hydric Status: All hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	16 inches	clay	Not reported	Not reported	Max: 1.4 Min: 0.42	Max: 9 Min: 7.9
2	16 inches	59 inches	clay	Not reported	Not reported	Max: 1.4 Min: 0.42	Max: 9 Min: 7.9

Soil Map ID: 3

Soil Component Name: Novato

Soil Surface Texture: clay

Hydrologic Group: Class D - Very slow infiltration rates. Soils are clayey, have a high water table, or are shallow to an impervious layer.

Soil Drainage Class: Very poorly drained

Hydric Status: Partially hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	16 inches	clay	Not reported	Not reported	Max: 1.4 Min: 0.42	Max: 9 Min: 7.9
2	16 inches	59 inches	clay	Not reported	Not reported	Max: 1.4 Min: 0.42	Max: 9 Min: 7.9

Soil Map ID: 4

Soil Component Name: Urban land

Soil Surface Texture:

Hydrologic Group: Class D - Very slow infiltration rates. Soils are clayey, have a high water table, or are shallow to an impervious layer.

Soil Drainage Class:

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	5 inches		Not reported	Not reported	Max: 0.01 Min: 0	Max: Min:

Soil Map ID: 5

Soil Component Name: Water

Soil Surface Texture:
Hydrologic Group: Class D - Very slow infiltration rates. Soils are clayey, have a high water table, or are shallow to an impervious layer.

Soil Drainage Class:
Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

No Layer Information available.

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

Appendix D

Resumes

1046 West Taylor Street, Suite 105, San Jose, CA
408.402-2238

Janelle Amendola
Project Manager

Ms. Amendola has more than 20 years of diverse environmental and engineering consulting experience, and extensive skills conducting and managing numerous concurrent and varied projects for diverse public and private sector clients. Ms. Amendola's specific areas of expertise and experience include Phase I Environmental Site Assessments, Phase II Environmental Site Assessments, soil and ground water contamination investigation and remediation, soil gas and vapor intrusion investigations, environmental regulatory compliance, storm water pollution prevention planning and sampling, hazardous materials compliance, air emissions permitting, underground storage tank removals, NEPA and state-equivalent programs, SPCC plan preparation, annual and biennial reporting, industrial wastewater permitting and monitoring programs, NPDES permits, hazardous materials business plans, environmental due diligence, property condition assessments, soil and ground water contamination investigation, geotechnical engineering, construction inspections, brownfields redevelopment, and project management/coordination.

.

SELECTED PHASE I AND PHASE II PROJECT EXPERIENCE

City of San Carlos, San Carlos, CA

Ms. Amendola conducted a Phase I Environmental Site Assessment on behalf of the City of San Carlos for three adjacent formerly industrial parcels in preparation of property acquisition and resale for commercial redevelopment. A chlorinated solvent release was previously investigated and closed at the site, but our assessment showed the concentrations of chlorinated solvents remaining at the site significantly exceeded current health standards for potential vapor intrusion. Ms. Amendola conducted multiple stages of Phase II investigations to define the nature and extent of the soil, soil vapor, and groundwater contamination. All work was performed under the guidance of the San Mateo County Department of Environmental Health (DEH). Upon completion of the investigations a remedial action plan (RAP) using enhanced bioremediation was submitted to the County and approved. The RAP was implemented and groundwater monitoring is currently being performed to document the effectiveness of the RAP.

Bradford Manufacturing, Santa Clara, CA

Ms. Amendola conducted a Phase I Environmental Site Assessment on five contiguous industrial parcels at which numerous releases were known to have occurred and varying amount of previous investigation had been conducted. AWR conducted multiple stages of Phase II investigations at the site under the direction and approval of the Department of Toxic Substance Control (DTSC) to define the nature and extent of the impacts, evaluate groundwater impacts, and prepare a remedial action plan that was approved by the DTSC. Ms. Amendola oversaw the removal of impacted soil and groundwater monitoring, culminating in the receipt of a no further action letter from the DTSC.

City of Osseo, Osseo, MN

Ms. Amendola conducted a Phase I and Phase II Environmental Site Assessment of a former salvage yard in Osseo, Minnesota, successfully prepared financial grant applications funding the majority of the investigation and remediation costs for the site, developed and implemented a remediation plan, worked closely with state and local agencies throughout the remediation, conducted a geotechnical investigation, and oversaw the construction testing for the construction of a new office building at the site.

Suncap Property Group, Redwood City, CA

Ms. Amendola conducted a Phase I Environmental Site Assessment for the previous owner of a formerly industrial property. Ms. Amendola then worked with the prospective property purchaser to implement multiple stages of Phase II investigations to evaluate environmental issues identified in the Phase I ESA under the direction and approval of the San Francisco Bay Regional Water Quality Control Board (RWQCB). The investigation led to Ms. Amendola preparing and overseeing the implementation of the remedial action workplan (RAW), culminating in receiving case closure from the RWQCB and the successful redevelopment of the site.

Santa Cruz County Department of Public Works, Santa Cruz, CA

Ms. Amendola conducted site investigation and remediation to evaluate and remediate a clarifier release at the Department of Public Works storage yard that impacted surface soils and also entered the onsite storm water management system and subsequently discharged elsewhere on the same property.

San Jose Unified School District, San Jose, CA

The site action was additional evaluation for the property owner to further evaluate the extent of a release and obtain formal closure for a known historical release that had only been informally investigated and remediated with no agency involvement or approvals. The specific work included Phase II investigations under the direction of the Santa Clara County DEH to define the extent of soil contamination, groundwater sampling and evaluation. The DEH issued a no further action letter and the case was closed. Ms. Amendola also prepared a Phase I ESA at this site for a subsequent property transfer.

EMPLOYMENT HISTORY

Applied Water Resources, Corporation/Environmental Risk Specialties, San Jose/Santa Clara, California – Project Manager, 2009-present
O'Brien & Gere Engineers, Inc., Santa Clara, California, - Sr. Project Scientist, 2005-2009
ATC Associates, Monterey, California- Sr. Scientist, 2002-2005
Pinnacle Engineering, Maple Grove, Minnesota – Project Engineer, 1995-2002-

EDUCATION and CERTIFICATION:

University of Minnesota, Institute of Technology, BSCE
Professional Engineer, MN 41645
Registered Environmental Assessor, CA, No. 07647
Hazardous Material 40 Hour Training
Competent Person Excavation Training
Licensed Nuclear Density Gauge Operator

1046 West Taylor Street, Suite 105, San Jose, CA
408.220.4876

Kendall W. Price, CEG, REA
Principal Consultant/Regional Manager

Mr. Price has more than 40 years of professional experience. As a Senior Managing Scientist with O'Brien & Gere and consulting for United Soil Engineering, Inc., and President of E2C, Inc. he established technical criteria, provided technical guidance, and directed the activities of large or unique project teams including regional office groups. He is responsible for preparing project authorizations, establishing budget costs and schedules for each project under supervision, maintaining and updating all CIS system reports, and periodically reviewing the fiscal status and schedule of projects. Mr. Price assumes a project management role in leading major multi-disciplinary project teams of staff members from other sections and/or offices within the Firm, and offers significant contributions in the areas of technical development and quality improvement. He also provides continuous follow-up on client relations by maintaining personal contact with the client throughout the duration of a project and following project completion. Mr. Price also performs Phase I environmental site assessments and works with developers and their lenders to evaluate the environmental quality of redevelopment projects for higher better use.

Mr. Price has been responsible for the business development of the San Jose office. Client relations and project development has allowed the office to be recognized as a significant leader within the developer community as the go to consultant for both environmental as well as geotechnical/geological services. His client leadership has sustained the office from its opening in July 2009 to the present.

SELECTED PROJECT EXPERIENCE

Phase I Environmental Site Assessments, - Hayward, CA

Prepared Phase I Environmental Site Assessments, working with lenders and their specific environmental requirements. Studies included investigation of leaking underground fuel tanks and completion of the associated reports. Performed field studies on sanitary landfill to investigate leachate migration. Performed studies and quarterly monitoring events to comply with the owner's reporting requirements to the State of California.

EMC Planning Group, Inc. - King City, CA

Mr. Price provided the expertise for the formulation of a site investigation plan for a 70-acre agricultural site for development as a single-family residential subdivision. The investigation included an initial sampling plan to identify areas that were impacted by the past use of agricultural chemicals. Subsequent to that investigation an in-depth geotechnical investigation was performed to provide the recommendations for initial site development. Mr. Price was the primary technical interface between the various technical consultants.

California Bavarian Corp., - Sunnyvale, CA

Project included the closure of a chemical manufacturing facility through the local fire department, demolition of the building, excavation and disposal of contaminated soils. After the site was demolished, an in-depth geotechnical investigation was performed to provide design criteria for the development of the proposed mid-rise office building. Mr. Price was the primary contact during the site construction and interfaced with all other site development professionals. Responsible for Consultant Fees of $125,000.

Montera & Tehama, - Monterey, CA:

Mr. Price manages the geotechnical and geological investigations for this 6,000 acre residential development. He reviews the field investigation tasks, assists in evaluating the field and laboratory data, and outlines the various construction recommendations to be implemented during the various phases of site development. In addition Mr. Price also manages the technical inspection staff and interfaces with the grading contractor. ($10M site development)

Cypress Marina, Marina, CA

Mr. Price provided the geotechnical oversight with respect to the redevelopment of 115 acres of former Fort Ord property. The investigation included an evaluation of the dune sands that would be the foundation soils for the proposed single family residences. Site development with respect to grading within the dune sands proved to be a challenge. Moisture loss in the wind blown sands and proper compaction were an ongoing concern. Mr. Price worked with the grading contractor to maximize compaction effort during site grading and minimizing the need to regrade areas that had met prior compaction. Individual lot development has been slowed as a result of the current economic conditions.

Suncap Property Group, Redwood City, CA

Project consisted of a Phase I investigation and multiple stages of Phase II investigations to define the area of soil impact. The project was over seen by the RWQCB. Mr. Price designed the remedial action plan that was approved by the RWQCB. That plan was implemented and successfully received case closure from the RWQCB.

Curt Lanning, Mt. View, CA

Remedial Action to remove impacted soil from a former UST site. Mr. Price worked with Santa Clara County DEH regarding the remediation of a former UST site. The work included the excavation of impacted soil and removal of groundwater under DEH oversight. The project was issued a no further action letter from the County DEH. The tank was initially removed in the 1980s but did not receive and remedial action at that time. The issue surfaced as the result of the pending sale of the project.

City of San Carlos, San Carlos, CA

Phase I investigation for property acquisition and redevelopment. Upon completion of the Phase I work Mr. Price designed multiple Phase II investigations to define the fate and transport of the soil and groundwater contamination. All work was performed under the guidance of the San Mateo County DEH. Upon completion of the investigations a remedial action plan (RAP) was submitted to the County and

approved. The RAP was implemented and groundwater monitoring is currently being performed to monitor the efficacy of the RAP. Vapor intrusion is the principal contaminant of concern.

Bradford Manufacturing, Santa Clara, CA

Redevelopment of a former forge and flange manufacturing property in operation since the 1940s. A Phase I and multiple Phase II investigations were performed at the site under the direction and approval of the Department of Toxic Substance Control (DTSC). Upon defining the fate and transport of the site contaminants, Mr. Price prepared a remedial action plan that was approved by the DTSC. It was implemented and the and soil was remediated and groundwater monitored. This project took over 3 years to complete and receive a no further action letter from the DTSC.

Tron Do, San Jose, CA

This project consisted of multiple Phase II investigations to define soil/groundwater contamination from multiple USTs at the site. Mr. Price worked with the client and the Santa Clara County DEH regarding the various investigations and the remedial action to be implemented at the site. A remedial action plan was submitted and approved. Upon completing the implementation of the approved plan and subsequent groundwater monitoring the site was granted no further action status. This project took over 2 years to complete.

San Jose Unified School District, San Jose, CA

The site action resulted from a discharge from a UST. Mr. Price prepared multiple Phase II investigations under the direction of the Santa Clara County DEH to define the extent of soil contamination. The investigations were of sufficient detail to conclude that the discharge would not impact groundwater at the site. Therefore, the DEH issued a no further action letter and the case was closed.

Dollinger Properties, Fremont, CA

A Phase I investigation was performed with additional Phase II studies to define the extent of an oil discharge from a transformer at the site. All of the work was over seen by the Alameda County Water District (ACWD). The soil contamination was defined and a removal action plan was presented to the ACWD and approved. The impacted soil was removed from the site and the site was granted case closure by the ACWD.

EMPLOYMENT HISTORY

Applied Water Resources, Corporation - Regional Manager, San Jose Office

O'Brien & Gere Engineers, Inc., Sr. Managing Scientist

E2C, Inc., Santa Clara, CA, President; United Soil Engineering, Inc., Santa Clara, CA, Vice President; International Engineering Co., Inc., San Francisco, CA, Associate Engineering Geologist.

W.A. Wahler & Associates, Palo Alto, CA, Staff Geologist –

EDUCATION and CERTIFICATION:

San Jose State University; B.S. (Geology)
Registered Geologist, CA, No. 3787; OR, No. 261
Certified Engineering Geologist, CA, No. 1188; OR, No. 261
Registered Environmental Assessor, CA, No. 456
National Water Well Association
Association of Engineering Geologists
Hazardous Material 40 Hour & Supervisor Training
Competent Person Excavation Training

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Applied Water Resources Corporation were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Report is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Report includes a search of available city directory data at 5 year intervals.

RECORD SOURCES

EDR's Digital Archive combines historical directory listings from sources such as Cole Information and Dun & Bradstreet. These standard sources of property information complement and enhance each other to provide a more comprehensive report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer. Reproduction of City Directories without permission of the publisher or licensed vendor may be a violation of copyright.

EDR Property Tax Map Report

Environmental Data Resources, Inc.'s EDR Property Tax Map Report is designed to assist environmental professionals in evaluating potential environmental conditions on a target property by understanding property boundaries and other characteristics. The report includes a search of available property tax maps, which include information on boundaries for the target property and neighboring properties, addresses, parcel identification numbers, as well as other data typically used in property location and identification.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

Disclaimer - Copyright and Trademark Notice

This Report contains certain information obtained from a variety of public and other sources reasonably available to Environmental Data Resources, Inc. It cannot be concluded from this Report that coverage information for the target and surrounding properties does not exist from other sources. **NO WARRANTY EXPRESSED OR IMPLIED, IS MADE WHATSOEVER IN CONNECTION WITH THIS REPORT. ENVIRONMENTAL DATA RESOURCES, INC. SPECIFICALLY DISCLAIMS THE MAKING OF ANY SUCH WARRANTIES, INCLUDING WITHOUT LIMITATION, MERCHANTABILITY OR FITNESS FOR A PARTICULAR USE OR PURPOSE. ALL RISK IS ASSUMED BY THE USER. IN NO EVENT SHALL ENVIRONMENTAL DATA RESOURCES, INC. BE LIABLE TO ANYONE, WHETHER ARISING OUT OF ERRORS OR OMISSIONS, NEGLIGENCE, ACCIDENT OR ANY OTHER CAUSE, FOR ANY LOSS OR DAMAGE, INCLUDING, WITHOUT LIMITATION, SPECIAL, INCIDENTAL, CONSEQUENTIAL, OR EXEMPLARY DAMAGES. ANY LIABILITY ON THE PART OF ENVIRONMENTAL DATA RESOURCES, INC. IS STRICTLY LIMITED TO A REFUND OF THE AMOUNT PAID FOR THIS REPORT.** Purchaser accepts this Report "AS IS". Any analyses, estimates, ratings, environmental risk levels or risk codes provided in this Report are provided for illustrative purposes only, and are not intended to provide, nor should they be interpreted as providing any facts regarding, or prediction orforecast of, any environmental risk for any property. Only a Phase I Environmental Site Assessment performed by an environmental professional can provide information regarding the environmental risk for any property. Additionally, the information provided in this Report is not to be construed as legal advice.

COVENANT AND ENVIRONMENTAL RESTRICTION ON PROPERTY

3695-3723 Haven Avenue
Menlo Park, California

This Covenant and Environmental Restriction on Property (this "Covenant") is made as of the 9th day of Aug., 1999 by Integris/Millenium Joint Venture LLC ("Covenantor") who is the Owner of record of that certain property situated at 3695-3723 Haven Avenue, in the City of Menlo Park, County of San Mateo, State of California, which is more particularly described in Exhibit A attached hereto and incorporated herein by this reference (such portion hereinafter referred to as the "Burdened Property"), for the benefit of the California Regional Water Quality Control Board for the San Francisco Bay Region (the "Board"), with reference to the following facts:

A. The Burdened Property and groundwater underlying the property contain hazardous materials.

B. Contamination of the Burdened Property. It is believed that certain industrial operations caused soil and groundwater at the Burdened Property to be contaminated with halogenated volatile organic compounds, including trichloroethene and vinyl chloride, which constitute hazardous materials as that term is defined in Health & Safety Code section 25260. To mitigate potential exposure to such chemicals, soil excavation, in-situ chemical oxidation, if feasible, and institutional controls, including this Covenant, are to be implemented.

C. Exposure Pathways. The contaminants addressed in this Covenant are present in soil and groundwater on the Burdened Property. Without the mitigation measures described above, exposure to these contaminants could take place via direct contact, resulting in dermal exposure, inhalation, or ingestion by humans. The risk of public exposure to the contaminants has been and will be substantially lessened by the remediation and controls described herein.

D. Adjacent Land Uses and Population Potentially Affected. The Burdened Property is currently vacant but has been used for industrial and commercial uses, and is adjacent to industrial and commercial land uses.

3229 V01

E. Full and voluntary disclosure to the Board of the presence of hazardous materials on the Burdened Property has been made and extensive sampling of the Burdened Property has been conducted.

F. Covenantor desires and intends that in order to benefit the Board, and to protect the present and future public health and safety, the Burdened Property shall be used in such a manner as to avoid potential harm to persons or property that may result from hazardous materials that may have been deposited on portions of the Burdened Property.

ARTICLE I

GENERAL PROVISIONS

1.1 Provisions to Run with the Land. This Covenant sets forth protective provisions, covenants, conditions and restrictions (collectively referred to as "Restrictions") upon and subject to which the Burdened Property and every portion thereof shall be improved, held, used, occupied, leased, sold, hypothecated, encumbered, and/or conveyed. The restrictions set forth in Article III are reasonably necessary to protect present and future human health and safety or the environment as a result of the presence on the land of hazardous materials. Each and all of the Restrictions shall run with the land, and pass with each and every portion of the Burdened Property, and shall apply to, insure to the benefit of, and bind the respective successors in interest thereof, for the benefit of the Board and all Owners and Occupants. Each and all of the Restrictions are imposed upon the entire Burdened Property unless expressly stated in the Risk Management Plan, see below, as applicable to a specific portion of the Burdened Property. Each and all of the Restrictions run with the land pursuant to section 1471 of the Civil Code. Each and all of the Restrictions are enforceable by the Board.

1.2 Concurrence of Owners and Lessees Presumed. All purchasers, lessees, or possessors of any portion of the Burdened Property shall be deemed by their purchase, leasing, or possession of such Burdened Property, to be in accord with the foregoing and to agree for and among themselves, their heirs, successors, and assignees, and the agents, employees, and lessees of such owners, heirs, successors, and assignees, that the Restrictions as herein established must be adhered to for the benefit of the Board and the Owners and Occupants of the Burdened Property and that the interest of the Owners and Occupants of the Burdened Property shall be subject to the Restrictions contained herein.

1.3 Apportionment of Burden Among Multiple Owners. Where ownership of the Burdened Property is held by multiple persons, holding by several titles, the burdens imposed by this Covenant shall be apportioned between them proportionate to the value of the property held by each owner, if such value can be ascertained, and if not, then according to their respective interests in point of quantity. (Cal. Civ. Code § 1467.)

1.4 Incorporation into Deeds and Leases. Covenantor desires and covenants that the Restrictions set out herein shall be incorporated in and attached to each and all deeds and leases of any portion of the Burdened Property. Recordation of this Covenant shall be deemed binding on all successors, assigns, and lessees, regardless of whether a copy of this Covenant and Agreement has been attached to or incorporated into any given deed or lease.

1.5 Purpose. It is the purpose of this instrument to convey to the Board real property rights, which will run with the land, to facilitate the remediation of past environmental contamination and to protect human health and the environment by reducing the risk of exposure to residual hazardous materials.

ARTICLE II

DEFINITIONS

2.1 Board. "Board" shall mean the California Regional Water Quality Control Board for the San Francisco Bay Region and shall include its successor agencies, if any.

2.2 Improvements. "Improvements" shall mean all buildings, roads, driveways, regradings, and paved parking areas, constructed or placed upon any portion of the Burdened Property.

2.3 Occupants. "Occupants" shall mean Owners and those persons entitled by ownership, leasehold, or other legal relationship to the exclusive right to occupy any portion of the Burdened Property.

2.4 Owner or Owners. "Owner" or "Owners" shall mean the Covenantor and/or its successors in interest, who hold title to all or any portion of the Burdened Property.

2.5 Risk Management Plan. "Risk Management Plan" (also referred to herein as "RMP") shall mean that certain Plan concerning the Burdened Property, prepared by Erler & Kalinowski, Inc. and dated March 12, 1999, and any and all subsequent addenda thereto, on file with the California Regional Water Quality Control Board, San Francisco Bay Region; the San Mateo County Division of Environmental Health and the City of Menlo Park Building Department. Covenantor shall cause the RMP to be filed with the aforementioned three agencies. Owner, at the time of any addenda to the RMP, shall cause the addenda to be filed with the aforementioned three agencies. The RMP is attached hereto and incorporated herein by this reference as Exhibit B.

ARTICLE III

DEVELOPMENT, USE AND CONVEYANCE OF THE BURDENED PROPERTY

3.1 Restrictions on Development and Use. Covenantor promises to restrict the use of the Burdened Property as follows:

a. Development of the Burdened Property shall be restricted to industrial, commercial or office space;

b. No residence for human habitation shall be permitted on the Burdened Property;

c. No hospitals shall be permitted on the Burdened Property;

1999-135815
03/08/1999 03:24P
OR Page 3 of 183

d. No schools for persons under 21 years of age shall be permitted on the Burdened Property;

e. No day care centers for children or day care centers for Senior Citizens shall be permitted on the Burdened Property;

f. No Owners or Occupants of the Burdened Property or any portion thereof shall conduct any excavation work on the Burdened Property, except in strict compliance with the RMP or unless expressly permitted in writing by the Board. Any contaminated soils brought to the surface by grading, excavation, trenching, or backfilling shall be managed by Covenantor or his agent in accordance with all applicable provisions of local, state and federal law;

g. All uses and development of the Burdened Property shall be consistent with the Risk Management Plan or any applicable Board Order, each of which is hereby incorporated by reference including future amendments thereto. All uses and development shall preserve the integrity of any cap, any remedial measures taken or remedial equipment installed, and any groundwater monitoring system installed on the Burdened Property pursuant to the requirements of the Board, unless otherwise expressly permitted in writing by the Board;

h. No Owners or Occupants of the Property or any portion thereof shall drill, bore, otherwise construct, or use a well for the purpose of extracting water for any use, including but not limited to, domestic, potable, or industrial uses, unless expressly permitted in writing by the Board;

i. The Owner shall notify the Board of each of the following: (1) The type, cause, location and date of any disturbance to any cap, any remedial measures taken or remedial equipment installed, and of the groundwater monitoring system installed on the Burdened Property pursuant to the requirements of the Board, which could affect the ability of such cap or remedial measures, remedial equipment, or monitoring system to perform their respective functions and (2) the type and date of repair of such disturbance. Notification to the Board shall be made by registered mail within ten (10) working days of both the discovery of such disturbance and the completion of repairs;

j. The Covenantor agrees that the Board, and/or any persons acting pursuant to Board orders, shall have reasonable access to the Burdened Property for the purposes of inspection, surveillance, maintenance, or monitoring, as provided for in Division 7 of the Water Code,

k. No Owner or Occupant of the Burdened Property shall act in any manner that will aggravate or contribute to the existing environmental conditions of the Burdened Property. All use and development of the Burdened Property shall preserve the integrity of any capped areas;

3.2 Enforcement. Failure of an Owner or Occupant to comply with any of the restrictions, as set forth in paragraph 3.1, shall be grounds for the Board, by reason of this Covenant, to have the authority to require that the Owner modify or remove any Improvements constructed in violation of that paragraph. Violation of the Covenant shall be grounds for the Board to file civil actions against the Owner as provided by law.

1998-1358 1 B
05/07/1998 03:34P
OR Page 4 of 153

3.3 Notice in Agreements. After the date of Recordation hereof, all Owners and Occupants shall execute a written instrument which shall accompany all purchase agreements or leases relating to the property. Any such instrument shall contain the following statement:

> This statement is not a declaration that a hazard exists. The land described herein contains hazardous materials in soils and in the groundwater under the property, and is subject to a deed restriction dated as of July _____, 1999, and recorded on July _____, 1999, in the Official Records of San Mateo County, California, as Document No. _____, which Covenant and Restriction imposes certain covenants, conditions, and restrictions on usage of the property described herein.

ARTICLE IV

VARIANCE AND TERMINATION

4.1 Variance. Any Owner or, with the Owner's consent, any Occupant of the Burdened Property or any portion thereof may apply to the Board for a written variance from the provisions of this Covenant.

4.2 Termination. Any Owner or, with the Owner's consent, any Occupant of the Burdened Property or a portion thereof may apply to the Board for a termination of the Restrictions as they apply to all or any portion of the Burdened Property.

4.3 Term. Unless terminated in accordance with paragraph 4.2 above, by law or otherwise, this Covenant shall continue in effect in perpetuity.

ARTICLE V

MISCELLANEOUS

5.1 No Dedication Intended. Nothing set forth herein shall be construed to be a gift or dedication, or offer of a gift or dedication of the Burdened Property or any portion thereof to the general public.

5.2 Notices. Whenever any person gives or serves any notice, demand, or other communication with respect to this Covenant, each such notice, demand, or other communication shall be in writing and shall be deemed effective (1) when delivered, if personally delivered to the person being served or official of a government agency being served, or (2) three (3) business days after deposit in the mail if mailed by United States mail, postage paid certified, return receipt requested:

5.3 Partial Invalidity. If any portion of the Restrictions or terms set forth herein is determined to be invalid for any reason, the remaining portion shall remain in full force and effect as if such portion had not been included.

5.4 Article Headings. Headings at the beginning of each numbered article of this Covenant are solely for the convenience of the parties and are not a part of the Covenant.

5.5 Recordation. This instrument shall be executed by the Covenantor and by the Executive Officer of the Board. This instrument shall be recorded by the Covenantor in the County of San Mateo within ten (10) days of the date of execution.

5.6 References. All references to Code sections include successor provisions

5.7 Construction. Any general rule of construction to the contrary notwithstanding, this instrument shall be liberally construed in favor of the Covenant to effect the purpose of this instrument and the policy and purpose of the Water Code. If any provision of this instrument is found to be ambiguous, an interpretation consistent with the purpose of this instrument that would render the provision invalid shall be favored over any interpretation that would render it invalid.

5.8 Effective Date. This Covenant, its terms and conditions, and the burdens imposed and the benefits derived therefrom, shall become effective upon Recordation of this Covenant.

IN WITNESS WHEREOF, the parties execute this Covenant as of the date set forth above.

A. Human Health Risk Assessment (Appendix A from Feasibility Study/Remedial Action Plan, dated 12 March 1999)

1. INTRODUCTION

This Risk Management Plan is intended to address residual concentrations of chemicals of concern in environmental media at the 3695-3673 Haven Avenue property located in Menlo Park, California (the "Site"; Figure 1). The term Site, as used in this Risk Management Plan, refers to the entire property at the address 3695 -3723 Haven Avenue, Menlo Park, California and any parcels or subdivided parcels that may result from sale of portions of the current property to other owners. Mitsubishi Silicon America ("MSA"), the present owner, has made the property available for sale in whole or in part. Because current zoning of the Site is industrial, the Risk Management Plan contemplates redevelopment of the Site for a variety of industrial/commercial purposes.

The Risk Management Plan provides a decision framework to manage residual chemicals [(i.e., halogenated volatile organic compounds ("VOCs")] in soil and groundwater at the Site in a manner that is: (1) satisfactory to the RWQCB, as lead agency, and other involved regulatory agencies with oversight authority, as required, (2) protective of human health and the environment, and (3) consistent with planned land uses. This Risk Management Plan contains the following:

- description of the Site background, including a brief history of Site usage, discussion of environmental investigations and remedial actions performed at the Site, and a summary of identified remaining environmental conditions;
- summary of the risk assessment that was conducted to evaluate potential human health impacts at the Site;
- short-term risk management plan to be implemented during construction at the Site, which includes worker health and safety planning requirements and construction impact mitigation measures; and,
- non-construction risk management plan for mitigation of potential long-term risks to human health and the environment, which includes a provision to ensure long-term compliance with this Risk Management Plan.

1.1 Representations

This Risk Management Plan is based on a current understanding of environmental conditions at the Site as well as current environmental policies, laws, and regulations. If environmental conditions are found to differ from those described herein or in the environmental reports referenced in Section 2.3.1, or if environmental policies, laws, and regulations change, then the Risk Management Plan may have to be modified to accommodate those differing conditions. No representation is made by any present or future owner or developer of the Site or their consultants, agents, and contractors as to the

applicability of this Risk Management Plan with respect to future environmental policies, laws, and regulations.

1.2 Owner Responsibilities

All owners, developers, and any other entities with responsibility for Site activities shall have a continuing obligation to:

- determine the adequacy of this Risk Management Plan in light of the conditions actually encountered and the intended land use;
- comply with policies, laws, and regulations applicable at the time; and,
- establish a notification procedure and protocols for future sub-surface activity to ensure long-term compliance with the Risk Management Plan.

25 Page: 10 of 183

2. SITE BACKGROUND

This section describes the Site background, including the previous Site uses and the geology and hydrology at the Site.

2.1 Site Setting

The Site is located in an industrial section of east Menlo Park, adjacent to San Francisco Bay (Figures 1 and 2). Directly to the east of the Site is a channelized creek that runs to the Bay via Flood and Westpoint Sloughs. A public storage facility, salt evaporators, and Bayfront Park (the former Menlo Park landfill) are located north of the Site. West of the Site is a yard that contains used equipment and materials, and to the south, across Haven Avenue, are two-story buildings that are occupied by light industrial and commercial tenants. Figure 2 is an aerial photograph taken during early October 1998 of the Site and vicinity, prior to demolition of "Building 2".

2.2 Site History

The Site, as defined in Chapter 1, refers to the entire property at the address 3695 -3723 Haven Avenue, Menlo Park, California. Currently, the MSA Property is occupied by two vacant buildings ("Building 1" and "Building 3" in Figure 2) and covered by asphalt or concrete pavement with narrow planted areas along Haven Avenue.

Based on a review of historical aerial photographs performed by EKI, the MSA Property was formerly bare land with a few scattered buildings and cars prior to its development in 1969. In the 1969 aerial photograph, the MSA Property was developed with three buildings, two of which are standing as of this writing.

Based on a review of file information from the San Mateo County Department of Health Services and files provided by MSA, uses of the MSA Property have included:

- the fabrication and manufacturing of magnetic materials and electronic devices;
- manufacturing and fabrication of electronic components;
- manufacturing of polished silicon wafers;
- distribution of electronic equipment;
- warehousing and installation of automobile wheels and automotive accessories; and,
- a musical recording studio.

One of the prior tenants of the MSA Property was Siltec Corporation, a corporate predecessor to MSA. From 1970 through 1989, Siltec Corporation used the MSA

Property as manufacturing facility for polished silicon wafers, and as office space. Other more recent tenants of the MSA Property have included KOB Auto Inc., Nor Cal Tire and Wheel, Multiplex Studios, Huettig & Schromm Landscape Contractors, and BSG Associates, Inc.

During October 1998, the middle of the three buildings originally built at the Site during 1969 was demolished. The purpose of demolishing this building (Building 2) was to allow excavation of Site soils with elevated concentrations of halogenated VOCs.

2.3 Summary of Site Investigations and Remedial Actions

This section summarizes:

- the reports submitted to the RWQCB regarding investigative work, risk assessments, treatability studies, and work plans describing future work to be performed at the Site;
- the subsurface geology at the Site;
- the local hydrology;
- the chemicals detected in both soil and groundwater at the Site; and,
- the remedial actions performed or planned for the Site.

2.3.1 Documents Summary

The following documents describe the results of previous investigations and remedial, treatability, and risk assessments performed at the Site:

- *Feasibility Study and Remedial Action Plan, 3695 - 3723 Haven Avenue, Menlo Park, California*, Erler & Kalinwoski, Inc., 10 March 1999 (EKI 1999a)
- *In Situ Chemical Oxidation Bench-Scale Treatability Test Results, 3695-3723 Haven Avenue, Menlo Park, Californi*- Erler & Kalinowski, Inc., 8 January 1999 (EKI 1999b)
- *Revised Risk Calculations and Cleanup Goals for Source Area Soil Excavation, 3695-3723 Haven Avenue, Menlo Park, California*, Erler & Kalinowski, Inc., 12 February 1999 (EKI 1999c)
- *Results of Sampling and Analysis, 3645 and 3665 Haven Avenue, Menlo Park, California*, Erler & Kalinowski, Inc., 30 June 1998 (EKI 1998a)
- *Results of Sampling and Analysis, Vicinity of 3695-3723 Haven Avenue, Menlo Park, California*, Erler & Kalinowski, Inc., 28 October 1998 (EKI 1998b)

Directly underlying the A-zone are sediments that are generally coarser grained, consisting of sand and gravel. For the purposes of this report, these sediments that occur between approximately 15 and 38 feet bgs are referred to as the "B-zone".

2.3.3 Hydrology

During the on-Site and off-Site investigations, selected groundwater samples from borings and monitoring wells were measured for density, total dissolved solids, and chloride. The purpose of collecting such data for groundwater was to allow generalized mapping of the various water bodies that are present along the bay margin: fresh water, salt water associated with the Bay, and brines associated with the evaporation ponds. The available data indicate that brines have apparently leaked from salt evaporation ponds and have intruded primarily into the B-zone. Landward incursion of brines is pronounced beneath the Site as well as at the adjacent Fedex Facility to the east. It appears that the presence of brines in the subsurface has served as a barrier, limiting off-Site migration of chemicals of concern (see Section 2.3.4).

During drilling at the Site, groundwater has been encountered in the subsurface at depths of approximately 8 to 11 feet bgs in fine-grained sediments of the A-zone (EKI 1997a). During October 1998, the piezometric surface for the A-zone occurred at elevations of approximately 0.8 to 1.2 feet relative to the National Geodetic Vertical Datum 1929 (EKI 1999a). The groundwater gradient was to the southeast with a magnitude of approximately 0.003 ft/ft (EKI 1999a). During October 1998, the piezometric surface for the B-zone, corrected for variable density, occurred at elevations of 1.3 to 1.9 feet, relative to the National Geodetic Vertical Datum 1929. The groundwater gradient for the B-zone was generally to the north with a magnitude of approximately 0.003 ft/ft (EKI 1997a). These data indicate that there is a relative upward groundwater gradient at the Site. It should be noted that the local groundwater gradient is strongly affected by density variations. Thus, changes in operation of the nearby salt evaporation ponds could result in changed groundwater gradients.

2.3.4 Chemicals of Concern Detected in Soil and Groundwater

The primary chemicals of concern ("COCs") at the Site, based on prevalence in soil and groundwater at the Site and the results from the risk assessment, are halogenated VOCs. The VOCs that contribute most to the estimated risks at the Site are trichloroethene ("TCE") and vinyl chloride ("VC"). Tables 1 and 2 list all the VOCs that have been detected in soil or groundwater samples collected from the Site. The VOCs that have been detected in more than ten groundwater samples collected at the Site include, in order of decreasing frequency of detection:

- TCE;
- cis-1,2-dichloroethene ("cis-1,2-DCE");
- chloroform;
- 1,1,2-trichloro-1,2,2-trifluoro ethane ("CFC-113");
- carbon tetrachloride; and
- VC.

TCE and CFC-113 are believed to have been used historically at the Site. Further, the cis-1,2-DCE and VC found at the Site are presumed to be daughter products of naturally occurring reductive dechlorination of TCE in the soil and groundwater.

TCE is present in groundwater samples collected from the Site in the vicinity of former Building 2 at concentrations that suggest the presence of separate-phase dense non-aqueous phase liquid ("DNAPL"). The presence of separate-phase DNAPL can result in the long-term persistence of VOCs in groundwater. Furthermore, DNAPL liquids can, in some instances, migrate to deeper depths if remedial activities or other subgrade activities penetrate confining media or alter the hydrologic conditions.

Carbon tetrachloride has been detected at significantly higher concentrations in groundwater samples collected from the adjacent property to the west. The source of carbon tetrachloride is unknown but appears to be up-gradient of the Site. The chloroform found in groundwater samples collected on-Site may be a product of the naturally occurring degradation of the carbon tetrachloride.

1998-1358

56 Page: 23 of 153

2.3.5 Soil Remedial Actions

As discussed in the FS/RAP, source area soil near the northwestern corner of the former Building 2 will be excavated to a depth of approximately 6 feet during 1999. The extent of planned excavation is shown on Figure 3 (EKI 1998c). The remedial excavation will remove soil known to contain concentrations of COCs above the risk-based action levels listed in Table 3. Results of the remedial excavation will be documented in the Remedial Action Completion Report anticipated to be submitted to the RWQCB as described in Section 2.5.1.

After source area soil is excavated, clean backfill will be placed in the excavation. A high-density polyethylene ("HDPE") liner will be installed as a vapor barrier in the backfill at approximately 4 feet bgs. The vapor barrier will reduce the potential for the clean backfill to be contaminated by VOC vapors emanating from the underlying groundwater. The vapor barrier will also reduce the potential for migration of VOC vapors from groundwater into any buildings that may be constructed in that location in the future, thereby further reducing the potential future risks at the Site.

As discussed below, future owners of the property will be required to protect the integrity of the vapor barrier by not penetrating through the barrier during construction or maintenance activity at the Site unless (a) damage to the barrier can be effectively repaired, or (b) the underlying groundwater no longer contains VOCs above risk-based action levels.

2.3.6 Groundwater Remedial Actions

As discussed in the FS/RAP, a pilot test is planned to evaluate the efficacy of ICO by injecting potassium permanganate ("Oxidant") into saturated zone soils and groundwater

near the northwestern corner of the former Building 2 (EKI 1998d). The oxidant is intended to oxidize halogenated VOCs in soil and groundwater to less toxic daughter products. If the pilot test is successful, full-scale ICO treatment will be performed as described in the FS/RAP.

2.4 Remaining Environmental Conditions

This Section describes the available information regarding the residual concentrations of VOCs in soil, groundwater, and soil gas beneath concrete slabs. For the purposes of this document, it is assumed that soil excavation activities, including removal of the concrete slab and installation of a vapor barrier, as proposed in EKI (1998e) will have been executed.

2.4.1 Residual Concentrations of Halogenated VOCs in Soil

Figure 3 shows the locations of soil borings drilled in and around the source area at the northwestern corner of the former Building 2 as well as the proposed extent of the remedial soil excavation. Table 1 summarizes the data for soil samples collected from the area outside the remedial excavation area and represents the available data regarding residual concentrations of VOCs in Site soils post-excavation. The concentrations of TCE and VC in post-excavation Site soils are shown on Figures 4 and 5, respectively.

For the purposes of this Risk Management Plan, it has been assumed that there may exist on the Site areas of contamination undetected by previous investigations. Therefore, risk management for all future activities involving disturbance of soil at the Site will be performed under the assumption that VOCs may be present in soil, as discussed further in Chapter 4.

2.4.2 Residual Concentrations of Halogenated VOCs in Groundwater

Figures 6, 7, and 8 show the extents of TCE, VC, and carbon tetrachloride, respectively, in groundwater at the Site. Table 2 summarizes data for groundwater samples collected from the Site.

Elevated concentrations of VOCs have been detected in groundwater in the vicinity of the northern portion of former Building 2. The area of groundwater containing VOCs in excess of the risk-based action levels for groundwater is shown on Figure 9. For the purposes of this Risk Management Plan, this area is defined as the Groundwater Risk Area.

2.4.3 Possible Presence of Chlorinated VOCs Under Concrete Slabs

The VOCs detected in soil gas during the remedial investigation include trichloroethene, cis-1,2-dichloroethene, CFC-113, chloroform, and benzene (EKI 1997a). Trichloroethene, cis-1,2-dichloroethene, and CFC-113 are the three chemicals detected at highest concentrations (EKI 1997a). Elevated concentrations of these chemicals were

detected in soil gas from the vicinity of the northwestern corner of the former Building 2, both inside and outside of the former building.

It should be noted that some of the soil gas samples from locations within the former building were collected within the gravel base beneath the building slab. It is possible that the concentrations of chemicals detected in these samples reflect some relatively increased lateral migration because of the permeable gravel base. It is possible that, in the future, without proper engineering controls, VOCs could migrate from groundwater into permeable subgrade material beneath new structures. Chapter 5 discusses the use of engineering controls to prevent this type of VOC migration.

3. SUMMARY OF HUMAN HEALTH RISK ASSESSMENT

A human health risk assessment was undertaken to:

- Evaluate potential impacts to human health by chemicals of concern ("COCs") present in soil and groundwater at the Site; and
- Develop risk-based action levels for soil and groundwater at the Site.

The risk assessment is included in Attachment A.

Note that baseline risks at the Site were calculated previously for development of risk-based action levels for soil excavation using data collected prior to April 1998 (EKI 1998c; EKI 1999b). However, some additional groundwater data were collected for the Site after April 1998. Therefore, the data set used herein and in Appendix A to calculate the baseline risk at the Site has been updated to include the soil and groundwater data for the Site available as of February 1999. Also, the proposed risk-based action levels have now been developed to consider VOCs in both soil and groundwater, and one of the physical assumptions (soil saturated porosity) for the Site has been modified.

The risk assessment was conducted assuming hypothetical exposure scenarios for future occupants of the Site. Occupants were subdivided into several receptor populations based on their expected locations and activities. Each group was assumed to be subjected to different concentrations of chemicals for different amounts of time. All assumptions used in the risk assessment are quantified in the text and tables included in Attachment A.

Baseline risks were calculated for the following three hypothetical receptor populations at the Haven Avenue Site:

- Future commercial/industrial building occupants, who will work indoors on-Site over a long period of time ("Indoor Workers");
- Workers involved in the construction of new buildings or subsurface utilities on-Site, who will occupy the Site for much more limited periods ("Construction Workers"); and,
- Future maintenance personnel such as groundskeepers, who will labor primarily outdoors over a long period of time ("Maintenance Workers").

3.1 Risk Calculations

As discussed in the risk assessment (Attachment A), summation of Hazard Indices over all pathways and chemicals gives the non-carcinogenic effects Hazard Index for each hypothetical receptor population. A total Hazard Index less than or equal to one indicates

that the population will not be exposed to the chemical beyond a dosage considered safe for non-carcinogenic adverse health affects.

Summation of the estimated incremental carcinogenic risk from all carcinogenic chemicals over all pathways valid for a particular receptor population gives an estimated overall incremental excess carcinogenic risk ("Cancer Risk") for the hypothetical receptor population (Appendix A). The National Oil and Hazardous Substances Pollution Contingency Plan (40 CFR §300) mandates an acceptable range of Cancer Risk between 10^{-4} (1 in 10,000) and 10^{-6} (1 in 1,000,000). California law requires notification of on-Site workers if the Cancer Risk is estimated to exceed 10^{-5} (1 in 100,000) (California Code of Regulations ("CCR") Title 22, Section 12703). The targeted maximum Cancer Risk of 10^{-5}, used in the risk assessment for the Site, satisfies both sets of regulations.

1998-1351
08/06/1998 03:37p
88 Page 27 of 154

3.2 Estimated Baseline Risks

The estimated baseline risks for the three hypothetical future populations at the Site are summarized below based on the results of the risk assessment in Attachment A. Several references are made below to tables in Attachment A (e.g., "Table A-19").

Estimated baseline Hazard Indices and Cancer Risk for Indoor Workers are listed in Table A-19. Non-carcinogenic hazard for this population is calculated to have a Hazard Index equal to 0.08, less than the maximum target value of 1. The estimated Cancer Risk is 1.9×10^{-5}, above the maximum target level of 10^{-5}. The most significant chemical/pathway combination for Indoor Workers, in terms of the estimated Cancer Risk, is inhalation of TCE and VC evaporating from groundwater.

Estimated baseline Hazard Indices and Cancer Risks for Maintenance Workers through all pathways are listed in Table A-20. Non-carcinogenic hazard for this population is calculated to be 0.03, less than the maximum target level of 1. The estimated Cancer Risk is 4.5×10^{-6}, below the maximum target level of 1.0×10^{-5}. The most significant chemical/pathway combination for the Maintenance Worker receptor population is inhalation of VC evaporating from soil.

Estimated baseline risk and Hazard Indices and Cancer Risk for all Construction Worker exposure pathways are listed in Table A-21. The estimated Cancer Risk is 1.0×10^{-7}, less than the target level of 10^{-5}. Non-carcinogenic hazard for this population is calculated to be 0.01, less than the target level of 1. The most significant chemical/pathway combination, both in terms of Cancer Risk and non-carcinogenic health hazard for the Construction Worker receptor population is inhalation of VC evaporating from soil.

3.3 Calculation of Risk-Based Action Levels for Soil and Groundwater

Using the baseline risks calculated for the hypothetical receptor populations at the Site, risk-based action levels for soil and groundwater have been calculated, as discussed below. Risk-based action levels have been calculated considering potential exposures to the future hypothetical receptor populations, i.e., Maintenance Workers, Construction Workers, and Indoor Workers.

Risk-based action levels (cleanup goals) for soil and groundwater were calculated to apportion post-remediation risk such that Cancer Risk to the Indoor Worker, Construction Worker, and Maintenance Worker populations are each at or below 10^{-5}, and Hazard Indices are at or below 1.0. The method used for apportioning risk was to allocate most of the risk to the more hazardous chemicals and those more commonly found at the Site. This approach minimizes the volume of material to be remediated, while keeping future hypothetical populations' exposure to hazardous chemicals below the target maximum risk levels.

Tables 3 and 4 (and Tables A-22 and A-23 in Attachment A) list the calculated risk-based action levels for soil and groundwater, respectively. For soil, the risk-based action levels for TCE and VC are 3.2 mg/kg and 0.075 mg/kg, respectively. For groundwater, the risk-based action levels for TCE and VC are 8,000 ug/L and 500 ug/L, respectively, and carbon tetrachloride and chloroform have action levels of 2,600 ug/L and 2,000 ug/L, respectively.

Tables A-24, A-25, and A-26 show the estimated Hazard Indices and Cancer Risks for the receptor populations, i.e., Indoor Workers, Maintenance Workers and Construction Workers, assuming VOCs are present in soil and groundwater at the risk-based action level concentrations. For each population, the estimated total Hazard Index is less than 1 and the estimated cumulative Cancer Risk is less than or equal to 10^{-5}. Therefore, the risk-based action levels result in an acceptable level of risk for the future potentially exposed populations.

Future collection and analysis of soil or groundwater samples from the Site could potentially indicate the presence of chemical concentrations different from the current dataset. In this case, risk-based action levels for the Site may be recalculated to reflect the improved understanding of the distribution and concentrations of chemicals in Site soil or groundwater.

4. RISK MANAGEMENT DURING CONSTRUCTION

Risk management during construction activities at the Site involves precautions that will be taken by the property owner to mitigate risks to human health and the environment from possible exposure to chemicals of concern during various activities that involve disturbing soil at the Site. As discussed in Section 2.4.1, it is assumed for the purposes of this Risk Management Plan that residual VOCs may be present in soils located anywhere on-Site. Therefore, construction-related risk management procedures should be evaluated and implemented by the property owner, its contractors, agents, and consultants any time work will be performed that involves disturbing soil at the Site.

1999-1358 15
06/08/1999 03:24p
Page: 28 of 184

When establishing the procedures and precautions to be implemented, the evaluation should include, but not necessarily be limited to, the following:

- Establishing a notification procedure and protocols for future sub-surface activity to ensure long-term compliance with this Risk Management Plan;
- Establishment of health and safety training, worker protection procedures, and worker notification procedures for workers who may be exposed to VOC-containing soil or groundwater during any subsurface works;
- Use of construction methods that ensure that conduits to deeper groundwater zones are not created; and,
- Establishment of soil and groundwater management procedures to:
  - (1) appropriately manage soil and groundwater encountered during construction;
  - (2) characterize soil and groundwater that have indicators of VOC contamination;
  - (3) manage potential VOC vapors that could emanate from excavated soils or groundwater;
  - (4) properly store and dispose of soil and groundwater; and
  - (5) control or prevent storm water from contacting stored soils.

4.1 Site-Specific Health And Safety Worker Planning Requirements

Considering that VOCs may remain in soil, groundwater, and soil gas at the Site following completion of the remedial actions, preparation and implementation of health and safety plans ("HSPs") will be required for activities at the Site during which workers may encounter VOCs in soil, groundwater, or soil gas during subgrade work. Separate HSPs may be prepared for different types of work, i.e., depending on the nature of the work and the estimated potential for exposure to VOCs based on the available data. It will be the responsibility of the property owner to evaluate work activities at the Site and identify those activities that require preparation of a HSP, subject to the constraints described below.

It will be assumed for the preparation of HSPs that VOCs may be present in soil throughout the Site. Therefore, subgrade work activities requiring a HSP include, but are not limited to, (a) excavation and grading during demolition or construction activity, (b) subgrade utility installation or repair, (c) entrance into subgrade confined spaces, such as utility vaults or manholes, and (d) landscaping work that disturbs native soil, including but not limited to activities such as tree and shrub planting, sprinkler installation, and soil relocation.

A HSP is not required by this RMP for activities where no more than the upper 12 inches of soil will be disturbed if the work is in an area where clean fill soil has been imported during 1999 or later (e.g., new topsoil in landscaped areas, backfill installed in the source area soil excavation). For those activities, however, a HSP should still be prepared if required by applicable laws or regulations or if determined appropriate by the responsible party.

A HSP is not required by this RMP for workers who will perform activities at the Site without disturbing soil (e.g., carpenters, painters, carpet installers). When constructed, buildings and cover materials such as roads and walk-ways will prevent exposure to VOC-containing soil. It remains the responsibility of the property owner to determine if a health and safety plan is required for compliance with other federal, state, and local requirements.

4.2 Site-Specific Health And Safety Plans

Each HSP prepared pursuant to the requirements of this RMP will be required to address potential worker exposures to VOCs that could result from the work if VOCs are encountered in soil, groundwater, or soil gas during the work. To the extent required by applicable law, each HSP will be prepared in accordance with Federal and California Occupational Safety and Health Administration ("OSHA") standards for hazardous waste operations (29 CFR 1910.120 and 8 CCR 5192), or applicable regulations promulgated in the future. The HSP should also include but not be limited to a description of health and safety training requirements for the affected workers, a description of the level of personal protective equipment to be used, if any, air quality monitoring plans if necessary, and any other applicable precautions to reduce potential exposure to VOCs to acceptable levels.

4.3 Construction Impact Mitigation Measures

This section outlines measures that should be considered to mitigate potential impacts to human health and the environment during construction at the Site. The need to implement any active measures should be identified in a Construction Impact Mitigation Plan to be prepared by the property owner or its agent. Identified mitigation measures should be implemented during construction. At a minimum, measures to be considered for implementation should include:

- Management of soil;

- Management of groundwater (e.g., during excavation dewatering);
- Preventing creation of migration pathways for contamination to deeper aquifer zones;
- Protection of the vapor barrier installed by MSA in the source area soil excavation backfill (see Section 2.3.5); and
- Protection of groundwater monitoring wells at the Site.

1995—13818
08/07/1999 03:24P
58 Page: 31 of 183

4.3.1 Soil Management Plan

The Construction Impact Mitigation Plan should include a section that establishes procedures for safely managing excavated soil. The soil management plan should consider, at a minimum, the following:

- Methods for the safe excavation and on-Site storage of removed soil;
- Methods for screening excavated soil for the presence of VOCs, as discussed in Section 4.3.1.1;
- Methods for preventing exposure to VOC vapors that may emanate from excavated soil;
- Methods for controlling storm water runoff such that contact with excavated soils is eliminated; and
- Procedures for characterizing and properly disposing excavated soil.

4.3.1.1 Soil Screening Methodology During Construction

During future excavation of soil, an appropriate field instrument should be used during the excavation to help determine if VOCs are present in the soil. VOC screening measurements should be taken periodically as soil is excavated at the Site. A soil screening plan also should be developed as part of the Site-specific health and safety plan generally described in Section 4.2. The soil screening plan should describe procedures for screening soil for the presence of VOCs and action levels for terminating work activities or upgrading worker personal protective equipment. Elevated VOC screening readings may be an indication of VOC contamination in soil.

4.3.1.2 Management of Soil with Indications of VOC Contamination

Contingency protocols should be included in the Construction Impact Management Plan for management of soils should VOC screening indicate the presence of VOC contamination. These contingency protocols should include methods for safely stockpiling soil until the actual concentrations of VOCs in soil are identified and, based

on regulations governing management of excavated soil, an appropriate management method is determined. Excavated soil should be stored in a manner so as to limit access to and contact by unauthorized personnel and to minimize contact with storm water.

4.3.2 Groundwater Management Plan

If construction at the Site is performed such that groundwater will be removed, a groundwater management plan should be included in the Construction Impact Mitigation Plan. The groundwater management plan should, at a minimum, consider implementing methods in accordance with applicable regulations to perform the following:

- safely remove and store groundwater during construction;
- limit exposure to VOC vapors that may emanate from groundwater; and
- characterize and properly dispose of stored groundwater.

4.3.3 Use Of Construction Methods that Minimize the Potential for Creating Vertical Conduits

As discussed in Section 2.6.2, residual concentrations of VOCs currently exist in shallow groundwater at concentrations that suggest the presence of separate-phase DNAPL. The top of this shallow groundwater zone is typically encountered at a depth of approximately 6 to 8 feet bgs (EKI 1997a). DNAPLs can, in some instances, migrate to deeper depths if conduits are created in confining media or hydrologic conditions are altered.

If in the future chemical concentrations in groundwater suggest the presence of DNAPL, construction activities should be conducted such that the potential for DNAPL migration is limited. For example, penetrations through the bottom of the B-zone at the Site into deeper aquifers could potentially provide a conduit for the migration of groundwater containing elevated concentrations of VOCs to deeper aquifers that are currently not impacted. A specific example of a penetration to a deeper aquifer is the installation of pilings for the foundation of new construction.

Penetrations to below the B-zone will not be allowed in areas where VOCs are present in groundwater above California Maximum Contaminant Levels ("MCLs") for drinking water, unless (a) sufficient precautions are taken to prevent migration of impacted groundwater to deeper groundwater zones, and (b) RWQCB concurs that the design is adequate to prevent impacts to deeper groundwater.

4.3.4 Protection of Vapor Barrier

A vapor barrier will be installed at approximately 4 feet bgs in the backfill for the source area soil excavation. The barrier is designed to prevent possible migration of VOC vapors from underlying groundwater into the clean backfill. The barrier would also reduce the rate at which VOCs from groundwater could migrate into any overlying

structures. Owners of the property are required to protect the integrity of the vapor barrier by not penetrating through the barrier during construction or maintenance activity at the Site unless (a) damage to the barrier can be effectively repaired, or (b) the underlying groundwater no longer contains VOCs above risk-based action levels.

4.3.5 Protection of Monitoring Wells

It is anticipated that selected existing groundwater monitoring wells at the Site will be required for future groundwater monitoring. Existing monitoring wells at the Site include monitoring wells MW-1, MW-2, MW-3, MW-4, MW-5B, MW-6B, and MW-7B. Of these, monitoring wells MW-2, MW-5B, MW-6B, and MW-7B are planned for a future groundwater monitoring program. In addition two additional on-Site wells, MW-8 and MW-9 are planned for installation and monitoring. Existing and proposed on-Site monitoring wells are shown on Figure 10.

As long as groundwater monitoring is required by the RWQCB or other regulatory agency, construction procedures should be implemented to prevent accidental damage to the required groundwater monitoring wells. With the approval of the RWQCB, groundwater monitoring wells may be abandoned and replaced with new groundwater monitoring wells at a different locations.

1999-18015
08/09/1999 03:24P
CR Page: 33 of 153

5. DESIGN CONSIDERATIONS FOR NEW CONSTRUCTION

Based on the results of the human health risk assessment (Chapter 3), the highest identified risk to indoor workers at the Site is exposure to VOCs migrating into enclosed spaces. No buildings currently exist over the Groundwater Risk Area, discussed in Section 2.4.2. Unless it is demonstrated that VOC concentrations in groundwater are less than risk-based action levels, any new buildings should be designed so that migration of VOCs into new buildings is limited. Materials and methods (e.g., liners, sub-slab aeration, low permeability concrete, crack sealants) are available to restrict vapor intrusion through building floors. At the time of building design, a professional engineer experienced in this type of work should be consulted to design appropriate barriers to prevent the potential migration of VOCs into new buildings.

1999-1-3515
03/09/1999 05:24P
DR Page 34 of 183

6. NON-CONSTRUCTION RISK MANAGEMENT

This risk management plan also addresses precautions that should be implemented to mitigate long-term risks to human health and the environment related to exposure to COCs during periods of normal, non-construction activity. Any construction that will disturb the soil, building foundations, or pavement should be completed in a manner that is consistent with Chapters 4 and 5 and applicable environmental policies, laws, and regulations.

Components of the risk management plan for non-construction activities are as follows:

- Ensuring that future land uses are consistent with the commercial/industrial uses assumed under this Risk Management Plan;
- Monitoring groundwater at the perimeter of the Groundwater Risk Area to monitor for possible future expansion of the Groundwater Risk Area, unless VOC concentrations in groundwater samples collected in all on-Site wells are less than risk-based action levels;
- Prohibiting the use of groundwater at the Site, unless VOC concentrations in groundwater are less than MCLs;
- Establishing a notification procedure and protocols for future sub-surface activity to ensure long-term compliance with this Risk Management Plan; and
- Inspecting the Site as necessary to verify that risk management controls are being implemented and that they are effective in limiting potential exposure to VOCs at the Site.

6.1 Property Manager and Tenant Notification

The property owner shall provide notification of the known environmental conditions at the Site and of the requirements of this RMP to (a) the property manager, and (b) tenants and other entities leasing or otherwise exercising control over space at the Site.

6.2 Maintaining Commercial/Industrial Land Use

The Site is restricted to commercial/industrial use, except that uses for day-care or primary education are explicitly not allowed. If other uses are proposed, the owner may make a proposal to the RWQCB or other appropriate agency, supported by analysis, that the provisions of this RMP should be changed.

6.3 Monitoring of Existing Buildings

As discussed in Section 2.4.2, groundwater with VOC concentrations above the risk-based action levels has not been detected outside the Groundwater Risk Area shown on Figure 7. However, over time, it is possible that the groundwater flow regime at the Site

Notes:

(a) Sample depth range in feet below ground surface (ft bgs).

(b) A hyphen (-) indicates that the sample was not analyzed for the chemical.

(c) Shaded rows indicate samples collected from soil to be removed as part of the remedial soil excavation.

Notes
(a) Depth of groundwater interval sampled in feet below ground surface ("ft bgs").
(b) 1,1,2-Trichloro-1,2,2-Trifluoroethane = Freon 113
(c) Trichlorofluoromethane = Freon 11
(d) Less than symbol ("<") denotes that analyte was not present above the laboratory detection limit indicated.
(e) A hyphen (-) indicates that no analysis was performed for the chemical.
(f) Sample collected by Geomatrix, 1995; value unknown.
(g) Duplicate sample.
(h) Laboratory indicates this result is an estimated value.

Table 3

Risk-Based Action Levels for Soil

3695-3723 Haven Avenue Property

Menlo Park, California

Chemical	Risk-Based Action Level for Soil (mg/kg)
Acetone	1000
Benzene	0.50
Carbon Tetrachloride	0.50
Chloroform	0.50
1,2-Dichlorobenzene	50
1,1-Dichloroethane	5.0
1,2-Dichloroethane	0.50
1,1-Dichloroethene	5.0
cis-1,2-Dichloroethene	500
trans-1,2-Dichloroethene	50
Methylene Chloride	0.50
Tetrachloroethene	0.50
Toluene	5.0
1,1,1-Trichloroethane	5.0
Trichloroethene	3.2 (b)
1,1,2-Trichloro-1,2,2-Trifluoroethane	1000
Vinyl Chloride	0.075 (b)

Note:

(a) Risk-based action level concentrations rounded to two significant digits.

(b) These volatile organic compounds have been detected in Site soil at concentrations greater than the risk-based action level.

Table 4

Risk-Based Action Levels for Groundwater

3695-3723 Haven Avenue Property

Menlo Park, California

Chemical	Risk-Based Action Level for Groundwater (ug/L)
Acetone	500
Benzene	1,000
Carbon Tetrachloride	2,600
Chloroform	2,000
1,2-Dichlorobenzene	500
1,1-Dichloroethane	510
1,2-Dichloroethane	500
1,1-Dichloroethene	520
cis-1,2-Dichloroethene	50,000
trans-1,2-Dichloroethene	510
Methylene Chloride	500
Tetrachloroethene	510
Toluene	510
1,1,1-Trichloroethane	510
Trichloroethene	8,000 (b)
1,1,2-Trichloro-1,2,2-Trifluoroethane	29,000
Vinyl Chloride	500 (b)

Notes

(a) Risk-based action level concentrations rounded to two significant digits.

(b) These volatile organic compounds have been detected in Site groundwater at concentrations greater than the risk-based action level.

EXECUTIVE SUMMARY

This human health risk assessment was performed to:

- Evaluate potential impacts to human health by chemicals of concern ("COCs") present in soil and groundwater at the commercial/industrial property located at 3695-3723 Haven Avenue, Menlo Park, California (the "Site"); and,
- Develop risk-based action levels for soil and groundwater at the Site.

An analysis of risk was conducted assuming hypothetical exposure scenarios for potential future occupants of the Site. Occupants were subdivided into three hypothetical receptor populations based on their expected locations and activities. Each hypothetical population is described herein with a unique set of environmental and physiological assumptions, and was thus assumed to be exposed to different concentrations of chemicals for different amounts of time. All assumptions used in the risk assessment are quantified in the attached tables.

Baseline risks were calculated for the following three hypothetical receptor populations at the Site:

- Future commercial/industrial building occupants, who will work indoors on-Site over a long period of time ("Indoor Workers");
- Future maintenance personnel such as groundskeepers, who will labor primarily outdoors over a long period of time ("Maintenance Workers").
- Workers involved in the construction of new buildings or subsurface utilities on-Site, who will occupy the Site for much more limited periods ("Construction Workers"); and

A summary table of calculated baseline risks to each of the hypothetical future populations is shown below (Table A-I). These values represent the estimated total (a) Hazard Index for non-carcinogenic adverse health affects, and (b) incremental excess carcinogenic risk ("Cancer Risk"), to the hypothetical populations due to current Site conditions. In general, potential exposure pathways considered in the calculation of these baseline risks include exposure through incidental ingestion of soil, dermal contact with soil, inhalation of vapors from soil, and inhalation of vapors from groundwater.

One of the assumptions regarding the future Indoor Worker receptor population is that, unlike future Maintenance and Construction Workers, its members never work directly with soil. Thus, incidental ingestion and dermal contact with contaminated soil are not considered exposure pathways for this population. Inhalation of volatile organic

compounds evaporating from soil and groundwater were considered as complete pathways for all hypothetical populations.

Hypothetical Population	Baseline Hazard Index	Baseline Cancer Risk
Future Indoor Workers	0.08	1.9×10^{-5}
Future Maintenance Workers	0.03	4.5×10^{-6}
Construction Workers	0.01	1.0×10^{-7}

Table A-I. Summary of Baseline Risks to Hypothetical Future Site Populations.

A more complete summary of estimated Hazard Index and Cancer Risk for the above populations may be found in Tables A-19, A-20, and A-21. Risk calculations are further documented in Tables A-9 through A-18.

Risk Calculations

Table A-19 is a summary of estimated baseline risks for Indoor Workers. The most significant chemical/pathway combination for Indoor Workers, in terms of Cancer Risk, is inhalation of TCE evaporating from groundwater. The non-carcinogenic Hazard Index for this population is dominated by inhalation of vinyl chloride, trichloroethene ("TCE"), and *cis*-1,2-dichloroethene ("*cis*-1,2-DCE") from groundwater.

Baseline estimated Hazard Indices and Cancer Risk for Maintenance Workers through all pathways are listed in Table A-20. The most significant chemical/pathway combination for the Maintenance Worker receptor population is inhalation of vinyl chloride volatilizing from soil.

Baseline estimated Hazard Indices and Cancer Risk for all Construction Worker exposure pathways are listed in Table A-21. The most significant chemical/pathway combination, both in terms of Cancer Risk and the non-carcinogenic Hazard Index for the Construction Worker receptor population is inhalation of vinyl chloride volatilizing from soil.

Calculation of Risk-Based Action Levels

Using the baseline risks calculated for the hypothetical receptor populations at the Site, risk-based action levels for soil and groundwater have been calculated, as discussed below.

Risk-based action levels for soil and groundwater were calculated to apportion post-remediation risk such that overall Cancer Risk to the Indoor Worker, Maintenance Worker, and Construction Worker are each at or below 1.0×10^{-5}, and overall Hazard Index is at or below 1.0.

Table A-II is a listing of the risk-based action levels for those chemicals found in Site soil at concentrations exceeding the risk-based action levels. These include vinyl chloride and TCE. A more complete listing of risk-based action levels in soil for all chemicals of concern is provided in Table A-22.

1999-13516
08/09/1999 03:24P
28 Page: 79 of 153

VOLATILE ORGANIC COMPOUND	RISK-BASED ACTION LEVEL IN SOIL (ug/kg)
vinyl chloride	75
trichloroethene	3,200

Table A-II. Risk-Based Action Levels for VOCs in Soil

Table A-III is a summary of risk-based action levels for chemicals with maximum concentrations found in Site groundwater exceeding the risk-based action levels, i.e. TCE and vinyl chloride. Table A-23 is a more detailed enumeration of the calculated groundwater risk-based action levels.

VOLATILE ORGANIC COMPOUND	RISK-BASED ACTION LEVEL IN GROUNDWATER (ug/L)
vinyl chloride	500
trichloroethene	8,000

Table A-III. Risk-Based Action Levels for VOCs in Groundwater.

The method used for apportioning risk was to allocate most of the "available" risk to the more hazardous chemicals and those more commonly found at the Site. This approach minimizes the volume of soil and groundwater potentially requiring remediation, while keeping future hypothetical populations' estimated risks below target levels. Concentrations of vinyl chloride and TCE have been encountered in soil and groundwater samples from the Site in exceedence of their risk-based action levels. Other chemicals of concern have been discovered at concentrations consistently below the action levels.

Tables A-24, A-25, and A-26 are summaries of Hazard Index and Cancer Risk to each of the three hypothetical future worker populations at the calculated risk-based action levels

for soil and groundwater. Cumulative Hazard Indices and Cancer Risks are equal to or below 1.0 and 1.0×10^{-5}, respectively, in each case. Therefore, the risk-based action levels for soil and groundwater presented in Tables A-II and A-III result in an acceptable level of risk for future potentially exposed populations.

Future installation of monitoring wells (or other on-Site environmental work) may involve the collection of soil or groundwater samples for chemical analysis. Such analyses could potentially indicate the presence of chemical concentrations different from the current dataset. In this case, risk-based action levels for the Site may be recalculated to reflect the improved understanding of the distribution and concentrations of chemicals in Site soil or groundwater.

1. INTRODUCTION

This appendix presents a human health risk assessment that was performed to:

- evaluate potential impacts to human health by chemicals of concern ("COCs") present in soil and groundwater at the commercial/industrial property located at 3705-3723 Haven Avenue, Menlo Park, California (the "Site"), and
- develop risk-based action levels for soil and groundwater at the Site.

Note that baseline risks at the Site were calculated previously for development of risk-based action levels for soil excavation using data collected prior to April 1998 (EKI 1998c; EKI 1999b). The methods and assumptions used in the risk calculations described herein are consistent with the previous risk calculations, with the following exceptions. The previous risk assessment used the most conservative measured values of vadose and capillary zone saturated porosities for Site soil. The calculated risks presented herein have instead assumed Site-average values for each parameter. Some additional groundwater data were collected for the Site after April 1998. Therefore, the data set used herein to calculate the baseline risk at the Site has been updated to include all the soil and groundwater data for the Site available as of February 1999. Also, the proposed risk-based action levels have now been developed to consider VOCs in both soil and groundwater.

The risk assessment was conducted assuming hypothetical exposure scenarios for future occupants of the Site. Occupants are subdivided into several receptor populations based on their expected locations and activities. Each group was assumed to be subjected to different concentrations of chemicals for different amounts of time. All assumptions used in the risk assessment are quantified in the attached tables.

This report is divided into three major sections. The first discusses criteria used to define each of the future occupant populations, outlines the chemicals present at the Site and their representative concentrations, and explains the toxicity criteria used in calculations. The second section presents and discusses the calculation of risk-based cleanup goals at the Site, and the third section discusses conservative assumptions used and uncertainty involved in the calculations.

This risk assessment was performed using guidelines published by the U.S. Environmental Protection Agency ("USEPA"), the California Environmental Protection Agency ("Cal-EPA"), and the American Society for Testing and Materials ("ASTM"), in the following documents:

- USEPA. December 1989, *Risk Assessment Guidance for Superfund. Volume 1. Human Health Evaluation Manual.*

- Cal-EPA, July 1992, *Supplemental Guidance for Human Health Multimedia Risk Assessments of Hazardous Waste Sites and Permitted Facilities.*

- ASTM, September 1995, *Standard Guide for Risk-Based Corrective Action Applied at Petroleum Release Sites ("RBCA").*

Although all three documents are used for guidance in the risk assessment calculations, RBCA was the source of transport models used to calculate indoor and outdoor air exposure point concentrations for the assessment.

Chemicals of concern at the Site include halogenated volatile organic compounds ("VOCs"), acetone, and the aromatics benzene and toluene. Ordered by frequency of detection, the most common contaminants in soil and groundwater are trichloroethene ("TCE"), *cis*-1,2-dichloroethene ("cis-1,2-DCE"), and 1,1,2-trichloro-1,2,2-trifluoroethane ("CFC-113"). In groundwater, chloroform is also a common constituent. Based on the current set of samples, more chemicals appear to be present at detectable levels in groundwater than in soil.

2. ASSESSMENT OF BASELINE HUMAN HEALTH RISKS

The objective of a risk assessment for a particular location is to calculate the potential for adverse health effects, caused by chemicals present at the Site, to hypothetical current and future populations that may use the Site. The Site is currently unoccupied. Therefore, risk calculations in this report concern only hypothetical future populations. This section presents a discussion of the following topics:

- Potentially exposed receptor populations and relevant exposure pathways,
- Chemicals of concern present in soil and groundwater,
- Toxicity criteria for the chemicals of concern used in risk calculations,
- Assumptions used to calculate representative and exposure-point contaminant concentrations, and
- Results of the risk calculations.

1998-135815
05/06/1999 08:24P
OR Page 74 of 153

2.1 Identification of Potentially Exposed Receptor Populations and Relevant Exposure Pathways

The Site is a commercial/industrial property, previously used for the manufacture of polished silicon wafers. It is located in a low-elevation, industrial/commercial area, approximately one hundred feet south of the salt evaporation ponds at the margin of San Francisco Bay. Two buildings are located on the Site; both are currently vacant. Populations at risk of potential exposure to chemicals of concern at the Site are therefore limited to hypothetical future populations of workers, which for the purpose of this study are grouped into three categories:

- Future commercial/industrial building occupants, who will work indoors on-Site over a long period of time ("Indoor Workers");
- Future maintenance personnel such as groundskeepers, who will labor primarily outdoors over a long period of time ("Maintenance Workers"); and
- Workers involved in the construction of new buildings or subsurface utilities on-Site, who will occupy the Site for much more limited periods ("Construction Workers").

Based on current land use and zoning, no residential, health-care, or educational facilities are expected to be built on-Site. Thus, all potentially exposed receptor populations in the risk assessment are assumed to be adults. Each potentially exposed future population at the Site has a set of possible exposure mechanisms, or pathways, through which it may come in contact with various chemicals of concern. These exposure pathways are dependent upon the type of activity or tasks expected from the population.

Oral ingestion of groundwater is a potential exposure pathway that was considered and rejected. Analytical results for samples of groundwater from the Site range from 8,600 mg/L to 154,200 mg/L total dissolved solids ("TDS") [EKI, 1999a], which classifies the water as brackish to saline [Drever, 1988]. The groundwater beneath the Site cannot be considered a potential source of drinking water because these values exceed the California state TDS guideline of 3,000 mg/L for drinking water sources (CRWQCB, 1995).

Dermal contact with groundwater was also rejected. Historic depth to groundwater at the Site is six to eight feet below ground surface ("bgs") [EKI, 1997a]. Expected depth of excavation for future construction utility installation or repair is estimated to be less than six to eight feet, so direct dermal exposure to groundwater is not treated as a valid exposure pathway for any of the hypothetical future Site receptor populations.

For the purpose of calculating baseline risk, parameters assumed in this study for each of the receptor populations are the following:

- INDOOR WORKERS
  - Exposure Pathways:
    - Inhalation of volatiles from groundwater
    - Inhalation of volatiles from soil
  - Exposure Parameters:
    - Frequency: 250 working days per year, none doing excavation work; all days spent working indoors
    - Duration: 25 years
- MAINTENANCE WORKERS
  - Exposure Pathways:
    - Inhalation of volatiles from soil
    - Inhalation of volatiles from groundwater
    - Dermal contact with soil
    - Incidental ingestion of soil
  - Exposure Parameters:
    - Frequency: 250 working days per year; 5 days of excavation work, 245 days of non-excavation work; all working days spent outside
    - Duration: 25 years

- CONSTRUCTION WORKERS

- Exposure Pathways:
  - Inhalation of volatiles from soil
  - Inhalation of volatiles from groundwater
  - Dermal contact with soil
  - Incidental ingestion of soil

- Exposure Parameters:
  - Frequency: 250 working days per year, 87 spent doing excavation work
  - Duration: 4 months

Unlike the Indoor Worker population, Maintenance and Construction Workers are assumed to have contact with Site soil in the course of their jobs during excavation work. Thus, dermal contact and incidental ingestion pathways are considered for these populations. Although the hypothetical Maintenance and Construction Worker populations share the same potential exposure pathways, the two groups differ in exposure duration. Maintenance Workers, being permanent employees, are assumed to undergo exposure through activities at the Site for 25 years [USEPA, 1991]. Construction Workers are assumed to have a much shorter per-individual exposure of one year, a span of time assumed to encompass the earthwork stage of a construction project. An additional difference between the two outdoor receptor populations is the assumption that Maintenance Workers engage in excavation-type activities for an average of 5 days per year of 250 days, whereas Construction Workers perform excavation 87 days (four months) of their work year. This is significant in that excavation work is modeled with a higher soil ingestion rate than non-excavation activity.

The Site is almost completely covered by asphalt or concrete. Due to this cover, mobilization of chemicals through inhalation of particulate matter from surficial soils is not considered as a viable exposure pathway. The assumption was made that the Site will retain a similar type of cover, such as asphalt, concrete, or clean landscaping fill, in the future. Volatilization of chemicals from surficial soils to ambient air is similarly precluded, as almost none of the soil at the Site exists at the surface. For modeling purposes, all contaminated soil is treated as subsurface soil.

Mobilization and diffusion of vapor-phase chemicals (volatilized from soil or groundwater) from the subsurface to the surface is driven by a concentration gradient between the subsurface source of the vapors and the local atmosphere. Many chemicals at the Site are present in both soil and groundwater, and are conservatively assumed, in the baseline risk calculations, to volatilize and diffuse from both soil and groundwater into the atmosphere.

1858-125815
08/08/1998 03:24P
08 Page 76 of 153

1992a; Cal-EPA, 1992]. The conservative assumption is made whereby analyses that did not detect a particular chemical of concern are treated as though the chemical had been detected at a concentration of one half the detection limit [USEPA, 1989]. Representative concentrations for all chemicals of concern at the Site are shown in Table A-3.

2.3 Toxicity Criteria

Accumulated data from various laboratory toxicity studies have been compiled and interpreted by a number of Federal and State agencies, among them the U.S. Environmental Protection Agency and the California Environmental Protection Agency. Results from human and, more commonly, animal trials are summarized into reference doses ("RfDs") for non-carcinogenic chemicals and risk slope factors ("SFs") for carcinogens. Toxicity values used in this risk assessment are taken from a hierarchy of several sources. If the needed value was not available in the preferred source, the next most reviewed source was consulted, and so on.

Non-carcinogen RfDs are preferentially obtained from the U.S. EPA Integrated Risk Information System ("IRIS") [USEPA, 1996], an on-line database of peer-reviewed toxicity information. The next most desirable RfD sources, in order of preference, are the U.S. EPA Health Effects Summary Tables ("HEAST") [USEPA, 1997], the U.S. EPA National Center for Environmental Assessment ("NCEA") Risk Assessment Issue Papers, and the Cal-EPA Office of Environmental Health Hazard Assessment Technical Support Document for the Determination of Non-Cancer Chronic Reference Exposure Levels ("OEHHA") [Cal-EPA, 1997].

Carcinogen SFs are preferentially culled from the Cal-EPA Memorandum Concerning Cancer Potency Factors: Update [Cal-EPA, 1996]. Values unavailable in that document are obtained from one of the above references for RfDs, in the same order of preference.

2.3.1 Non-Carcinogenic Toxicity Criteria

Toxicity of non-carcinogenic chemicals is expressed through reference doses, or RfDs, in units of milligrams per kilogram of body weight per day (mg/kg-day). The RfD for a particular chemical of concern is the hypothetical dose which will cause no adverse effects in human populations. An oral or ingestion reference dose ("RfDo") for a chemical is calculated from a different set of experiments than is an inhalation reference dose ("RfDi"). When one quantity or the other is unavailable, a "route-to-route extrapolation," or substitution, is sometimes used in the above data sources to estimate the missing value. As most toxicity studies are performed on laboratory animals, direct quantitative data for human toxicity of a particular chemical are uncommon. Published RfDs therefore generally contain safety factors of one or two orders of magnitude, to account for cross-species uncertainty, uncertainty from experimental procedures, and other effects. RfDs may be interpreted as representing the maximum "safe" dosage of a non-carcinogenic chemical. A low RfD indicates a low threshold dose, and therefore a

more toxic chemical; a high RfD denotes a substance with less toxicity. Reference doses for each chemical of concern at the Site are listed in Table A-4, together with a summary of demonstrated health effects and sources of the toxicological data.

2.3.2 Carcinogenic Toxicity Criteria

Toxicity for carcinogens is expressed as a risk slope factor, or "SF". Units of an SF are inverse exposure units, or $(mg/kg\text{-}day)^{-1}$. When multiplied by a dose, the inverse dosage units cancel, resulting in a dimensionless value that represents the risk associated with that dose. Slope factors are therefore the "plausible upper-bound estimates of the probability of a carcinogenic response per unit of chemical intake over a lifetime" [USEPA, 1989]. As opposed to RfDs, chemicals with low SFs are less carcinogenic than those with high SFs. Slope factors for chemicals of concern at the Site are summarized in Table A-5, along with carcinogenic effects and SF data sources for each chemical.

2.4 Calculation of Exposure Point Concentrations and Chronic Daily Intakes

Based on the calculated representative concentrations for the chemicals of concern at the Site, estimates can be calculated for the concentration each potentially exposed receptor population might experience through a particular set of exposure pathways. Called exposure point concentrations ("EPCs"), these values, along with parameters describing the potentially exposed populations, allow determination of a Chronic Daily Intake ("CDI") for each chemical, population, and pathway. CDIs are expressed as dosages, in units of milligram of chemical per kilogram of body weight per day (mg/kg-day). Carcinogenic CDIs are calculated differently from non-carcinogenic CDIs. Averaging time is assumed to be 25 years for non-carcinogens but a full lifetime of 70 years for carcinogens. Assumed values for all parameters, along with the sources of the assumptions, are summarized in Table A-6.

2.4.1 Ingestion and Dermal Contact Exposure Pathways

For the cases of soil ingestion and dermal contact, exposure point concentrations are identical to representative concentrations. CDIs for the two potential future receptor populations assumed to have the greatest likelihood of contact with Site soil, Maintenance Workers and Construction Workers, are calculated according to equations [1] and [2]:

Ingestion:

$$CDI_i = \frac{C_s \times IR_s \times EF \times ED \times 10^{-6}\,\frac{kg}{mg}}{BW \times AT} \qquad [1]$$

where

CDI_i = Chronic daily intake through ingestion (mg/kg-day)

C_s = Representative Concentration = Concentration in soil (mg/kg)

IR_s = Ingestion rate of soil (mg/day)
EF = Exposure frequency (days/year)
ED = Exposure duration (years)
BW = Body weight (kg)
AT = Averaging time (days)

Dermal Contact:

$$CDI_{dc} = \frac{C_s \times SA_s \times ABS \times AF \times EF \times ED \times 10^{-6} \frac{kg}{mg}}{BW \times AT} \quad [2]$$

where
CDI_{dc} = Chronic daily intake through dermal contact (mg/kg-day)
C_s = Representative Concentration = Concentration in soil (mg/kg)
SA_s = Surface area of skin exposed to soil contact (cm^2/event)
ABS = Soil-dermal absorption fraction (unitless)
AF = Soil adherence factor (mg/cm^2)
EF = Exposure frequency (days/year)
ED = Exposure duration (years)
BW = Body weight (kg)
AT = Averaging time (days)

The Maintenance and Construction Worker scenarios differ with regard to incidental ingestion of soil. A Maintenance Worker is assumed to excavate soil for a total of 5 days during a work year of 250 days. In contrast, a Construction Worker is assumed to engage in excavation labor for four months (approximately 87 days) throughout the 250-day work year. Soil ingestion is assumed to occur at a rate of 480 mg/day during excavation activity and 50 mg/day during routine maintenance activities [USEPA, 1991; Cal-EPA, 1992]. See Table A-6 for more details of human exposure assumptions.

2.4.2 Inhalation Exposure Pathways

Chemicals of concern can volatilize from the subsurface into the air, posing a potential hazard to on-Site workers breathing in the vicinity. Different algorithms are used to calculate Exposure Point Concentrations ("EPCs") for indoor and outdoor air. When chemicals evaporate from soil and groundwater, the rate of transfer, based on each chemical's volatility, must first be determined before air EPCs can be calculated. Volatilization is modeled as a linear transfer function of the chemical's concentration in soil or groundwater [ASTM, 1995]. Expressed as a volatilization factor ("VF"), the transfer function is based, in part, on a chemical's Henry's Law constant, diffusion coefficients in air and water, and organic carbon partition coefficient. Exposure point concentrations in air due to volatilization of chemicals present in soil and groundwater are calculated for all future worker receptor populations through equations [3] and [4]:

$$C_a = VFx \times RC \times AgF \quad [3]$$

for excavation work, and

$$C_a = VFx \times RC \quad [4]$$

for non-excavation work, where

C_a = Concentration in air, or EPC (mg/m³)
RC = Representative concentration of the chemical (mg/kg or mg/L)
AgF = Agitation factor to model enhanced evaporation from excavation (unitless)

and the general term VFx refers to one of the following pathway and chemical-specific Volatilization Factors ("VFs"):

VFs_{amb} = Soil-to-outdoor air (ambient) pathway (kg soil/m³ air):

$$VFs_{amb} = \frac{H \times \rho_S \times 10^3 \frac{cm^3 kg}{m^3 g}}{\left[\theta_{WS} + (k_{OC} \times f_{OC} \times \rho_S) + (H \times \theta_{AS})\right] \times \left(1 + \frac{U_{AIR} \times \delta_{AIR} \times L_S}{D_S^{eff} \times W}\right)} \quad [5]$$

VFw_{amb} = Groundwater-to-outdoor air (ambient) pathway (L H_2O/m³ air):

$$VFw_{amb} = \frac{H \times 10^3 \frac{L}{m^3}}{\left(1 + \frac{U_{AIR} \times \delta_{AIR} \times L_{GW}}{D_{WS}^{eff} \times W}\right)} \quad [6]$$

VFs_{enp} = Soil-to-indoor air (enclosed space) pathway (kg soil/m³ air):

$$VFs_{enp} = \frac{\left[\theta_{WS} + (k_{OC} \times f_{OC} \times \rho_S) + (H \times \theta_{AS})\right] \times \left[\frac{H \times \rho_S}{\frac{D_S^{eff}}{L_S \times ER \times L_B}}\right] \times 10^3 \frac{cm^3 kg}{m^3 g}}{1 + \left[\frac{D_S^{eff}}{L_S \times ER \times L_B}\right] + \left[\frac{D_S^{eff} \times L_{CRACK}}{L_S \times D_{CRACK}^{eff} \times \eta}\right]} \quad [7]$$

VFw_{enp}= Groundwater-to-indoor air (enclosed space) pathway (L H_2O/m^3 air):

$$VFw_{enp} = \frac{H \times \left[\frac{D^{eff}_{WS}}{L_{GW} \times ER \times L_B}\right] \times 10^3 \frac{L}{m^3}}{1 + \left[\frac{D^{eff}_{WS}}{L_{GW} \times ER \times L_B}\right] + \left[\frac{D^{eff}_{WS} \times L_{CRACK}}{L_{GW} \times D^{eff}_{CRACK} \times \eta}\right]} \quad [8]$$

VFs are based, in part, upon effective diffusion coefficients for each chemical, calculated as follows:

D^{eff}_S = Effective diffusion coefficient in soil based on vapor concentration (cm^2 / s):

$$D^{eff}_S = \left[D^{air} \times \frac{(\theta_{AS})^{3.3}}{(\theta_T)^2}\right] + \left[D^{water} \times \frac{(\theta_{WS})^{3.3}}{H \times (\theta_T)^2}\right] \quad [9]$$

D^{eff}_{CAP} = Effective diffusion coefficient through capillary fringe (cm^2 / s):

$$D^{eff}_{CAP} = \left[D^{air} \times \frac{(\theta_{ACAP})^{3.3}}{(\theta_T)^2}\right] + \left[D^{water} \times \frac{(\theta_{WCAP})^{3.3}}{H \times (\theta_T)^2}\right] \quad [10]$$

D^{eff}_{WS} = Effective diffusion coefficient between groundwater and surface (cm^2 / s):

$$D^{eff}_{WS} = \frac{(h_{CAP} + h_V)}{\left[\frac{h_{CAP}}{D^{eff}_{CAP}} + \frac{h_V}{D^{eff}_S}\right]} \quad [11]$$

D^{eff}_{CRACK} = Effective diffusion coefficient through floor or wall cracks (cm^2 / s)

$$D^{eff}_{CRACK} = \left[D^{air} \times \frac{(\theta_{ACRACK})^{3.3}}{(\theta_T)^2}\right] + \left[D^{water} \times \frac{(\theta_{WCRACK})^{3.3}}{H \times (\theta_T)^2}\right] \quad [12]$$

Where:

D^{air} = Diffusion coefficient of the chemical in air (cm^2 / s)

D^{water} = Diffusion coefficient of the chemical in water (cm^2 / s)

ER = Enclosed-space air exchange rate (L / sec)
f_{OC} = Fraction of organic carbon in soil (g C / g soil)
H = Henry's Law constant (cm³ H_2O / cm³ air)
h_{cap} = Thickness of capillary fringe (cm)
h_v = Thickness of vadose zone (cm)
k_{OC} = Organic carbon-water sorption coefficient (cm³ H_2O / g C)
L_B = Enclosed-space volume / infiltration area ratio (cm)
L_{CRACK} = Enclosed-space floor or wall thickness (cm)
L_{GW} = Depth to groundwater, i.e. $h_{cap} + h_v$ (cm)
L_S = Depth to subsurface soil sources (cm)
U_{AIR} = Wind speed above ground surface in ambient mixing zone (cm / sec)
W = Width of source area parallel to wind or groundwater flow direction (cm)
δ_{AIR} = Ambient air mixing zone height (cm)
δ_{GW} = Groundwater mixing zone thickness (cm)
η = Areal fraction of cracks in floor or wall (cm² cracks / cm² total area)
θ_{ACAP} = Volumetric air content in capillary fringe soil (cm³ air / cm³ soil)
θ_{ACRACK} = Volumetric air content in floor or wall cracks (cm³ air / cm³ crack vol.)
θ_{AS} = Volumetric air content in vadose zone soil (cm³ air / cm³ soil)
θ_T = Total soil porosity (cm³ / cm³ soil)
θ_{WCAP} = Volumetric water content in capillary fringe soil (cm³ water / cm³ soil)
θ_{WCRACK} = Volumetric water content in floor or wall cracks (cm³ water / cm³ crack vol.)
θ_{WS} = Volumetric water content in vadose zone soil (cm³ water / cm³ soil)
ρ_S = Soil bulk density (g soil / cm³ soil)

Volatilization Factors are calculated according to the method described in the ASTM RBCA guidance [ASTM, 1995]. Air diffusion coefficients ("D_{air}") for chemicals of concern at the Site are estimated using the FSG method [Lyman, et al., 1990; USEPA, 1988]. Water diffusion coefficients ("D_{water}") are calculated through the method of Hayduk and Laudie [Lyman, et al., 1990]. Ambient-air VFs are used for calculations regarding Construction and Maintenance Workers, while enclosed-space air VFs are used for Indoor Worker EPC calculations. Specific physical parameter assumptions used in the above VF equations can be found in Table A-7; the quantities are Site-specific and noted as such where available, and otherwise are default values from the ASTM RBCA guidance [ASTM, 1995]. Table A-8 lists the resulting VFs and other data for each chemical of concern and volatilization pathway.

Construction Workers are modeled herein as performing excavation for their four month on-Site tenure of 87 working days (USEPA, 1991; Cal-EPA, 1992), consequently equation [3] is applied throughout. Maintenance Workers, however, are assumed to only labor five days per year in excavation tasks; AgF is only factored in through the use of equation [3] for those five days annually. The rest of the time, Maintenance Worker air EPCs are calculated using equation [4]. Indoor Workers are assumed to never perform excavation tasks, thus air EPCs are calculated with equation [4].

Chronic Daily Intakes in air due to volatilization of chemicals present in soil are calculated for all future worker receptor populations through equation [13]:

$$CDI_{air} = \frac{C_a \times IR_a \times EF \times ED}{BW \times AT} \qquad [13]$$

where

CDI_{air} = Chronic daily intake through inhalation (mg/kg-day)
C_a = Concentration in air, or EPC (mg/m^3)
IR_a = Inhalation rate of air (m^3/day)
EF = Exposure frequency (days/year)
ED = Exposure duration (years)
BW = Body weight (kg)
AT = Averaging time (days)

Chronic daily intakes of chemicals of concern for each valid population/pathway combination are summarized in Table A-9 through Table A-18.

2.5 Baseline Risk Characterization

For the purpose of risk assessment at the Site, effects from chemicals of concern are split into two broad categories, Cancer Risk and non-carcinogenic Hazard Index. Each of these types of risk is calculated differently, although many contaminants at the Site have both effects, and are assigned both classifications. The separation is driven by the toxicity data for the two chemical effect categories. Non-carcinogens are assigned a Reference Dose ("RfD") in mg/kg-day, and carcinogens are assigned a Slope Factor ("SF"), having inverse dosage units of (mg/kg-day)$^{-1}$. This section outlines assumptions used to calculate quantitative, Site-specific estimates of potential health hazards from non-carcinogens and of incremental lifetime Cancer Risk from carcinogens occurring at the Site.

Note that baseline risks are calculated assuming receptor populations are unprotected from exposure to hazardous chemicals (i.e. no engineering controls or personal protection equipment used).

As discussed in Section 1.3, non-carcinogenic RfDs are generally based on the highest no-adverse-effects chronic dosages from several studies. The hazard of a chemical of concern through a particular exposure pathway is calculated as the Chronic Daily Intake ("CDI") divided by the RfD for that pathway. This quantity is called the Hazard Index ("HI"). It is unique to the site, chemical, exposure pathway, and receptor population:

$$HI_a = \frac{CDI_a}{RfD_a} \qquad [14]$$

where

HI_n = Hazard Index for the n^{th} combination of population, exposure pathway, and chemical of concern (dimensionless)

CDI_n = Chronic Daily Intake for the n^{th} combination of population, exposure pathway, and chemical of concern (mg/kg-day)

RfD_n = Reference Dose for the n^{th} combination of exposure pathway and chemical of concern (mg/kg-day)

For an explanation of CDI calculation for each population / pathway combination, please see footnotes to Tables A-9 through A-18, as appropriate.

Summation of Hazard Indices over all pathways and chemicals gives the Hazard Index for each population, which is targeted to remain at or below a value of one. A total HI less than or equal to one indicates that the population will not be exposed to the chemical beyond a dosage considered safe.

Carcinogenic chemicals are assigned, based on experimental evidence and mathematical modeling, a published Slope Factor for each exposure pathway. When multiplied by the CDI for that pathway, a unitless quantity results which represents the incremental risk of developing cancer from exposure to that chemical, through that exposure pathway, over a lifetime of 70 years [USEPA, 1989].

$$CR_n = CDI_n \times SF_n \qquad [15]$$

where

CR_n = Estimated incremental excess Cancer Risk for the n^{th} combination of population, exposure pathway, and chemical of concern (dimensionless)

CDI_n = Chronic Daily Intake for the n^{th} combination of population, exposure pathway, and chemical of concern (mg/kg-day)

SF_n = Slope Factor for the n^{th} combination of exposure pathway and chemical of concern $(mg/kg\text{-}day)^{-1}$

As with the non-cancer Hazard Index, summation of risk from all chemicals over all pathways valid for a particular receptor population gives an overall Cancer Risk for the population at the Site. This value is targeted to remain at or below 10^{-5}. The National Oil and Hazardous Substances Pollution Contingency Plan (40 CFR §300) mandates an acceptable range of maximum incremental carcinogenic risk between 10^{-4} and 10^{-6}. California law requires notification of on-Site workers if Cancer Risk is estimated to exceed 10^{-5} (California Code of Regulations ("CCR") Title 22, Section 12703). The targeted maximum carcinogenic risk of 10^{-5} satisfies both sets of regulations.

All potentially exposed populations are assumed to be unprotected in the baseline risk calculations.

2.5.1 Future Indoor Workers

One of the assumptions regarding the future Indoor Worker receptor population is that its members never work with soil, thus, incidental ingestion and dermal contact with contaminated soil are not considered exposure pathways for this population. Inhalation of volatile organic compounds evaporating from soil, however, is valid and is presented in Table A-9. The same data for inhalation of VOCs from groundwater is shown in Table A-10.

A summary of baseline hazard and risk for Indoor Workers may be found in Table A-19. The most significant chemical/pathway combination for Indoor Workers, in terms of Cancer Risk, is inhalation of TCE evaporating from groundwater. The non-carcinogenic Hazard Index for this population is dominated by inhalation of vinyl chloride, TCE, and cis-1,2-DCE from groundwater.

2.5.2 Future Maintenance Workers

Baseline risk characterization data for Maintenance Workers is compiled in several tables. Table A-11 summarizes the soil ingestion exposure pathway, and Table A-12 displays similar data for the soil dermal contact exposure pathway. Table A-13 displays Hazard Index and Cancer Risk for the inhalation pathway through volatilization of organic compounds from soil. The same calculations for inhalation of VOCs from groundwater are shown in Table A-14.

Hazard and risk for Maintenance Workers through all pathways is summarized in Table A-20. The most significant chemical/pathway combination for the Maintenance Worker receptor population is inhalation of vinyl chloride volatilizing from soil. Note that under existing Site conditions, potential risks experienced by the hypothetical Maintenance Worker population are within acceptable limits.

2.5.3 Construction Workers

Baseline Hazard Indices and Cancer Risks for each chemical of concern at the Site are organized in the same way as for Maintenance Workers. Table A-15 lists the soil ingestion exposure pathway, and Table A-16 lists similar data for the soil dermal contact pathway. Table A-17 lists Hazard Index and Cancer Risk for the inhalation pathway of volatile organic compounds evaporating from soil; groundwater VOC volatilization is detailed in Table A-18. A summary of baseline Cancer Risks and Hazard Indices for all Construction Worker exposure pathways is listed in Table A-21. The most significant chemical/pathway combination, both in terms of potential carcinogenic risk and non-carcinogenic health hazard for the Construction Worker receptor population, is inhalation of vinyl chloride volatilizing from soil. Dermal contact with vinyl chloride is also a significant pathway in terms of generation of carcinogenic risk for Construction Workers. Note that under current conditions, potential risks experienced by the hypothetical Construction Worker population are less than the acceptable maximum values.

3. CALCULATION OF RISK-BASED ACTION LEVELS FOR SOIL AND GROUNDWATER

Using the baseline risks calculated for the hypothetical receptor populations at the Site, risk-based action levels for soil and groundwater have been calculated, as discussed below. Risk-based action levels have been calculated considering potential exposures to future hypothetical receptor populations, i.e., Indoor Workers, Maintenance Workers, and Construction Workers.

Risk-based action levels for soil and groundwater were calculated to apportion post-remediation risk such that overall Cancer Risk to all hypothetical worker populations is at or below 1.0×10^{-5}, and overall Hazard Index is at or below 1.0. The method used for apportioning risk was to allocate most of the risk to the more hazardous chemicals and those more commonly found at the Site. This approach minimizes the volume of soil and groundwater potentially requiring remediation, while keeping future hypothetical populations' estimated risks below target levels.

Table A-22 lists risk-based action levels for soil, and Table A-23 lists risk-based action levels for groundwater. Current representative concentrations of chemicals within soil and groundwater are also shown on Tables A-22 and A-23 for comparison. TCE and vinyl chloride have been detected in Site soil and groundwater at concentrations greater than their respective risk-based action levels.

Estimates of future estimated Hazard Indices and Cancer Risks for each of the hypothetical populations are listed in Tables A-24, A-25, and A-26. These risks represent estimates of what would result from cleanup of both soil and groundwater at the Site to the respective risk-based action levels. Estimated cumulative Hazard Indices and Cancer Risks for each hypothetical population are equal to or below 1.0 and 1.0×10^{-5}, respectively. Therefore, the risk-based action levels for soil and groundwater listed in Tables A-22 and A-23 would result in an acceptable level of risk for future potentially exposed populations.

If, in the future, chemicals are measured in soil or groundwater samples that differ significantly from the current dataset, risk-based action levels may be recalculated to more accurately reflect the distribution and concentrations of the chemicals.

4. CONSERVATIVE ASSUMPTIONS IN THE RISK ASSESSMENT

The estimated baseline risks and the risk-based action levels presented in the attached tables are upper-bound, health conservative estimates of baseline risks and risk-based action levels for reasonable maximum exposure scenarios. Actual risks may be lower. This section discusses the conservative nature of some of the assumptions in the risk assessment.

Major conservative assumptions include:

- the method used to calculate representative concentrations for chemicals in soil and groundwater;
- the use of all chemicals detected on-Site for risk calculation, even if the frequency of detection was very low;
- the use of conservative exposure frequency assumptions (in days of exposure per year) for hypothetical future worker populations;
- "double counting" of certain calculated risks caused by summing the risks due to volatilization of VOCs from soil and from groundwater; and
- apportionment of risk to each chemical of concern in both soil and groundwater, even when the chemical was actually detected in only one medium.

4.1 Calculation of Representative Concentrations

Representative concentrations of chemicals used to calculate baseline risks are assumed to be the lesser of the maximum detected concentration or the 95% upper confidence limit of the mean concentration ("95% UCL"), based on a lognormal model. When calculating the 95% UCL, samples without detectable concentrations were conservatively assumed to contain chemicals at concentrations equal to half the detection limit for the analyses. Potentially exposed populations may actually be exposed to a lesser concentration than either the maximum or the 95% UCL, as the distribution of chemicals at the Site is not homogeneous.

4.2 Frequency of Detection

Chemicals detected in Site soil and groundwater are dominated by TCE and cis-1,2-DCE. As a conservative approach, however, all detected chemical species were used in calculation of baseline risks, regardless of each chemical's frequency of detection. Table A-3 shows frequencies of detection for all chemicals detected on-Site.

Given the overall conservative nature of the risk assessment, actual non-carcinogenic and carcinogenic risks to potentially exposed populations are likely to be significantly lower than reported herein. The calculated health risk-based action levels are founded on the same conservative assumptions as the baseline risk calculations. Consequently, chemicals present in soil and groundwater at their human health risk-based action level concentrations should not pose an adverse risk to occupants at the Site.

Notes:

(a) Sample depth range in feet below ground surface (ft bgs).

(b) A hyphen (-) indicates that the sample was not analyzed for the chemical.

(c) The 95% upper confidence limit of the mean concentration was calculated assuming a log-normal data distribution. One-half the detection limit value was used for samples in which the analyte concentration was reported as below the detection limit.

(d) The representative concentration was selected as the lesser of either the 95% upper confidence limit or the maximum detected concentration.

Table A-2
Summary of Chemical Analytical Data for Groundwater Samples
3695-3723 Haven Avenue Property, Menlo Park, California

Sample	Sample Collection Depth (ft bgs)[a]	Sample Collection Date	EPA Analysis Method	Concentration in Groundwater (ug/L)															
				Acetone	Benzene	Carbon Tetrachloride	Chloroform	1,1-Dichloroethane	1,2-Dichloroethane	1,1-Dichloroethene	cis-1,2-Dichloroethene	trans-1,2-Dichloroethene	Methylene Chloride	Tetrachloroethene	Toluene	1,1,1-Trichloroethane	Trichloroethene	1,1,2-Trichloro-1,2,2-Trifluoroethane	Vinyl Chloride
Summary of Concentrations (ug/L)																			
Number of Samples Analyzed				32	35	102	102	102	34	102	102	102	102	102	33	102	102	32	102
Number of Analyte Detections				6	2	22	43	4	2	10	51	2	1	1	1	8	71	14	12
Frequency of Detection (%)				19%	6%	22%	42%	4%	6%	10%	50%	2%	1%	1%	3%	8%	70%	44%	12%
Minimum Concentration				11	4.7	6.1	0.5	1.9	5	0.9	0.62	1.6	32	46	6.6	0.73	0.57	5.9	1.1
Maximum Concentration				37	460	2300	1000	140	5	270	25000	1.6	32	46	6.6	27	260000	12000	1400
95% Upper Confidence Limit[c]				88	23	2014	3308	262	31941	288	52099	259	2621	284	14	247	3130151	2221	651
Representative Concentration (ug/L)[d]				37	23	2,000	1,000	140	5.0	270	25,000	2.0	32	46	7.0	27	260,000	2,200	650

Notes:

(a) Depth of groundwater interval sampled in feet below ground surface ("ft bgs").

(b) A hyphen (-) indicates that no analysis was performed for the chemical.

(c) The 95% upper confidence limit of the mean concentration was calculated assuming a log-normal data distribution. One-half the detection limit value was used for samples in which the analyte concentration was reported as below the detection limit.

(d) The representative concentration was selected as the lesser of either the 95% upper confidence limit concentration or the maximum detected concentration.

Table A-3
Representative Concentrations of Chemicals in Soil and Groundwater
3695-3723 Haven Avenue Property, Menlo Park, California

Chemical	Soil		Groundwater	
	Frequency of Detection	Representative Concentration[a] (mg/kg)	Frequency of Detection	Representative Concentration[a] (ug/L)
Acetone	-[b]	-	19%	37
Benzene	-	-	6%	23
Carbon Tetrachloride	1%	0.021	22%	2000
Chloroform	2%	0.016	42%	1000
1,2-Dichlorobenzene	1%	0.066	-	-
1,1-Dichloroethane	1%	0.065	4%	140
1,2-Dichloroethane	-	-	6%	5.0
1,1-Dichloroethene	-	-	10%	270
cis-1,2-Dichloroethene	60%	4.0	50%	25000
trans-1,2-Dichloroethene	1%	0.063	2%	2
Methylene Chloride	-	-	1%	32
Tetrachloroethene	1%	0.063	1%	46
Toluene	-	-	3%	7
1,1,1-Trichloroethane	-	-	8%	27
Trichloroethene	62%	1.8	70%	260000
1,1,2-Trichloro-1,2,2-Trifluoroethane	33%	0.57	44%	2200
Vinyl Chloride	4%	0.14	12%	650

Notes:

(a) Representative Concentrations ("RCs") were calculated as the lesser of the maximum concentration or the 95% Upper Confidence Limit of the mean concentration ("UCL95"), assuming a lognormal distribution.

(b) A hyphen (-) means the chemical was not detected.

Table A-4
Oral and Inhalation Non-Carcinogenic Toxicity Information for Chemicals of Concern
3695-3723 Haven Avenue Property, Menlo Park, California

Compound	Oral Reference Dose (mg/kg-day)	Inhalation Reference Dose (mg/kg-day)	Non-Carcinogenic Effects	Source[a]
Acetone	0.1	0.1[b]	Liver toxicity in mice, liver and kidney weight gain in rats.	IRIS
Benzene	0.003	0.0017	Neoplasia in rats and mice.	NCEA
Carbon Tetrachloride	0.0007	0.011	Liver lesions in rats.	IRIS (o), OEHHA (i)
Chloroform	0.01	0.086	Liver cyst formation in dogs.	IRIS (o), OEHHA (i)
1,2-Dichlorobenzene	0.09	0.057	Liver necrosis and lymphocyte depletion in rats and mice.	IRIS (o), HEAST (i)
1,1-Dichloroethane	0.1	0.14	Under review	HEAST
1,2-Dichloroethane	-[c]	-	-	-
1,1-Dichloroethene	0.009	0.0057	Hepatic lesions in rats, alimentary system effects.	IRIS (o), HEAST (i)
cis-1,2-Dichloroethene	0.01	0.01[b]	Decreased hematocrit and hemoglobin in rats.	HEAST
trans-1,2-Dichloroethene	0.02	0.02[b]	Changes in serum chemistry, decreased thymus gland weight in rats.	IRIS
Methylene Chloride	0.06	0.086	Liver toxicity in rats.	IRIS (o), OEHHA (i)
Tetrachloroethene	0.01	0.011	Liver toxicity in mice, liver and kidney weight gain in rats.	IRIS (o), OEHHA (i)
Toluene	0.2	0.11	Neurotoxicity in humans when inhaled; change in liver, kidney weights in rats.	IRIS (o), OEHHA & IRIS (i)
1,1,1-Trichloroethane	0.035	0.29	Central nervous system depression, psychomotor effects in humans.	NCEA
Trichloroethene	0.17[d]	0.17	Under review.	OEHHA
1,1,2-Trichloro-1,2,2-Trifluoroethane	30	26	Psychomotor impairment in occupationally exposed humans.	IRIS (o), OEHHA (i)
Vinyl Chloride	0.0014[d]	0.0014	Under review.	OEHHA

Table A-4
Oral and Inhalation Non-Carcinogenic Toxicity Information for Chemicals of Concern
3695-3723 Haven Avenue Property, Menlo Park, California

Notes:

(a) Reference doses ("RfDs") were obtained from the California EPA Office of Environmental Health Hazard Assessment, 1997 Technical Support Document for the Determination of Noncancer Chronic Reference Exposure Levels ("OEHHA"); the U.S. Environmental Protection Agency Integrated Risk Information System ("IRIS"); the U.S. EPA 1997 Health Effects Assessment Summary Tables ("HEAST"); or the U.S. EPA National Center for Environmental Assessment Risk Assessment Issue Papers ("NCEA"); in order of precedence. Notation: (o) = oral reference dose, (i) = inhalation reference dose.

(b) An inhalation RfD is not defined in the listed sources, so the corresponding oral RfD (i.e. route-to-route extrapolation) is shown.

(c) A hyphen (-) indicates that no data for the indicated parameter was available from the listed sources.

(d) An oral RfD is not defined in the listed sources, so the corresponding inhalation RfD (i.e. route-to-route extrapolation) is shown.

Table A-5
Oral and Inhalation Carcinogenic Toxicity Information for Chemicals of Concern
3695-3723 Haven Avenue Property, Menlo Park, California

Compound	Weight of Evidence Classification[a]	Oral Slope Factor $(mg/kg\text{-}d)^{-1}$	Inhalation Slope Factor $(mg/kg\text{-}d)^{-1}$	Carcinogenic Effects	Source[b]
Acetone	D	-[c]	-	-	IRIS
Benzene	A	0.1	0.1	Non-lymphocytic leukemia from occupational exposure of humans.	Memo
Carbon Tetrachloride	B2	0.15	0.15	Liver cell carcinomas in rats, mice, hampsters.	Memo
Chloroform	B2	0.031	0.019	Several tumor types formed in rats and mice.	Memo
1,2-Dichlorobenzene	D	-	-	-	IRIS
1,1-Dichloroethane	C	0.0057	0.0057	Mammary gland carcinomas, liver cell carcinomas, benign uterine polyps in female rats and mice.	Memo
1,2-Dichloroethane	B2	0.07	0.07	Several tumor types in rats. Lung papillomas in mice.	Memo
1,1-Dichloroethene	C	-	-	-[d]	IRIS
cis-1,2-Dichloroethene	D	-	-	-	IRIS
trans-1,2-Dichloroethene	-	-	-	-	-
Methylene Chloride	B2	0.014	0.0035	Liver cell and lung neoplasms in mice. Salivary gland sarcomas, benign mammary tumors in rats.	Memo
Tetrachloroethene	B2	0.051	0.021	-	Memo
Toluene	D	-	-	-	IRIS
1,1,1-Trichloroethane	D	-	-	-	IRIS
Trichloroethene	B2	0.015	0.01	-	Memo
1,1,2-Trichloro-1,2,2-Trifluoroethane	-	-	-	-	-
Vinyl Chloride	A	0.27	0.27	Liver, lung tumors in rats.	Memo

Table A-5
Oral and Inhalation Carcinogenic Toxicity Information for Chemicals of Concern
3695-3723 Haven Avenue Property, Menlo Park, California

Notes:

(a) U.S. EPA weight-of-evidence classification is as follows:

A = Human Carcinogen

B1 or B2 = Probable Human Carcinogen; B1 indicates that limited human data are available; B2 indicates that there is sufficient evidence in animals and inadequate or no evidence in humans.

C = Possible Human Carcinogen

D = Not Classifiable as to Human Carcinogenicity

E = Evidence of Non-Carcinogenicity for Humans

Weight-of-evidence information obtained from the U.S. Environmental Protection Agency Integrated Risk Information System database ("IRIS"); the July 1997 U.S. EPA Health Effects Assessment Summary Tables ("HEAST"); or the U.S. EPA National Center for Environmental Assessment Risk Assessment Issue Papers ("NCEA"), in order of precedence.

(b) Slope factors were obtained from the California Environmental Protection Agency, 1996 Memorandum of Cancer Potency Factors Update ("Memo", see below); the U.S. EPA IRIS database; the 1997 U.S. EPA HEAST; or the U.S. EPA NCEA, in order of precedence.

(c) A hyphen (-) indicates that no data for the indicated field was available in the listed sources.

(d) 1,1-Dichloroethene is not recognized as a human carcinogen by the State of California (source: California EPA, 1996, *California Cancer Potency Factors*, California Environmental Protection Agency, Office of Environmental Health Hazard Assessment, Sacramento, California, 1 April 1996).

Table A-6
Human Exposure Assumptions
3695-3723 Haven Avenue Property, Menlo Park, California

Parameter	Variable	Value	Reference [a]
Air Inhalation Rate (m^3/day)	IRa		
All Adult Workers		20	USEPA (1991), Cal-EPA (1992)
Averaging Time (days)	AT		
Non-Carcinogens			
Maintenance Worker (25 yrs)		9125	USEPA (1991), Cal-EPA (1992)
Construction Worker (1 yr)		365	USEPA (1991), Cal-EPA (1992)
Indoor Worker (25 yrs)		9125	USEPA (1991), Cal-EPA (1992)
Carcinogens			
All Workers (70 yrs)		25550	USEPA (1991), Cal-EPA (1992)
Body Weight (kg)	BW		
All Adult Workers		70	USEPA (1991), Cal-EPA (1992)
Exposure Duration (years)	ED		
Maintenance Worker		25	USEPA (1991), Cal-EPA (1992)
Construction Worker		1	Best Professional Judgement
Indoor Worker		25	USEPA (1991), Cal-EPA (1992)
Exposure Frequency (days/year or events/year)	EF		
Maintenance Worker - excavation		5	Best Professional Judgement
Maintenance Worker - nonexcavation		245	Best Professional Judgement
Construction Worker		87	USEPA (1991), Cal-EPA (1992)
Indoor Worker		250	USEPA (1991), Cal-EPA (1992)
Skin Surface Area (cm^2/event)	SAs		
All Adult Workers		3160	Based on U.S. EPA (1989a)
Soil Adherence Factor (mg/cm^2)	AF		
All Outdoor Workers - Excavation		0.5	ASTM (1995)
All Outdoor Workers - Nonexcavation		0.5	ASTM (1995)
Soil Agitation Factor for Volatilization During Excavation (dimensionless)	AgF	1	U.S. EPA (1989b)
Soil Ingestion Rate (mg/day)	IRs		
Maintenance Worker - excavation		480	USEPA (1991)
Maintenance Worker - nonexcavation		50	USEPA (1991), Cal-EPA (1992)
Construction Worker		480	USEPA (1991)
Soil-Dermal Absorbtion Fraction (dimensionless)	ABS		Cal-EPA (1994)
VOCs		0.1

θ_{as}	0.083	Volumetric air content in vadose zone soil (cm^3 air / cm^3 soil)	EKI, 1997b
θ_{ws}	0.331	Volumetric water content in vadose zone soil (cm^3 water / cm^3 soil)	EKI, 1997b
θ_{acap}	0.018	Volumetric air content in capillary fringe soil (cm^3 air / cm^3 soil)	EKI, 1997b
θ_{wcap}	0.396	Volumetric water content in capillary fringe soil (cm^3 water / cm^3 soil)	EKI, 1997b
θ_{acrack}	0.083	Volumetric air content in foundation or wall cracks (cm^3 air / cm^3 crack vol.)	ASTM, 1995 [b]
θ_{wcrack}	0.331	Volumetric water content in foundation or wall cracks (cm^3 water / cm^3 crack vol.)	ASTM, 1995
θ_T	0.414	Total soil porosity (cm^3 / cm^3 soil)	EKI, 1997b
η	0.001	Areal fraction of cracks in foundation or wall (cm^2 cracks / cm^2 total area)	Daugherty, 1992 [c]
ρ_s	1.57	Soil bulk density (g soil / cm^3 soil)	EKI, 1997b
Θ_m	0.225	Soil moisture content by mass (kg water / kg dry soil)	EKI, 1997b
L_B	244	Enclosed-space volume / infiltration area ratio (cm)	EKI [d]
L_{crack}	11	Enclosed-space foundation or wall thickness (cm)	EKI, 1997b
L_{gw}	190	Depth to groundwater, i.e. $h_{cap} + h_v$ (cm)	EKI, 1997b
L_s	30	Depth to subsurface soil sources (cm)	EKI, 1997b
ER	0.00023	Enclosed-space air exchange rate (L / sec)	ASTM, 1995
U_{air}	410	Wind speed above ground surface in ambient mixing zone (cm / sec)	WRRC, 1998 [e]
δ_{air}	200	Ambient air mixing zone height (cm)	ASTM, 1995
W	5100	Width of source area parallel to wind or groundwater flow direction (cm)	EKI, 1997a
foc	0.0061	Fraction of organic carbon in soil (g C / g soil)	EKI, 1997b

Notes:

(a) Parameter values were derived or estimated from physical properties measured onsite and documented in one of the following:

EKI, 1997a, *Remedial Investigation Report, 3695-3723 Haven Avenue and Vicinity, Menlo Park, California.* Erler & Kalinowski, Inc., 21 April 1997.

EKI, 1997b, *Results of Additional Investigations and Testing, 3695-3723 Haven Avenue and Vicinity, Menlo Park, California.* Erler & Kalinowski, Inc., 30 December 1997.

DR Page 112 of 163

Table A-7
Site Physical Parameter Assumptions
3695-3723 Haven Avenue Property, Menlo Park, California

(b) Parameter values were defaults taken from the ASTM RBCA guide:

ASTM, 1995, *Standard Guide for Risk-Based Corrective Action Applied at Petroleum Release Sites*. American Society for Testing and Materials, Designation E 1739-95, 10 September 1995.

Volumetric air and water content of foundation and wall cracks assumed to be identical to air and water content of vadose zone soil, as in RBCA.

(c) Taken from:

Daugherty, S.J., 1992, *Regulatory Approaches to Hydrocarbon Contamination from Underground Storage Tanks*. in Kostecki, P.T, and E.J. Calabrese, eds., Hydrocarbon Contaminated Soils and Groundwater: Analysis, Fate, Environmental and Public Health Effects, Remediation. Vol. 1. Lewis Publishers.

(d) Best professional judgement by EKI personnel.

(e) Western Regional Climate Center data for Moffett Field, Mountain View, CA.

Notes:

(a) Solubility values from Montgomery, J.H. and L.M. Welkom, 1991, *Groundwater Chemicals Desk Reference*. Lewis Pub. Co., Chelsea, Mich.

(b) Saturation soil concentration ("Csat") calculated through the equation:

$C_{sat} = (S \times \Theta m / \rho_s) \times (Koc \times foc \times \rho_s + \theta_{ws} + H' \times \theta_{as})$

(Parameters and values used in the above equation are shown in Table A-7 and Table A-8.)

(c) Definition of terms (for an explanation of calculations, see section 2.4 of the text):

- S = Solubility
- C_{sat} = Saturation concentration
- C_{max} = Maximum analysed concentration in soil samples
- H' = Dimensionless Henry's Law constant
- D_{air} = Diffusivity in air
- D_{water} = Diffusivity in water
- K_{oc} = Organic carbon partition coefficient
- VFw_{esp} = Volatilization factor for the groundwater to enclosed space air pathway
- VFs_{esp} = Volatilization factor for the soil to enclosed space air pathway
- VFw_{amb} = Volatilization factor for the groundwater to ambient air pathway
- VFs_{amb} = Volatilization factor for the soil to ambient air pathway

Total Estimated Risk due to Inhalation of COCs Volatilized from Soil to Indoor Air:								0.02	2.35E-06

Notes:

(a) Refer to Table A-3 for compilation of representative concentrations ("RCs").

(b) Volatilization factor from soil to enclosed-space air ("VFesp") was calculated for each chemical using the Risk-Based Corrective Action model ("RBCA") [ASTM, 1995]. Parameters used in the RBCA model are listed in Tables 7 and 8.

(c) Chronic daily intakes ("CDIs") were estimated using methods recommended by U.S. EPA or Cal-EPA. The following equation was used to calculate CDIs (Refer to Table A-6 for parameter values used in calculations):

$$CDI_{(inhalation)} = \frac{Ca * IRa * EF * ED}{BW * AT}$$

Table A-9

Characterization of Human Health Risks due to Inhalation of COCs Volatilized from Subsurface Soil for Future Indoor Workers

3695-3723 Haven Avenue Property, Menlo Park, California

where:

$CDI_{(inhalation)}$ = Chronic Daily Intake (mg/kg-day)
Ca = Exposure Point Air Concentration (mg/m^3) = VFssp * RC
IRa = Air Inhalation Rate (m^3/day)
EF = Exposure Frequency (days/year)
ED = Exposure Duration (years)
BW = Body Weight (kg)
AT = Averaging Time (days)

(d) See Table A-4 for an explanation of chronic noncancer reference doses (RfD) used here. A hyphen (-) indicates an RfD was not found for the compound.

(e) See Table A-5 for an explanation of carcinogenic slope factors (SFs) used here. A hyphen (-) indicates an SF was not found for the compound.

(f) Non-carcinogenic hazard index ("HI") for a compound "i" is defined as the CDI_i/RfD_i. The non-carcinogenic HI, summed for all compounds and exposure pathways, assumes that there is a level of exposure (i.e., RfD) below which it is unlikely even for sensitive populations to experience adverse health effects [U.S. EPA, 1989]. If the chronic daily intake (i.e., CDI) exceeds this RfD threshold (i.e., HI greater than 1), there may be concern for potential adverse non-carcinogenic health effects.

(g) Estimated lifetime incremental cancer risk for compound "i" is defined as $CDI_i \times SF_i$. The estimated incremental lifetime cancer risk to an individual of developing cancer due to COCs is given by the sum of incremental cancer risks for all chemicals and exposure pathways.

1,1,2-Trichloro-1,2,2-Trifluoroethane	0.575	3.3E-07	-	30	-	1.1E-08	-
Vinyl Chloride	0.137	7.8E-08	2.8E-08	0.0014	0.27	5.6E-05	7.6E-09
Total Estimated Risk due to Ingestion of Soil Containing COCs:						3.1E-04	1.5E-08

Notes:

(a) Refer to Table A-3 for compilation of representative concentrations.

(b) Chronic daily intakes (CDIs) were estimated using methods recommended by U.S. EPA or Cal-EPA, as follows:
(Note that different soil ingestion rates were assumed for excavation and non-excavation work. See Table A-6 for details.)

$$CDI_{(ingestion)} = \frac{Cs * IRs * EF * ED * 10^{-6}\ kg/mg}{BW * AT}$$

where:

$CDI_{(ingestion)}$ = Chronic daily intake (mg/kg-day)

Cs = Concentration in soil (mg/kg)

IRs = Ingestion Rate of soil (mg/day)

Table A-11
Characterization of Baseline Human Health Risks due to Ingestion of COCs in Soil for Future Maintenance Workers
3695-3723 Haven Avenue Property, Menlo Park, California

EP = Exposure Frequency (days/year)
ED = Exposure Duration (years)
BW = Body Weight (kg)
AT = Averaging Time (days)
and assuming Cs = RCsoj]

(c) See Table A-4 for an explanation of chronic noncancer reference doses (RfD) used here. A hyphen (-) indicates an RfD was not found for the compound.

(d) See Table A-5 for an explanation of carcinogenic slope factors (SFs) used here. A hyphen (-) indicates an SF was not found for the compound.

(e) Non-carcinogenic hazard index (HI) for a compound "i" is defined as the CDI_i/RfD_i. The non-carcinogenic HI, summed for all compounds and exposure pathways, assumes that there is a level of exposure (i.e., RfD) below which it is unlikely even for sensitive populations to experience adverse health effects [U.S. EPA, 1989]. If the chronic daily intake (i.e., CDI) exceeds this RfD threshold (i.e., HI greater than 1), there may be concern for potential adverse non-carcinogenic health effects.

(f) Estimated lifetime incremental cancer risk for compound "i" is defined as $CDI_i \times SF_i$. The estimated incremental lifetime cancer risk to an individual of developing cancer due to COCs is given by the sum of incremental cancer risks for all chemicals and exposure pathways.

Total Estimated Risk due to Inhalation of COCs Volatilized from Soil to Outdoor Air:								0.03	3.0E-06

Notes:

(a) Refer to Table A-3 for compilation of representative concentrations ("RCs").

(b) Volatilization factor from soil to ambient air ("VFsamb") was calculated for each chemical using the Risk-Based Corrective Action model ("RBCA") (ASTM, 1995). Parameters used in the RBCA model are listed in Tables 7 and 8.

(c) Chronic daily intakes ("CDIs") were estimated using methods recommended by U.S. EPA or Cal-EPA. The following equation was used to calculate CDIs (Refer to Table A-6 for parameter values used in calculations):

$$CDI_{(inhalation)} = \frac{Cp * IRa * EF * ED}{BW * AT}$$

Table A-13

Characterization of Baseline Human Health Risks due to Inhalation of COCs Volatilized from Subsurface Soil for Future Maintenance Workers

3695-3723 Haven Avenue Property, Menlo Park, California

where:

$CDI_{(inhalation)}$ = Chronic Daily Intake (mg/kg-day)

Ca = Exposure Point Air Concentration (mg/m^3) = VFsamb * RC for non-excavation work and Ca = VFsamb * RC * AgF for excavation work, where AgF = Agitation Factor = 18.

IRa = Air Inhalation Rate (m^3/day)

EF = Exposure Frequency (days/year)

ED = Exposure Duration (years)

BW = Body Weight (kg)

AT = Averaging Time (days)

(d) See Table A-4 for an explanation of chronic noncancer reference doses (RfD) used here. A hyphen (-) indicates an RfD was not found for the compound.

(e) See Table A-5 for an explanation of carcinogenic slope factors (SFs) used here. A hyphen (-) indicates an SF was not found for the compound.

(f) Non-carcinogenic hazard index ("HI") for a compound "i" is defined as the CDI_i/RfD_i. The non-carcinogenic HI, summed for all compounds and exposure pathways, assumes that there is a level of exposure (i.e., RfD) below which it is unlikely even for sensitive populations to experience adverse health effects [U.S. EPA, 1989]. If the chronic daily intake (i.e., CDI) exceeds this RfD threshold (i.e., HI greater than 1), there may be concern for potential adverse non-carcinogenic health effects.

(g) Estimated lifetime incremental cancer risk for compound "i" is defined as $CDI_i \times SF_i$. The estimated incremental lifetime cancer risk to an individual of developing cancer due to COCs is given by the sum of incremental cancer risks for all chemicals and exposure pathways.

Total Estimated Risk due to Inhalation of COCs Volatilized from Groundwater to Outdoor Air:								0.005	1.4E-06

Notes:

(a) Refer to Table A-3 for compilation of representative concentrations ("RCs").

(b) Volatilization factor from groundwater to ambient air ("VFwamb") was calculated for each chemical using the Risk-Based Corrective Action model ("RBCA") [ASTM, 1995]. Parameters used in the RBCA model are listed in Tables 7 and 8.

(c) Chronic daily intakes ("CDIs") were estimated using methods recommended by U.S. EPA or Cal-EPA. The following equation was used to calculate CDIs (Refer to Table A-6 for parameter values used in calculations):

$$CDI_{(inhalation)} = \frac{Ca * IRa * EF * ED}{BW * AT}$$

Table A-14

Characterization of Baseline Human Health Risks due to Inhalation of COCs Volatilized from Groundwater for Future Maintenance Workers

3695-3723 Haven Avenue Property, Menlo Park, California

where:

$CDI_{(inhalation)}$ = Chronic Daily Intake (mg/kg-day)

Ca = Exposure Point Air Concentration (mg/m^3) = VFwamb * RC

IRa = Air Inhalation Rate (m^3/day)

EF = Exposure Frequency (days/year)

ED = Exposure Duration (years)

BW = Body Weight (kg)

AT = Averaging Time (days)

(d) See Table A-4 for an explanation of chronic noncancer reference doses (RfD) used here. A hyphen (-) indicates an RfD was not found for the compound.

(e) See Table A-5 for an explanation of carcinogenic slope factors (SFs) used here. A hyphen (-) indicates an SF was not found for the compound.

(f) Non-carcinogenic hazard index ("HI") for a compound "j" is defined as the CDI_j/RfD_j. The non-carcinogenic HI, summed for all compounds and exposure pathways, assumes that there is a level of exposure (i.e., RfD) below which it is unlikely even for sensitive populations to experience adverse health effects [U.S. EPA, 1989]. If the chronic daily intake (i.e., CDI) exceeds this RfD threshold (i.e., HI greater than 1), there may be concern for potential adverse non-carcinogenic health effects.

(g) Estimated lifetime incremental cancer risk for compound "j" is defined as $CDI_j \times SF_j$. The estimated incremental lifetime cancer risk to an individual of developing cancer due to COCs is given by the sum of incremental cancer risks for all chemicals and exposure pathways.

Total Estimated Risk due to Ingestion of Soil Containing COCs:						0.0009	1.7E-09

Notes:

(a) Refer to Table A-3 for compilation of representative concentrations.

(b) Chronic daily intakes (CDIs) were estimated using methods recommended by U.S. EPA or Cal-EPA, as follows:
(Note that different soil ingestion rates were assumed for excavation and non-excavation work. See Table A-6 for details.)

$$CDI_{(ingestion)} = \frac{Cs * IRs * EF * ED * 10^{-6}\ kg/mg}{BW * AT}$$

where:

$CDI_{(ingestion)}$ = Chronic daily intake (mg/kg-day)
Cs = Concentration in soil (mg/kg)
IRs = Ingestion Rate of soil (mg/day)

Table A-15
Characterization of Baseline Human Health Risks due to Ingestion of COCs in Soil for Construction Workers
3695-3723 Haven Avenue Property, Menlo Park, California

EF = Exposure Frequency (days/year)
ED = Exposure Duration (years)
BW = Body Weight (kg)
AT = Averaging Time (days)
and assuming Cs = RCsoil

(c) See Table A-4 for an explanation of chronic noncancer reference doses (RfD) used here. A hyphen (-) indicates an RfD was not found for the compound.

(d) See Table A-5 for an explanation of carcinogenic slope factors (SFs) used here. A hyphen (-) indicates an SF was not found for the compound.

(e) Non-carcinogenic hazard index (HI) for a compound "i" is defined as the CDI_i/RfD_i. The non-carcinogenic HI, summed for all compounds and exposure pathways, assumes that there is a level of exposure (i.e., RfD) below which it is unlikely even for sensitive populations to experience adverse health effects [U.S. EPA, 1989]. If the chronic daily intake (i.e., CDI) exceeds this RfD threshold (i.e., HI greater than 1), there may be concern for potential adverse non-carcinogenic health effects.

(f) Estimated lifetime incremental cancer risk for compound "i" is defined as $CDI_i \times SF_i$. The estimated incremental lifetime cancer risk to an individual of developing cancer due to COCs is given by the sum of incremental cancer risks for all chemicals and exposure pathways.

Characterization of Baseline Human Health Risks due to Dermal Contact with COCs in Soil for Construction Workers
3695-3723 Haven Avenue Property, Menlo Park, California

Compound	Representative Concentration (RC) of Compound in Soil[a] (mg/kg)	Non-Carcinogenic Chronic Daily Intake[b] (mg/kg-day)	Carcinogenic Chronic Daily Intake[b] (mg/kg-day)	Non-Carcinogenic Ingestion Reference Dose[c] (RfDo) (mg/kg-day)	Carcinogenic Oral Slope Factor[d] (SFo) $(mg/kg\text{-}d)^{-1}$	Non-Carcinogenic Hazard Index[e]	Estimated Lifetime Incremental Cancer Risk[f]
Toluene	-	-	-	0.2	-	-	-
1,1,1-Trichloroethane	-	-	-	0.035	-	-	-
Trichloroethene	1.811	2.8E-06	1.0E-06	0.17	0.015	1.6E-05	1.5E-08
1,1,2-Trichloro-1,2,2-Trifluoroethane	0.575	8.9E-07	-	30	-	3.0E-08	-
Vinyl Chloride	0.137	2.1E-07	7.6E-08	0.0014	0.27	1.5E-04	2.0E-08
Total Estimated Risk due to Dermal Contact with Soil Containing COCs:						8.4E-04	3.9E-08

Notes:

(a) Refer to Table A-3 for compilation of representative concentrations.

(b) Chronic daily intakes (CDIs) were estimated using methods recommended by U.S. EPA or Cal-EPA, as follows:

$$CDI_{(\text{dermal contact})} = \frac{Cs * SAs * ABS * AF * EF * ED * 10^{-6}\ kg/mg}{BW * AT}$$

Table A-16
Characterization of Baseline Human Health Risks due to Dermal Contact with COCs in Soil for Construction Workers
3695-3723 Haven Avenue Property, Menlo Park, California

where:

$CDI_{(dermal\ contact)}$ = Chronic daily intake (mg/kg-day)
Cs = Concentration in soil (mg/kg)
SAs = Surface Area of Skin exposed to soil contact (cm^2/event)
AF = Soil Adherence Factor (mg/cm^2)
ABS = Soil-Dermal Absorbtion Fraction (dimensionless)
EF = Exposure Frequency (events/year)
ED = Exposure Duration (years)
BW = Body Weight (kg)
AT = Averaging Time (days)
and assuming Cs = RCsoil

(c) See Table A-4 for an explanation of chronic noncancer reference doses (RfD) used here. A hyphen (-) indicates an RfD was not found for the compound.

(d) See Table A-5 for an explanation of carcinogenic slope factors (SFs) used here. A hyphen (-) indicates an SF was not found for the compound.

(e) Non-carcinogenic hazard index (HI) for a compound "i" is defined as the CDI_i/RfD_i. The non-carcinogenic HI, summed for all compounds and exposure pathways, assumes that there is a level of exposure (i.e., RfD) below which it is unlikely even for sensitive populations to experience adverse health effects [U.S. EPA, 1989]. If the chronic daily intake (i.e., CDI) exceeds this RfD threshold (i.e., HI greater than 1), there may be concern for potential adverse non-carcinogenic health effects.

(f) Estimated lifetime incremental cancer risk for compound "i" is defined as $CDI_i \times SF_i$. The estimated incremental lifetime cancer risk to an individual of developing cancer due to COCs is given by the sum of incremental cancer risks for all chemicals and exposure pathways.

Vinyl Chloride	0.137	1.1E-03	1.5E-04	1.0E-05	1.5E-07	0.0014	0.27	7.3E-03	4.0E-08
Total Estimated Risk due to Inhalation of COCs Volatilized from Soil to Outdoor Air:								**0.0**	**4.2E-08**

Notes:

(a) Refer to Table A-3 for compilation of representative concentrations ("RCs").

(b) Volatilization factor from soil to ambient air ("VFsamb") was calculated for each chemical using the Risk-Based Corrective Action model ("RBCA") [ASTM, 1995]. Parameters used in the RBCA model are listed in Tables 7 and 8.

(c) Chronic daily intakes ("CDIs") were estimated using methods recommended by U.S. EPA or Cal-EPA. The following equation was used to calculate CDIs (Refer to Table A-6 for parameter values used in calculations):

$$CDI_{(inhalation)} = \frac{Ca * IRa * EF * ED}{BW * AT}$$

Table A-17
Characterization of Baseline Human Health Risks due to Inhalation of COCs Volatilized from Subsurface Soil for Construction Workers
3695-3723 Haven Avenue Property, Menlo Park, California

where:

$CDI_{(inhalation)}$ = Chronic Daily Intake (mg/kg-day)

Cs = Exposure Point Air Concentration (mg/m^3) = VFsamb * RC for non-excavation work and Cs = VFsamb * RC * AgF for excavation work, where AgF = Agitation Factor = 1.

IRa = Air Inhalation Rate (m^3/day)

EF = Exposure Frequency (days/year)

ED = Exposure Duration (years)

BW = Body Weight (kg)

AT = Averaging Time (days)

(d) See Table A-4 for an explanation of chronic noncancer reference doses (RfD) used here. A hyphen (-) indicates an RfD was not found for the compound.

(e) See Table A-5 for an explanation of carcinogenic slope factors (SFs) used here. A hyphen (-) indicates an SF was not found for the compound.

(f) Non-carcinogenic hazard index ("HI") for a compound "i" is defined as the CDI_i/RfD_i. The non-carcinogenic HI, summed for all compounds and exposure pathways, assumes that there is a level of exposure (i.e., RfD) below which it is unlikely even for sensitive populations to experience adverse health effects [U.S. EPA, 1989]. If the chronic daily intake (i.e., CDI) exceeds this RfD threshold (i.e., HI greater than 1), there may be concern for potential adverse non-carcinogenic health effects.

(g) Estimated lifetime incremental cancer risk for compound "i" is defined as $CDI_i \times SF_i$. The estimated incremental lifetime cancer risk to an individual of developing cancer due to COCs is given by the sum of incremental cancer risks for all chemicals and exposure pathways.

Table A-18

Characterization of Baseline Human Health Risks due to Inhalation of COCs Volatilized from Groundwater for Construction Workers

3695-3723 Haven Avenue Property, Menlo Park, California

Compound	Representative Concentration (RC) of Compound in Groundwater [a] (ug/L)	VFw_{amb} [b] (L H_2O / m^3 air)	Outdoor Air Exposure Point Concentration [c] (mg/m^3)	Non-Carcinogenic Chronic Daily Intake [c] (mg/kg-day)	Carcinogenic Chronic Daily Intake [c] (mg/kg-day)	Non-Carcinogenic Inhalation Reference Dose [d] (RfDI) (mg/kg-day)	Carcinogenic Inhalation Slope [e] (SFo) $(mg/kg-d)^{-1}$	Non-Carcinogenic Hazard Index [f]	Estimated Lifetime Incremental Cancer Risk [g]
Toluene	7.0	5.3E-06	3.7E-08	2.5E-09	-	0.11	-	2.3E-08	-
1,1,1-Trichloroethane	27	7.3E-06	2.0E-07	1.3E-08	-	0.29	-	4.6E-08	-
Trichloroethene	260000	5.8E-06	1.5E-03	1.0E-04	1.5E-06	0.17	0.01	6.0E-04	1.5E-08
1,1,2-Trichloro-1,2,2 Trifluoroethane	2200	3.8E-05	8.4E-05	5.7E-06	-	26	-	2.2E-07	-
Vinyl Chloride	650	1.2E-05	8.0E-06	5.5E-07	7.8E-09	0.0014	0.27	3.9E-04	2.1E-09
Total Estimated Risk due to Inhalation of COCs Volatilized from Groundwater to Outdoor Air:								0.00	1.9E-08

Notes:

(a) Refer to Table A-3 for compilation of representative concentrations ("RCs").

(b) Volatilization factor from groundwater to ambient air ("VFwamb") was calculated for each chemical using the Risk-Based Corrective Action model ("RBCA") [ASTM, 1995]. Parameters used in the RBCA model are listed in Tables 7 and 8.

(c) Chronic daily intakes ("CDIs") were estimated using methods recommended by U.S. EPA or Cal-EPA. The following equation was used to calculate CDIs (Refer to Table A-6 for parameter values used in calculations):

$$CDI_{(inhalation)} = \frac{Cg * IRa * EF * ED}{BW * AT}$$

Table A-18

Characterization of Baseline Human Health Risks due to Inhalation of COCs Volatilized from Groundwater for Construction Workers

3695-3723 Haven Avenue Property, Menlo Park, California

where:

$CDI_{(inhalation)}$ = Chronic Daily Intake (mg/kg-day)
Ca = Exposure Point Air Concentration (mg/m^3) = VFwamb * RC
IRa = Air Inhalation Rate (m^3/day)
EF = Exposure Frequency (days/year)
ED = Exposure Duration (years)
BW = Body Weight (kg)
AT = Averaging Time (days)

(d) See Table A-4 for an explanation of chronic noncancer reference doses (RfD) used here. A hyphen (-) indicates an RfD was not found for the compound.

(e) See Table A-5 for an explanation of carcinogenic slope factors (SFs) used here. A hyphen (-) indicates an SF was not found for the compound.

(f) Non-carcinogenic hazard index ("HI") for a compound "i" is defined as the CDI_i/RfD_i. The non-carcinogenic HI, summed for all compounds and exposure pathways, assumes that there is a level of exposure (i.e., RfD) below which it is unlikely even for sensitive populations to experience adverse health effects [U.S. EPA, 1989]. If the chronic daily intake (i.e., CDI) exceeds this RfD threshold (i.e., HI greater than 1), there may be concern for potential adverse non-carcinogenic health effects.

(g) Estimated lifetime incremental cancer risk for compound "i" is defined as $CDI_i \times SF_i$. The estimated incremental lifetime cancer risk to an individual of developing cancer due to COCs is given by the sum of incremental cancer risks for all chemicals and exposure pathways.

RWQCB Siltec Closure Package

CALIFORNIA
Water Boards

San Francisco Bay Regional Water Quality Control Board

June 16, 2014
File No. 41S0105 (RL)

SUMCO Phoenix Corp.
Attn: Mr. Jeffrey Bradshaw
19801 North Tatum Boulevard
Phoenix, AZ 85050

RE: No Further Action Required at the former Siltec site located at 3695-3723 Haven Avenue, Menlo Park, San Mateo County

Dear Mr. Bradshaw:

This letter confirms the completion of a site investigation and corrective action for the subject site. Thank you for your cooperation throughout this investigation.

This letter responds to the December 31, 2013, "Summary of Environmental Conditions, and Request for Declaration of No Further Active Remediation Status" prepared by Erler & Kalinowski, Inc. (EKI) on behalf of SUMCO Phoenix Corp. ("SUMCO") for the former Siltec facility located at 3695-3723 Haven Avenue, Menlo Park, in San Mateo County (Site). This request was based on an evaluation of the criteria specified in the Regional Water Board's July 31, 2009, "Assessment Tool for Closure of Low Threat Chlorinated Solvent Sites." As explained below, we conclude that no further action is necessary at the Site. I also concur with your request to properly abandon groundwater monitoring wells on-site, and on the off-site downgradient 3750 Haven Avenue property, except for the two on-site shallow monitoring wells MW-8 and MW-9, which are to be monitored by the current Site owner pursuant to the terms of the existing Deed Restrictions. You are requested to provide documentation within 30 days after the proper abandonment of these wells.

Summary of Site Investigation and Remediation

The Site is comprised of three commercial buildings and was formerly used for semiconductor manufacturing which resulted in adverse impact of subsurface soil and groundwater by volatile organic compounds (VOCs), principally trichloroethene (TCE) and cis-1,2-dichloroethene (cis-1,2-DCE). Due to the close proximity to former salt ponds, groundwater in the area has extremely elevated salinity and is not suitable for municipal supply. Extensive investigations of on-site and off-site soil and groundwater have been conducted from 1994 through 2012. Risk-based cleanup goals were developed as part of the 1999 Feasibility Study/Remedial Action Plan (FS/RAP) prepared by EKI. Remedial options were evaluated, including a pilot study of in-situ chemical oxidation using potassium permanganate injection. Ultimately, in-situ treatment did not achieve

targeted reductions in VOC concentrations, and Site remediation was accomplished in 1999 through excavation and removal of impacted soil that exceeded risk-based cleanup goal.

In accordance with the FS/RAP, approximately 2,860 cubic yards of VOC-impacted soil were excavated from the Site and the adjacent 3645 and 3665 Haven Avenue properties to the northwest. The excavation was backfilled with a multilayered mixture of materials intended to inhibit movement of VOC vapors from groundwater into the clean fill. As part of the excavation effort, the building in the middle (Building No. 2 at 3715 Haven Avenue) was demolished and a new two-story building was constructed south of the former Building 2 footprint, outside of the high groundwater risk area. A paved parking lot currently occupies this soil remediation area.

SUMCO and its predecessors have conducted groundwater monitoring for 13 years since Site source excavation, using on-site and off-site downgradient wells. Based on the available data, VOCs in groundwater have migrated off-site to the east and northeast, but the concentrations of chemicals of concern in groundwater have stabilized or declined over this time period through natural attenuation process. Shallow soil vapor sampling conducted by SUMCO's predecessors in 1999 near the commercial building on the adjacent downgradient property to the east (3750 Haven Avenue) did not detect chemicals of concern originated from the Site above laboratory reporting limits.

Currently, Building 2 (3715 Haven Avenue) is owned by Deerfield Realty, and Buildings 1 (3695-3705 Haven Avenue) and 3 (3721-3723 Haven Avenue) are owned by Integris Millennium Joint Venture LLC (Integris). A Risk Management Plan (RMP) was prepared and incorporated into a 1999 Covenant (a.k.a. Deed Restriction) between the Site owner and the Regional Water Board. In addition to specific measures to protect human health risk from residual contamination in the groundwater, the RMP also requires the performance of groundwater monitoring in certain on-site wells, and evaluation of changing Site and regulatory conditions, by the Site owner. SUMCO sampled the two on-site shallow (A-zone) wells MW-8 and MW-9 from 1999 through 2004, during which time the concentrations remained below site-specific risk-based screening levels. After 2004, Regional Water Board approved SUMCO's proposal to discontinue monitoring of these wells and they have not been sampled by the current owner since 2004. Based on the 2004 groundwater data, 95 and 3,300 µg/l of TCE remain in the sample collected from MW-8 and MW-9, respectively, which are lower than the site specific screening levels.

Conclusion

Based on our review, we conclude that the Site meets the Water Board's criteria for a low-threat chlorinated solvent site. Remedial actions implemented to date have effectively removed the source and resulted in stabilized and improving groundwater condition. Further remedial actions will have marginal effect and it is anticipated that groundwater quality will further improve over time due to natural attenuation processes. There is an isolated pocket of elevated TCE concentrations in groundwater near MW-9 based on 2004 sampling result, which is above the existing Regional Water Board's Environmental Screening Levels (ESLs) for commercial land use. However, MW-9 is located outside of existing building footprint areas and the detected TCE concentrations were

below the site-specific risk-based screening levels. Based on groundwater data since 2004 from other monitoring wells at the Site, it is reasonable to expect that current TCE concentrations at MW-9 have also decreased significantly from its 2004 level.

Based on information in the above-referenced file and with the provision that the information provided to this agency was accurate and representative of site conditions, I conclude that no further action is necessary at the subject Site. Any risk associated with residual contamination can be adequately managed by the RMP and the deed restrictions. However, in the event the current or future land owner(s) proposes a more sensitive land use at the Site, we will require the use of up-to-date groundwater information, especially near the MW-9 area, to evaluate the risk before any revision of the deed restrictions can be granted.

If you have any questions concerning this letter, please contact Randy Lee of my staff at (510) 622-2375, [e-mail: rylee@waterboards.ca.gov].

Sincerely,

CASE CLOSURE SUMMARY

I. AGENCY INFORMATION

Date: June 12, 2014

Agency Name: SF Bay Regional Water Quality Control Board ("RWQCB")	*Address*: 1515 Clay Street, Suite 1400
City/State/Zip: Oakland, CA 94612	*Phone*: 510-622-2300
Responsible Staff Person: Randy Lee	*Title*: Water Resource Control Engineer

II. SITE INFORMATION

Site Facility Name: former Siltec facility		
Site Facility Address: 3695-3723 Haven Avenue, Menlo Park, San Mateo County		
RB Case No.: 41S0186	*Local Case No.*:	*Priority*:
Responsible Parties (include addresses and phone numbers)		
SUMCO Phoenix Corp. Attn: Mr. Jeffrey Bradshaw, Dir. Env. Health & Safety		
19801 North Tatum Boulevard		
Phoenix, AZ 85050		
(480) 473-6503		

Tank No.	*Size in Gallons*	*Contents*	*Closed In-Place/Removed?*	*Date*
n/a				

III. RELEASE AND SITE CHARACTERIZATION INFORMATION

Cause and Type of Release. Release to soil and groundwater associated with manufacture of silicon wafers		
Site characterization complete? Yes	*Date Approved by Oversight Agency:* March 1999	
Monitoring wells installed? Yes	*Number.* 6 onsite, 4 offsite, 3 destroyed	*Proper screened interval?* Yes
Highest GW Depth Below Ground Surface: 4 11	*Lowest Depth.* 9.00	*Flow Direction:* E - ENE
Most Sensitive Current Use: Commercial office		
Most Sensitive Potential Use and Probability of Use: Only commercial/industrial land use allowed on Site, by deed restriction. Surrounding properties used for commercial/industrial purposes		
Are drinking water wells affected? No	*Aquifer Name:* n/a	
Is surface water affected? No	*Nearest surface water name:* un-named channelized creek	
Off-Site Beneficial Use Impacts (Addresses/Locations): Minimal (see Sections IV and VI, below)		
Report(s) on file? Yes	*Where is report(s) filed?* Water Board

Comments:

Excavation was performed in 1999-2001 to a maximum depth of approximately 6 feet below ground surface, i.e., approximately one foot above groundwater (EKI, 2000; EKI, 2001). Deeper excavation into the capillary fringe or saturated zone was not practicable.

Notes:

(a) Listed pre-excavation VOC concentrations in soil and groundwater are from EKI (1999).

(b) Post-excavation soil sampling was not required by the RWQCB. Soil was excavated to approximately one foot above groundwater, and lateral excavation boundaries were pre-determined, based on soil sampling prior to excavation. Excavation boundaries enclosed soil samples with VOCs above risk-based screening levels, and were extended to include soil samples with VOCs above reporting limits but below screening levels, as a conservative measure (EKI, 2000). Of the chemical species detected on-Site, risk drivers were trichloroethene and vinyl chloride. Values shown above, in the soil post-excavation column, are the risk-based maximum soil screening levels for VOCs used to demarcate excavation boundaries. These data do not represent analytical results for confirmation soil samples.

(c) Post-remediation VOC concentrations in groundwater are the maximum analytical values from the three most recent sampling events for each well (EKI, 2013). All maximum post-remediation concentrations listed (except benzene and toluene) are analytical results of samples collected from on-site A-zone well MW-9, most recently sampled in 2004 (EKI, 2013).

(d) The risk-based soil screening level for this chemical was greater than the maximum observed concentration, thus its distribution did not influence cleanup goals or excavation boundaries.

IV. CLOSURE

Does completed corrective action protect existing beneficial uses per the Regional Board Basin Plan? Yes. Current listed beneficial uses include MUN, PROC, and IND for groundwater. Given the extreme salinity of groundwater at and around the Site, such uses currently are not possible. Nevertheless, VOC concentrations are expected to continue to decline over time, such that such beneficial uses could be possible in the absence of high salinity in groundwater.		
Does completed corrective action protect potential beneficial uses per the Regional Board Basin Plan? Yes. Potential beneficial uses include AGR for groundwater. Given elevated salinity of groundwater at and around the Site, such use is not currently possible. Nevertheless, VOC concentrations are expected to continue to decline over time such that such a beneficial use could be possible in the absence of high salinity in groundwater.		
Does corrective action protect public health for current land use? Yes		
Site Management Requirements. Site activities must be managed in accordance with the Risk Management Plan, dated 12 March 1999, recorded 9 August 1999, County of San Mateo, California; Document no. 1999-135815.		
Monitoring Wells Decommissioned.	*Number Decommissioned.*	*Number Retained:* 2 on-site shallow wells to be retained
List Enforcement Actions Taken: None		
List Enforcement Actions Rescinded: N/A

VI. ADDITIONAL COMMENTS, DATA, ETC.

EKI (2013) presents a comprehensive summary of the land use history, physical characteristics, former and current chemical concentrations, and remediation activities completed at the 3695-3723 Haven Avenue property ("Site"). Also presented are a description of administrative and engineering controls implemented to address potential future risks presented by residual concentrations of VOCs at the Site, and an analysis of concentration trends and potential fate and transport of VOCs in groundwater at the Site, and downgradient of the Site.

The Site Risk Management Plan ("RMP") is presented in EKI (1999), and is attached to a Covenant and Environmental Restriction on the Property (i.e., a "deed restriction"), between the RWQCB and the property owner. The deed restriction and RMP detail the responsibilities of current and future owners of the Site for environmental monitoring and risk management, and prohibits certain land uses (e.g., water wells, day-care facilities, and others) that could potentially introduce or complete exposure pathways to future Site users. The deed restriction is recorded in the Official Records of San Mateo County and obligates current and future owners to specific actions to protect human health at the Site.

The Site meets RWQCB's criteria for a low-threat chlorinated solvent site. Additional environmental monitoring and remediation by SUMCO would not be productive, given the following:

- VOC concentrations in soil, groundwater, and soil vapor at and near the Site have been characterized;
- Source removal has been implemented;
- Engineering and administrative controls have been designed and implemented;
- Thirteen years of groundwater monitoring have been completed;
- VOC concentration trends in the off-Site VOC plume in groundwater are stable to declining;
- Off-site VOC concentrations are well below appropriate Environmental Screening Levels;
- The VOC plume poses minimal to no threat to existing and potential uses of groundwater;
- Movement of VOCs in groundwater to marine water of San Francisco Bay is expected to take centuries to millennia;
- The most recent on-Site VOC groundwater concentration data were below Site-specific risk-based cleanup levels; and
- Under the RMP and deed restriction between the Site owner and the RWQCB, the Site owner is required to monitor on-Site VOC concentrations and perform certain other actions to manage risk at the property; SUMCO is not a party to the RMP or deed restriction.

This document and the related CASE CLOSURE LETTER shall be retained by the lead agency as part of the official site file.

Subject: Destruction of Monitoring Wells at the Former Siltec Site
3695 - 3723 Haven Avenue
Menlo Park, California
(EKI 960007.26)

Dear Mr. Lee,

On behalf of SUMCO Phoenix Corporation ("SUMCO"), Erler & Kalinowski, Inc. ("EKI") is pleased to provide the California Regional Water Quality Control Board, San Francisco Bay Region ("RWQCB") this report, which documents the destruction of SUMCO's nine groundwater monitoring wells located at and near the former Siltec site at 3695-3723 Haven Avenue, Menlo Park, California ("Site"). The groundwater monitoring wells were destroyed as part of Site closure, authorized by the California Regional Water Quality Control Board in the 16 June 2014 letter titled *No Further Action Required At The Former Siltec Site Located At 3695-3723 Haven Avenue, Menlo Park, San Mateo County.*

BACKGROUND

The Site is a commercial and light-industrial property, formerly used for semiconductor manufacturing, located adjacent to San Francisco Bay in Menlo Park, California (Figure 1). Siltec's industrial operations at the Site extended from approximately 1970 to 1989, during which time chlorinated volatile organic compounds ("VOCs") were released to the subsurface, predominantly trichloroethylene ("TCE") and cis-1,2-dichloroethylene ("cis-1,2-DCE"). SUMCO and its predecessors have conducted extensive environmental investigations and remediation, including excavation and source removal, in-situ chemical oxidation, and groundwater monitoring from 1994 through 2012, using on-Site and off-Site wells. SUMCO's wells on the Site and on the adjacent parcel to the east were drilled during several investigations in the 1990s. Additional details of site history, remediation, and environmental data are available in EKI (2013).

During December 2014, SUMCO's remaining nine groundwater monitoring wells were destroyed. Two groundwater monitoring wells (MW-8 and MW-9) were not destroyed, as they belong to the current property owner. These monitoring wells will be needed for ongoing monitoring of shallow groundwater, which the property owner is obligated to perform. During Site remediation, a Risk Management Plan ("RMP") was incorporated into a covenant between the RWQCB and the current Site owner, when the owner purchased the Site from SUMCO's predecessor Mitsubishi Silicon America ("Deed Restriction"; Integris, 1999). The RMP requires the current Site owner to conduct groundwater monitoring using the owner's two on-Site monitoring wells MW-8 and MW-9, and also requires the current Site owner to periodically evaluate any changes in Site or regulatory conditions, among other things, subject to enforcement by the Water Board.

PREPARATION AND PLANNING

Site monitoring well locations are shown on Figure 2, and well construction and grouting details are summarized in Table 1. Well destruction permits are included in Appendix A. Borehole logs and California Department of Water Resources Driller's Reports for the destroyed wells are compiled in Appendix B.

In preparation for destruction and abandonment of SUMCO's wells on the Site and on the adjacent property to the east, EKI coordinated with the property owners of the 3715 Haven Avenue property (Deerfield Realty) and the 3750 Haven Avenue property (David D. Bohannon Organization) for drilling permit authorization and access to work locations.

EKI completed and submitted two applications for drilling permits from the San Mateo County Department of Environmental Health, Groundwater Protection Division ("SMCDEH"), one per parcel, with the required application fees of $577.00 each. Authorization was requested from the SMCDEH to destroy the wells through pressure-grouting. After reviewing borehole logs and construction details for the wells, SMCDEH determined that pressure-grouting was appropriate for seven of the nine wells, but required that the two monitoring wells constructed of ¾-inch PVC casing (MW-FE2B and PZ-1) be abandoned by overdrilling.

For drilling and grouting services, EKI contracted with Gregg Drilling and Testing, Inc. of Martinez, California ("Gregg Drilling"), a California C-57 licensed well driller.

EKI contracted with MacLeod and Associates of San Carlos, California ("MacLeod"), a California-licensed land surveyor, to determine the locations of two monitoring wells (MW-7 and PZ-1) that had been obscured by landscaping and soil fill cover. EKI met MacLeod at the Site on 10 December 2014 to locate and identify the hidden wells.

WELL DESTRUCTION

On 18 December 2014, EKI marked the locations of the two monitoring wells scheduled to be overdrilled (PZ-1 and MW-FE2B), and notified local underground utility companies through Underground Services Alert ("USA"), as required by law.

Field work began 22 December 2014, when EKI coned off work zones around well locations in parking areas, and worked with Subdynamic Locating Services of San Jose, California, to determine the location of existing underground utilities near the two wells requiring overdrilling. Gregg Drilling mobilized to the Site with capability to either pressure-grout or overdrill wells, as needed. From 22 - 24 December 2014, EKI observed as Gregg Drilling pressure-grouted monitoring wells MW-2, MW-5B, MW-6B, and MW-7B on the 3715 Haven Avenue parcel and wells MW-FE1, MW-FE1B, and MW-FE3 on the 3750 Haven Avenue parcel. Table 1 is a summary of well destruction details, including calculated and actual grout volumes emplaced.

Grout was mixed at the surface in the approximate ratio of one 47-lb bag of cement to three gallons of potable water, and was emplaced using a ¾-inch diameter tremie pipe, which was retracted during grouting to maintain the tremie pipe aperture just above the grout level in the well casing.

After the casing was full, a compression fitting cap with a quick-connect air valve was attached to the top of casing, and 25 pounds per square inch ("psi") of pressure from the rig compressor was applied to the grout column. All boreholes held pressure of 25 pounds per square inch for at least five minutes. After the application of pressure, the compression fitting cap was removed, and the grout level was topped-off, as needed.

Gregg Drilling also destroyed monitoring well MW-FE2B on the 3750 Haven Avenue parcel, and monitoring well PZ-1 on the 3715 Haven Avenue parcel, by overdrilling with a hollow-stem auger drilling rig.

Monitoring well MW-FE2B was originally emplaced in a 2 ½ inch diameter direct-push borehole, and it was overdrilled using six-inch augers to its total depth. The entire ¾-inch diameter PVC well casing was recovered from the borehole in two sections, and the hole was tremie-grouted to the surface with neat cement.

Monitoring well PZ-1 was not immediately accessible, having been buried beneath landscaping at some point in the past. After locating the well using its surveyed coordinates, EKI cut out a section of sod above it, and hand-dug to expose the vault and casing. The well was undamaged. The drilling rig was used to overdrill the well using eight-inch diameter augers, and the borehole was tremie-grouted to the current surface with neat cement grout. The ¾ -inch diameter PVC well casing from PZ-1 was recovered in several large pieces during drilling.

All wells had been built using at-grade flush-mount vaults. After grouting, the well vaults were removed, and the remaining hole was filled to grade with pre-mixed concrete, dyed as necessary to match the existing asphalt surface. Boreholes in landscaped areas were filled with grout to approximately one foot below ground surface, backfilled above the grout with mildly compacted imported turf soil, and re-seeded. At former monitoring well PZ-1, the original sod was replaced.

Borehole cuttings and other investigation-derived wastes ("IDW") were contained in two 55-gallon steel drums and sampled for disposal. Produced water was minor, and was combined in the soil drums or added to the mix water for grouting. Cuttings were collected and composited to a single soil sample, which was submitted to K Prime Analytical Laboratory in Santa Rosa,

California, a state-certified analytical laboratory. Drums were staged on-Site near the trash enclosure at 3715 Haven Avenue while waiting for analytical results.

IDW samples were submitted to the laboratory for the following analyses:

- Volatile Organic Compounds ("VOCs") by EPA Method 8260B;
- Title 22 Metals by EPA Method 6020;
- Total Petroleum Hydrocarbons quantified as diesel ("TPH-d") by EPA Method 8015M; and
- Total Petroleum Hydrocarbons quantified as motor oil ("TPH-mo") by EPA Method 8015M.

The laboratory report is included in Appendix C. Results indicated the soil was non-hazardous, and arrangements were made for disposal with Belshire Environmental Services, Inc., ("Belshire") of Foothill Ranch, California. Belshire picked up the drums on 13 January 2015 and transported them to the thermal treatment and recycling facility operated by Soil Safe, Inc., in Adelanto, California.

EKI attempted to limit the impact of well destruction activity on areas where monitoring wells were located in sensitive landscaping, i.e., around wells PZ-1 and MW-5B. During drilling or grouting, plywood sheets were used under the tires and outriggers to protect the grass, as needed. Sod was cut, rolled, preserved, and replaced at the PZ-1 location. Imported topsoil was backfilled and mildly compacted, then seeded with fertilized tall fescue grass seed at the former locations of monitoring well MW-5B. Seed also was added to the sod patch area at former monitoring well PZ-1, to speed its recovery from drilling impacts.

California Department of Water Resources ("DWR") Driller's Well Completion report forms for all destroyed wells are compiled in Appendix B.

Please contact me with any questions.

Very truly yours,
ERLER & KALINOWSKI, INC.

Jeff R. Shaw, P.G.
Project Manager

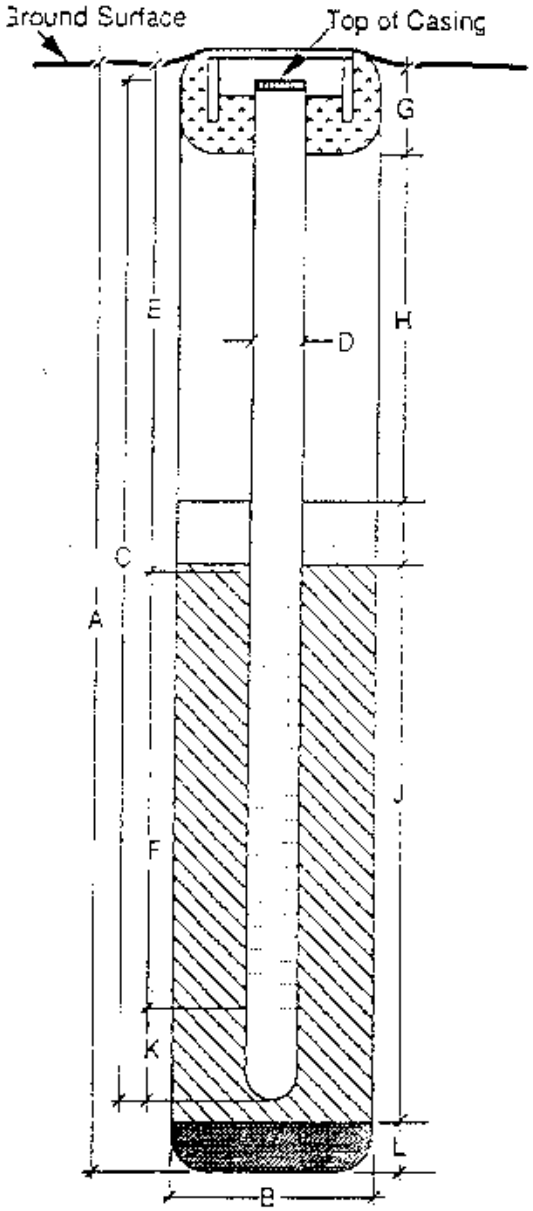
REMARKS

The boring was drilled with a hollow stem auger to 16 feet below the ground surface (bgs) and converted to a groundwater monitoring well. Water was first encountered at 11 feet bgs and was raised to 8 feet bgs.

WELL DETAIL

Client Name:	Edmond F. St. Geme	**Boring/Well Nº:**	MW2
Location:	3705 Haven Avenue, Menlo Park, CA	**Top of Casing Elev:**	Within 0.01'
Project Nº:	041-94.01	**Ground Surface Elev:**	Within 0.01'
Installation Date:	10-3-94	**Datum:**	Grade
Well Permit Nº:	MW-072-94	**Installed By:**	Alpha Geo Services



Wellhead constructed of a water-tight locking well cap and a traffic-rated cover

EXPLORATORY BORING:

A. Total Depth 16 ft.
B. Diameter 8 in.

WELL CONSTRUCTION:

C. Total Casing Length 15 ft
Material Schedule 40 PVC
D. Diamter 2 in.
E. Depth to Top Perforation 5.5 ft.
F. Perforated Length 10 ft.
Perforated Interval from ____ to ____ ft.
Perforation Type Continuous Slot
Perforation Size 0.020"
G. Surface Seal ____ ft
Material Concrete
H. Backfill 3 ft.
Material Cement
I. Seal 1 ft.
Material Bentonite
J. Gravel Pack 11 ft.
Gravel Pack Interval from ____ to ____ ft.
Material Monterey #3 Sand
K. Sump ____ ft.
Material ____
L. Bottom Seal 0 ft.
Material ____

Mr. Randy Lee
Regional Water Quality Control Board, San Francisco Bay Region
1515 Clay St., Ste. 1400
Oakland, California 94612

Subject: Summary of Environmental Conditions, and
Request for Declaration of No Further Active Remediation Status
(EKI 960007.25)

Dear Mr. Lee:

Erler & Kalinowski, Inc. ("EKI") is pleased to present this summary of environmental history to the California Regional Water Quality Control Board, San Francisco Bay Region ("Water Board"), and requests that the Water Board grant No Further Active Remediation ("NFAR") status to SUMCO Phoenix Corporation ("SUMCO") for the Former Siltec facility located at 3695 - 3723 Haven Avenue in Menlo Park, California ("Site").

SUMCO requests NFAR status from Water Board consistent with criteria specified in the 31 July 2009 Water Board document *Assessment Tool for Closure of Low Threat Chlorinated Solvent Sites, Draft Final.*

If you have any questions, please do not hesitate to call.

Very truly yours,
ERLER & KALINOWSKI, INC.

Jeff Shaw, P.G.
Project Geologist

Carey E. Peabody, Ph.D., P.G.
Vice President

EXECUTIVE SUMMARY

This document provides an environmental history summary of the Former Siltec facility located at 3695 - 3723 Haven Avenue in Menlo Park, California ("Site"), reports the results of groundwater monitoring events at the Site performed by SUMCO, successor to Siltec Corporation, and requests that the Site be granted No Further Active Remediation ("NFAR") status. NFAR status would allow a complete curtailment of the Site remediation and monitoring activity, and would allow the destruction and proper abandonment of unnecessary on-Site and off-Site groundwater monitoring wells.

SUMCO requests NFAR status from the California Regional Water Quality Control Board, San Francisco Bay Region ("Water Board"), consistent with criteria specified by the Water Board in the 31 July 2009 document *Assessment Tool for Closure of Low Threat Chlorinated Solvent Sites, Draft Final,* (RWQCB, 2009). SUMCO and its predecessors have performed voluntary investigation and remediation of the Site since 1996, with results reported to the Water Board during the process. No formal cleanup agreement with the Water Board exists, nor has the Water Board issued an Order for the Site.

The Site is a commercial and light-industrial property, formerly used for semiconductor manufacturing, that is located adjacent to San Francisco Bay in Menlo Park, California. The Site and adjacent properties have been subjected to extensive environmental investigations over the 18-year period from 1994 through 2012. Investigations of on-Site and off-Site soil and groundwater have resulted in spatial characterization of volatile organic compounds ("VOCs") in the subsurface, principally trichloroethene ("TCE") and cis-1,2-dichloroethene ("cis-1,2-DCE"). Other chemical species also have been detected in soil (EKI, 1999c) and groundwater at lesser concentrations.

Using Site-specific data, EKI developed risk-based cleanup goals, approved by the Water Board, for Site soil and groundwater as part of the Site Feasibility Study / Remedial Action Plan ("FSRAP"; EKI, 1999c). Remedial options were evaluated, including a pilot study of in-situ chemical oxidation using potassium permanganate injection. Ultimately, in-situ treatment did not achieve targeted reductions in VOC concentrations (EKI, 1999f), and Site remediation was accomplished through excavation, removal, and treatment at an approved off-Site disposal facility in 1999 (EKI, 2000b; EKI, 2001b). A Risk Management Plan ("RMP") was drafted as part of the FSRAP, and was incorporated into a Covenant between the Site owner and the Water Board ("Deed Restriction") which requires the performance of groundwater monitoring in certain on-Site wells, and evaluation of changing Site and regulatory conditions, among other things, by the purchaser of the Site (Integris, 1999), subject to enforcement by the Water Board.

SUMCO and its predecessors have conducted groundwater monitoring for the 13 years since Site source excavation, using on-Site and off-Site downgradient wells. Based on the available data, VOCs in groundwater have migrated off-Site to the east and northeast, but the concentrations of chemicals of concern in groundwater have stabilized or declined over this time period through natural attenuation processes.

Shallow soil vapor sampling conducted by SUMCO's predecessors in 1999 near the commercial building on the adjacent downgradient site to the east did not detect Site chemicals of concern in shallow soil vapor above laboratory reporting limits (EKI, 1999g).

Based on comparison of known Site conditions and the most recent sampling results to criteria for Site closure under the Water Board's Low-Threat Chlorinated Solvent Site guidance, the Site does not represent a current or projected threat to future on-Site and off-Site occupants, other receptors, or the environment. Based on this assessment, SUMCO requests the Site be granted No Further Active Remediation status by the Water Board.

Additional monitoring of environmental media pursuant to the terms of the Deed Restriction (e.g., monitoring of groundwater from wells MW-8 and MW-9) is the responsibility of current and future Site owners, under the terms of the Deed Restriction and their purchase agreements.

SUMCO sampled the two on-Site shallow A-zone groundwater wells MW-8 and MW-9 from 1999 through 2004, during which time the concentrations remained below Site-specific risk-based screening levels. After 2004, the Water Board approved SUMCO's proposal to discontinue monitoring of these wells. As stated in the Deed Restriction, it is the responsibility of the current property owners to determine the current status of (a) on-Site concentrations of chemicals of concern in shallow groundwater, and (b) regulatory limits on concentrations applicable to the Site. If conditions have changed since 2004, the current property owners may need to further investigate groundwater, soil vapor, or indoor air at the Site to ensure the safety of Site occupants.

This report provides an introduction to the Site in Section 1, a summary of environmental investigations conducted by SUMCO and its predecessors in Section 2, a report of the most recent field investigation results in Section 3, a summary of current Site conditions in Section 4, an evaluation of Site conditions with respect to Water Board criteria in Section 5, a summary of conclusions in Section 6, and references cited in Section 7.

1 INTRODUCTION

This document summarizes the results of environmental investigations and remedial actions conducted at the Former Siltec Corporation site at 3695 - 3723 Haven Avenue, Menlo Park, California ("Site") from 1994 to the present. Current conditions on the Site are consistent with closure criteria issued in the 31 July 2009 document *Assessment Tool for Closure of Low Threat Chlorinated Solvent Sites, Draft Final,* published by the California Regional Water Quality Control Board ("Water Board") (RWQCB, 2009), as illustrated in this document.

Accordingly, SUMCO requests that the Water Board issue a declaration of No Further Active Remediation ("NFAR") status for SUMCO at the Site, which would be independent of the current Site owners' responsibilities pursuant to the Covenant and Environmental Restriction attached to the deed in 1999, described below. Investigation and remediation of the Site has been performed voluntarily by SUMCO and its predecessors since 1996, with results reported to the Water Board during the process. No formal cleanup agreement with the Water Board was drawn up, and the Water Board has not issued an Order for the Site.

The Site, originally developed in 1969, is a commercial and light-industrial property located adjacent to San Francisco Bay in Menlo Park, California (Figure 1). Immediately north of the Site (3735 Haven Avenue) is a public storage and dog kennel facility; further north are former salt concentrator and evaporator ponds, and the former Menlo Park landfill, now covered by Bayfront Park. East of the Site across a section of Haven Avenue is a channelized creek that runs to San Francisco Bay via Flood and Westpoint Sloughs. West of the Site (3665 Haven Avenue) is an unpaved yard used for equipment and vehicle storage, and across Haven Avenue to the south are two-story buildings that are occupied by light industrial and commercial tenants.

From 1970 through 1989, Siltec Corporation used the Site for manufacturing polished silicon wafers, conducting various industrial activities in the three on-Site buildings. Chlorinated volatile organic compounds ("VOCs") were used on-Site during this period, and in 1994 VOCs were detected in local soil and groundwater.

On 1 July 1996, Siltec Corporation became Mitsubishi Silicon America ("MSA"). In 1999, after extensive investigation of soil and groundwater, and pilot-testing of in-situ remediation at the Site, the middle of the three original buildings (i.e., Building 2) was demolished to allow excavation and off-Site disposal of soil containing chlorinated VOCs and other chemicals of concern. After excavation, some concentrations of VOCs remained in subsurface soils within the saturated zone. MSA developed a risk-management plan ("RMP") for the residual concentrations in Site soil and groundwater.

In 1999, the Site was sold to Integris Millennium Joint Venture LLC ("Integris"). Accompanying the title was a Covenant between the new owners and the Water Board, in the form of a deed restriction (Integris, 1999) specifying prohibitions on certain Site uses, and outlining certain monitoring responsibilities of the new owners, including practices specified in the RMP. The RMP was incorporated into the deed restriction, and both were recorded in the Official Records of San Mateo County on 9 August 1999.

In 1999 and 2000, Integris constructed a new two-story building south of the former Building 2 footprint. On 1 February 2002, Mitsubishi Materials (including MSA) merged with Sumitomo Metals to form Sumitomo Mitsubishi Silicon Corporation ("SUMCO USA"), which was renamed SUMCO Phoenix Corporation ("SUMCO").

Currently, the Site is occupied by three slab-on-grade buildings, two of them dating from the original development, and is used for commercial purposes. Surrounding the buildings, the Site is mostly covered by asphalt or concrete pavement, with landscaped and planted areas located along Haven Avenue, adjacent to buildings, and in narrow strips in the parking area (Figure 2). The 3695 and 3723 Haven Avenue properties currently are owned by Integris, and Deerfield Realty currently owns the 3715 Haven Avenue property.

From 1994 to the present, SUMCO and its predecessor corporations have investigated, remediated, and monitored environmental conditions at the Site. Investigations and remedial activities conducted during the period 1994 to 2009 are summarized below in Section 2, with the results of recent 2010-2012 groundwater monitoring activities summarized in Section 3. Section 4 is a description of current Site conditions. This summary forms the basis for SUMCO's request to the Water Board for a declaration of Site NFAR status in Section 5.

2 SUMMARY OF ENVIRONMENTAL INVESTIGATIONS, 1994 - 2009

From 1994 through 2009, numerous environmental investigations were conducted at the Site and on adjacent properties (ESI, 1994a, 1994b; Geomatrix, 1995; EKI, 1996a, 1996b, 1997a, 1997b, 1997c, 1997d, 1998a, 1998b, 1998c, 1998d, 1998e, 1998f, 1998g, 1999a, 1999b, 1999c, 1999d, 1999e, 1999f, 2000a, 2000b, 2000c, 2000d, 2000e, 2001a, 2001b, 2001c, 2001d, 2001e, 2002a, 2002b, 2003, 2004, 2005, 2006, 2007, 2010). Through these investigations, chlorinated VOCs were detected in on-Site soil and groundwater, and off-Site groundwater, principally trichloroethene ("TCE") and cis-1,2-dichloroethene ("cis-1,2-DCE"), with lesser concentrations of other VOCs. The purpose of Section 2 is to provide a summary of these environmental investigations.

2.1 Pre-1996 Investigations

In October 1994, following up on a Phase I Environmental Site Assessment (ESI, 1994a), EnviroScience, Inc. drilled and sampled four exploratory soil boreholes to a maximum depth of approximately 16 feet below ground surface ("ft bgs") (ESI, 1994b) and constructed monitoring wells (i.e., MW-1, MW-2, and MW-3) in three of the boreholes. ESI sampled the wells and discovered TCE and cis-1,2-DCE in groundwater at concentrations of 140,000 micrograms per liter ("ug/L") and 23,000 ug/L, respectively in groundwater sampled from monitoring well MW-2 and benzene at a concentration of 460 ug/L in monitoring well MW-1. Well locations are shown on Figure 2.

In December 1994, Geomatrix Consultants collected shallow grab groundwater samples from a maximum depth of 15 ft bgs, at eight locations on-Site and four locations on the adjacent property to the west, 3665 Haven Avenue. The maximum detected concentrations of TCE and

cis-1,2-DCE in on-Site grab groundwater samples were 35,000 ug/L and 25,000 ug/L, respectively, as well as lesser concentrations of other VOCs (Geomatrix, 1995).

2.2 1996-1999 Investigations

In the mid- to late-1990s, EKI performed a series of environmental investigations on behalf of Siltec, and later MSA (e.g., EKI, 1997a, 1997d, 1998b, 1998d, 1999a, 1999b, 1999c, 1999d, 1999f). The distributions of VOCs in soil and groundwater were investigated, including TCE, cis-1,2-DCE, chloroform, Freon-113, carbon tetrachloride, and vinyl chloride.

On-Site and off-Site monitoring wells were constructed and sampled over time to characterize the extent of VOCs in shallow ("A-Zone") and deeper ("B-Zone") groundwater (EKI, 1997a). The finer-grained sediments of the "A-zone" extend from the ground surface to approximately 15 ft bgs, and the coarser sediments of the "B-zone" extend to an approximate depth of at least 38 ft bgs (EKI, 1997a). Well and selected grab groundwater sampling locations from these investigation efforts are shown on Figure 2. Besides VOCs, groundwater samples were found to contain elevated concentrations of total dissolved solids ("TDS"), up to approximately 150,000 milligrams per liter ("mg/L"), apparently related to subsurface migration of dense brine from the then operational salt concentrator and evaporator ponds located to the north, at the margin of San Francisco Bay. Later sampling of on-Site wells revealed TDS concentrations over 200,000 mg/L. For comparison, TDS of seawater is approximately 35,000 mg/L (Stumm & Morgan, 1996).

To assess the potential for VOC migration to the open channelized creek located east of the Site across Haven Avenue, samples of sediment and surface water were collected in 1996 from the channel and analyzed for VOCs. No VOCs were detected, indicating that the drainage channel had not been impacted (EKI, 1997a). The Remedial Investigation Report summarizes investigations conducted at the Site during this period (EKI, 1997a).

To assess the potential for migration of VOCs to off-Site locations and San Francisco Bay, grab groundwater samples were collected on properties east of the Site, west of the Site, and between the Site and the Bay (EKI, 1998b; EKI, 1998d). Analytical data from these grab groundwater samples defined a plume of VOC-impacted groundwater that extended off-Site to the east-northeast. Grab groundwater data were generated in 1999 along an east-west transect between the Site and the Bay to the north (Figure 2). As shown on cross section A-A' (Figure 3), TCE concentrations in groundwater were low or below the detection limit at most sampled intervals. Based on the results of the grab groundwater data, additional groundwater monitoring wells were constructed off-Site to allow assessment of VOC concentrations in groundwater through time (EKI, 1998d).

Hydraulic testing of three on-Site wells was conducted in November 1996 (EKI, 1997a). Pumped wells were A-zone monitoring wells MW-3 and MW-4, and B-zone monitoring well MW-5B. Hydraulic conductivity of the A-zone sediments, based on the analysis of the MW-3 and MW-4 pumping tests, ranged from 15 - 131 feet per day ("ft/day"). B-zone sediments have a higher hydraulic conductivity of 71 - 176 ft/day, based on analysis of the pumping test in monitoring well MW-5B.

Horizontal groundwater gradients within the A-zone were determined to be toward the open-channelized creek along Haven Avenue. B-zone groundwater gradient directions, based on data collected during this period, appeared to vary but generally pointed northeast to east, toward San Francisco Bay and Flood Slough. Correction of measured water levels for groundwater density was not performed during this period; thus the presence of brines in the B-zone likely confounded an accurate determination of gradient direction. Chemical concentrations in off-Site monitoring wells suggested an easterly flow of groundwater in the B-zone.

During the period 1996 to 1997, the extent of VOCs in on-Site soil was investigated. A significant volume of soils containing elevated concentrations of VOCs was discovered beneath and northwest of Building 2. The zone of soil affected by VOCs extended onto the adjacent 3645 and 3665 Haven Avenue properties to the northwest (EKI, 1997a).

In 1999, an in-situ chemical oxidation ("ICO") pilot test was performed at the Site, where potassium permanganate (a strong oxidant) was injected into VOC-impacted soils and groundwater to test its effectiveness at reducing in-situ VOC concentrations. The pilot test showed permeability of Site soils to be very low, preventing uniform, effective delivery of potassium permanganate to targeted VOC concentrations. Concentrations were temporarily reduced, but rebounded within a short period. Thus, this method of cleanup was not adopted for the Site (EKI, 1999f).

2.3 1999 Soil Excavation, Feasibility Study, and Remedial Action Plan

In September 1998, EKI submitted a Work Plan on behalf of MSA to excavate soils containing VOCs in the vicinity of former Building 2. The Work Plan was approved by the Water Board in a letter dated 2 March 1999. A Feasibility Study and Remedial Action Plan ("FSRAP") was prepared for the Site, submitted to the Water Board in March 1999 (EKI, 1999c), and was approved by the Water Board in a letter dated 23 April 1999.

A Human Health Risk Assessment was performed, and based on that work, risk-based action levels ("cleanup goals") were established as provided in Appendix A of the FSRAP for the three primary risk-driving VOCs found in Site soil and groundwater.

Risk-based soil action levels in milligrams per kilogram (EKI, 1999c; EKI, 2001b):

- TCE 3.2 mg/kg
- cis-1,2-DCE 15 mg/kg
- vinyl chloride 0.075 mg/kg

Risk-based groundwater action levels in micrograms per liter (EKI, 1999c):

- TCE 8,000 ug/L
- cis-1,2-DCE 50,000 ug/L
- vinyl chloride 500 ug/L

In accordance with the FSRAP, approximately 3,200 tons (approximately 2600 cubic yards) of VOC-affected soil were excavated from the Site and the adjacent 3645 Haven Avenue property to the northwest, in November and December 1999 (EKI, 2001b). Excavation depths ranged from four to six feet below ground surface (EKI, 1999c). After an access agreement was reached with the owner of a second adjacent property to the northwest located at 3665 Haven Avenue, an additional 260 cubic yards of soil was excavated from that parcel in January 2001 (EKI, 2001b). Groundwater was encountered at approximately seven feet below ground surface at the Site at the time of excavation. Excavated soil was transported to Allied Waste's Forward landfill, a permitted Class II disposal facility located in Stockton, California (EKI, 2001b). Final pit outlines, after excavation from all three parcels, are shown in EKI (2001b).

The excavation was backfilled with a multilayered mixture of materials intended to inhibit movement of VOC vapors from groundwater into the clean fill. In the bottom of the excavation, a 6-inch thick layer of pozzolanic controlled density fill ("PCDF") was placed, followed by a hydrated bentonite clay liner, and a 12-inch layer of clean, angular, crushed compacted rock. The crushed rock was placed to disrupt movement of VOCs in groundwater to the surface through capillary action. A geotextile filter was placed over the crushed rock, to reduce movement of overlying soil fines into void spaces. The remaining depth of the excavation was backfilled with clean granular fill in compacted 6-inch lifts containing 10% - 30% fines, to reduce air permeability and restrict vapor migration from groundwater (EKI, 2000b).

The unexcavated soil left in-place complied with the Water Board approved Site risk-based cleanup levels, based on analytical data from a dense network of in-situ soil samples collected and analyzed before the onset of excavation (EKI, 2000b). Due to the large spatially-distributed analytical dataset available prior to excavation, no additional sampling or analyses were performed at the time of excavation.

A paved parking lot currently occupies this soil remediation area. A new two-story building was constructed south of the former soil remediation area shortly after excavation.

2.4 1999 Risk Management Plan and Deed Restriction

A Site Risk Management Plan ("RMP") was prepared in 1999, included as Appendix C to the FSRAP (EKI, 1999c), and incorporated into the Site Deed Restriction (Integris, 1999, see below). The Deed Restriction, a covenant between the Water Board and all current and future Site owners, runs with the land title, and specifically references the RMP. The RMP details (a) risk management protocols to be implemented during future construction on Site; and (b) post-construction risk management protocols for mitigation of long-term human-health risks from contact with VOCs in soil or groundwater during activities related to Site use, occupancy, repairs, or maintenance. An area near the middle of the Site containing elevated residual groundwater concentrations of VOCs is defined as the "Groundwater Risk Area" ("GRA") in the RMP. Specific future owners' requirements for monitoring and risk management in the GRA and elsewhere on the Site are detailed in the RMP.

The RMP states "It will be the responsibility of the property owner to monitor the existing groundwater monitoring wells [at the perimeter of the Groundwater Risk Area, i.e., wells MW-8

and MW-9] and to verify that groundwater with concentrations of VOCs greater than risk-based action levels have not migrated outside of the Groundwater Risk Area." The GRA delineated in 1999 is shown on Figure 2.

The RMP was prepared to facilitate implementation of prudent short-term and long-term risk management measures for the Site. It is a communication and planning tool prepared for the independent review and appropriate use by current and future owners of the Site, and by lessees and contractors for construction or maintenance activities, as needed.

The RMP was attached to, and made part of, a "Covenant And Environmental Restriction on Property" ("Deed Restriction") recorded on 9 August 1999, in the San Mateo County Recorder's Office (Integris, 1999). In accordance with the Deed Restriction, the current property owners are responsible for maintaining land use conditions and implementing the RMP, to ensure that the cleanup levels for soil and groundwater achieved on-Site continue to effectively protect human health. Activities prohibited or specifically regulated by the Deed Restriction include:

- Residential development, or other non commercial/industrial development;
- Construction or operation of hospitals, schools, or day care facilities for children or senior citizens;
- Excavation except as specified in the RMP, with strict controls on soil management;
- Any uses or activities in conflict with guidance from the RMP;
- Drilling and well construction for domestic, potable, industrial, or other uses, except as expressly allowed by the Water Board;
- Damage to the integrity of the engineered backfill or to monitoring wells or remediation equipment, without notification to the Water Board within 10 working days of any damage, plus specifics of the type and date of repair;
- Aggravation or contribution to existing environmental conditions; and
- Reasonable Water Board access to the Site must be maintained.

Additionally, the Deed Restriction specifies that Site owners must comply with the RMP, and provides the Water Board with enforcement power (Integris, 1999).

2.5 1999 Off-Site Soil Vapor Investigation

Given the presence of a northeast-trending plume of VOCs in deeper groundwater extending from the Site, the potential for vapor intrusion was assessed through active soil vapor sampling on the eastern adjacent downgradient 3750 Haven Avenue property on 28 September 1999 (EKI, 1999g). Soil vapor samples were collected at depths of approximately 3 ft bgs and 6 ft bgs in each of four hydraulic direct-push soundings located near the 3750 Haven Avenue building, two on the northeast side, and two on the northwest side. Samples were collected using the post-run tubing system, where a hollow steel rod with a short stainless-steel mesh screen ("implant") threaded onto an expendable drive-cone tip was advanced to the sampling depth, then a length of polyethylene tubing with a threaded tip was pushed down through the rods and screwed into the

top of the implant screen, to allow collection of a soil vapor sample through the screen and tubing. The top of the drill string was sealed, the rods were retracted approximately six inches to expose the screen to the soil, and approximately 200 milliliters ("mL") of air was purged from the tubing and apparatus, at a flow rate of approximately 200 mL per minute. After purging, samples were collected into evacuated, passivated stainless steel 1L Summa-type canisters for transport to K-Prime analytical laboratory, under chain-of-custody protocol. One duplicate sample was collected from approximately 3 ft bgs at location SV-3, and a trip blank Summa canister was included with all samples.

Analytical results indicated that soil vapor samples did not contain TCE, 1,2-DCE, or vinyl chloride above laboratory reporting limits ranging from 1.00 to 6.25 parts per billion volumetric "ppbv" (i.e., 6.11 to 36.7 ug/m^3, at standard temperature and pressure). These reporting limits for Site chemicals of concern are well below the Water Board's current soil vapor Environmental Screening Levels ("ESLs") for commercial/industrial land use of 3,000 ug/m^3 for TCE, 20,000 ug/m^3 for cis-1,2-DCE, and 160 ug/m^3 for vinyl chloride.

The soil vapor samples from the 3750 Haven Avenue property contained other VOCs, including methylene chloride in all but one sample, at concentrations ranging from 39.3 to 525 ppbv, and toluene in all samples, at concentrations ranging from 4.68 to 1520 ppbv. Other chemicals detected were low levels of m+p xylene (3 samples), styrene (2 samples), and 1,2,4-trimethylbenzene (2 samples). The trip blank did not contain detectable VOCs above reporting limits. These chemical species have not been detected in soil or groundwater on-Site and therefore suggest the presence of other sources of VOCs at the 3750 Haven Avenue property that are unrelated to the Site. Based on these soil vapor results, MSA concluded that no additional investigation of soil vapor was necessary (EKI, 1999g), and the Water Board did not request further investigation.

2.6 2000-2009 Monitoring and Other Field Activities

In October 2000, under Water Board approval, and working on behalf of MSA, EKI destroyed and abandoned three on-Site shallow monitoring wells (MW-1, MW-3, and MW-4), and two on-Site multilevel monitoring points constructed of continuous multichannel tubing (MLMP-1 and MLMP-2), which had been constructed as part of an in-situ chemical oxidation ("ICO") pilot test (EKI,1999a). The wells were abandoned in accordance with existing guidance and regulations from San Mateo County Department of Health Services (EKI, 2000a).

In January 2002, EKI submitted a report on behalf of MSA to the Water Board summarizing the previous two years of groundwater monitoring data, noting that the VOC plume in shallow groundwater at the Site appeared to be stable, and proposed abandonment of on-Site and off-Site shallow (A-zone) monitoring wells, except the on-Site wells MW-8 and MW-9 (EKI, 2002a)[1].

[1] In accordance with the Risk Management Plan for the Site, it is the responsibility of the current property owner to monitor A-Zone wells MW-8 and MW-9 (EKI, 1999).

In June 2002, the Water Board issued a response letter denying the proposed well abandonment, and requesting three more annual groundwater monitoring events, to be conducted in 2002, 2003, and 2004 (RWQCB, 2002). The purpose for ongoing monitoring was to establish a sufficiently long data set to allow assessment of plume stability.

In November 2004, EKI submitted a follow-up report on behalf of SUMCO to the Water Board summarizing the results of five years of groundwater monitoring (EKI, 2004). Based on the available data, the report concluded that (a) VOCs in groundwater did not exceed applicable human health risk-based action levels, (b) no adverse impact to downgradient environmental receptors existed, and (c) the VOC plume appeared to be stable. The Water Board requested a continuation of groundwater monitoring.

In March 2005, EKI submitted a proposal on behalf of SUMCO to the Water Board to modify the groundwater monitoring program at the Site (EKI, 2005). EKI described the shallow A-zone groundwater plume as adequately characterized, and proposed that SUMCO's groundwater monitoring be discontinued in the on-Site and off-Site A-Zone wells, i.e., MW-8, MW-9, MW-FE1, and MW-FE3.

SUMCO further proposed to monitor groundwater elevations and groundwater chemical quality semi-annually in B-zone wells MW-6B, MW-FE1B and MW-FE2B, and proposed that groundwater elevations also be monitored in B-Zone well MW-5B. The proposed additional groundwater monitoring was intended to facilitate evaluation of an apparent upward trend in TCE concentrations detected in groundwater from off-Site well MW-FE2B. SUMCO's proposal was approved by the Water Board in a letter dated 27 June 2005 (RWQCB, 2005).

In February 2006, EKI submitted a summary of the results of the 2005 monitoring program on behalf of SUMCO to the Water Board (EKI, 2006). In the report, EKI proposed to further modify the groundwater monitoring program, based on the discovery that groundwater in the B-Zone wells was stratified with a layer of fresher water overlying a dense brine[2], likely related to infiltration and migration of highly saline water from the salt works evaporation ponds located north of the Site (Figure 1). This brine, occurring at depths below approximately 18-24 ft bgs, appeared to contain greater concentrations of VOCs in all wells. EKI proposed that the apparent increase in TCE concentration in well MW-FE2B may have been an artifact of inadvertently mixing brine and fresher water in the well during sampling. To evaluate this possibility, EKI proposed modification of the Site groundwater monitoring program (a) to collect vertically-spaced discrete measurements of electrical conductivity and temperature (i.e., "profiles") within wells MW-5B, MW-6B, MW-FE1B, and MW-FE2B, and (b) to collect discrete samples from existing groundwater density layers within the wells, using a low-flow sampling technique. SUMCO's proposal was verbally approved by the Water Board during a meeting between EKI and the Water Board on 22 February 2006.

---

[2]Water classification by Total Dissolved Solids (Freeze and Cherry, 1979):

Classification	Total Dissolved Solids
Fresh water	0 to 1,000 mg/L
Brackish water	1,000 to 10,000 mg/L
Saline water	10,000 to 100,000 mg/L
Brine	more than 100,000 mg/L

In June 2007, EKI submitted a report on behalf of SUMCO to the Water Board summarizing data collected through 2006, and proposing a two-year continuation of semi-annual monitoring and temperature and electrical conductivity profiling (EKI, 2007). Further evidence in support of local groundwater stratification into a relatively freshwater layer overlying a layer of brine was described and discussed. The proposal was accepted by the Water Board on 20 December 2007.

During 2008 and 2009, EKI conducted semiannual groundwater sampling and electrical conductivity and temperature profiling in the wells MW-6B, MW-FE1B, and MW-FE2B, and electrical conductivity and temperature profiling in monitoring well MW-5B.

2.7 2010 Reduction and Simplification of Groundwater Monitoring Procedures

In 2010, EKI submitted a report on behalf of SUMCO to the Water Board (EKI, 2010), summarizing the semiannual groundwater monitoring data for 2008 and 2009. The report included a proposal to (a) reduce the frequency of groundwater sampling to once per year, (b) to simplify the investigation procedure by discontinuing electrical conductivity profiling, since the density profiles did not appear to change markedly from year to year; and (c) to collect samples only from the lower-elevation dense brine, which based on previous analytical data had been observed to contain the majority of VOC concentrations (EKI, 2010). The Water Board approved the plan in an email dated 9 September 2010.

3 2011 - 2012 FIELD INVESTIGATION RESULTS

The purpose of Section 3 is to summarize the results of the B-zone groundwater monitoring program conducting during 2011 - 2012. The objective of the work was to collect additional data to allow assessment of whether VOC concentrations in the northwest-trending off-Site B-zone plume were increasing, stable, or declining.

Environmental monitoring at the Site in 2011-2012 consisted of water-level gauging and low-flow sampling of three B-Zone monitoring wells (i.e., wells screened within the coarser-grained saturated zone, located between approximately 15 and 35 feet below ground surface) near the end of the local "dry season". This work was performed in accordance with EKI's proposal, submitted to the Water Board on 30 August 2010 and approved 9 September 2010, entitled *2010 Groundwater Monitoring Report and Proposal For Modification of Ongoing Groundwater Monitoring Program, 3695-3750 Haven Avenue, Menlo Park, California.* Samples were submitted to K-Prime for VOC analysis. Well gauging and sampling was conducted on 12 August 2011 and 11 September 2012.

3.1 Preparation for Sampling

Prior to each sampling event, EKI coordinated with the property owners regarding the schedule for the planned work, and for temporary staging of purged groundwater and decontamination

wash and rinse water at the Site. EKI contracted with Blaine Tech Services ("Blaine Tech") of San Jose, California, to assist with groundwater sampling and measurements in the field.

3.2 Water-Level Gauging and Groundwater Sampling

Upon arrival at the Site and following a health and safety briefing, monitoring wells MW-5B, MW-6B, MW-FE1B, and MW-FE2B were opened to allow equilibration with atmospheric pressure. Existing well locations are shown on Figure 2, and well construction details are summarized in Table 1. After a minimum of 30 minutes, a round of groundwater elevation measurements was then collected from the four wells using an electric sounder. All downhole equipment was thoroughly decontaminated before use and between uses by washing in a solution of laboratory-grade detergent (e.g., Liquinox™) and distilled water, followed by two separate rinses in distilled water.

After well gauging was completed, monitoring wells MW-6B, MW-FE1B, and MW-FE2B were sampled, using a low-flow minimal-drawdown technique. Data from previous sampling efforts indicate that a high-dissolved-solids brine layer persists in the lower screened intervals of the wells and that higher concentrations of VOCs are associated with this brine (EKI 2006). Discrete samples of groundwater were collected from the brine layer near the bottom of each well's screened interval.

Groundwater sampling was performed by Blaine Tech with oversight by EKI. Wells were purged with a peristaltic pump at approximately 200 mL/min until water quality parameters stabilized. A YSI 556 multi-parameter meter with flow-through cell was used to measure temperature, pH, electrical conductivity, turbidity, dissolved oxygen, and oxidation-reduction potential during purging. Parameters were recorded manually on field data sheets (compiled in Appendix A). Stability was judged using the following guidance:

Parameter	Maximum change between measurements
• pH	± 0.1 pH unit
• Temperature:	± 0.2°C
• Conductivity:	± 3%
• Dissolved Oxygen:	± 10% (if practicable)
• Turbidity	± 10% (if practicable)

Samples were collected for off-Site analysis by K-Prime of Santa Rosa, California. Analyses requested included VOCs, TDS, alkalinity, major anions, and major cations. Sampling started with the downgradient well, then progressed upgradient toward the Site in a general order of increasing expected VOC concentrations, i.e., the sampling order was (1) MW-FE2B, (2) MW-FE1B, and (3) MW-6B.

At each well, groundwater samples were collected using new, clean polyethylene tubing down the well casing and new flexible tubing at the pump head. Sample bottles were new, supplied by the analytical laboratory, and pre-preserved, as appropriate to each analysis. Groundwater samples for each VOC analysis were collected in three 40-milliliter ("mL") Volatile Organic

Analysis sample vials ("VOAs") pre-preserved with hydrochloric acid. Groundwater samples for TDS, alkalinity, and major anion analysis were collected in unpreserved 250-mL polyethylene bottles, and groundwater samples for major cation analysis were field-filtered using an inline 0.45-micron filter into 250-mL polyethylene bottles pre-preserved with nitric acid.

Water density was measured at each well in the field, using a floating hydrometer in a 1000-mL graduated cylinder. The cylinder was filled immediately after purging was complete, but just before sampling. The temperature of the water was noted, and the hydrometer was read to a precision of 0.001 g/mL.

Duplicate groundwater samples were collected for VOC analysis from well MW-FE2B during each of the two 2011-2012 sampling events. An equipment rinseate blank of de-ionized water also was collected during each sampling event by rinsing the multi-probe sonde with deionized water after it had been decontaminated.

Sample containers were labeled with a unique sample identification number, and the date and time of collection. The containers were then packed on ice in an insulated cooler, and transported to the analytical lab under chain-of-custody protocol. Copies of field notes and data collection sheets are compiled in Appendix A. Analytical laboratory reports and chain-of-custody forms are presented in Appendix B.

3.3 Chemical Analysis

After collection, samples were labeled with a unique identifier and the date and time of collection, stored on ice in an insulated cooler, and couriered under chain-of-custody protocols to K-Prime in Santa Rosa. Groundwater samples were analyzed by K-Prime for the following:

- VOCs using EPA Method 8260B;
- Cations (Ca, Mg, K, Na, Fe, and Mn) using EPA Method 200.8.
- Anions (F, Cl, NO_3-N, NO_2-N, SO_4, Br, PO_4) using EPA Method 300.0;
- Total Dissolved Solids using SM 2540C; and
- Alkalinity using SM2320B.

For VOC analysis, the normal analyte list for EPA Method 8010 was expanded to include 1,1,2-tricholoro-1,2,2-trifluoroethane ("CFC-113").

3.4 Results of 2011-2012 Sampling

Groundwater level and elevation data from 2011 and 2012 are combined with data from previous well-gauging events and summarized in Table 2. Analytical results for VOCs from the 2011 and 2012 sampling events are compiled with previous analytical data from 1999-2010 and presented in Table 3. Analytical data from 2011 and 2012 for major ions, alkalinity, and total dissolved solids are combined with data from previous sampling events (2005-2009) and summarized in Table 4.

Concentrations of TCE and cis-1,2-DCE, the primary VOCs of concern, appear to be stable or declining in downgradient off-Site wells, based on the full set of analytical data from 1999 through 2012. Other analytes appeared to be within their previous range of concentrations. A discussion of concentration trends is presented below, in Section 4.4.

The density-corrected B-zone piezometric surface is contoured for the latest (2012) sampling event on Figure 4. Based on these data, the groundwater gradient direction for the deeper B-zone is generally east-northeastward, toward San Francisco Bay and Flood Slough, as it has been during previous sampling and well-gauging events.

3.5 Density Correction of Hydraulic Data

The Site is located within 200 feet of former commercial saltwater concentration and evaporation ponds ("saltworks") that border much of the existing San Francisco Bay shoreline. Over decades, the saltworks operation appears to have produced elevated levels of dissolved solids in shallow groundwater, with salinity several times greater than seawater. The resulting brines appear to have migrated landward in complex ways, moving into shallow water-bearing zones, and following irregular and laterally discontinuous small channel-bed features (EKI, 1997a; EKI, 1999a). On-Site and off-Site wells historically have contained highly saline water with measured TDS ranging up to 210,000 mg/L in the deeper screened intervals, a characteristic that also was evident in the 2011-2012 sampling and analytical data.

From 2006-2009, a series of depth-discrete water electrical conductivity measurements ("profiles") was collected within each sampled well prior to sampling. Electrical conductivity profiling of the wells was conducted during each sampling event as a simpler surrogate for depth -discrete density profiling. The conductivity data were then used to estimate a downhole density profile for each well, using a Site-specific empirical linear regression equation[3] (EKI, 2010). In 2010, the Water Board approved SUMCO's request to discontinue conductivity profiling, as the data had shown that the stratification did not change appreciably over time.

Density profiling in monitoring wells at the Site was discontinued after 2009, with approval from the Water Board (RWQCB, 2010). Density-corrected hydraulic heads for the 2011-2012 water level data were obtained by scaling the average 2008-2009 depth-discrete density profiles to match the 2011 and 2012 measured densities at the depth of measurement. Estimated (scaled) density profiles for 2011 are shown on Table 5a, and for 2012 on Table 5b. The method of density correction is discussed in Appendix C.

3.6 Abandonment of Off-Site Monitoring Well NP-1

In January 1999, EKI constructed a narrow-diameter well (NP-1) for piezometric surface measurements on the nearby 3760 Haven Avenue property, as part of an off-Site investigation which included grab groundwater sampling and limited well construction (EKI, 1999d). This

[3] [Estimated Density, (g/mL)] = 7.228e-07 * [Electrical Conductivity, (uS/cm)] + 0.9974; $R^2 = 0.9917$

monitoring well remained in a closed vault with a locked well plug in-place, but to SUMCO's knowledge, the well was neither gauged nor sampled after 1999.

In January 2012, a representative of the David D. Bohannon Organization ("Bohannon"), the owner of the 3760 Haven Avenue parcel, contacted the Water Board concerning several existing wells on the property, including the NP-1 monitoring well. Bohannon was planning redevelopment of the 3760 Haven Avenue property and wanted to decommission the wells. An EKI geologist visited the property, and confirmed that one of the wells in question was indeed monitoring well NP-1. The other wells were of unknown origin.

An agreement was reached between SUMCO and Bohannon to abandon the well. An EKI geologist observed the destruction of NP-1 by over-drilling, casing removal, and cement grouting on 17 February 2012, performed by the drilling firm Environmental Control Associates of Aptos, California, under supervision of Bohannon's representative Eric Lautenbach of Light, Air & Space Construction of San Jose, California. Amy Demasi of San Mateo County Health Department, Environmental Health Services Division also observed the abandonment. Field notes from the abandonment, as well as the California Department of Water Resources well completion report for NP-1 are included in Appendix A.

4 CURRENT SITE CONDITIONS

Current Site improvements include the central two-story building at 3715 Haven Avenue constructed in 2000-2001, and the two single-story buildings to the north and south, dating from the Site's initial industrial development in 1969. The central building (3715 Haven Avenue) is occupied by Deerfield Realty and a credit union office; the other buildings are used for various commercial interests, or are vacant. Paved areas and landscaping have remained largely unchanged since Site redevelopment in 2001.

4.1 Regional Hydrogeologic Setting

The Site is located within the 48,000-acre San Mateo Plain sub-basin of the Santa Clara Valley Groundwater Basin (DWR, 2003), which is filled with Plio-Pleistocene to Quaternary alluvial fan deposits ranging from less than 10,000 years up to 5 million years old (Metzger, 2002; RWQCB, 2003). The Quaternary alluvium consists of gravel, sand, silt, and clay strata deposited by streams as they converged and flowed eastward from the Santa Cruz Mountains toward the present-day San Francisco Bay. At the bay margins, stream channels are typically confined within natural levees (Helley et al., 1979). The coarse-grained channel sediments grade laterally into silty and clay-rich material, reflecting the stream courses shifting over time and depositing interfingered and laterally-discontinuous gravel and sand layers (Ferriz, 2001; RWQCB, 2003).

At greater depths within the Quaternary alluvium, several thin aquifers extend through much of the sub-basin (DWR, 2003; Poland & Garrett, 1943), separated by confining layers of clay and silt up to 200 feet thick (Fio & Leighton, 1995; RWQCB, 2003). Below the Quaternary alluvium are the interbedded and laterally-discontinuous clastic sediments of the Santa Clara Formation

(DWR, 2003), underlain by faulted, sheared, and folded Mesozoic rocks of the Franciscan Complex (Brabb, Graymer, & Jones, 2000).

Regionally, fresh water flows from the Santa Cruz Mountains through surface channels and groundwater aquifers towards San Francisco Bay, where it mixes into the salt water of the bay itself, and into the marine sediments below the bay (Fio & Leighton, 1995). Highly-saline brines, associated with former salt evaporation ponds that ring much of southern San Francisco Bay, have migrated landward in the subsurface saturated zone near the bay margins, including in the area adjacent to the Site (EKI, 2006).

4.2 Surface Water Drainage

Surface water drainage runs eastward toward a storm drain along the eastern Site frontage, which then drains into the channelized creek east of Haven Avenue. Near the north end of the Site, Haven Avenue crosses a two-lane bridge over the creek and turns east. The creek meanders north and east approximately 650 curvilinear feet from the bridge, then enters Flood Slough, a tributary of Westpoint Slough, located within the tidal flats and shallow water of southern San Francisco Bay.

The tidal shallows extend several thousand feet into the bay, having water depths of less than five feet, out to approximately 17,000 feet (3.2 miles) northeast of the Site, where the main channel of the bay cuts through accumulated sediment, with an approximate water depth of 40-45 feet (NOAA, 2006).

4.3 Subsurface Site Geology and Groundwater Hydrology

The Site is located on an alluvial plain adjacent to San Francisco Bay (Helley et al., 1979). Based on local subsurface investigations, the Site has been characterized as having two subsurface units of interest, the lower-permeability, variably-saturated silts and clays of the "A-zone", from near surface to 15 ft bgs, and the discontinuous, higher-permeability coarser materials of the saturated "B-zone", from 15 to approximately 38 ft bgs (EKI, 1997a).

Schematic cross-section A-A' (Figure 3) illustrates a simplified interpretation of the unconsolidated-sediment geology and 1999 grab groundwater sampling results between the saltworks ponds and the Site. Cross-section A-A' trends west to east; its location is shown on Figure 2. As illustrated, two distinct subsurface sand and gravel beds, located at a depth of approximately 20-30 ft bgs, appear to be horizontally separated by a deposit of finer-grained sediments, interpreted as probable fluvial overbank deposits of silt and clay. The sand and gravel unit near the western end of cross-section A-A' is interpreted to be the northern extension of buried lag deposits laid down gradually by what is now the channelized creek on the east side of Haven Avenue. The eastern sand and gravel unit shown on cross-section A-A' is interpreted as a different channel, possibly related to lag deposits of ancestral Flood Slough.

Based on borehole logs and grab groundwater sampling data, the coarser, more permeable materials in both the A-zone and B-zone are typically relatively thin, discontinuous beds of sand

with variable gravels, probably laid down in complex deposits by local sloughs and streams. Multiple buried irregular stream channels appear to exist at the Site and on adjacent properties (Figure 3). These coarser-grained intervals likely comprise the primary conduits for groundwater flow.

Depth to groundwater at the Site generally varies from 5 to 8 ft bgs. The groundwater gradient direction in the B-zone appears to be northeasterly toward San Francisco Bay (Figure 4), but existing grab groundwater and well sampling analytical data indicate the actual direction of VOC transport in groundwater is more easterly, toward Flood Slough (EKI, 2010).

The presence of industrial sea-salt production ponds less than 200 feet north of the Site adds additional complexity to Site groundwater flow. The saltworks ponds were used for salt mining through concentration and evaporation of marine bay water, leading, over decades, to the accumulation of highly saline groundwater ("brine") in the subsurface. This brine appears to have migrated landward from the evaporation ponds (EKI, 1997a), and has been observed on-Site in the lower screened intervals of B-zone monitoring wells, forming a dense, hypersaline layer with generally higher concentrations of VOCs (EKI, 2006). TDS within the brine have been measured as high as 222,000 mg/L (Table 4), which is over six times the TDS of normal sea water (Stumm & Morgan, 1996). Density of the brine was measured as high as 1.160 g/mL in the field during sampling, requiring the addition of 1.64 feet of water to the measured piezometric head in the well, in order to correct back to equivalent freshwater head. Correction methods are described in Table 2, and in Appendix C.

Given that the brine concentration is spatially-variable, actual piezometric surface gradients in areas affected by brine are complex. Thus, as described above, although piezometric surface contours indicate a gradient direction northeast toward the bay (Figure 4), the primary direction of historical groundwater flow appears to have been more eastward, toward Flood Slough, based on analytical VOC data (Table 3; Figure 3; Figure 5). Concentrations of chemicals of concern analyzed in grab groundwater samples collected along cross-section A-A' (Figure 3) indicate that groundwater flow directly toward San Francisco Bay from the Site (i.e., north-northeast) is impeded. The apparently preferred east-northeast flow direction may be controlled by a combination of (a) heterogeneous sedimentary channel deposits, (b) hydraulic influence of a potential buried channel gravel aligned with Flood Slough, and (c) the continued presence of highly dense, relatively low-mobility residual brines in the B-zone related to the former saltworks operations.

4.4 Concentration Trends of Chlorinated VOCs in Groundwater

From 1999 through 2012, the Water Board has required SUMCO to perform groundwater monitoring, using a number of both on-Site and off-Site wells. After 2004, SUMCO was required to monitor (gauge and sample) on-Site well MW-6B, and off-Site downgradient wells MW-FE1B and MW-FE2B, and to gauge MW-5B. The Water Board approved the discontinuation of sampling and analysis in other wells after September 2004, including those screened within the shallower A-zone (RWQCB, 2005). Figures 6, 7, and 8 are chemical concentration time-series plots for on-Site well MW-6B and off-Site wells MW-FE1B and MW-

FE2B, respectively. The figures graphically depict concentrations of the chemicals of concem TCE and cis-1,2-DCE measured in these wells over time.

Based on this dataset, the groundwater VOC plume migrating from the Site toward San Francisco Bay appears to have stabilized, with stable or declining concentrations of the major constituents (TCE and cis-1,2-DCE) in off-Site wells MW-FE1B and MW-FE2B (Figures 7 and 8). Concentrations in on-Site well MW-6B appear to be stable (i.e., no trend is visible) but concentrations are more variable than in the downgradient wells (Figure 6). A visible break in 2006 of the concentration patterns for all wells illustrates the effect of changing to a low-flow minimal-drawdown sampling technique, with the later samples collected from discrete depths, i.e., in each well, one sample collected from the relatively-fresh shallow water near the top of the water column, and one sample collected from the deeper brine near the bottom of each well.

The graphs on Figures 6, 7, and 8 illustrate that in each monitored well, concentrations of TCE and cis-1,2-DCE, the primary constituents of concern, are less than Water Board groundwater ESLs for evaluation of potential vapor intrusion concerns during commercial and industrial activities. The 2013 commercial/industrial ESL for TCE in groundwater is 1,300 ug/L. The 2013 guidance currently does not include a screening level for cis-1,2-DCE, but the 2008 commercial/industrial ESL was 17,000 ug/L (Table 3, and Figures 6, 7, and 8).

As shown on the figures, VOC concentrations remaining in monitored on-Site and off-Site wells are below current ESLs for commercial and industrial uses. Table 3 also lists analytical data for other infrequently-detected VOCs such as chloroform and 1,1,2-trichloro-1,2,2-trifluoroethane ("CFC-113"). Concentrations of these analytes, when detected in monitored wells, were below their respective commercial-industrial ESLs (RWQCB, 2013).

On-Site monitoring wells MW-8 and MW-9 are not monitored by SUMCO, as the Deed Restriction places that responsibility on the current property owners, and SUMCO does not know the status of groundwater monitoring by the current property owners. As of September 2012, EKI observed that the well vaults for monitoring wells MW-8 and MW-9 were still in-place, but the current condition of the wells, and their suitability for sampling, is unknown. VOC concentrations in shallow A-zone groundwater could be determined through sampling and analysis of those wells, if they still exist and are in proper condition for sampling. The analytical data could be compared to existing ESLs, to evaluate the potential for hazards to human health and the environment due to residual VOC concentrations in groundwater, if any exist.

4.4.1 Statistical Evaluation of Concentration Trends in Groundwater

A Mann-Kendall analysis (Gibbons, 1994) was used to evaluate the presence or absence of a trend in concentration of TCE and cis-1,2-DCE in groundwater, based on recent analytical data from 2008-2012. In accordance with the FSRAP (EKI, 1999c), the Mann-Kendall test was used to evaluate the statistical significance of potential trends in chemical concentrations detected in groundwater at the Site and was conducted using data from on-Site B-zone well MW-6B and off-Site B-zone wells MW-FE1B and MW-FE2B. Data were from six sampling events between 22 February 2008 and 11 September 2012. Table 6 summarizes the analysis.

The Mann-Kendall test determines whether a trend in chemical concentrations exists over time by calculating an indicator statistic, called Kendall's S ("S"), which is effectively the sum of the signs of the change in slope between all possible data pairs, in a series of concentration values over time. If S is a negative number of sufficient magnitude, then later measurements tend to be smaller than those taken earlier, indicating a decreasing trend of concentration with time. Similarly, if S is positive and large enough, an increasing trend is indicated (Gilbert, 1987). For the purposes of this analysis, the "null" (default) hypothesis was that no trend exists in groundwater chemical concentrations at a given well, i.e., concentrations are stable. USEPA (1994) recommends use of a significance level of $\alpha = 0.05$ (corresponding to a 95% confidence interval) to ensure adequate statistical power, while limiting false positives. USEPA (1998) also recommends a minimum of four data points for statistical analysis using the Mann-Kendall test (USEPA, 1998a; Gilbert, 1987). In this case, the six most recent sampling events were used for analysis.

As shown in Table 6, groundwater concentrations of TCE and cis-1,2-DCE did not express a statistically significant trend at either a 95% or a 90% confidence level in any of the monitored wells over the period from February 2008 to September 2012. Off-Site wells MW-FE1B and MW-FE2B did show decreasing cis-1,2-DCE concentration trends, however, at the 92% and 97.5% confidence levels, respectively. Thus, the northwest-trending VOC plume in groundwater from the B-zone appears to be stable or declining in concentration.

5 COMPARISON OF SITE CONDITIONS TO WATER BOARD LOW-THREAT CLOSURE CRITERIA

The Water Board guidance document, *Assessment Tool for Closure of Low-Threat Chlorinated Solvent Sites - Draft Final, 31 July 2009* ("Low-Threat Assessment Guidance"; RWQCB, 2009) is intended to outline "criteria for evaluating if and when chlorinated solvent sites that pose little threat to human and ecological health, water quality, and beneficial uses but do not yet meet cleanup standards at all locations, could be closed." Discussion of specific Site conditions and comparison to closure criteria are included below.

5.1 Conceptual Site Model

As described in the Low-Threat Assessment Guidance, the Conceptual Site Model for the Site includes the following elements:

- Identification and evaluation of pollutant sources;
- Assessment of site characterization adequacy; and
- Identification of exposure pathways, receptors, potential risks, and threats.

5.1.1 Identification and Evaluation of Pollutant Sources

As reported above, the Site was developed in 1969, and from 1970 through 1989 was used for manufacture of silicon crystals for the semiconductor industry. Chlorinated solvents, principally

TCE, were used on-Site as part of the manufacturing process. Sumps in the floor of Building 2 of the manufacturing facility were identified as having likely provided a conduit for movement of VOCs into the fine-grained sediments of the shallow subsurface (EKI, 1998c). Contaminated source-zone soil was delineated using site-specific risk-based cleanup levels, excavated, and removed off-Site in 1999 (EKI, 2000b). However, analytical data from 2004 for groundwater from monitoring well MW-9, the most recent data available, indicate that residual VOC contamination may remain in shallow Site groundwater (Table 3).

Based on analytical data from off-Site wells and grab groundwater samples, other off-Site sources of low-level VOC contamination may exist in the area. For example, the presence of 1,1-dichloroethene ("1,1-DCE"), 1,1-dichloroethane ("1,1-DCA"), and 1,1,1-trichloroethane ("1,1,1-TCA") in off-Site wells (Table 3) and grab groundwater samples to the northeast and east (EKI, 1998d) appear to suggest another source or sources of VOCs may exist in the area.

5.1.2 Assessment of Site Characterization Adequacy

Since 1994, the Site has been investigated using various techniques in numerous locations both on-Site and off-Site. Section 2 of this document provides a summary of the major investigations and remedial efforts conducted.

Methods of investigation have included:

- Continuous-core soil sampling;
- Cone penetration soil testing;
- Dual-tube direct-push grab groundwater sampling;
- Monitoring well and piezometer construction and sampling;
- Passive and active soil vapor sampling;
- Subslab vapor sampling;
- Surficial sediment and surface water sampling in the creek channel; and
- Hydraulic testing of monitoring wells.

Soil and grab groundwater sampling, monitoring well construction and sampling, and subslab or soil vapor sampling have been conducted on the Site proper and also on adjacent sites to the northwest, northeast, and east (Figure 2). As a result of this body of data, the lateral and vertical extents of contamination in soil were defined resulting in the excavation and off-Site disposal discussed in Section 2.3.

As discussed above, groundwater monitoring of the B-zone has been conducted from 1999 through 2012. As discussed in Section 4.4, thirteen years of groundwater monitoring have provided sufficient data to document evolution of the off-Site plume to a state of stability or decline (Figures 6, 7, and 8). Given that future decreases in groundwater VOC concentrations are likely, and concentrations measured since 2006 have been below Water Board ESLs for all constituents of concern, additional monitoring of the B-Zone appears unnecessary.

SUMCO conducted groundwater monitoring in the A-zone from 1999 through 2004. TCE, cis-1,2-DCE, and vinyl chloride concentrations detected in on-Site A-zone monitoring wells MW-8 and MW-9, and in off-Site A-zone monitoring wells MW-FE1 and MW-FE3 remained below the Site-specific risk-based action levels during that time period (Table 3). Accordingly, in 2005, EKI submitted a proposal to the Water Board on behalf of SUMCO to discontinue monitoring in the A-Zone wells. This proposal was approved by the Water Board in a letter dated 27 June 2005 (RWQCB, 2005).

On-Site A-Zone monitoring wells MW-8 and MW-9 are subject to monitoring requirements in the property Deed Restriction, and are the responsibility of the current property owners to monitor. SUMCO has not performed any A-Zone groundwater monitoring in those wells since 2004, and does not know the status of groundwater monitoring by the current Site owners.

The most recent available analytical data for VOCs in groundwater from monitoring wells MW-8 and MW-9 are from 2004. These data were below the Site-specific risk-based action levels calculated in 1999, using regulatory and toxicological guidance available at the time. SUMCO has no knowledge of the current concentrations of VOCs in groundwater in these wells or consequently whether the concentrations are above or below current screening levels, such as the ESLs issued by the Water Board in 2013. It is the responsibility of the current Site owner to assess Site conditions with respect to current regulatory guidance and laws.

5.1.3 Identification of Exposure Pathways, Receptors, Potential Risks, and Threats

Human-health and ecological risks from residual VOC concentrations in Site soil and groundwater were evaluated in 1999, prior to excavation (EKI, 1999c). Results of that evaluation are summarized below, along with discussion of other pathways, receptors, and risks.

5.1.3.1 1999 FSRAP and Human Health Risk Assessment

As described in Section 2.3, EKI submitted a Site Feasibility Study / Remedial Action Plan on behalf of MSA to the Water Board in March 1999 (EKI, 1999c). This FSRAP was reviewed and approved by the Water Board in a letter dated 23 April 1999.

Appendix A of the FSRAP is a human health risk assessment which quantified estimates of carcinogenic risk and non-carcinogenic hazard for potential Site occupants. Part of the risk assessment detailed calculations of risk based action levels for cleanup of Site soil, allowing establishment of dig lines for the excavation which was carried out later that year (see Section 2.3). The risk assessment also contained calculated risk-based action levels for future monitoring of VOC concentrations in groundwater from A-zone wells. Based on the risk calculations and assumptions, future occupants of the Site would experience a U.S. EPA-defined "acceptable" cumulative additional cancer risk of 1×10^{-5} or less (i.e., 1 in 100,000) from Site A-zone groundwater if it contained no more than the following maximum concentrations:

- TCE 8,000 ug/L
- cis-1,2-DCE 50,000 ug/L
- vinyl chloride 500 ug/L

From 1999 to 2004, TCE, cis-1,2-DCE, and vinyl chloride concentrations detected in groundwater from the A-zone monitoring wells (i.e., MW-8, MW-9, MW-FE1 and MW-FE3) remained below the Site-specific risk-based action levels (Table 3). SUMCO has no knowledge of VOC concentration data for A-zone groundwater after 2004.

5.1.3.2 Exposure to Residual VOCs in Soil

Based on Site soil sampling and analysis data, and based on risk-based action levels calculated as part of the Water Board-approved Site-specific human health risk assessment (EKI, 1999a), shallow soil containing VOCs above action levels was identified, excavated to 4 or 6 ft bgs (depending on location within the pit), and removed off-Site. Details are presented in Section 2.3. Remaining shallow soil left in-place contained VOC concentrations below action levels, based on the existing data.

Deeper soil (i.e., greater than 4-6 ft bgs) within the saturated zone did contain VOC concentrations above action levels. Thus, (a) the excavation was backfilled with engineered materials designed to isolate the deeper soil and reduce movement of groundwater and VOCs through the capillary zone to the surface, and (b) a Deed Restriction specifying mitigation and monitoring requirements was placed on the property, prior to its sale to Integris in 1999. The engineered fill is described in Section 2.3, and the Deed Restriction is described in more detail in Sections 2.4 and 5.2.

5.1.3.3 Exposure to Residual VOCs in Groundwater and Volatilization from Groundwater

The most recent analytical data for groundwater available to SUMCO for monitoring well MW-9 date from September 2004 (Table 3). It is possible that VOC concentrations may persist in A-zone shallow groundwater within the on-Site Groundwater Risk Area above current Commercial / Industrial ESLs (Figure 2). Off-Site, concentrations in shallow A-Zone and deeper B-Zone groundwater are below ESLs for concerns of vapor intrusion (Table 3, Figures 3, 6, 7, and 8).

On-Site, potential groundwater exposure pathways for human health are addressed through engineering and administrative controls implemented as part of the Risk Management Plan, and the Deed Restriction (EKI, 1999c; see Section 2.4). These potential pathways include the following:

- Drinking water, industrial use, or agricultural use:
    - Use or construction of wells for water supply are prohibited by the Deed Restriction.

- Gross contamination (e.g., taste, odors):
  - Groundwater is isolated from the surface and cannot be legally used.
- Vapor intrusion to indoor air:
  - Administrative requirements are specified in the Deed Restriction regarding construction/excavation practices;
  - Engineering requirements are specified in the Deed Restriction to prevent vapor migration into new construction; and
  - The Deed Restriction requires the Site owners to monitor groundwater in A-zone monitoring wells and assess the potential for vapor intrusion.

Off-Site, potential exposure to groundwater does not present a human-health risk, as VOC concentrations are significantly below current Commercial / Industrial ESLs for concerns of vapor intrusion by a factor of approximately 6 to 18; and the extreme salinity of the deeper groundwater (see Section 4.4) precludes its use for drinking, industrial, or agricultural uses. Supply wells in the area are not known to draw from the shallow saturated B-zone, presumably due to its high dissolved-solids content. Vertical conduits to deeper groundwater from improperly-abandoned historical supply wells are not known to exist on-Site, nor in the adjacent properties down-gradient of the Site.

A soil vapor sampling investigation conducted in 1999 on the off-Site downgradient 3750 Haven Avenue property did not detect TCE, 1,2-DCE, or vinyl chloride above laboratory reporting limits (EKI, 1999g). The reporting limits were well below the Water Board's 2013 soil vapor ESLs for commercial/industrial land use of 3,000 ug/m^3 for TCE and 160 ug/m^3 for vinyl chloride. The 2013 guidance does not contain a soil vapor ESL for cis-1,2-DCE, but the ESL published in 2008 was 20,000 ug/m^3, well above the reporting limits of the soil vapor analyses.

Exposure pathways such as groundwater discharge to surface water bodies, including the channelized creek and San Francisco Bay, appear to be incomplete, based on existing data. Sampling of creek water and channel sediment was conducted in 1997 and VOC analytical results were below detection limits for all surface water and sediment samples (EKI, 1997a). Although A-zone groundwater gradients tend to direct groundwater flow toward the creek channel (EKI, 2004), generally low seepage velocities in the shallow saturated sediments on-Site and in the surrounding area appear to prevent movement of sufficient VOC flux to the creek to cause detectable concentrations. The RWQCB concurred with this conclusion (RWQCB, 2002).

5.1.3.4 Transport of VOCs in Groundwater to San Francisco Bay

In an effort to examine whether or not Site groundwater with VOCs migrates north to northeast in an approximately straight-line pathway to San Francisco Bay, EKI collected grab groundwater samples along an east-west transect between the Site and the Bay in 1998 (EKI, 1998d). Most samples did not contain detectable concentrations of VOCs. Those that did contain VOCs were collected from locations farther east of the Site, indicating that the transport of VOCs off-Site and downgradient to the Bay followed a complex pathway to the east-northeast, rather than directly toward the saltworks ponds across the property to the north. The data also indicated the

presence of other non-Site related sources of VOCs in groundwater in the area, based on detections of chemical species (e.g., chloroform) not generally detected on-Site (EKI, 1998d).

The potential exposure of humans and other species to Site chemicals of concern via San Francisco Bay was evaluated using three approaches:

- Seepage velocity calculations based on Site-specific hydraulic data and assumed groundwater gradients;
- Assessment of VOC retardation during groundwater transport using peak concentration time-series data, and calculation of a Site-specific retardation factor for TCE; and
- 1-D modeling of VOC transport using the USEPA fate and transport model BIOCHLOR (Aziz & Newell, 2002).

To assess the exposure pathway to San Francisco Bay, an estimate was made of the probable seepage velocity of groundwater flow to the bay, using hydraulic conductivity values derived from the pumping test conducted in 1996, and recent (2012) measured head differences corrected for density. Discharge to the bay was assumed to occur from the deeper B-zone (located approximately 15-35 ft bgs) only where the sand and gravel units are likely to be exposed to marine water at the main scour channel along the axis of the bay, approximately 17,000 feet (3.25 mi) north-northeast of the Site (NOAA, 2006). Between the Site and the main channel, mapped water depths in the bay are less than five feet, and in most locations are less than three feet. Groundwater from the A-zone was assumed to enter the bay by seepage into the channelized creek, but at such a minor flux that VOC concentrations remain negligible, as demonstrated in a previous investigation of the creek water and sediment (EKI, 1997a).

Based on the assumptions above, and using additional assumptions as detailed in Appendix D, the estimated mean groundwater travel time in the B-zone from the Site (MW-6B) to San Francisco Bay (at the main scour channel 17,000 feet northeast) using Site-specific hydraulic data and current density-corrected gradients ranged from approximately 250 years to 650 years, corresponding to seepage velocities of 67 to 26 feet per year ("ft/year"), depending upon the value of hydraulic conductivity used (see Appendix D).

Local groundwater flow from Site well MW-6B to off-Site well MW-FE2B may be faster, due to the greater magnitude of the piezometric gradient between these wells in comparison to the overall gradient in the tidal flats, with seepage velocity estimates ranging from 191 to 492 ft/year, using the reported range of hydraulic conductivity values for the B-zone (EKI, 1997a).

Estimates of TCE transport velocity (as opposed to groundwater seepage velocity) in the B-zone also were calculated, assuming that (a) observed declines in TCE concentration from peak values were due to source removal in 1999, and (b) that the timing of the peak TCE concentration observed in a given well was due to transport of VOC-containing groundwater from the source area to the well. TCE concentration data in off-Site monitoring wells MW-FE1B and MW-FE2B were used to determine the time to peak concentration, and the travel distance was assumed to be from the location of the former source-area well MW-2. Based on these assumptions, VOC

transport from the former on-Site source area to off-Site wells was estimated to range from 46 ft/year to 80 ft/year, approximately 4-6 times slower than groundwater.

To check the between-well TCE transport velocity estimated above, the empirical TCE retardation factor described above was compared to an estimate for the TCE retardation factor ("Rf") calculated from chemical-specific and Site-specific soil parameters, using the following equation (Freeze & Cherry, 1979):

$$Rf = (Vs / Vc) = 1 + (\rho b / n) * Koc * foc$$

Where:

Rf	=	Retardation factor for TCE at the Site
Vs	=	mean estimated linear seepage velocity of groundwater, (using gradients from MW-2 to MW-FE1B, and MW-2 to MW-FE2B)
Vc	=	mean estimated linear velocity of TCE
ρ_b	=	mean bulk density of aquifer materials
n	=	mean porosity of aquifer materials
Koc	=	organic carbon partition coefficient for TCE
foc	=	mass fraction of organic carbon in aquifer materials

The empirical retardation factor, Rf, for TCE in the vicinity of the Site varies from 5.4, using the chemical peak-concentration timing approach, to 4.6, using Site-specific soil parameters. These methods of estimation are independent, yet the calculated Rf values are similar enough to provide some assurance that the actual retardation factor for TCE moving from the Site to off-Site wells is near 5, i.e., movement of TCE is approximately 5 times slower than groundwater.

Based on this Site-specific average retardation factor of 5 for TCE, and the groundwater velocity estimates described above, the time for chemicals of concern to reach San Francisco Bay from the Site are estimated to range from 1,250 years to 3,250 years.

Calculations and assumed parameter values are described in more detail in Appendix D. Implicit assumptions are that saturated-zone sediment characteristics on-Site and in the immediate area (e.g., tortuosity, hydraulic conductivity, organic carbon in sediments, physical and chemical conditions of groundwater, sea-level elevation, etc.) are representative of conditions in B-zone sediments under the Bay, and that they do not vary in time or space.

Modeling of chemical fate and transport using BIOCHLOR (Aziz & Newell, 2002) was performed to examine movement of VOCs in groundwater to San Francisco Bay from Site monitoring well MW-6B, along a flowpath through MW-FE1B and MW-FE2B. A number of conservative simplifying assumptions were made to facilitate modeling, including the assumption of a constant VOC source at MW-6B at 2012 concentrations, and only dispersion, no biotransformation, during transport. Simulation was run for 300 years, assuming no change in conditions. Specific values for parameters and assumptions are shown in Appendix E.

Based on the model output, dispersion alone will restrict concentration of total chlorinated ethenes after 300 years of movement to less than 10 micrograms per liter ("ug/L") at a downgradient distance of approximately 3,500 feet, or approximately one-third of the way to the main scour channel in the bay. Based on the approach outlined in Aziz & Newell (2002), "limited evidence" exists for biotransformation of chlorinated ethenes at the Site, thus, the assumption of no biodegradation in the simulation is conservative, and attenuation of VOCs in groundwater would likely be greater, and concentrations less, than calculated by the BIOCHLOR model.

The ESLs for protection of aquatic receptors (RWQCB, 2008) are 360 ug/L for TCE, and 590 ug/L for cis-1,2-DCE. The modeling results discussed above indicate that VOC concentrations will remain well below these aquatic receptor ESLs for several centuries, under the conservative assumptions in the model. Thus, existing VOCs in groundwater do not appear to present a significant exposure risk for aquatic receptors. Predicted sea-level rise due to climate change over the modeled period also will tend to reduce or even reverse the magnitude of the hydraulic gradient, thus slowing or stopping the movement of groundwater from the Site toward San Francisco Bay, further attenuating the potential impact to downgradient aquatic receptors.

5.2 Control of Pollution Sources and Implemented Risk-Mitigation Measures

5.2.1 Completeness of Source Remediation to Extent Feasible

As described in Section 2.3, above, and in accordance with the Water Board-approved FSRAP, remediation of the on-Site source of VOCs has been accomplished. Source soil was delineated using human-health risk-based criteria, excavated, and removed to the extent feasible (i.e., above the saturated zone). The excavation was backfilled with engineered materials which were designed to prevent or reduce VOC migration from groundwater to the surface, and to hypothetical future buildings at the Site. Currently, a parking lot covers the former excavation. Groundwater plume monitoring has been performed for over 13 years. Monitoring was conducted in both the shallow A-zone and deeper B-zone until 2004, after which the Water Board approved cessation of monitoring in the A-zone, but required a continuation of monitoring in the B-zone until 2012.

Residual VOCs in on-Site B-zone groundwater persist above ESLs in the Groundwater Risk Area, but groundwater in the GRA contains very high dissolved solids, having salinity several times that of seawater (EKI, 1999c). Long-term monitoring data indicate that B-Zone groundwater VOC concentrations continue to decline (Figures 6, 7, and 8). VOC concentrations in A-Zone groundwater on-Site are not currently known (see Section 5.1.2).

5.2.2 Mitigation of Current and Future Risks to Human Health, Ecological Health, and Sensitive Receptors

Potential receptor categories, considering current and future uses of the Site, could include

- On-Site commercial / industrial workers
- Off-Site commercial / industrial workers
- Ecological receptors

Current and future risks to on-Site commercial and industrial workers and other potential future Site receptors are mitigated through engineering and administrative controls (see Sections 2.3 and 2.4),. Engineering controls include the low-vapor permeability backfill used to restore the Site after source area excavation (EKI, 2000b; EKI, 2001b), and construction of the 3715 Haven Avenue office building south and upgradient of the former excavation and Groundwater Risk Area (Figure 3).

A partial list of administrative controls mandated by the Deed Restriction for the Site includes (a) mandatory health and safety procedures in the RMP for future Site construction (EKI, 1999c); (b) construction design requirements which will help avoid creating vertical conduits on-Site for soil vapor or groundwater; (c) a prohibition on use of groundwater for any purpose; (d) management requirements for soil or groundwater produced from the Site; and (e) the requirement that current Site owners must monitor groundwater over time and notify occupants of any changes in conditions. If the current Site owners have not complied with their obligations regarding administrative controls at the Site, e.g., groundwater monitoring and notification, the Water Board may compel them to do so. Obtaining up-to-date concentration data for chemicals of concern in Site groundwater, and comparing these data to current Water Board ESLs, would allow evaluation of potential health risks to current Site occupants, if such risks exist.

The Deed Restriction also includes a prohibition on construction of on-Site residential housing, schools, hospitals, or day-care facilities. These controls, in combination with other details of the Deed Restriction, mitigate risks to potential future occupants of the Subject Property.

Off-Site, mitigation of potential threats to human health by vapor intrusion to indoor air is unnecessary, because off-Site VOC concentrations in groundwater have declined below commercial/industrial ESLs for vapor intrusion concerns (Table 3, Figures 7 and 8). Other exposure pathways are rendered incomplete by (a) the occurrence of chemicals of concern primarily within deeper groundwater, which is unsuitable for most beneficial uses due to its extremely high salinity, (b) low groundwater seepage and VOC transport velocities, and (c) natural attenuation of groundwater VOC concentrations (see Section 5.1.3, above).

As discussed in Section 2.4, the area where VOCs in groundwater exceed risk-based allowable concentrations was defined in 1999 as the Groundwater Risk Area, or "GRA" (Figure 3; EKI, 1999c). Here, the current Site property owners are required to conduct groundwater monitoring of Site A-zone wells MW-8 and MW-9, to ensure that VOC concentrations remain at acceptable levels. Mitigation measures are specified within the RMP if the current or future property owners discover concentrations above risk-based levels during monitoring.

Measures listed in the RMP are codified in the Deed Restriction, as are legal terms and conditions of the restriction, including prohibited future activities on the Site, such as construction of residences, schools, or health-care facilities (Integris, 1999). Additional requirements are listed in the Deed Restriction, and summarized in Section 2.4.

5.2.3 Mitigation of Unacceptable Threats to Groundwater and Surface Water Resources, Considering Both Existing and Potential Beneficial Uses

The Water Board document *San Francisco Bay Basin (Region 2) Water Quality Control Plan* ("Basin Plan") locates the Site within the South Bay surface water basin, and the Santa Clara Valley Groundwater Basin, San Mateo Plain Sub-Basin (2-9.03) (RWQCB, 2011; DWR, 2003). Tidelands downgradient of the Site are mapped as salt ponds, marshlands, and tidal flats.

Flood Slough (the recipient of discharge from the creek adjacent to the Site) is not specifically listed as a surface water body in the Basin Plan, but nearby Ravenswood Slough is listed as having existing beneficial uses of (a) estuarine habitat, (b) preservation of rare and endangered species, (c) wildlife habitat, (d) water contact recreation, and (e) non-water contact recreation. The San Mateo Plain Sub-Basin is listed as providing groundwater for existing beneficial uses of (1) municipal and domestic supply, (2) industrial process water supply, and (3) industrial service water supply. Agricultural water supply also is listed as a "potential" beneficial use (RWQCB, 2011).

Groundwater quality objectives for basins designated as having a beneficial use of municipal or domestic water supply are equivalent to U.S. EPA maximum contaminant levels for drinking water ("MCLs") for VOCs, but locally, the presence of extremely saline brines in the subsurface, combined with generally low transmissivity, would preclude use of local groundwater within the Site VOC plume for domestic, industrial, or agricultural supply.

The channelized creek that runs north toward San Francisco Bay along the east side of Haven Avenue was sampled in several locations during the remedial investigation (EKI, 1997a). Surface water and sediment samples were collected and analyzed for VOCs. All analytes were below reporting limits (EKI, 1997a), and were below current groundwater ESLs for protection of aquatic receptors, i.e., below 360 ug/L TCE, and 590 ug/L cis-1,2-DCE (RWQCB, 2008).

EKI performed a comparative analysis in 2002 of creek sampling results and shallow groundwater analytical data, and concluded based on relative concentrations of TDS and VOCs that groundwater contributions to the creek were negligible. Thus, VOC concentrations in the shallow subsurface do not represent a threat to local surface water, and do not require mitigation. As discussed in Section 5.1.3.4 above, interpretation of existing data and reasonable projections based on modeling indicate that VOC concentrations in groundwater from the Site and surrounding off-Site areas do not, and will not, present a risk to existing and potential beneficial uses listed for surface and groundwater in the Basin Plan. This includes surface freshwater in the channelized creek and San Francisco Bay.

Changes to existing and potential beneficial uses of groundwater at the Site (and downgradient) are unlikely, as the basin has all currently-designated beneficial use categories listed as either existing or possible (RWQCB, 2011). Future changes to current beneficial uses of groundwater at the Site are unlikely, given the widespread presence of the brine in the B-zone.

5.3 Lack of Adverse Effects on Present and Anticipated Land and Water Uses from Residual Pollution

Existing land uses for the Site are limited to commercial and light industrial activity. Residential use is expressly prevented by the Deed Restriction. There are no present or anticipated groundwater uses on the Site, nor are there known human uses of groundwater from downgradient locations within the plume of elevated groundwater VOC concentrations. Groundwater use on-Site also is prohibited by the Deed Restriction.

5.3.1 Groundwater Plumes are Decreasing

As discussed in Section 4.4, VOC concentrations analyzed in on-Site and off-Site B-zone wells are either stable, with no trend, or are decreasing. Groundwater VOC plumes have been characterized by monitoring of concentrations in on-Site and off-Site wells for over 13 years. The lateral and vertical extent of VOCs in groundwater has been determined by grab groundwater sampling in the late 1990s, and periodic monitoring of wells through 2012.

Spatial and temporal trends for TCE and cis-1,2-DCE have been estimated, by means of time series concentration plots, and a Mann-Kendall analysis (see Section 4.4). The consistent presence of TCE breakdown products cis-1,2-DCE, and sporadic detections of low levels of vinyl chloride in on-Site well MW-6B and off-Site well MW-FE1B may indicate ongoing reductive dechlorination (Table 3). U.S. EPA's natural attenuation screening protocol (USEPA, 1998b) as presented within the screening tools of BIOCHLOR (Aziz & Newell, 2002) indicates "limited evidence for anaerobic biodegradation of chlorinated organics" based on field criteria collected during monitoring well sampling, e.g., dissolved oxygen, nitrate, pH, and temperature, along with analyzed concentrations of cis-1,2-DCE and vinyl chloride.

5.3.2 Cleanup Standards Can Be Met in a Reasonable Timeframe

The slow rate of groundwater movement requires long periods of data collection to determine trends in concentration, thus estimation of the time frame for on-Site and off-Site groundwater to achieve cleanup standards is imprecise. Based on projected log-linear concentration trends interpreted from concentration time-series graphs (Figures 7 and 8), natural attenuation of TCE and cis-1,2-DCE to MCL values of 5 ug/L and 6 ug/L, respectively, may occur within approximately 20 to 30 years in off-Site wells, assuming other groundwater conditions and the existing head distribution remain unchanged.

6 CONCLUSIONS

In summary, SUMCO believes that it has investigated and addressed residual VOCs at the Site, and that additional environmental monitoring and remediation by SUMCO would not be productive, given the following:

- VOC concentrations in soil, groundwater, and soil vapor at and near the Site have been characterized;
- Source removal has been implemented;
- Engineering and administrative controls have been designed and implemented;
- Thirteen years of groundwater monitoring have been completed;
- Concentration trends are well below appropriate ESLs;
- The VOC plume poses little to no threat to existing and potential beneficial uses of groundwater;
- Movement of VOCs in groundwater to marine water of San Francisco Bay is expected to take centuries to millennia;
- VOC concentration trends in the off-Site VOC plume in groundwater are stable to declining; and
- Monitoring of on-Site VOC concentrations is required of the current Site owner, in a covenant between the current Site owner and the Water Board, of which SUMCO is not a party.

Therefore, SUMCO requests that the Water Board issue a letter granting SUMCO No Further Active Remediation status for the 3695-3723 Haven Avenue Site.

Based upon results and interpretation of data obtained through the investigations described above, SUMCO believes the Site meets the Water Board's criteria for a low-threat chlorinated solvent site. A possible exception can be made for VOCs in on-Site shallow A-zone groundwater, the current status of which is the contractual responsibility of the Site owner to assess, as established in the Deed Restriction.

Accordingly, SUMCO proposes to destroy and abandon the remaining groundwater monitoring wells on-Site, and on the adjacent 3750 Haven Avenue property, except for monitoring wells MW-8 and MW-9, which are to be monitored by the current Site owner pursuant to the terms of the Deed Restriction, and are not SUMCO's responsibility.

Table 2
Summary of Groundwater Elevation Data
3695-3723 and 3750 Haven Avenue
Menlo Park, California

Abbreviations

ft, NGVD: Elevation in feet relative to National Geodetic Vertical Datum of 1929
ft bTOC: Feet below top of well casing
g/mL: Grams per milliliter
TOC: Top of casing
-- : No data available

Notes:

(a) Due to site regrading, the top of casing for monitoring well MW-5B was extended on 29 October 2001. The top of casing elevation was recalculated from the measured length of the extension and the previous top of casing elevation. The new ground surface elevation at MW-5B was similarly recalculated. Monitoring well MW-6B was damaged during regrading and construction in 2001. The TOC elevation and ground surface elevation were resurveyed on 28 June 2001 by Wilsey-Ham, Inc. The TOC and ground surface elevations for sampled wells were resurveyed on 8 May 2006 by MacLeod and Associates, Inc. for incorporation into GeoTracker.

(b) Unless otherwise noted, density and temperature data were measured in the field. Density and temperature data for samples collected on 20 March 2000 were measured at EKI in San Mateo, CA. Density and temperature data for samples collected on 19 December 2006 were measured at EKI in Burlingame, CA.

(c) Two groundwater samples have been collected from each well except MW-5B since the 8 August 2006 sampling event, including one sample each from the upper and lower density zones of the water column. For multilevel sampling, the sampling depth in ft bTOC is indicated here in square brackets. No samples were collected from monitoring well MW-5B.

(d) Density-corrected "equivalent freshwater" heads for water levels measured after 2006 were calculated through the equation shown below (Guo & Langevin, 2002). Depth-integrated density was estimated for each well from the electrical conductivity and temperature profiles shown on Table 3. Equivalent freshwater heads were calculated using a slightly different method from 1999 through 2006 (EKI, 2008).

$$h_f = \frac{\rho}{\rho_f} \times h - \frac{\rho - \rho_f}{\rho_f} \times Z$$

h_f = Corrected "equivalent freshwater" head
ρ = Density of saline water
h = Measured head
Z = Elevation of bottom of well screen
ρ_f = Density of freshwater, calculated as a function of temperature, using the Theisen-Scheel-Diesselhorst equation (see Table A1)

(e) After 2006, monitoring well MW-5B was no longer actively sampled, and field-measured density data of water samples were not collected. Density was estimated from electrical conductivity profiling.

Abbreviations:

<0.50 = Compound not detected at or above indicated laboratory detection limit
CFC-113 = Freon 113 (1,1,2-Trichloro-1,2,2-trifluoroethane)
CFC-11 = Freon 11 (Trichlorofluoromethane)
ug/L = Micrograms per Liter
n/a = Not applicable

Notes:

(a) All samples were analyzed using EPA Method 8010 or 8021B prior to the end of 2001, and using 8260B beginning 2002 with an analyte list expanded to include CFC-113. VOCs not shown were not detectable above laboratory reporting limits.
(b) The laboratory control sample ("LCS") recovery for this analyte is greater than the control limit range. This indicates the possibility of positive bias in the associated sample result. Therefore, the result should be considered estimated because the actual concentration may be lower than reported.
(c) No concentration value is listed for this analyte in the 2013 ESLs.

Abbreviations:

<0.50 = Compound not detected at or above indicated laboratory detection limit
TDS = Total Dissolved Solids
µg/L = Micrograms per liter

Notes:

(a) Samples were analyzed using Method SM2320B
(b) Samples were analyzed using EPA Method 300.
(c) Samples were analyzed using EPA Method 200.8 using ICP/MS.
(d) Samples were analyzed using EPA Method 160.1.

Abbreviations:
bTOC - below top of casing
°C - degrees Celsius
uS/cm - microsiemens per centimeter
g/mL - grams per milliter

Notes:
(a) Depth to water measurements collected using an electric water level sounder.
(b) Temperature and conductivity measurements collected using a YSI 650 MDS multiparameter instrument with YSI 600 XLM flow-through cell.
(c) Density measured in the field
(d) Density estimated by scaling regression-calculated 2008-2009 high densities (> 1.005) by current (September 2012) measured values.
2008-2009 estimated density calculated from electrical conductivity by means of a site-specific empirical regression:
[Estimated Density, (g/ml)] = 7.228e-07 * [Electrical Conductivity, (uS/cm)] + 0.9974; Coefficient of Determination (R2) = 0.9917
(see Table C-3)
(e) Estimated using 2008-2009 data.

Abbreviations:
bTOC - below top of casing
°C - degrees Celsius
uS/cm - microsiemens per centimeter
g/mL - grams per milliter

Notes:
(a) Depth to water measurements collected using an electric water level sounder.
(b) Temperature and conductivity measurements collected using a YSI 650 MDS multiparameter instrument with YSI 600 XLM flow-through cell.
(c) Density measured in the field.
(d) Density estimated by scaling regression-calculated 2008-2009 high densities (> 1.005) by current (September 2012) measured values.
2008-2009 estimated density calculated from electrical conductivity by means of a site-specific empirical regression:
[Estimated Density, (g/ml)] = 7.223e-07 * [Electrical Conductivity, (uS/cm)] + 0.9974; Coefficient of Determination (R2) = 0.9917
(see Table C-3)
(e) Estimated using 2008-2009 data.

INTRODUCTION

This noise impact analysis has been prepared to evaluate the potential noise impacts and reduction measures associated with the proposed Hotel Moxy Project (project) in the City of Menlo Park, California. This report is intended to satisfy the City of Menlo Park's (City) requirement for a project-specific noise impact analysis by examining the impacts of the project site and evaluating noise reduction measures that the project may require.

PROJECT LOCATION AND DESCRIPTION

The 0.76-acre project site is located at 3723 Haven Avenue in the City of Menlo Park, San Mateo County, California. The project site is shown in Figure 1, Project Location, and is currently developed with an existing office building and associated parking lot. The project site is located within a developed urban setting, surrounded by primarily commercial and industrial uses.

The proposed project would include the demolition of the existing office building and the construction of a 163-room hotel, totaling 57,923 square feet. The proposed project would provide 124 parking spaces largely contained in the first three floors of the new structure as podium parking, including 40 electric vehicle (EV) parking spaces. The building would contain three stories of podium parking, five stories of hotel rooms, a ground floor lobby space and coffee shop, which would be open to the public, and a fourth floor bar and restaurant area, which would include an outdoor rooftop garden and would also be publicly accessible (regardless of coffee shop and bar/lounge patronage) from 6:00 a.m. to 10:00 p.m. See Figure 2, Site Plan.

Once operational, the proposed project would generate 957 net new average daily trips. The proposed project would be built to Leadership in Energy and Environmental Design (LEED) Silver standards, would include solar panels, and would be 12 percent more energy efficient than the 2019 Title 24 standards. In addition, the proposed project would not increase the demand for natural gas as the City's reach codes would require the buildings to be all electric. The proposed project would also include a 625 kilovolt-amp (670 horsepower [HP]) diesel backup generator.

Construction of the proposed project is anticipated to begin in January 2023 and end in January 2025. In addition, construction activities would include the demolition of the existing building and surface parking lot on the project site and would include the net import of approximately 439 cubic yards of soil.

EXISTING LAND USES IN THE PROJECT AREA

The project site is surrounded primarily by commercial and industrial uses. The areas adjacent to the project site include the following uses:

- **North:** Existing Menlo-Atherton Storage
- **East:** Existing FedEx Ship Center opposite Haven Avenue
- **South:** Existing office building
- **West:** Existing multi-family apartments (Elan Menlo Park Apartments)

NOISE AND VIBRATION FUNDAMENTALS

CHARACTERISTICS OF SOUND

Noise is usually defined as unwanted sound. Noise consists of any sound that may produce physiological or psychological damage and/or interfere with communication, work, rest, recreation, and sleep.

To the human ear, sound has two significant characteristics: pitch and loudness. Pitch is generally an annoyance, while loudness can affect the ability to hear. Pitch is the number of complete vibrations, or cycles per second, of a sound wave, which results in the tone's range from high to low. Loudness is the strength of a sound, and it describes a noisy or quiet environment; it is measured by the amplitude of the sound wave. Loudness is determined by the intensity of the sound waves combined with the reception characteristics of the human ear. Sound intensity is the average rate of sound energy transmitted through a unit area perpendicular to the direction in which the sound waves are traveling. This characteristic of sound can be precisely measured with instruments. The analysis of a project defines the noise environment of the project area in terms of sound intensity and its effect on adjacent sensitive land uses.

MEASUREMENT OF SOUND

Sound intensity is measured with the A-weighted decibel (dBA) scale to correct for the relative frequency response of the human ear. That is, an A-weighted noise level de-emphasizes low and very high frequencies of sound, similar to the human ear's de-emphasis of these frequencies. Decibels (dB), unlike the linear scale (e.g., inches or pounds), are measured on a logarithmic scale representing points on a sharply rising curve.

For example, 10 dB is 10 times more intense than 0 dB, 20 dB is 100 times more intense than 0 dB, and 30 dB is 1,000 times more intense than 0 dB. Thirty decibels (30 dB) represents 1,000 times as much acoustic energy as 0 dB. The decibel scale increases as the square of the change, representing the sound pressure energy. A sound as soft as human breathing is about 10 times greater than 0 dB. The decibel system of measuring sound gives a rough connection between the physical intensity of sound and its perceived loudness to the human ear. A 10 dB increase in sound level is perceived by the human ear as only a doubling of the sound's loudness. Ambient sounds generally range from 30 dB (very quiet) to 100 dB (very loud).

Sound levels are generated from a source, and their decibel level decreases as the distance from that source increases. Sound levels dissipate exponentially with distance from their noise sources. For a single point source, sound levels decrease approximately 6 dB for each doubling of distance from the source. This drop-off rate is appropriate for noise generated by stationary equipment. If noise is produced by a line source (e.g., highway traffic or railroad operations), the sound decreases 3 dB for each doubling of distance in a hard site environment. Line-source sound levels decrease 4.5 dB for each doubling of distance in a relatively flat environment with absorptive vegetation.

There are many ways to rate noise for various time periods, but an appropriate rating of ambient noise affecting humans also accounts for the annoying effects of sound. The equivalent continuous sound level (L_{eq}) is the total sound energy of time-varying noise over a sample period. However, the predominant rating scales for human communities in the State of California are the L_{eq} and Community Noise Equivalent Level (CNEL) or the day-night average noise level (L_{dn}) based on A-weighted decibels. CNEL is the time-weighted average noise over a 24-hour period, with a 5 dBA weighting factor applied to the hourly L_{eq} for noises occurring from 7:00 p.m. to 10:00 p.m. (defined as relaxation hours) and a 10 dBA weighting factor applied to noises occurring from 10:00 p.m. to 7:00 a.m. (defined as sleeping hours). L_{dn} is similar to the CNEL scale but without the adjustment for events occurring during relaxation hours. CNEL and L_{dn} are within 1 dBA of each other and are normally interchangeable. The City uses the CNEL noise scale for long-term traffic noise impact assessment.

Other noise rating scales of importance when assessing the annoyance factor include the maximum instantaneous noise level (L_{max}), which is the highest sound level that occurs during a stated time period. The noise environments discussed in this analysis for short-term noise impacts are specified in terms of maximum levels denoted by L_{max}, which reflects peak operating conditions and addresses the annoying aspects of intermittent noise. It is often used together with another noise scale, or noise standards in terms of percentile noise levels, in noise ordinances for enforcement purposes. For example, the L_{10} noise level represents the noise level exceeded 10 percent of the time during a stated period. The L_{50} noise level represents the median noise level. Half the time the noise level exceeds this level, and half the time it is less than this level. The L_{90} noise level represents the noise level exceeded 90 percent of the time and is considered the background noise level during a monitoring period. For a relatively constant noise source, the L_{eq} and L_{50} are approximately the same.

Noise impacts can be described in three categories. The first category includes audible impacts, which are increases in noise levels noticeable to humans. Audible increases in noise levels generally refer to a change of 3 dB or greater because this level has been found to be barely perceptible in exterior environments. The second category, potentially audible, refers to a change in the noise level between 1 dB and 3 dB. This range of noise levels has been found to be noticeable only in laboratory environments. The last category includes changes in noise levels of less than 1 dB, which are inaudible to the human ear. Only audible changes in existing ambient or background noise levels are considered potentially significant.

Physiological Effects of Noise

Physical damage to human hearing begins at prolonged exposure to sound levels higher than 85 dBA. Exposure to high sound levels affects the entire system, with prolonged sound exposure in excess of 75 dBA increasing body tensions, thereby affecting blood pressure and functions of the heart and the nervous system. In comparison, extended periods of sound exposure above 90 dBA would result in permanent cell damage. When the sound level reaches 120 dBA, a tickling sensation occurs in the human ear, even with short-term exposure. This level of sound is called the threshold of feeling. As the sound reaches 140 dBA, the tickling sensation is replaced by a feeling of pain in the ear (i.e., the threshold of pain). A sound level of 160–165 dBA will result in dizziness or a

loss of equilibrium. The ambient or background noise problem is widespread and generally more concentrated in urban areas than in outlying, less developed areas.

Table A lists definitions of acoustical terms, and Table B shows common sound levels and their sources.

Table A: Definitions of Acoustical Terms

Term	Definitions
Decibel, dB	A unit of sound measurement that denotes the ratio between two quantities that are proportional to power; the number of decibels is 10 times the logarithm (to the base 10) of this ratio.
Frequency, Hz	Of a function periodic in time, the number of times that the quantity repeats itself in 1 second (i.e., the number of cycles per second).
A-Weighted Sound Level, dBA	The sound level obtained by use of A-weighting. The A-weighting filter de-emphasizes the very low and very high frequency components of the sound in a manner similar to the frequency response of the human ear and correlates well with subjective reactions to noise. (All sound levels in this report are A-weighted unless reported otherwise.)
L_{01}, L_{10}, L_{50}, L_{90}	The fast A-weighted noise levels that are equaled or exceeded by a fluctuating sound level 1%, 10%, 50%, and 90% of a stated time period, respectively.
Equivalent Continuous Noise Level, L_{eq}	The level of a steady sound that, in a stated time period and at a stated location, has the same A-weighted sound energy as the time-varying sound.
Community Noise Equivalent Level, CNEL	The 24-hour A-weighted average sound level from midnight to midnight, obtained after the addition of 5 dBA to sound levels occurring in the evening from 7:00 p.m. to 10:00 p.m. and after the addition of 10 dBA to sound levels occurring in the night between 10:00 p.m. and 7:00 a.m.
Day/Night Noise Level, L_{dn}	The 24-hour A-weighted average sound level from midnight to midnight, obtained after the addition of 10 dBA to sound levels occurring in the night between 10:00 p.m. and 7:00 a.m.
L_{max}, L_{min}	The maximum and minimum A-weighted sound levels measured on a sound level meter, during a designated time interval, using fast time averaging.
Ambient Noise Level	The all-encompassing noise associated with a given environment at a specified time. Usually a composite of sound from many sources from many directions, near and far; no particular sound is dominant.
Intrusive	The noise that intrudes over and above the existing ambient noise at a given location. The relative intrusiveness of a sound depends upon its amplitude, duration, frequency, time of occurrence, and tonal or informational content, as well as the prevailing ambient noise level.

REGULATORY SETTING

APPLICABLE NOISE STANDARDS

The applicable noise standards governing the project site include the criteria in the Noise Element of the City's General Plan (Noise Element), and the City of Menlo Park Municipal Code.

City of Menlo Park

Noise Element of the General Plan

The City of Menlo Park addresses noise in the City's Noise Element of the General Plan (City of Menlo Park 2013). The goals, objectives, and policies in the City's General Plan are designed to provide noise compatible land use relationships by establishing noise standards utilized for design and siting purposes and minimize noise impacts from significant noise generators. The following policies are applicable to the proposed project:

- **Goal N1:** Achieve Acceptable Noise Levels.

  Policies:

  - N1.1: *Compliance with Noise Standards*. Consider the compatibility of proposed land uses with the noise environment when preparing or revising community and/or specific plans. Require new projects to comply with the noise standards of local, regional, and building code regulations, including but not limited to the City's Municipal Code, Title 24 of the California Code of Regulations, and subdivision and zoning codes.

  - N1.2: *Land Use Compatibility Noise Standards*. Protect people in new development from excessive noise by applying the City's Land Use Compatibility Noise Standards for New Development (see Table C) to the siting and required mitigation for new uses in existing noise environments.

  - N1.3: *Exterior and Interior Noise Standards for Residential Use Areas.* Strive to achieve acceptable interior noise levels and exterior noise levels for backyards and/or common usable outdoor areas in new residential development and reduce outdoor noise levels in existing residential areas where economically and aesthetically feasible.

  - N1.4: *Noise Sensitive Uses*. Protect existing residential neighborhoods and noise sensitive uses from unacceptable noise levels and vibration impacts. Noise sensitive uses include, but are not limited to, hospitals, schools, religious facilities, convalescent homes and businesses with highly sensitive equipment. Discourage the siting of noise-sensitive uses in areas in excess of 65 dBA CNEL without appropriate mitigation and locate noise sensitive uses away from noise sources unless mitigation measures are included in development plans.

  - N1.5: *Planning and Design of New Development to Reduce Noise Impacts*. Design residential developments to minimize the transportation-related noise impacts to adjacent residential areas and encourage new development to be site planned and architecturally designed to

minimize noise impacts on noise sensitive spaces. Proper site planning can be effective in reducing noise impacts.

- N1.6: *Noise Reduction Measures*. Encourage the use of construction methods, state-of-the-art noise abating materials and technology and creative site design including, but not limited to, open space, earthen berms, parking, accessory buildings, and landscaping to buffer new and existing development from noise and to reduce potential conflicts between ambient noise levels and noise-sensitive land uses. Use sound walls only when other methods are not practical or when recommended by an acoustical expert.

- N1.8: *Potential Annoying or Harmful Noise*. Preclude the generation of annoying or harmful noise on stationary noise sources, such as construction and property maintenance activity and mechanical equipment.

L_{dn}: day-night average noise level

Municipal Code

Chapter 8.06 of the City's Municipal Code (City of Menlo Park 2022) establishes the maximum permissible noise level that may intrude into a neighbor's property. The Noise Ordinance establishes noise level standards for various land use categories affected by stationary noise sources. The following regulations would be applicable to the Project:

Section 8.06.030 Noise Limitations.

(a) Except as otherwise permitted in this chapter, any source of sound in excess of the sound level limits set forth in Section 8.06.030 shall constitute a noise disturbance. For purposes of determining sound levels from any source of sound, sound level measurements shall be made at a point on the receiving property nearest where the sound source at issue generates the highest sound level.

(1) For all sources of sound measured from any residential property:

(A) "Nighttime" hours (10:00 p.m. to 7:00 a.m.) — Fifty (50) dBA

(B) "Daytime" hours (7:00 a.m. to 10:00 p.m.) — Sixty (60) dBA

(2) (For all sources of sound within a multifamily residential structure transmitting through a common interior partition (wall, floor or ceiling) from one (1) dwelling unit to another:

(A) "Nighttime" hours (10:00 p.m. to 7:00 a.m.) —thirty-five (35) dBA

(B) "Daytime" hours (7:00 a.m. to 10:00 p.m.) —forty-five (45) dBA

Section 8.06.040 Exceptions

The following are exceptions to the noise limitations set forth in Section 8.06.030. These activities may occur at other times provided they meet the noise levels set forth in Section 8.06.030.

(a) **Construction Activities**

(1) Construction activities between the hours of 8:00 a.m. and 6:00 p.m. Monday through Friday.

(2) Residents/property owners personally undertaking construction activities to maintain or improve their property on Saturdays, Sundays or holidays between the hours of 9:00 a.m. and 5:00 p.m.

(3) A sign, containing the permitted hours of construction activities exceeding the noise limits set forth in Section 8.06.030, shall be posted at all entrances to a construction site upon the commencement of construction, for the purpose of informing contractors and subcontractors and all other persons at the construction site of the basic requirements of this chapter. The sign shall be at least five (5) feet above ground level and shall consist of a white background with black letters.

(4) Notwithstanding any other provision set forth above, all powered equipment shall comply with the limits set forth in Section 8.06.040(b).

(b) **Powered Equipment**

(1) Powered equipment used on a temporary, occasional, or infrequent basis operated between the hours of 8:00 a.m. and 6:00 p.m. Monday through Friday. No piece of equipment shall generate noise in excess of 85 dBA at 50 feet.

(2) Residents/property owners personally using powered equipment to maintain their property and/or residence on Saturdays, Sundays or holidays between the hours of 9:00 a.m. and 5:00 p.m. No piece of equipment shall generate noise in excess of 85 dBA at 50 feet.

Federal Transit Administration

Although the City does not have daytime construction noise level limits for activities that occur within the specified hours in Section 11.80.030(D)(7) to determine potential California Environmental Quality Act (CEQA) noise impacts, construction noise was assessed using criteria from the *Transit Noise and Vibration Impact Assessment Manual* (FTA 2018) (FTA Manual). Table D shows the FTA's General Assessment Construction Noise Criteria based on the composite noise levels per construction phase.

Table D: General Assessment Construction Noise Criteria

Land Use	Daytime 1-hour L_{eq} (dBA)	Nighttime 1-hour L_{eq} (dBA)
Residential	90	80
Commercial	100	100
Industrial	100	100

dBA = A-weighted decibels
FTA = Federal Transit Administration
L_{eq} = equivalent continuous sound level

OVERVIEW OF THE EXISTING NOISE ENVIRONMENT

The primary existing noise sources in the project area are transportation facilities. Traffic on Haven Avenue, Marsh Boulevard, and U.S. Highway 101 are a steady source of ambient noise.

AMBIENT NOISE MEASUREMENTS

Two long-term (24-hour) noise level measurements were conducted on August 2 through August 3, 2022, using two Larson Davis Spark 706RC Dosimeters. Table E provides a summary of the measured hourly noise levels from the noise level measurements. Hourly noise levels at surrounding sensitive uses are as low as 42.0 dBA L_{eq} during nighttime hours and 49.9 dBA L_{eq} during daytime hours. Noise monitoring data results are provided in Appendix A. Figure 3 shows the noise monitoring locations.

Table E: Existing Noise Level Measurements

Location	Location Description	Daytime Noise Levels[1] (dBA L_{eq})	Average Daytime Noise Level (dBA L_{eq})	Evening Noise Levels[2] (dBA L_{eq})	Nighttime Noise Levels[3] (dBA L_{eq})	Average Daily Noise Levels (dBA CNEL)
LT-1	Western corner of project site, on a tree closest to the fence	53.3 – 57.8	55.6	51.2 – 55.5	42.4 – 55.0	58.4
LT-2	Northern corner of existing building façade, closest to parking lot behind the building, on a black pipe attached to the building.	49.9 – 63.0	56.5	48.8 – 58.4	42.0 – 50.2	57.3

L_{eq} = equivalent continuous sound level

EXISTING AIRCRAFT NOISE

Airport-related noise levels are primarily associated with aircraft engine noise made while aircraft are taking off, landing, or running their engines while still on the ground. The closest airports to the proposed project site are San Carlos (SQL) and Palo Alto (PAO) Airports, located approximately 4.2 miles west and east of the project site, respectively. The project site is outside the 60 dBA CNEL noise contour of SQL based on the *San Carlos Airport Final Airport Land Use Compatibility Plan (ALUCP)* (ESA Airports 2015) and PAO based on the *2022 Forecasted Palo Alto Airport Noise Contour Map* (Palo Alto Airport 2016 Annual noise complaints report). Therefore, the project site is not expected to experience airport-related noise levels in excess of the City of Menlo Park exterior standards. No further analysis is necessary.

PROJECT IMPACT ANALYSIS

SHORT-TERM CONSTRUCTION NOISE IMPACTS

Two types of short-term noise impacts could occur during the construction of the proposed project. First, construction crew commutes and the transport of construction equipment and materials to the site for the proposed project would incrementally increase noise levels on access roads leading to the site. Although there would be a relatively high single-event noise-exposure potential causing intermittent noise nuisance (passing trucks at 50 ft would generate up to 84 dBA L_{max}), the effect on longer-term ambient noise levels would be small when compared to existing daily traffic volumes on Haven Avenue. Because construction-related vehicle trips would not approach existing daily traffic volumes, traffic noise would not increase by 3 dBA CNEL. A noise level increase of less than 3 dBA would not be perceptible to the human ear in an outdoor environment. Therefore, short-term, construction-related impacts associated with worker commute and equipment transport to the project site would be less than significant.

The second type of short-term noise impact is related to noise generated during construction, which includes demolition, site preparation, grading, building construction, trenching, paving, landscaping, and architectural coating on the project site. Construction is completed in discrete steps, each of which has its own mix of equipment and, consequently, its own noise characteristics. These various sequential phases would change the character of the noise generated on the site and, therefore, the noise levels surrounding the site as construction progresses. Despite the variety in the type and size of construction equipment, similarities in the dominant noise sources and patterns of operation allow construction-related noise ranges to be categorized by work phase. Table F lists typical construction equipment noise levels recommended for noise impact assessments, based on a distance of 50 ft between the equipment and a noise receptor, taken from the Federal Highway Administration's (FHWA) *Roadway Construction Noise Model* (FHWA 2006).

In addition to the reference maximum noise level, the usage factor provided in Table F is used to calculate the hourly noise level impact for each piece of equipment based on the following equation:

$$L_{eq}(equip) = E.L. + 10\log(U.F.) - 20\log\left(\frac{D}{50}\right)$$

where: $L_{eq}(equip)$ = L_{eq} at a receiver resulting from the operation of a single piece of equipment over a specified time period.

E.L. = noise emission level of the particular piece of equipment at a reference distance of 50 ft.

U.F. = usage factor that accounts for the fraction of time that the equipment is in use over the specified period of time.

D = distance from the receiver to the piece of equipment.

Table F: Typical Construction Equipment Noise Levels

Equipment Description	Acoustical Usage Factor (%)[1]	Maximum Noise Level (L_{max}) at 50 Feet[2]
Auger Drill Rig	20	84
Backhoes	40	80

Welder	40	73

Source: *FHWA Roadway Construction Noise Model User's Guide,* Table 1 (FHWA 2006).
Note: Noise levels reported in this table are rounded to the nearest whole number.
[1] Usage factor is the percentage of time during a construction noise operation that a piece of construction equipment is operating at full power.
[2] Maximum noise levels were developed based on Specification 721.560 from the Central Artery/ Tunnel program to be consistent with the City of Boston's Noise Code for the "Big Dig" project.
FHWA = Federal Highway Administration
L_{max} = maximum instantaneous sound level

Each piece of construction equipment operates as an individual point source. Using the following equation, a composite noise level can be calculated when multiple sources of noise operate simultaneously:

$$Leq\ (composite) = 10 * \log_{10}\left(\sum_{1}^{n} 10^{\frac{Ln}{10}}\right)$$

While noise levels associated with construction noise can be described in both maximum levels (L_{max}) and average hourly levels (L_{eq}), the potential impacts from on-site construction activities to surrounding uses is most accurately assessed using the L_{eq} metric. Because activities within each phase are likely to occur for multiple hours in a given day or for a number of days, the average noise level is the best method to capture the potential impact. Using the equations from the methodology

above, the reference information in Table F, and the construction equipment list provided, the composite noise level of each construction phase was calculated. The project construction composite noise levels at a distance of 50 ft would range from 74 dBA L_{eq} to 89 dBA L_{eq}, with the highest noise levels occurring during the rough grading phase.

Once composite noise levels are calculated, reference noise levels can then be adjusted for distance using the following equation:

$$Leq\ (at\ distance\ X) = Leq\ (at\ 50\ feet) - 20 * \log_{10}\left(\frac{X}{50}\right)$$

In general, this equation shows that doubling the distance would decrease noise levels by 6 dBA, while halving the distance would increase noise levels by 6 dBA.

Table G shows the nearest sensitive uses to the project site, their distance from the center of construction activities, and composite noise levels expected during the loudest phase of construction, rough grading. These noise level projections do not consider intervening topography or barriers. Table H shows the construction noise levels, by phase when construction occurs at the western property line, closest to the nearest sensitive receptor. Construction equipment calculations are provided in Appendix B.

While construction noise will vary, it is expected that composite noise levels during construction at the nearest off-site sensitive residential use to the west would reach an average noise level of 83 dBA L_{eq} during daytime hours. These predicted noise levels would only occur if all construction equipment is operating simultaneously near the property line and, therefore, are assumed to be conservative in nature. While construction-related short-term noise levels have the potential to be higher than existing ambient noise levels in the project area under existing conditions, the noise impacts would no longer occur once project construction is completed.

Table G: Potential Construction Noise Impacts at Surrounding Receptors During Rough Grading – Center of Site

Receptor (Location)	Composite Noise Level at 50 ft[1] (dBA L_{eq} / dBA L_{max})	Distance (ft)	Composite Noise Level (dBA L_{eq} / dBA L_{max})
Residences (West)	85 / 90	130	77 / 81

[1] The distance from the perimeter of construction to the closest residential receptor.
dBA = A-weighted decibels
ft = foot/feet
L_{eq} = equivalent continuous sound level
L_{max}= maximum sound level

As stated above, construction activities are regulated by the City's Noise Ordinance. The proposed project would comply with the construction hours specified in the City's Noise Ordinance, which states that construction activities are allowed between the hours of 8:00 a.m. and 6:00 p.m. Monday through Friday.

As it relates to off-site uses, construction-related noise levels would remain below the daytime 90 dBA L_{eq} 1-hour construction noise level criteria established by the FTA for residential and similar sensitive uses. However, construction noise would be 83 dBA L_{eq} at the nearest receptor, which is 27.4 dBA greater than the measured average noise level of 55.6 at this receptor location. Therefore, construction would increase ambient noise at the nearest sensitive receptor by more than 10 dBA. As such, additional mitigation would be required. Implementation of a 16-foot-high construction noise barrier at the western project site boundary would provide approximately 14 dBA reduction in noise levels to the 1st floor of the closest residential receptors to the west. At 2nd floor and 3rd receptors, the barrier would reduce construction noise levels by approximately 11 to 13 dBA. As presented in Appendix B, additional barrier calculations were completed to test the effectiveness of increasing the barrier to heights of 18 and 20 feet. The results indicate that each 2-foot increment increase only provides an additional reduction of less than 2 dBA. Due to minimum increase of noise reduction and the increased heights, a barrier height of 16 feet is recommended. The recommended barrier shall have a minimum density of 2 lb/ft^2 or is sound rated with a minimum Sound Transmission Class (STC) rating of 28 or higher. With these minimum material requirements, it is expected that noticeable noise would not be transmitted through the barrier, thus, increasing the barrier thickness would provide negligible noise reduction overall.

Implementation Project-Specific Mitigation Measure (MM) NOI-1 and Mitigation Measure NOISE-1c from the *ConnectMenlo: General Plan Land Use & Circulation Elements Update Environmental Impact Report* (ConnectMenlo EIR) would be required to reduce construction noise. With the implementation of Project-Specific MM NOI-1 noise levels would be reduced to 69 dBA L_{eq} (83 dBA – 14 dBA= 69 dBA) at the 1st floor receptors height where impacts are typically assessed during the noisiest phase of construction and when construction is occurring at the property line. This noise level would be greater than a 10 dBA increase in ambient noise at the nearest sensitive receptor. However, the ConnectMenlo EIR identified Mitigation Measure NOISE-1c, which includes noise reducing construction practices that would minimize noise impacts to surrounding receptors. The Connect Menlo EIR found that implementation of this measure would reduce construction noise impacts to a less than significant level. Therefore, impacts after mitigation would be less than significant.

Project-Specific MM NOI-1

The construction contractor shall ensure that a minimum 16-foot-high barrier, such as a plywood structure or flexible sound control curtain that has a density of 2 lb/ft^2 or is sound rated with a minimum Sound Transmission Class (STC) rating of 28 or higher, shall be erected on the western project site boundary adjacent to the sensitive receptors to minimize the amount of noise during construction.

ConnectMenlo EIR MM NOISE-1c

Project applicants shall minimize the exposure of nearby properties to excessive noise levels from construction-related activity through CEQA review, conditions of approval and/or enforcement of the City's Noise Ordinance. Prior to issuance of demolition, grading, and/or building permits for development projects, a note shall be provided on development plans indicating that during on-going grading, demolition, and construction, the property owner/developer shall be responsible for requiring contractors to implement the following measures to limit construction- related noise:

- Construction activity is limited to the daytime hours between 8:00 a.m. to 6:00 p.m. on Monday through Friday, as prescribed in the City's Municipal Code.
- All internal combustion engines on construction equipment and trucks are fitted with properly maintained mufflers, air intake silencers, and/or engine shrouds that are no less effective than as originally equipped by the manufacturer.
- Stationary equipment such as generators and air compressors shall be located as far as feasible from nearby noise-sensitive uses.
- Stockpiling is located as far as feasible from nearby noise-sensitive receptors.

- Limit unnecessary engine idling to the extent feasible.
- Limit the use of public address systems.
- Construction traffic shall be limited to the haul routes established by the City of Menlo Park.

LONG-TERM OPERATIONAL NOISE IMPACT ANALYSIS

Potential long-term noise would be associated with stationary sources proposed on the project site. New operational sources of noise would be associated with the project's proposed heating, ventilation, and air conditioning (HVAC) system and back-up generator. The back-up generator would be tested on the first Monday of every month at 9:00 am for a period of 30 minutes

Heating, Ventilation, and Air Conditioning Equipment

The project would include a variety of rooftop mechanical equipment include rooftop HVAC units (RTU). The HVAC equipment could operate 24 hours per day. The project is estimated to have 18 rooftop HVAC units on the proposed building to provide ventilation to the proposed hotel rooms and restaurant. The HVAC equipment could operate 24 hours per day and based on reference information, would generate sound pressure levels (SPL) of up to 72 dBA L_{eq} at 5 ft, based on manufacturer data (Trane) for similar equipment expected to be used. The combined equipment has the potential to approach 61 dBA L_{eq}. With the incorporation of the parapet wall that is a minimum of 7 ft tall around the perimeter of the roof, an additional 7 dBA can be expected resulting in a noise level of 54 dBA L_{eq}. In order to achieve a noise level of 50 dBA L_{eq}, the nighttime stationary noise standard, an additional noise reduction of 4 dBA L_{eq} would be necessary. With the implementation of Project-Specific MM NOI-2, operational noise levels would be reduced to below 50 dBA L_{eq}.

Project-Specific MM NOI-2 The following mitigation measure is required to reduce heating, ventilation, and air conditioning (HVAC) operational noise levels:

- Once specifications of the rooftop HVAC equipment are determined, an analysis shall be prepared and submitted to the satisfaction of the City Planning Director to confirm that the operation of rooftop equipment would meet the City's nighttime 50 dBA equivalent continuous sound level (L_{eq}) noise level standard. This can be achieved by the following design features:

  1. Choosing rooftop mechanical equipment that has a reference noise level of 68 dBA L_{eq} at 5 feet or less, or

  2. Installation of silencers or enclosures capable of reducing noise levels by a minimum of 4 dBA.

Back-up Generator

The proposed project would include a 625 Kilovolt-amp (670 horsepower [hp]) diesel backup generator (Generac SD500). Based on the specifications provided, the generator would achieve an average noise level of 75 dBA at 23 ft at full load with a level 2 sound attenuated enclosure. The generator will be placed in a room with a wall height of 11 ft, 8 inches according to the site plans and would be tested periodically during the daytime hours. A standard concrete masonry unit (CMU) block wall with a density of 95 pounds per cubic foot lbs/ft^3) would reduce noise by approximately 36 dBA resulting in a noise level of 39 dBA L_{eq} at a distance of 23 ft. When propagated to the adjacent property line 10 ft away, the resulting noise level would be approximately 46.5 dBA L_{eq}. With distance and wall attenuation, the generated noise levels would be below the daytime noise level standard of 60 dBA $L_{eq,}$ and no further reduction is necessary.

Exterior Deck Operations

The proposed project would include two (2) decks, one public and one hotel deck, on the west side of the project site on the fourth floor. There would be no hosted events or amplified sound at either deck. Both decks would be closed daily at 10:00 p.m. Published data for human speech noise levels were used to estimate additional noise from adults talking. Reference speech noise levels for people in various noise environments are shown in Table I. It was assumed that up to 10 adults (five male and five female) would be talking in loud voices simultaneously at the roof deck for extended periods of time.

Table I: Sound Levels of Speech for Different Vocal Efforts

Vocal Effort	Sound Level at 3.3 ft. (dBA L_{eq})		
	Male	Female	Children
Casual	53	50	50
Normal	58	55	55
Raised	65	62	62
Loud	75	71	71
Shout	88	82	82

Source: Harris 1998; U.S. Environmental Protection Agency 1977.
dBA = A-weighted decibels ft = foot/feet
L_{eq} = equivalent continuous sound level

Based on the calculations provided in Appendix C, with distance attenuation, the generated noise levels would be approximately 58 dBA L_{eq} at the residential use to the west. This noise level would be as much as 9 dBA higher above the quietest hour measured between 7:00 a.m. and 10:00 p.m., the hours defined as "daytime" by the City Municipal Code. However, this noise level would only be 2 dBA above the average ambient noise level during daytime hours, 56 dBA L_{eq}, and would be below the daytime noise level standard of 60 dBA $L_{eq,}$; therefore, the two decks would not result in noise impacts to off-site receptors.

CONCLUSION

Off-Site Construction Impacts

As described in the analysis above, construction of the proposed project would not result in potentially significant short-term noise impacts on adjacent land uses. Construction activities would be short-term and would be less than significant with the implementation of Project-Specific MM NOI-1 and ConnectMenlo EIR MM NOISE-1c. Construction vibration impacts to surrounding receptors would be less than significant.

Project-Specific MM NOI-1

The construction contractor shall ensure that a minimum 16-foot-high barrier, such as a plywood structure or flexible sound control curtain, shall be erected on the western project site boundary adjacent to the sensitive receptors to minimize the amount of noise during construction.

ConnectMenlo EIR MM NOISE-1c

Project applicants shall minimize the exposure of nearby properties to excessive noise levels from construction-related activity through CEQA review, conditions of approval and/or enforcement of the City's Noise Ordinance. Prior to issuance of demolition, grading, and/or building permits for development projects, a note shall be provided on development plans indicating that during on-going grading, demolition, and construction, the property owner/developer shall be responsible for requiring contractors to implement the following measures to limit construction- related noise:

- Construction activity is limited to the daytime hours between 8:00 a.m. to 6:00 p.m. on Monday through Friday, as prescribed in the City's Municipal Code.
- All internal combustion engines on construction equipment and trucks are fitted with properly maintained mufflers, air intake silencers, and/or engine shrouds that are no less effective than as originally equipped by the manufacturer.
- Stationary equipment such as generators and air compressors shall be located as far as feasible from nearby noise-sensitive uses.
- Stockpiling is located as far as feasible from nearby noise-sensitive receptors.
- Limit unnecessary engine idling to the extent feasible.
- Limit the use of public address systems.
- Construction traffic shall be limited to the haul routes established by the City of Menlo Park.

Off-Site Operations Impacts

Implementation of the proposed project would generate stationary noise from HVAC equipment to surrounding receptors. However, with the implementation of Project-Specific MM NOI-2, stationary source noise impacts would be less than significant.

Project-Specific MM NOI-2

The following mitigation measure is required to reduce heating, ventilation, and air conditioning (HVAC) operational noise levels:

- Once specifications of the rooftop HVAC equipment are determined, an analysis shall be prepared and submitted to the satisfaction of the City Planning Director to confirm that the operation of rooftop equipment would meet the City's nighttime 50 dBA equivalent continuous sound level (L_{eq}) noise level standard. This can be achieved by the following design features:

    1. Choosing rooftop mechanical equipment that has a reference noise level of 68 dBA L_{eq} at 5 feet or less, or

    2. Installation of silencers or enclosures capable of reducing noise levels by a minimum of 4 dBA.

APPENDIX A

NOISE MONITORING DATA

Noise Measurement Survey – 24 HR

Project Number: CMK2201
Project Name: Hotel Moxy

Test Personnel: Moe Abushanab
Equipment: Spark 706RC (SN:18904)

Site Number: LT-1 Date: 8/2/2022

Time: From 12:00 p.m. To 12:00 p.m.

Site Location: Located on the west corner of project site, on a tree closest to the western fence.

Primary Noise Sources: Regular traffic noise on Haven Avenue, Marsh Rd, and Hwy 101 Occasional parking lot activities.

Comments:

Executive Summary

This report presents the results of the Transportation Impact Analysis (TIA) conducted for the proposed hotel development at 3723 Haven Avenue in the City of Menlo Park, California. The project proposes to construct a 163-room hotel including a lounge, fitness center and business center above a three-level parking garage. Currently the site is occupied by a one-story office building with 13,681 square feet (s.f.), which would be demolished. Vehicular access to the project site would be provided by one full-access driveway located on Haven Avenue.

The transportation impacts of the project were evaluated following the standards and methodologies established by the City of Menlo Park in the TIA Guidelines. The transportation analysis report for the project includes a California Environmental Quality Act (CEQA) transportation analysis focused on Vehicle Miles Travelled (VMT) and a non-CEQA level of service (LOS) analysis (or roadway congestion analysis) to inform local planning efforts.

Pursuant to SB 743, LOS is no longer a threshold of significance under CEQA. Therefore, noncompliance with a local LOS standard does not constitute an impact under CEQA and any improvements to remedy deficiencies would need to be addressed as conditions of approval through the entitlement process and not mitigation measures in the CEQA process.

CEQA Transportation Impacts

Based on consultation with the City and applicant, the VMT analysis for the proposed hotel development focuses on the evaluation of VMT generated by land uses within a three-mile radius of the proposed hotel. Hexagon used the citywide travel demand forecast model to evaluate the project's effect on total daily VMT generated by land uses within a three-mile radius under existing conditions (year 2020 model scenario).

Hexagon compared the total daily VMT generated by land uses within a three-mile radius with and without the proposed project. The proposed project was shown to slightly reduce the total daily VMT generated by land uses within a three-mile radius of the project site (see Table ES 1). Since the proposed hotel would be located within very close proximity to a major employment area in the Bayfront Area, hotel patrons would enjoy shorter travel distances to their business destinations. Because the proposed project would not cause an increase in total VMT generated by the analysis area, it is concluded that the proposed project would have a less-than-significant transportation impact. It should be noted that this conclusion is not based on the City-required 20 percent TDM reduction, and the project would still be required to implement trip-reduction measures to meet the 20 percent TDM reduction requirement outlined in the City's Zoning Ordinance.

Table ES 1
Project VMT Evaluation

	3-Mile Radius Area of Project Site		
	Existing Condition	Existing with Project Condition	% Change
Total Daily VMT [1]	7,126,189	7,092,216	-0.5%

Notes:
1. Total daily VMT includes VMT generated by all trips having at least one trip-end in the analysis area, as estimated by the citywide travel demand model.

Level of Service (LOS) Transportation Analysis (Non-CEQA Analysis)

Project Trip Generation

The trip generation rates published for hotel (Land Use Code 310) were used to estimate the trips generated by the proposed project. Based on the ITE rates, the proposed project would generate 1,363 gross daily vehicle trips, including 77 gross AM peak-hour vehicle trips and 98 gross PM peak-hour vehicle trips. After applying the required TDM trip reductions and crediting the existing trips, the proposed project is expected to generate a net total of 957 daily vehicle trips with 46 trips (22 in and 24 out) during the AM peak hour and 62 trips (37 in and 25 out) during the PM peak hour.

Table ES 2
Project Trip Generation Estimates

			Daily		AM Peak Hour				PM Peak Hour			
					Pk-Hr	Trips			Pk-Hr	Trips		
Land Use	ITE Land Use Code	Size	Rate	Trips	Rate	In	Out	Total	Rate	In	Out	Total
Proposed Land Use												
Hotel[1]	310	163 rm	8.36	1,363	0.47	45	32	77	0.60	50	48	98
TDM Reduction (20%)				*(273)*		*(9)*	*(6)*	*(15)*		*(10)*	*(10)*	*(20)*
Existing Land Use												
Office[2]	710	13,681 s.f.	9.74	(133)	1.16	(14)	(2)	(16)	1.15	(3)	(13)	(16)
Net Project Trips				**957**		**22**	**24**	**46**		**37**	**25**	**62**

Notes:
All trip rates are from *ITE Trip Generation Manual, 10th Edition*, 2017.
1. Average trip rates for Hotel (Land Use 310), expressed in trips per room (rm).
2. Average trip rates for General Office Building (Land Use 710), expressed in trips per 1,000 s.f. of GFA.

Existing Plus Project Intersection Levels of Service

The TIA Guidelines require consideration of level of service for local planning purposes. If a project would result in increased delay exceeding the standards identified in the TIA Guidelines, the TIA is required to discuss specific measures to remedy the deficiencies which may occur as a result of the proposed project. The results of the intersection level of service analysis show that the following five study intersections would continue operating at acceptable LOS D or better and would comply with the City's TIA Guidelines with the proposed project.

#1 Marsh Road and US 101 Northbound Off Ramp
#2 Marsh Road and US 101 Southbound Off Ramp
#3 Marsh Road and Haven Avenue/Bayfront Expressway (SR 84)
#4 Chrysler Drive and Bayfront Expressway (SR 84)
#5 Chilco Street and Bayfront Expressway (SR 84)

The following two study intersections would continue to operate at an unacceptable level of service F during both AM and PM peak hours under existing plus project conditions. The increases in delay attributed to the proposed project would be less than four seconds, which would not meet the criteria established by the City of Menlo Park to define non-compliance with local policies for intersections involving two state routes:

#6 University Avenue (SR 109) and Bayfront Expressway (SR 84)
#7 Willow Road (SR 114) and Bayfront Expressway (SR 84)

Near-term (2022) Plus Project Intersection Levels of Service

Under near-term (2022) plus project conditions, the following four study intersections would continue operating at acceptable LOS D or better and would comply with the City's TIA Guidelines with the proposed project.

#1 Marsh Road and US 101 Northbound Off Ramp
#2 Marsh Road and US 101 Southbound Off Ramp
#4 Chrysler Drive and Bayfront Expressway (SR 84)
#5 Chilco Street and Bayfront Expressway (SR 84)

The following two study intersections would continue to operate at an unacceptable level of service F during both AM and PM peak hours under near-term (2022) plus project conditions. The increases in delay attributed to the proposed project would be less than four seconds, which would not meet the criteria established by the City of Menlo Park to define non-compliance with local policies for intersections involving two state routes:

#6 University Avenue (SR 109) and Bayfront Expressway (SR 84)
#7 Willow Road (SR 114) and Bayfront Expressway (SR 84)

The intersection at Marsh Road and Bayfront Expressway (SR 84) would operate at LOS E during the AM peak hour under near-term (2020) plus project conditions. The addition of project traffic causes an increase of more than 0.8 seconds of delay to vehicles on the most critical movements at this intersection, which would be considered to be non-compliant with local policies based on the criteria specified in the TIA Guidelines. The City's planned Haven Avenue streetscape project would restripe the eastbound approach at this intersection to include a shared through-left lane, a shared through-right lane, and a right-turn only. With the planned reconfiguration, the intersection at Marsh Road and Bayfront Expressway would operate at an acceptable level of service (LOS) D during both the AM and PM peak hours. Because the proposed project would pay the City of Menlo Park's Transportation Impact Fee, which will partially fund the Haven Avenue streetscape project, the project would comply with local policies related to intersection levels of service.

Cumulative (2040) Plus Project Intersection Levels of Service

Under cumulative (2040) plus project conditions, the following two study intersections would continue operating at acceptable LOS D or better and would comply with the City's TIA Guidelines with the proposed project.

#1 Marsh Road and US 101 Northbound Off Ramp
#2 Marsh Road and US 101 Southbound Off Ramp

The following two study intersections would continue to operate at an unacceptable level of service F during both AM and PM peak hours under cumulative (2040) plus project conditions. The increases in delay attributed to the proposed project would be less than four seconds, which would not meet the criteria established by the City of Menlo Park to define non-compliance with local policies for intersections involving two state routes:

#6 University Avenue (SR 109) and Bayfront Expressway (SR 84)
#7 Willow Road (SR 114) and Bayfront Expressway (SR 84)

Measured against the City's level of service standards, the proposed project would cause the following three intersections to be potentially non-compliant with local policies during either the AM or the PM peak hour under cumulative (2040) plus project conditions.

#3 Marsh Road and Haven Avenue/Bayfront Expressway (SR 84) – AM peak hour
#4 Chrysler Drive and Bayfront Expressway (SR 84) – PM peak hour
#5 Chilco Street and Bayfront Expressway (SR 84) – AM peak hour

#3. Marsh Road and Haven Avenue/Bayfront Expressway (SR 84)

The results show that under cumulative (2040) no project conditions, this intersection would operate at LOS E during the AM peak hour. Under cumulative (2040) plus project conditions, the intersection would continue operating at LOS E and the proposed project would cause an increase in delay of the critical movement on the local approach by more than 0.8 seconds. Measured against the City's level of service standards, the project would cause this intersection to be potentially non-compliant with local policies during the AM peak hour.

The City of Menlo Park is implementing a traffic signal adaptive coordination system on the Marsh Road, Bayfront Expressway, and Willow Road corridors to improve traffic flow. Adaptive traffic control is a technology that automatically adjusts traffic signal timing based on actual traffic demand at an intersection. This measure will improve the intersection operations and could reduce the intersection delay. The reduction in delay due to adaptive signal coordination is not expected to bring the intersection in compliance with the City's level of service policy. Other physical intersection improvements are considered infeasible due to right-of-way constraints and/or adverse effects on pedestrian and bicycle travel. In addition, since this intersection is owned and maintained by Caltrans, any physical improvements need Caltrans' approval.

#4. Chrysler Drive and Bayfront Expressway (SR 84)

The results show that under cumulative (2040) no project conditions, the intersection of Chrysler Drive and Bayfront Expressway (SR 84) would operate at LOS E during the PM peak hour. Under cumulative (2040) plus project conditions, the intersection would continue operating at LOS E and the proposed project would cause an increase in delay of the critical movement on the local approach by more than 0.8 seconds. Measured against the City's level of service standards, the project would cause this intersection to be potentially non-compliant with local policies during the PM peak hour. The planned traffic signal adaptive coordination system will improve the intersection operations on Bayfront Expressway and could reduce the intersection delay. The reduction in delay due to adaptive signal coordination is not expected to bring the intersection in compliance with the City's level of service policy. Due to right-of-way constraints and/or adverse effects on pedestrian and bicycle travel there are no feasible physical improvements to bring the intersection in compliance with TIA guidelines/standards. In addition, since this intersection is owned and maintained by Caltrans, any physical improvements need Caltrans' approval.

#5. Chilco Street and Bayfront Expressway (SR 84)

The results show that under cumulative (2040) no project conditions, the intersection of Chilco Street and Bayfront Expressway (SR 84) would operate at LOS E during the AM peak hour. Under cumulative (2040) plus project conditions, the intersection would continue operating at LOS E and the proposed project would cause an increase in delay of the critical movement on the local approach by more than 0.8 seconds. Measured against the City's level of service standards, the project would cause this intersection to be potentially non-compliant with local policies during the AM peak hour. The planned traffic signal adaptive coordination system will improve the intersection operations on Bayfront Expressway and could reduce the intersection delay. The reduction in delay due to adaptive signal coordination is not expected to bring the intersection in compliance with the City's level of service policy. Due to right-of-way constraints and/or adverse effects on pedestrian and bicycle travel, there are no feasible physical improvements to bring the intersection in compliance with TIA guidelines/standards. In addition, since this intersection is owned and maintained by Caltrans, any physical improvements need Caltrans' approval.

Other Transportation Issues

Generally, the proposed site plan shows adequate site access and on-site circulation, and the proposed project would not have an adverse effect on the existing transit services, pedestrian facilities, or bicycle facilities in the study area. Hexagon provides the following recommendations and enhancements for the proposed project:

1. Proper signage should be placed to direct hotel guests to the drop-off and pick-up area.
2. The drop off space near the driveway entrance should be extended to accommodate two vehicles and the hotel should ensure sufficient valet staff are on hand to avoid back-ups onto the street during peak periods.
3. The current site plan does not show a pick-up zone for hotel guests to pick up their vehicles. The site plan should be modified to provide more room for valet operations. Opposite the loading area would be a turn-out, which is designated as a parking space in the site plan. It is recommended that this turn-out be modified into a pick-up zone and extended to accommodate two vehicles.
4. A pedestrian connection should be added between the hotel lobby and the pick-up zone. Furthermore, the drop-off and pick-up area will also be used by ridesharing taxi services. Sufficient space should be provided for the taxi to turn around and exit the site after pick-up/drop-off.
5. It is recommended that the parking space on level 3 of the garage near Exit Stair A be removed or the exit be redesigned to allow for sufficient space to park a vehicle.
6. Vehicles driving up the garage ramp would not be able to see a vehicle backing out of the tandem parking space immediately adjacent to the top of the garage ramp. A mirror should be placed at an appropriate location at the top of the ramp to improve the visibility at this location. Likewise, valet staff should be instructed to reduce speed and check the mirror when traveling up the ramp.
7. It is recommended that one of the ADA accessible spaces be designated as a van space.
8. It is recommended that bike parking in the upper levels of the garage be shifted to the ground floor or signage be installed to discourage bikes from riding on the parking garage ramps.

Notes:

* Indicates LOS based on "unserved demand." At this location, upstream & downstream congestion results in delay not captured by the VISTRO analysis.

[1] The critical movement on local approaches shifts from eastbound left turn under existing and background conditions to eastbound through under cumulative conditions.

Bold indicates a substandard level of service.

Bold indicates that the project would cause the intersection to be potentially non-compliant with local policies.

1. Introduction

This report presents the results of the Transportation Impact Analysis (TIA) conducted for the proposed hotel development at 3723 Haven Avenue in City of Menlo Park, California. The proposed project would consist of a 163-room hotel including a lounge, fitness center and library above a three-level parking garage. The site is currently occupied by a one-story office building with 13,681 square feet (s.f.), which would be demolished. Vehicular access to the project site would be provided by one full-access driveway located on Haven Avenue. The project site and the surrounding study area are shown on Figure 1. The project site plan is shown on Figure 2.

Scope of Study

The purpose of the traffic study is to identify any traffic impacts in accordance with City of Menlo Park standards and procedures. This report includes an evaluation of transportation impacts according to CEQA and a non-CEQA level of service (LOS) analysis (or roadway congestion analysis) to inform local planning efforts per the City's TIA Guidelines.

CEQA Analysis

Vehicle Miles Travelled (VMT) Analysis

Senate Bill (SB) 743 changed the way transportation impacts are identified under CEQA from level of service (LOS) to vehicle miles travelled (VMT). The City of Menlo Park adopted updated Transportation Impact Analysis (TIA) Guidelines (June 16, 2020) that set forth new procedures and thresholds for VMT. The updated TIA Guidelines require that a project shall analyze both VMT to determine impacts under CEQA and non-CEQA level of service (LOS) for planning purposes, except those meeting the following exemption criteria:

1. Projects generating less than 100 vehicle trips/day

2. Local servicing retail projects and other commercial projects where the total square footage is 10,000 square feet or less (less than 10,000 square feet is exempt from VMT analysis only)

3. Residential or office developments located in a low VMT area and within ½ mile of an existing "major transit stop" or within ½ mile of a "high-quality transit corridor"

4. Affordable housing developments with 100 percent affordable units, either in a low VMT area or within ½ mile of an existing major transit stop or within ½ mile of a high-quality transit corridor

5. Local serving public facilities where the total new or added square footage is 10,000 square feet or less, such as libraries, police stations, fire stations or parks. Facility type and size outside the description shall provide evidence of local serving status to City satisfaction.

6. Projects in compliance with the El Camino Real and Downtown Specific Plan

The proposed hotel development would not meet the above exemption criteria. Therefore, the CEQA transportation impact analysis was based on an evaluation of the proposed project's VMT and also includes a non-CEQA LOS analysis for planning purposes.

VMT Analysis Methodology

In order to estimate VMT, the City's TIA Guidelines require the use of a travel demand forecast model. The model estimates the proposed project's effect on total daily VMT in accordance with City's TIA Guidelines. The evaluated daily VMT accounts for the entire distance of a trip associated with the proposed project. For example, the entire length of a trip made by a hotel staff person coming from and returning to their home would be captured in the daily VMT analysis.

However, hotel land uses are not explicitly represented in the model. Therefore, the hotel rooms and jobs expected for the proposed project are accounted for separately. Hotel employees are represented in the model by service employees. To reflect trips by hotel patrons, Hexagon used residential land use as a proxy, as it most closely resembles the behavior pattern of a hotel guest. Trip making characteristics for the residential land uses were restricted to offices and restaurants/shops to mimic patron activities at a typical business hotel (home-based work and home-based shopping trips).

Based on consultation with the City and applicant, the hotel is expected to have a service area of approximately three miles in radius. The VMT analysis is conducted by comparing the existing and existing plus project scenarios to determine the relative impact of the proposed project on VMT.

CEQA Significance Criteria Based on VMT Analysis

The proposed hotel project would generate more than 100 daily trips (based on the ITE rates, the proposed project would generate 1,363 gross daily vehicle trips). Per the City's TIA Guidelines, Attachment B, for large projects (nonexempt, non-retail projects that generate more than 100 daily vehicle trips), the City travel demand model is used to estimate the total daily City VMT, which is a measure of the total vehicle travel generated by all land uses within the City of Menlo Park. Based on the newly adopted City TIA Guidelines, a hotel development is considered to have a significant impact on VMT if the project causes a net increase in total City VMT.

Non-CEQA Level of Service (Roadway Congestion Analysis)

An LOS analysis also was conducted to identify whether the proposed project would comply with local policies. The following thresholds are from the City's TIA Guidelines and the proposed project's compliance with local policies was evaluated based on these thresholds:

- A project is considered potentially noncompliant with local policies if the addition of project traffic causes an intersection on a collector street operating at LOS A through C to operate at an unacceptable level (LOS D, E or F) or have an increase of 23 seconds or greater in average vehicle delay, whichever comes first. Potential noncompliance shall also include a project that causes an intersection on arterial streets or local approaches to State controlled signalized intersections operating at LOS A through D to operate at an unacceptable level (LOS E or F) or have an increase of 23 seconds or greater in average vehicle delay, whichever comes first.

- A project is also considered potentially noncompliant if the addition of project traffic causes an increase of more than 0.8 seconds of average delay to vehicles on all critical movements for intersections operating at a near-term LOS D through F for collector streets and at a near-term LOS E or F for arterial streets. For local approaches to State controlled signalized intersections, a project is considered to be potentially noncompliant if the addition of project traffic causes an increase of more than 0.8 seconds of delay to vehicles on the most critical movements for intersections operating at a near-term LOS E or F.

State (Caltrans) Controlled Intersections:

For signalized intersections involving two state routes, the project is considered potentially non-compliant with local policies if for any peak hour:

1. The level of service degrades from an acceptable LOS D or better under existing conditions to an unacceptable LOS E or F under existing plus project conditions, and the average delay per vehicle increases by four seconds or more, or
2. The level of service is an unacceptable LOS E or F under existing conditions and the addition of project trips causes an increase in the average control delay at the intersection by four seconds or more.

The effects of the project on other transportation facilities, such as bicycle facilities and transit service, were determined on the basis of engineering judgment.

Because the proposed project would generate only about 70 net peak-hour trips, its effect would extend to only a small area in the vicinity of the project site. The traffic analysis is based on the AM and PM peak-hour LOS for seven signalized intersections in the vicinity of the project site. The study intersections are listed below.

Study Intersections

#1 Marsh Road and US 101 Northbound Off Ramp
#2 Marsh Road and US 101 Southbound Off Ramp
#3 Marsh Road and Haven Avenue/Bayfront Expressway (SR 84)
#4 Chrysler Drive and Bayfront Expressway (SR 84)
#5 Chilco Street and Bayfront Expressway (SR 84)
#6 University Avenue (SR 109) and Bayfront Expressway (SR 84)
#7 Willow Road (SR 114) and Bayfront Expressway (SR 84)

Traffic conditions at the study intersections were analyzed for the weekday AM and PM peak hours of adjacent street traffic. The AM peak hour is expected to occur between 7:00 AM and 10:00 AM, and the PM peak hour between 4:00 PM and 7:00 PM on a typical weekday. These are the hours during which most traffic congestion occurs on the roadways.

The proposed project would generate less than 100 peak-hour trips on San Mateo County Congestion Management Plan (CMP) facilities. The City/County Association of Governments of San Mateo County (C/CAG) administers the CMP. Therefore, an analysis in accordance with the C/CAG's CMP guidelines, as well as a C/CAG checklist, is not required.

The proposed project would only add minimal trips to the freeway ramps; therefore, a freeway ramp analysis is not necessary. Instead, the study documents the trips added by the proposed project to the freeway ramps for informational purposes only.

Figure 1
Site Location and Study Intersections

NORTH

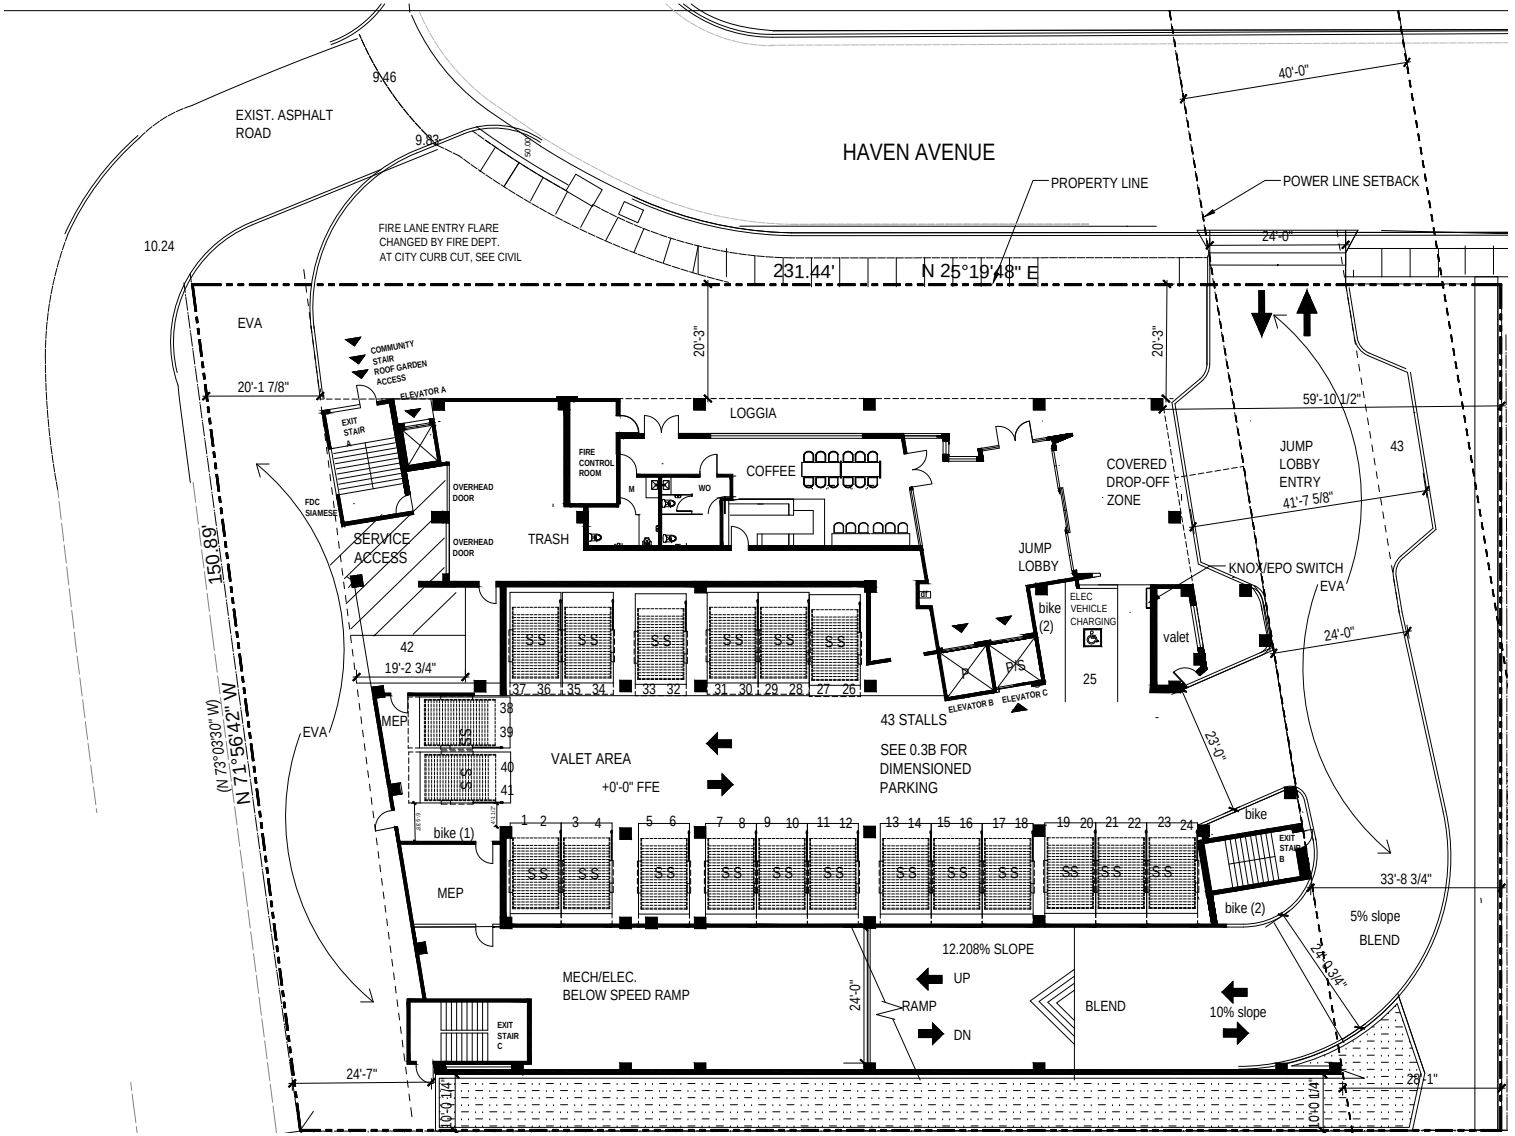

Figure 2
Site Plan

NORTH
Not to Scale

Traffic conditions were evaluated for the following scenarios:

Scenario 1: *Existing Conditions.* Existing traffic volumes at the study intersections are based on traffic counts obtained from the City of Menlo Park and/or previous studies for other nearby developments.

Scenario 2: *Existing plus Project Conditions.* Existing traffic volumes with the project were estimated by adding to existing traffic volumes the additional traffic generated by the project. Existing plus project conditions were evaluated relative to existing conditions in order to determine if the project is compliant with local policies.

Scenario 3: *Near-term (2022) Conditions.* Near-term traffic volumes were estimated by adding to existing traffic volumes the projected volumes from approved but not yet constructed projects that would generate trips at the study intersections. Near-term no project traffic volumes were obtained from the Commonwealth: Building 3 Project traffic study being conducted by Kittelson & Associates, Inc. In addition, roadway improvements associated with the approved developments were assumed as directed by City Staff.

Scenario 4: *Near-term (2022) plus Project Conditions.* Near-term traffic volumes with the project were estimated by adding to near-term traffic volumes the additional traffic generated by the project. Near-term plus project conditions were evaluated relative to near-term conditions.

Scenario 5 *Cumulative (2040) Conditions.* The 2040 model run results for the City of Menlo Park General Plan EIR certified in December 2016 were used to describe operating conditions at the study intersections under cumulative (2040) conditions. Because the current development proposal at 123 Independence Drive is larger than the development size assumed in the General Plan traffic study, the trips associated with the 107 extra units proposed at 123 Independence Drive were added to produce cumulative (2040) plus project traffic forecasts. The City has determined that the proposed hotel was included in the Year 2040 model forecasts. Therefore, the cumulative (2040) no project traffic volumes were estimated by subtracting the trips generated by the proposed project from the cumulative (2040) plus project traffic volumes.

Scenario 6 *Cumulative (2040) Plus Project Conditions.* The 2040 model run results for the City of Menlo Park General Plan EIR certified in December 2016 were used to describe operating conditions at the study intersections under cumulative (2040) plus project conditions. Cumulative (2040) plus project conditions were evaluated relative to cumulative (2040) without project conditions.

Methodology

This section presents the methods used to determine the traffic conditions at study intersections for each scenario described above. It includes descriptions of the data requirements, the analysis methodologies, and the applicable level of service standards and criteria used to determine if a project is compliant with local policies.

Data Requirements

The data required for the analysis were obtained from the City of Menlo Park, field observations, and previous studies. The following data were obtained from these sources:

- existing peak-hour intersection turning-movement volumes,
- existing lane configurations,
- signal timing and phasing,
- existing bicycle and pedestrian volumes, and
- list of approved projects.

Intersection Level of Service Methodologies

Traffic conditions were evaluated using level of service (LOS). Level of service is a qualitative description of operating conditions ranging from LOS A, or free-flow conditions with little or no delay, to LOS F, or forced-flow conditions with extreme delays. Per City's LOS standard (Policy CIRC-3.4 in the Circulation Element of the City's General Plan, adopted on 11/29/2016), the City strives to maintain LOS D at all City-controlled signalized intersections during peak hours, except at the intersection of Ravenswood Avenue and Middlefield Road and at intersections along Willow Road from Middlefield Road to US 101. The City shall work with Caltrans to ensure that average stopped delay on local approaches to State-controlled signalized intersections does not exceed LOS E.

Traffic operations at all the signalized intersections in the City of Menlo Park were evaluated using the VISTRO software based on the level-of-service method described in the *Highway Capacity Manual (HCM) 6th Edition*. The *HCM 6th Edition* evaluates signalized intersection operations on the basis of average control delay time for all vehicles at the intersection. Table 1 shows the level of service definitions for signalized intersections.

Table 1
Signalized Intersection Level of Service Definitions Based on Control Delay

Level of Service	Description	Average Control Delay Per Vehicle (sec.)
A	Signal progression is extremely favorable. Most vehicles arrive during the green phase and do not stop at all. Short cycle lengths may also contribute to the very low vehicle delay.	10.0 or less
B	Operations characterized by good signal progression and/or short cycle lengths. More vehicles stop than with LOS A, causing higher levels of average vehicle delay.	10.1 to 20.0
C	Higher delays may result from fair signal progression and/or longer cycle lengths. Individual cycle failures may begin to appear at this level. The number of vehicles stopping is significant, though some vehicles may still pass through the intersection without stopping.	20.1 to 35.0
D	The influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable signal progression, long cycle lengths, or high volume-to-capacity (V/C) ratios. Many vehicles stop and individual cycle failures are noticeable.	35.1 to 55.0
E	This is considered to be the limit of acceptable delay. These high delay values generally indicate poor signal progression, long cycle lengths, and high volume-to-capacity (V/C) ratios. Individual cycle failures occur frequently.	55.1 to 80.0
F	This level of delay is considered unacceptable by most drivers. This condition often occurs with oversaturation, that is, when arrival flow rates exceed the capacity of the intersection. Poor progression and long cycle lengths may also be major contributing causes of such delay levels.	greater than 80.0

Source: Transportation Research Board, *Highway Capacity Manual 6th Edition* (Washington, D.C., 2016), p.16-19.

Intersection Vehicle Queuing Analysis

For selected high-demand movements at the study intersections, the estimated maximum vehicle queues were compared to the existing or planned storage capacity. The queuing analysis is used to determine the appropriate storage lengths for the high-demand turn lanes where the project would add a substantial number of trips to these movements. Vehicle queues were estimated using a Poisson probability distribution, which estimates the probability of "n" vehicles for a vehicle movement using the following formula:

$$\text{Probability } (X=n) = \frac{\lambda^n e^{-(\lambda)}}{n!}$$

Where:

Probability (X=n) = probability of "n" vehicles in queue per lane

n = number of vehicles in the queue per lane

λ = Average number of vehicles in queue per lane (vehicles per hour per lane/signal cycles per hour)

The basis of the analysis is as follows: (1) the Poisson probability distribution is used to estimate the 95th percentile maximum number of queued vehicles per signal cycle for a particular movement; (2) the estimated maximum number of vehicles in the queue is translated into a queue length, assuming 25 feet per vehicle; and (3) the estimated maximum queue length is compared to the existing or planned available storage capacity for the movement.

For signalized intersections, the 95th percentile queue length value indicates that during the peak hour, a queue of this length or less would occur on 95 percent of the signal cycles. In other words, a queue length larger than the 95th percentile queue would only occur on five percent of the signal cycles (about three cycles during the peak hour for a signal with a 60-second cycle length). Therefore, left-turn storage pocket designs based on the 95th percentile queue length would ensure that storage space would be exceeded only five percent of the time. The 95th percentile queue length is also known as the "design queue length."

Report Organization

The remainder of this report is divided into five chapters. Chapter 2 describes existing conditions including the existing roadway network, transit service, bicycle, pedestrian facilities, and an introduction of a new transportation metric – vehicle miles travelled. Chapter 3 describes the CEQA transportation analysis, including the VMT analysis and mitigation measures to reduce the project's VMT impact. Chapter 4 describes the LOS transportation analysis including operations of study intersections, the methods used to estimate project-generated traffic, the project's effect on the local transportation system, and any recommended improvements for circulation or access deficiencies. Chapter 5 provides an evaluation of other transportation-related issues, such as site access, on-site circulation, vehicle queuing, parking, as well as potential project impacts on bicycle, pedestrian, and transit facilities.

2. Existing Conditions

This chapter describes the existing conditions for transportation facilities in the vicinity of the project site, including the roadway network, transit service, pedestrian, and bicycle facilities. A new transportation metric, vehicle miles travelled, is also discussed.

Existing Roadway Network

Regional access to the project study area is provided by US 101 and SR 84. Local access to the project site is provided by Marsh Road, Haven Avenue, Chilco Street, Constitution Drive, and Chrysler Drive. These facilities are described below. Many streets in the study area run at a diagonal compared to the ordinal directions. For the purposes of this study, US 101 and all parallel streets are considered to run east-west, and cross streets are considered to run north-south.

US 101 extends to the northwest through San Francisco and to the southeast through San Jose. Within Menlo Park, this freeway has three general-purpose travel lanes, one high-occupancy vehicle (HOV) lane, and one auxiliary lane in each direction. Access to and from the project study area is provided via a full-access interchange at Marsh Road.

Bayfront Expressway (SR 84) is a six-lane expressway that extends along the northern edge of Menlo Park. SR 84 extends eastward across the Dumbarton Bridge into Alameda County and westward through San Mateo County. Bayfront Expressway provides access to the project site via Haven Avenue.

Marsh Road extends from SR 84/Bayshore Expressway in the north to Middlefield Road in the south. In the project area, Marsh Road is a four-lane thoroughfare between Scott Drive and Bayfront Expressway. The posted speed limit in the project area is 35 mph. Sidewalks are present on both sides of Marsh Road between Bayfront Expressway and Scott Drive. It transfers to a mixed-use collector between Scott Drive and Bay Road. A Class III bike route is designated between Bay Road and Scott Drive. On-street parking is permitted on the west side of Marsh Road between Fair Oaks Avenue and Rolison Road. Access to the project site is provided via Haven Avenue.

Haven Avenue is a two-lane mixed use collector street that extends to the east from Sleepy Hollow Lane and then turns north at Haven Court. In the vicinity of the project site, Haven Avenue turns back to east and connects with Marsh Road and Bayfront Expressway. Sidewalks are presented along both directions of the roadway except for the section where it connects to Marsh Road. The posted speed limit is 30 mph along the most sections of the roadway. In the vicinity of the project site, there is an advisory speed limit of 15 mph when the roadway curves from north to east. Class II bike lanes are present on the east-west segment of Haven Avenue. On-street parking is permitted along most

sections of Haven Avenue except for the north-south segment in the vicinity of the project site, where on-street parking is prohibited along both directions. Haven Avenue serves as the eastern boundary of the project site and provides direct access to the project site.

Chilco Street is a two-lane mixed use collector street in the project area, extending from Bayfront Expressway in the north to Hamilton Avenue in the south. South of Hamilton Avenue, Chilco Street serves as a neighborhood collector and connects to Windermere Avenue. The posted speed limit is 25 to 40 mph. Sidewalks are present on both sides of Chilco Street between Windermere Avenue and the Menlo Park Fire District Station No. 77. A sidewalk is present on the east side of Chilco Street between Constitution Drive and Bayfront Expressway. A Class I separated shared-use path is present along Chilco Street between the fire station and Constitution Drive. Class II bike lanes are provided on both sides between Constitution Drive and Bayfront Expressway and in the southbound direction between Constitution Drive and the fire station. On-street parking is permitted on both sides of Chilco Street between Windermere Avenue and the fire station.

Chrysler Drive is a north-south two-lane mixed use collector street that extends from Commonwealth Drive in the south to Bayfront Expressway in the north. A sidewalk is present on the east side of Chrysler Drive and some segments on the west side. Class II bike lanes are present along Chrysler Drive between Independence Drive and Bayfront Expressway. On-street parking is permitted. The speed limit on Chrysler Drive is 25 mph.

Constitution Drive is a two-lane mixed use collector street with a speed limit of 35 mph. It extends from Independence Drive to connect to Chilco Street in the east. Sidewalks are present along the south side of the street. Class II bike lanes are present along Constitution Drive with on-street parking prohibited.

Existing Bicycle Facilities

Bicycle facilities include bike paths, bike lanes, and bike routes. Bike paths (Class I facilities) are pathways, separate from roadways that are designated for use by bicycles. Often, these pathways also allow pedestrian access. Bike lanes (Class II facilities) are lanes on roadways designated for use by bicycles with special lane markings, pavement legends, and signage. Bike routes (Class III) are existing rights-of-way that accommodate bicycles but are not separate from the existing travel lanes. Routes are typically designated only with signs.

The existing bicycle facilities in the study area are shown on Figure 3. Information about bicycle facilities in the study area is provided in the *General Plan Circulation Element*, published by the City of Menlo Park in 2016, and in the *San Mateo County Bicycle Map,* published by San Mateo County in 2010. The following bicycle facilities exist within the vicinity of the project site:

Bike Paths:

- Bayfront Expressway between Marsh Road and Marshlands Road across the Dumbarton Bridge
- Chilco Street between the Menlo Park Fire District Station No. 77 and Constitution Drive
- The Bay Trail along University Avenue north of Purdue Avenue
- Recreational trails at Bedwell Bayfront Park, Facebook along Hacker Way, and on the Bay Trail near Ravenswood Preserve

Bike Lanes:

- Haven Avenue between Sleepy Hollow Ln and Haven Court
- Chrysler Drive between Independence Drive and Bayfront Expressway
- Constitution Drive between Independence Drive and Chilco Street
- Chilco Street between Constitution Drive and Bayfront Expressway

- Willow Road between Bayfront Expressway and Bay Road south of US 101
- University Avenue between Donohoe Street and Bayfront Expressway
- Bay Road on the south side of US 101
- Jefferson Drive between Chrysler Drive and Constitution Drive

Bike Routes:

- Independence Drive between Constitution Drive and Chrysler Drive
- Market Place between Hamilton Avenue and Newbridge Street
- Ivy Drive between Market Place and Almanor Avenue
- Hamilton Avenue between Modoc Avenue and Chilco Street
- Newbridge Street in the westbound direction between Bay Road and Menalto Avenue
- Hacker Way

Proposed bicycle facilities in the vicinity of the project site include a multi-use pedestrian/bike bridge over Bayfront Expressway located between Chilco Street and Facebook MPK 21 Driveway. The bridge is currently in the design phase. In conjunction with City's planned Haven Avenue Streetscape Project, a new bicycle and pedestrian bridge over the Atherton Channel is planned as a part of a City project to extend the bike lanes and sidewalks on Haven Avenue to Marsh Road.

Overall, the existing and proposed bicycle facilities in the project vicinity provide some connection for bicycles along major thoroughfares. These bicycle facilities do not provide immediate access to the project site. However, due to low traffic volumes, Haven Avenue immediately adjacent to the project site is conducive to bicycle traffic.

Existing Pedestrian Facilities

Pedestrian facilities consist of sidewalks, crosswalks, and pedestrian signals at signalized intersections. Roadways providing pedestrian access to the project site include Haven Avenue and Marsh Road. Sidewalks are present along both sides of Haven Avenue except for the section where it connects to Marsh Road. Sidewalks are provided on both sides of Marsh Road between Bayfront Expressway and Scott Drive. South of Scott Drive, sidewalks are only provided on the east side of Marsh Road.

Crosswalks with pedestrian signal heads and push buttons are found on one or more approaches at all the signalized study intersections. The intersection at Marsh Road/Bayfront Expressway has crosswalks on all approaches. The intersection at Marsh Road and US101 northbound off-ramp has crosswalks on all but the south approach. The intersection at Marsh Road and US101 southbound off-ramp has crosswalks on all but the north approach.

Existing bicycle and pedestrian counts were conducted as part of the peak-hour turning movement counts conducted for this study during the weekday AM and PM peak hours. Pedestrian and bicycle traffic are relatively low within the study area.

Existing Transit Service

Existing transit service to the study area is provided by the San Mateo County Transit District (SamTrans), AC Transit, and the Menlo Park Shuttle Service. The bus routes that provide services near the project site are described in Table 2 and shown on Figure 4. The transit services presented reflect reductions in service due to the current Covid-19 pandemic.

Table 2
Existing Bus Service

Bus Route	Route Description	Travelled Roadways	Weekday Hours of Operation	Headway
Dumbarton Express Line DB	Union City BART to Stanford University	Dumbarton Bridge, Bayfront Expressway, Willow Road, Middlefield Road	5:25 AM - 8:45 PM	15 - 75 min
Dumbarton Express Line DB1	Union City BART to Stanford Research Park	Dumbarton Bridge, Bayfront Expressway, Willow Road, US 101	5:10 AM - 8:30 PM	15 - 65 min
SamTrans Route 270	Redwood City Caltrain to Florence/17th Loop	Marsh Road, Haven Avenue, Florence Street, Bayshore Freeway, Bay Road, Broaway	6:30 AM - 7:10 PM	60 min
SamTrans Route 281	Onetta Harris Center to Stanford Mall	Newbridge Street, Bay Road, University Avenue	8:05 AM - 8:35 PM	60 min
SamTrans Route 296	Redwood City Transit Center to Palo Alto Transit Center	Middlefield Road, Willow Road, Newbridge Street, Bay Road	All Day	60 min
SamTrans Route 397	San Francisco to Palo Alto Transit Center	Middlefield Road, Willow Road, Newbridge Street, Bay Road, University Avenue	12:45 AM - 6:30 AM	60 min
M2 Belle Haven Shuttle	Menlo Park Senior Center to Partridge & Kennedy	Middlefield Road, Willow Road, Ivy Drive, Chilco Street, Terminal Avenue	6:40 AM - 5:45 PM	120 min
M3 Marsh Road Shuttle	Menlo Park Caltrain to Marsh Road Business Parks	Haven Avenue, Marsh Road, Bayfront Expressway, Jefferson Drive	6:50 AM - 9:30 AM 3:25 PM - 6:00 AM	50-60 min
M4 Willow Road Shuttle	Menlo Park Caltrain Station to Adams Court	Willow Road, O'Brien Drive, Hamilton Avenue, Hamilton Court, Adams Court	6:50 AM - 9:30 AM 3:25 PM - 6:00 AM	50-60 min

Note: Transit Service as of July 2020. The above schedule reflects reduced transit service due to shelter-in-place caused by COVID-19.

Existing Lane Configurations and Traffic Volumes

The existing lane configurations at the study intersections were obtained from field observations (see Figure 5).

Existing traffic volumes were obtained from counts conducted in April 2019 (see Appendix A). The existing traffic volumes at the study intersection are shown on Figure 6.

Observed Existing Traffic Conditions

Traffic conditions were observed in the field in order to identify existing operational deficiencies and to confirm the accuracy of calculated intersection levels of service. The purpose of this effort was (1) to identify any existing traffic problems that may not be directly related to level of service, and (2) to identify any locations where the level of service analysis does not accurately reflect existing traffic conditions. Field observations were conducted on a regular weekday during the AM and PM peak hours in May, October, and November of 2019. Most of the study intersections had no significant operational issues, and vehicular queues on all approaches were mostly able to clear in one cycle. The observed operational issues at the remaining study intersections are identified below.

University Avenue (SR 109) and Bayfront Expressway (SR 84)

During the AM peak hour, queues on westbound Bayfront Expressway extend on to the Dumbarton Bridge and need several green cycles to proceed through the intersection.

During the PM peak hour, there is congestion on the northbound University Avenue and eastbound Bayfront Expressway approaches. Northbound right-turn queues consistently extend through upstream intersections. Eastbound queues extend to the upstream intersection at Willow Road and Bayfront Expressway. Vehicles in the northbound and eastbound directions need several green cycles to proceed through the intersection.

Willow Road and Bayfront Expressway

During the AM peak hour, the northbound left-turn exceeds the queue storage. The northbound left-turn traffic encroaches into the adjacent northbound through lane. The northbound left-turn traffic may require more than one cycle to clear the intersection. The westbound left turn was observed to back up traffic due to congestion downstream on Willow Road. The Willow Road backup also affects southbound through traffic, which occasionally requires more than one cycle to clear the intersection.

During the PM peak hour, the northbound right-turn lanes exceed the queue storage length and spills into the nearest through lane. The northbound right-turn lane occasionally requires more than one cycle to clear the intersection.

All other study intersections were observed to operate in a manner consistent with their calculated level of service. No other operational problems were noted.

3. CEQA Transportation Analysis

This chapter describes the CEQA transportation analysis, including the VMT analysis methodology, threshold of significance, and the project-level VMT impact analysis results. Pursuant to SB 743, the California Natural Resources Agency finalized updates to the CEQA Guidelines in late 2018. The guidelines state that level of service will no longer be considered to be an environmental impact under CEQA and consider vehicle-miles-travelled (VMT) the most appropriate measure of transportation impact. The City of Menlo Park updated its *Transportation Impact Analysis Guidelines* (TIA Guidelines) in July 2020 to include guidelines on evaluating VMT. For hotel uses, a project is considered to have a significant impact on VMT if the project results in a net increase in total City VMT.

VMT Analysis Methodology

Travel Demand Model Introduction

VMT is simply defined as the total distance traveled by vehicles traveling to and from the proposed project site over a typical day. In order to estimate VMT, the City's TIA Guidelines require the use of a travel demand forecast model. The citywide travel demand model is the best available model to represent travel within the City of Menlo Park, and serves as the primary forecasting tool for the City. The model is a mathematical representation of travel within the nine Bay Area counties, as well as the Santa Cruz, San Benito, Monterey and San Juaquin counties. The base model structure was developed by Metropolitan Transportation Commission (MTC) and further refined by C/CAG and Santa Clara Valley Transportation Authority (VTA) for use within San Mateo and Santa Clara Counties. The City further refined this model for application within Menlo Park to add more detail to the zone structure and transportation network. There are four main components of the model: 1) trip generation, 2) trip distribution, 3) mode choice, and 4) trip assignment. The model uses socioeconomic inputs (i.e., population, income, employment) aggregated into geographic areas, called transportation analysis zones (TAZ) to estimate travel within the model area. There are 80 TAZs within the model to represent the City of Menlo Park.

The model estimates the proposed project's effect on total daily VMT in accordance with City's TIA Guidelines. The evaluated daily VMT accounts for the entire distance of a trip associated with the proposed project. For example, the entire length of a trip made by a hotel staff person coming from and returning to their home would be captured in the daily VMT analysis.

However, hotel land uses are not explicitly represented in the model. Therefore, the hotel rooms and jobs expected for the proposed project are accounted for separately. Hotel employees are represented in the model by service employees. To reflect trips by hotel patrons, Hexagon used residential land use as a proxy, as it most closely resembles the behavior pattern of a hotel guest. Trip making characteristics for these proxy residential land uses were restricted to offices and restaurants/shops to mimic patron activities at a typical business hotel (home-based work and home-based shopping trips).

Other types of trip-making typical to an actual home such as school trips are not applicable to hotel guests. Given the models could only explicitly represent hotel employee VMT before, this proxy evaluation provides a conservative analysis as more VMT (hotel guest VMT) can be associated with the proposed project. This methodology is undertaken only for VMT purposes.

Project Study Area

Based on consultation with the City and applicant, the hotel is expected to have a service area of approximately three miles in radius. This means that most of the destinations of hotel patrons are expected to be within three miles of the hotel. While some trips are expected to be longer than three miles, the majority of the change in VMT is expected to occur within this three-mile radius, and the analysis will include the total VMT generated by all land uses within this area. As mentioned above, the VMT includes the entire length of the trip even when it extends beyond the three-mile radius. Analyzing larger radii is not ideal, as it could reflect changes in VMT that are not related to the proposed project but rather merely the result of normal variations that can occur during the model's trip assignment process.

Scenario Evaluation

The VMT analysis is conducted by comparing the existing and existing plus project scenarios to determine the relative impact of the proposed project on VMT. Within the model, mathematical formulations are established so every person's travel needs (work, shopping, leisure, school, etc.) are accounted for. The number of jobs, and other attractions are scaled accordingly to ensure there is just enough for every person's travel needs to be met, in other words trip attractions are factored to balance with trip productions. Thus, adding more trip attractions for the proposed hotel without an equivalent reduction in attractions elsewhere would cause the model to scale down the trip making for all attractions to restore balance with trip productions. This scaling would cause a change in the travel characteristics and the distribution of trips within the whole model area (Bay Area and peripheral counties). Such changes in trip making far from the project site are merely the result of the model's need to balance trip productions and attractions and not a real result of the proposed development. To avoid this, the total travel needs and the jobs/attractions serving those travel needs are held constant between with and without project scenarios. This ensures a consistent comparison and isolates the change in VMT due to the proposed project. This process is represented in the model by redistribution of the hotel attractions from nearby existing hotels. Five comparable hotels were found within the area for this redistribution effort (see Figure 7).

Service employees are coded in the model under existing conditions for the zones representing the five existing hotels. Under the "with-project" model run, service employees at these zones were shifted to the project zone. According to the project applicant, the hotel would have 35 employees. Thus, seven service employees were shifted from each of the five existing zones to the project zone under the "with-project" model run.

The zones representing the five existing hotels do not include any residential land use as a proxy for hotel patrons under existing conditions. Thus, residential dwelling units were first added to these five zones under the "existing" model run, so that under the "with-project" model run, shifting these residential land uses to the project zone would still maintain the same model-wide total land uses. Approximately 282 households are needed at the project zone in addition to the 35 service employees under the "with-project" model run for the model to compute trip generations equivalent to the daily trip generations estimated by ITE. Therefore, under the "existing" model run, 282 households were evenly distributed to the five zones with existing hotels.

VMT Evaluation

Hexagon compared the total daily VMT generated by land uses within a three-mile radius with and without the proposed project. As shown in Table 3, the proposed project was shown to slightly reduce the total daily VMT generated by land uses within a three-mile radius of the project site. Since the proposed Moxy Hotel would be located within very close proximity to a major employment area in the Bayfront Area, hotel patrons would enjoy shorter travel distances to their business destinations. Because the proposed project would not cause an increase in total VMT generated by the analysis area, it is concluded that the proposed project would have a less than significant transportation impact on vehicle miles travelled. It should be noted that the City-required 20 percent TDM reduction is independent from the VMT evaluation, and the proposed project would still be required to implement trip-reduction measures to meet the 20 percent TDM reduction goal outlined in the City ordinance. Implementation of the TDM requirement of the Zoning Ordinance would further reduce VMT associated with the proposed project. Regardless, even without the required 20 percent TDM reduction, the proposed project would slightly reduce the VMT within the three-mile study radius.

Table 3
Project VMT Evaluation

	3-Mile Radius Area of Project Site		
	Existing Condition	Existing with Project Condition	% Change
Total Daily VMT [1]	7,126,189	7,092,216	-0.5%

Notes:
1. Total daily VMT includes VMT generated by all trips having at least one trip-end in the analysis area, as estimated by the citywide travel demand model.

Existing Comparable Hotels Used in VMT Analysis

4. Non-CEQA Level of Service Transportation Analysis

This chapter describes the level of service transportation analysis including the method by which project traffic is estimated and any adverse effects to intersection levels of service caused by the proposed project under existing, near-term (2022), and cumulative (2040) conditions.

Project Trip Estimates

The magnitude of traffic produced by a new development and the locations where that traffic would appear are estimated using a three-step process: 1) trip generation, 2) trip distribution, and 3) trip assignment. In determining project trip generation, the magnitude of traffic entering and exiting the project site is estimated for the AM and PM peak hours. As part of the project trip distribution, an estimate is made of the directions to and from which the project trips would travel. In the project trip assignment, the project trips are assigned to specific streets and intersections. These procedures are described below.

Trip Generation

Through empirical research, data have been collected that quantify the amount of traffic produced by many types of land uses. These data are compiled in the Institute of Transportation Engineers' (ITE) *Trip Generation Manual, 10th Edition (*2017). The magnitude of traffic added to the roadway system by a development is estimated by multiplying the applicable trip generation rates by the size of the development. The trip generation rates published for Hotel (Land Use Code 310) were used to estimate the trips generated by the proposed project. Based on the ITE rates, the proposed project would generate 1,363 gross daily vehicle trips, including 77 gross AM peak-hour vehicle trips and 98 gross PM peak-hour vehicle trips.

The proposed project will be required to develop a comprehensive Transportation Demand Management (TDM) plan to reduce vehicle trips by 20 percent. Therefore, this analysis assumes that the project site will achieve a 20 percent reduction in peak-hour and daily trips. Furthermore, the site is occupied by an office building. Trip generation rates published for General Office Building (Land Use Code 720) were used to estimate existing trips. After applying the TDM trip reductions and crediting the existing trips, the proposed project is expected to generate a net total of 957 daily vehicle trips with 46 trips (22 in and 24 out) during the AM peak hour and 62 trips (37 in and 25 out) during the PM peak hour (see Table 4).

Table 4
Project Trip Generation Estimates

Land Use	ITE Land Use Code	Size		Daily		AM Peak Hour				PM Peak Hour			
						Pk-Hr	Trips			Pk-Hr	Trips		
				Rate	Trips	Rate	In	Out	Total	Rate	In	Out	Total
Proposed Land Use													
Hotel[1]	310	163	rm	8.36	1,363	0.47	45	32	77	0.60	50	48	98
TDM Reduction (20%)					*(273)*		*(9)*	*(6)*	*(15)*		*(10)*	*(10)*	*(20)*
Existing Land Use													
Office[2]	710	13,681	s.f.	9.74	(133)	1.16	(14)	(2)	(16)	1.15	(3)	(13)	(16)
Net Project Trips					**957**		**22**	**24**	**46**		**37**	**25**	**62**

Notes:
All trip rates are from *ITE Trip Generation Manual, 10th Editio*n, 2017.
1. Average trip rates for Hotel (Land Use 310), expressed in trips per room (rm).
2. Average trip rates for General Office Building (Land Use 710), expressed in trips per 1,000 s.f. of GFA.

Trip Distribution and Assignment

The trip distribution pattern for the proposed use was estimated based on existing travel patterns on the surrounding roadway system and the location of complimentary land uses. The project trip distribution pattern for the proposed project is shown on Figure 8. A substantial proportion of the project trips (approximately 30 percent) are anticipated to be associated with hotel guests visiting employment sites in the M-2 Area of Menlo Park (east of US 101). Hotel trips traveling to and from the site via US 101 (approximately 55 percent) include hotel guest trips to and from more distant sites as well as hotel employees. The remaining hotel trips are expected to travel to the East Bay, East Palo Alto, or local destinations west of US 101 via Marsh Road. The net project trip assignment is shown on Figure 9.

Future Traffic Volumes

Near-Term (2022) Traffic Volumes

Near-term traffic conditions are defined as conditions just prior to completion of the proposed project. Traffic volumes for near-term (2022) conditions comprise volumes from existing traffic counts plus traffic generated by approved projects in the vicinity of the project site. Near-term (2022) traffic volumes for the study intersections (see Figure 10) were obtained from the Commonwealth: Building 3 Project traffic study being conducted by Kittelson & Associates, Inc. The near-term (2022) traffic volumes were estimated by adding to the existing traffic volumes the trips generated by nearby approved projects that have not been constructed or occupied. Vehicle trips from the approved projects were obtained from the project's TIA or environmental document (initial study or EIR), if available. For projects without a traffic study, trip estimates were developed using rates published in the ITE *Trip Generation Manual, 10th Edition*. The estimated trips were assigned to the study intersections according to distributions identified in the development traffic studies, if available, or based on local traffic patterns.

Near-Term (2022) No Project Traffic Volumes

HEXAGON

NORTH
Not to Scale

Existing Plus Project Traffic Volumes

For the existing plus project scenario, the net new trips generated by the proposed project were added to the existing traffic volumes to derive the existing plus project traffic volumes (see Figure 11).

Near-term (2022) Plus Project Traffic Volumes

For the near-term (2022) plus project scenario, the net new trips generated by the proposed project were added to the near-term (2022) traffic volumes to derive the near-term (2022) plus project traffic volumes (see Figure 12).

Cumulative (2040) Traffic Volumes

The AM and PM peak-hour traffic volumes under cumulative (2040) conditions were obtained from the 2040 forecasts developed by Kittelson & Associates, Inc. for the City of Menlo Park General Plan EIR certified in December 2016. Because the current development proposal at 123 Independence Drive is larger than the development size assumed in the General Plan traffic study, the trips associated with the 107 extra units proposed at 123 Independence Drive were added to produce cumulative plus project traffic forecasts. The City has determined that the proposed hotel was included in the Year 2040 model forecasts. Therefore, the cumulative (2040) no project traffic volumes were estimated by subtracting the trips generated by the proposed project from the cumulative (2040) plus project traffic volumes. Figures 13 and 14 show the traffic volumes under cumulative (2040) no project conditions and under cumulative (2040) plus project conditions, respectively. Compliance with local policies was evaluated by comparing the cumulative (2040) plus project traffic conditions to the cumulative (2040) no project traffic conditions.

Future Transportation Networks

Existing Plus Project Conditions

The transportation network and intersection lane configurations under existing plus project conditions are assumed to be the same as that described under existing conditions.

Near-term (2022) Conditions

The roadway network under near-term (2022) conditions is assumed to be the same as under existing conditions.

Cumulative (2040) Conditions

The transportation network under cumulative (2040) conditions is assumed to include the planned Haven Avenue streetscape project that would alter the lane configuration at the intersection of Marsh Road and Bayfront Expressway (SR 84):

- The eastbound approach will be restriped to include a shared through-left lane, a shared through-right lane, and a right-turn only lane.

In addition, the City is also planning to construct a multi-use pedestrian/bike bridge over Bayfront Expressway located between Chilco Street and the Facebook MPK 21 Driveway.

The ongoing implementation of a traffic signal adaptive coordination system on the Willow Road, Marsh Road, and Bayfront Expressway corridors was considered as a possible measure to improve traffic flow along with other improvements.

Existing Intersection Levels of Service

The results of the intersection level-of-service analysis under existing conditions show that most of the study intersections currently operate at an acceptable level (LOS D or better) (see Table 5). The following study intersections currently operate at an unacceptable level of service during at least one peak hour:

- University Avenue (SR 109) and Bayfront Expressway (SR 84)– AM and PM peak hours
- Willow Road (SR 114) and Bayfront Expressway (SR 84)– AM and PM peak hours

As noted in the City of Menlo Park General Plan EIR certified in December 2016, the counted traffic volumes at the intersections along Willow Road between the US 101 interchange and Bayfront Expressway do not accurately reflect demand, and isolated intersection operations limit the ability of the VISTRO program to capture these results. Therefore, a “User Defined Base Saturation Flow Rate” in VISTRO of 850 vehicles per hour (vph) was used for the through movements on Willow Road to address the unserved demand issues for the intersection at Willow Road and Bayfront Expressway. At the intersection of University Avenue and Bayfront Expressway, instead of calculated level of service, the existing level of service results are reported based on level of service as identified by the City to reflect “unserved demand”.

The intersection levels of service calculation sheets are included in Appendix B.

Table 5
Existing Intersection Levels of Service

#	Intersection	LOS Standards	Jurisdiction	Peak Hour	Count Date	Avg Delay	LOS

				PM	04/25/19	**94.1**	**F**

Notes:
* Indicates LOS based on "unserved demand." At this location, upstream & downstream congestion results in delay not captured by the VISTRO analysis.
Bold indicates a substandard level of service.

Near-Term (2022) Intersection Levels of Service

The results of the intersection level of service analysis under near-term conditions are summarized in Table 6. The intersection LOS calculation sheets are included in Appendix B. Most of the study intersections would operate at acceptable LOS. The following study intersections would operate at an unacceptable level of service during at least one peak hour:

- Marsh Road (SR 84) and Bayfront Expressway (SR 84)– AM peak hour
- University Avenue (SR 109) and Bayfront Expressway (SR 84)– AM and PM peak hours
- Willow Road (SR 114) and Bayfront Expressway (SR 84)– AM and PM peak hours

As described in Chapter 2, traffic volumes at the intersections along Willow Road between the US 101 interchange and Bayfront Expressway do not accurately reflect demand, and isolated intersection operations limit the ability of the VISTRO program to capture these results. Therefore, a “User Defined Base Saturation Flow Rate” in VISTRO of 850 vph was used for the through movements on Willow Road to address the unserved demand issues for the intersection at Willow Road and Bayfront Expressway. At the intersection of University Avenue and Bayfront Expressway, instead of calculated

level of service, the existing level of service results are reported based on level of service as identified by the City to reflect “unserved demand”.

Existing Plus Project Intersection Level of Service Analysis

The results of the intersection level of service analysis under existing plus project conditions are summarized in Table 7. The results show that the following five study intersections would continue operating at LOS D or better and would comply with the City's TIA Guidelines with the proposed project.

#1 Marsh Road and US 101 Northbound Off Ramp
#2 Marsh Road and US 101 Southbound Off Ramp
#3 Marsh Road and Haven Avenue/Bayfront Expressway (SR 84)
#4 Chrysler Drive and Bayfront Expressway (SR 84)
#5 Chilco Street and Bayfront Expressway (SR 84)

The following two study intersections would continue to operate at an unacceptable level of service F during both AM and PM peak hours under existing plus project conditions. The increases in delay attributed to the proposed project would be less than four seconds, which would not meet the criteria established by the City of Menlo Park to define non-compliance with local policies for intersections involving two state routes.

#6 University Avenue (SR 109) and Bayfront Expressway (SR 84)
#7 Willow Road (SR 114) and Bayfront Expressway (SR 84)

At the intersection of Marsh Road and Bayfront Expressway (SR 84), the average intersection delay would increase while the delay for the critical movement on the local approach (eastbound left turn) would decrease slightly with the addition of traffic by the proposed project. This occurs because the proposed project would add trips to the eastbound through and right-turn movements causing longer green time to be allotted to all eastbound movements. However, because the proposed project is not expected to add traffic to the eastbound left-turn volume, the delay would decrease slightly for this critical movement.

Table 7
Existing Plus Project Intersection Level of Service Summary

#	Intersection	LOS Standards	Peak Hour	Existing Avg Delay	Existing LOS	Existing Plus Project Avg Delay	Existing Plus Project LOS	Incr. In Avg./Crit. Delay
1	Marsh Road and US 101 Southbound Off Ramp	D	AM	19.0	B	19.0	B	0.0
			PM	17.0	B	17.0	B	0.0
2	Marsh Road and US 101 Northbound Off Ramp	D	AM	15.8	B	15.8	B	0.0
			PM	13.3	B	13.4	B	0.1
3	Marsh Road and Bayfront Expressway (SR 84)	D	AM	50.5	D	55.0	D	4.5
	Critical Movements on Local Approaches:							
	Eastbound Right Turn			**91.1**	**F**	**107.0**	**F**	15.9
			PM	31.6	C	32.1	C	0.5
	Critical Movements on Local Approaches:							
	Eastbound Left Turn			**69.4**	**E**	**69.1**	**E**	-0.3
4	Chrysler Drive and Bayfront Expressway (SR 84)	D	AM	8.4	A	8.4	A	0.0
	Critical Movements on Local Approaches:							
	Northbound Left Turn			14.1	B	14.2	B	0.0
			PM	13.1	B	13.2	B	0.1
	Critical Movements on Local Approaches:							
	Northbound Left Turn			21.4	C	21.5	C	0.1
5	Chilco Street and Bayfront Expressway (SR 84)	D	AM	12.7	B	12.7	B	0.0
	Critical Movements on Local Approaches:							
	Northbound Right Turn			25.4	C	25.7	C	0.4
			PM	16.0	B	16.0	B	0.0
	Critical Movements on Local Approaches:							
	Northbound Right Turn			39.7	D	40.0	D	0.4
6	Willow Road (SR 114) and Bayfront Expressway (SR 84)	D	AM	**106.0**	**F**	**106.1**	**F**	0.1
			PM	**168.1**	**F**	**168.0**	**F**	-0.1
7	University Avenue (SR 109) and Bayfront Expressway (SR 84)	D	AM	**>80***	**F**	**>80***	**F**	0.1
			PM	**94.1**	**F**	**94.2**	**F**	0.1

Notes:
* Indicates LOS based on "unserved demand." At this location, upstream & downstream congestion results in delay not captured by the VISTRO analysis.
Bold indicates a substandard level of service.
Bold indicates that the project would cause the intersection to be potentially non-compliant with local policies.

Near-Term (2022) Plus Project Intersection Level of Service Analysis

The results of the intersection level of service analysis under near-term plus project conditions are summarized in Table 8. Under near-term (2022) plus project conditions, the following four study intersections would continue operating at acceptable LOS D or better and would comply with the City's TIA Guidelines with the proposed project.

#1 Marsh Road and US 101 Northbound Off Ramp
#2 Marsh Road and US 101 Southbound Off Ramp
#4 Chrysler Drive and Bayfront Expressway (SR 84)
#5 Chilco Street and Bayfront Expressway (SR 84)

The following two study intersections would continue to operate at an unacceptable level of service F during both AM and PM peak hours under near-term (2022) plus project conditions. The increases in delay attributed to the proposed project would be less than four seconds, which would not meet the criteria established by the City of Menlo Park to define non-compliance with local policies for intersections involving two state routes:

#6 University Avenue (SR 109) and Bayfront Expressway (SR 84)
#7 Willow Road (SR 114) and Bayfront Expressway (SR 84)

The results show that #3 Marsh Road and Bayfront Expressway (SR 84) would continue operating at LOS E during the AM peak hour under near-term (2022) plus project conditions and the proposed project would cause the critical movement delay on the local approach to increase by more than 0.8 seconds per vehicle. Measured against the City's level of service standards, the proposed project would cause the intersection at Marsh Road and Bayfront Expressway (SR 84) to be potentially non-compliant with local policies during the AM peak hour. The City's planned Haven Avenue streetscape project would restripe the eastbound approach at this intersection to include a shared through-left lane, a shared through-right lane, and a right-turn only. With the planned reconfiguration, the intersection at Marsh Road and Bayfront Expressway would operate at an acceptable LOS D during both the AM and PM peak hours. Because the proposed project would pay the City of Menlo Park's Transportation Impact Fee, which will partially fund the Haven Avenue streetscape project, the project would comply with local policies related to intersection levels of service.

Table 8
Near-term (2022) Plus Project Intersection Level of Service Summary

				Near-term (2022)					Near-term (2022)Plus Project with Improvements

Notes:
Bold indicates a substandard level of service.
Bold indicates that the project would cause the intersection to be potentially non-compliant with local policies.

The following two study intersections would continue to operate at an unacceptable level of service F during both AM and PM peak hours under cumulative (2040) plus project conditions. The increases in delay attributed to the proposed project would be less than four seconds, which would not meet the criteria established by the City of Menlo Park to define non-compliance with local policies for intersections involving two state routes:

#6 University Avenue (SR 109) and Bayfront Expressway (SR 84)
#7 Willow Road (SR 114) and Bayfront Expressway (SR 84)

Measured against the criteria presented in Chapter 1, the proposed project would cause the following three intersections to be potentially non-compliant with local policies during either the AM or the PM peak hour.

#3 Marsh Road and Haven Avenue/Bayfront Expressway (SR 84) – AM peak hour
#4 Chrysler Drive and Bayfront Expressway (SR 84) – PM peak hour
#5 Chilco Street and Bayfront Expressway (SR 84) – AM peak hour

#3. Marsh Road and Haven Avenue/Bayfront Expressway (SR 84)

The results show that under cumulative (2040) no project conditions, this intersection would operate at LOS E during the AM peak hour. Under cumulative (2040) plus project conditions, the intersection would continue operating at LOS E and the proposed project would cause an increase in delay of the critical movement on the local approach by more than 0.8 seconds.

Measured against the City's level of service standards, the project would cause this intersection to be potentially non-compliant with local policies during the AM peak hour.

The City of Menlo Park is implementing a traffic signal adaptive coordination system on the Marsh Road, Bayfront Expressway, and Willow Road corridors to improve traffic flow. Adaptive traffic control is a technology that automatically adjusts traffic signal timing based on actual traffic demand at an intersection. This measure will improve the intersection operations and could reduce the intersection delay. The reduction in delay due to adaptive signal coordination is not expected to bring the intersection in compliance with the City's level of service policy. Other physical intersection improvements are considered infeasible due to right-of-way constraints and/or adverse effects on pedestrian and bicycle travel. In addition, since this intersection is owned and maintained by Caltrans, any physical improvements need Caltrans' approval.

#4. Chrysler Drive and Bayfront Expressway (SR 84)

The results show that under cumulative (2040) no project conditions, the intersection of Chrysler Drive and Bayfront Expressway (SR 84) would operate at LOS E during the PM peak hour. Under cumulative (2040) plus project conditions, the intersection would continue operating at LOS E and the proposed project would cause an increase in delay of the critical movement on the local approach by more than 0.8 seconds. Measured against the City's level of service standards, the proposed project would cause this intersection to be potentially non-compliant with local policies during the PM peak hour. The planned traffic signal adaptive coordination system will improve the intersection operations on Bayfront Expressway and could reduce the intersection delay. The reduction in delay due to adaptive signal coordination is not expected to bring the intersection in compliance with the City's level of service policy. Due to right-of-way constraints and/or adverse effects on pedestrian and bicycle travel, there are no feasible physical improvements to bring the intersection in compliance with TIA guidelines/standards. In addition, since this intersection is owned and maintained by Caltrans, any physical improvements need Caltrans' approval.

#5. Chilco Street and Bayfront Expressway (SR 84)

The results show that under cumulative (2040) no project conditions, the intersection of Chilco Street and Bayfront Expressway (SR 84) would operate at LOS E during the AM peak hour. Under cumulative (2040) plus project conditions, the intersection would continue operating at LOS E and the proposed project would cause an increase in delay of the critical movement on the local approach by more than 0.8 seconds. Measured against the City's level of service standards, the proposed project would cause this intersection to be potentially non-compliant with local policies during the AM peak hour. The planned traffic signal adaptive coordination system will improve the intersection operations on Bayfront Expressway and could reduce the intersection delay. The reduction in delay due to adaptive signal coordination is not expected to bring the intersection in compliance with the City's level of service policy. Due to right-of-way constraints and/or adverse effects on pedestrian and bicycle travel, there are no feasible physical improvements to bring the intersection in compliance with TIA guidelines/standards. In addition, since this intersection is owned and maintained by Caltrans, any physical improvements need Caltrans' approval.

5. Other Transportation Issues

This chapter presents other transportation issues associated with the proposed project. These include an analysis of:

- Site access and on-site circulation
- Potential impacts to transit, bicycle, and pedestrian facilities
- Vehicle queuing
- Parking

Unlike the level of service and VMT impact methodology, which is adopted by the City Council, the analyses in this chapter are based on professional judgment in accordance with the standards and methods employed by the traffic engineering community.

Site Access

Site access and on-site circulation were evaluated using commonly accepted transportation principles. This review is based on the site plan prepared by Coonan & Bonds Architects (see Figure 2).

Vehicle Site Access

Vehicular access to the project site would be provided by one full-access driveway on Haven Avenue. This driveway would provide direct access to a covered guest drop-off zone close to the entrance of the site. The driveway would continue running along the southern side of the project site and provide access to the surface level parking spaces and lead to a ramp up to level 2 and level 3 of the parking garage (see Figures 15, 16, and 17). The proposed hotel would provide mechanical stacker parking spaces in the parking garage. Therefore, full time valet service would be provided at the proposed hotel. Proper signage should be placed to direct hotel guests to the drop-off and pick-up area.

The project site will also have an emergency vehicle access (EVA) from Haven Avenue located along the northern portion of the site. The EVA provides access to the parking garage and internally connects to the project driveway via a service corridor in the parking garage.

Not to Scale

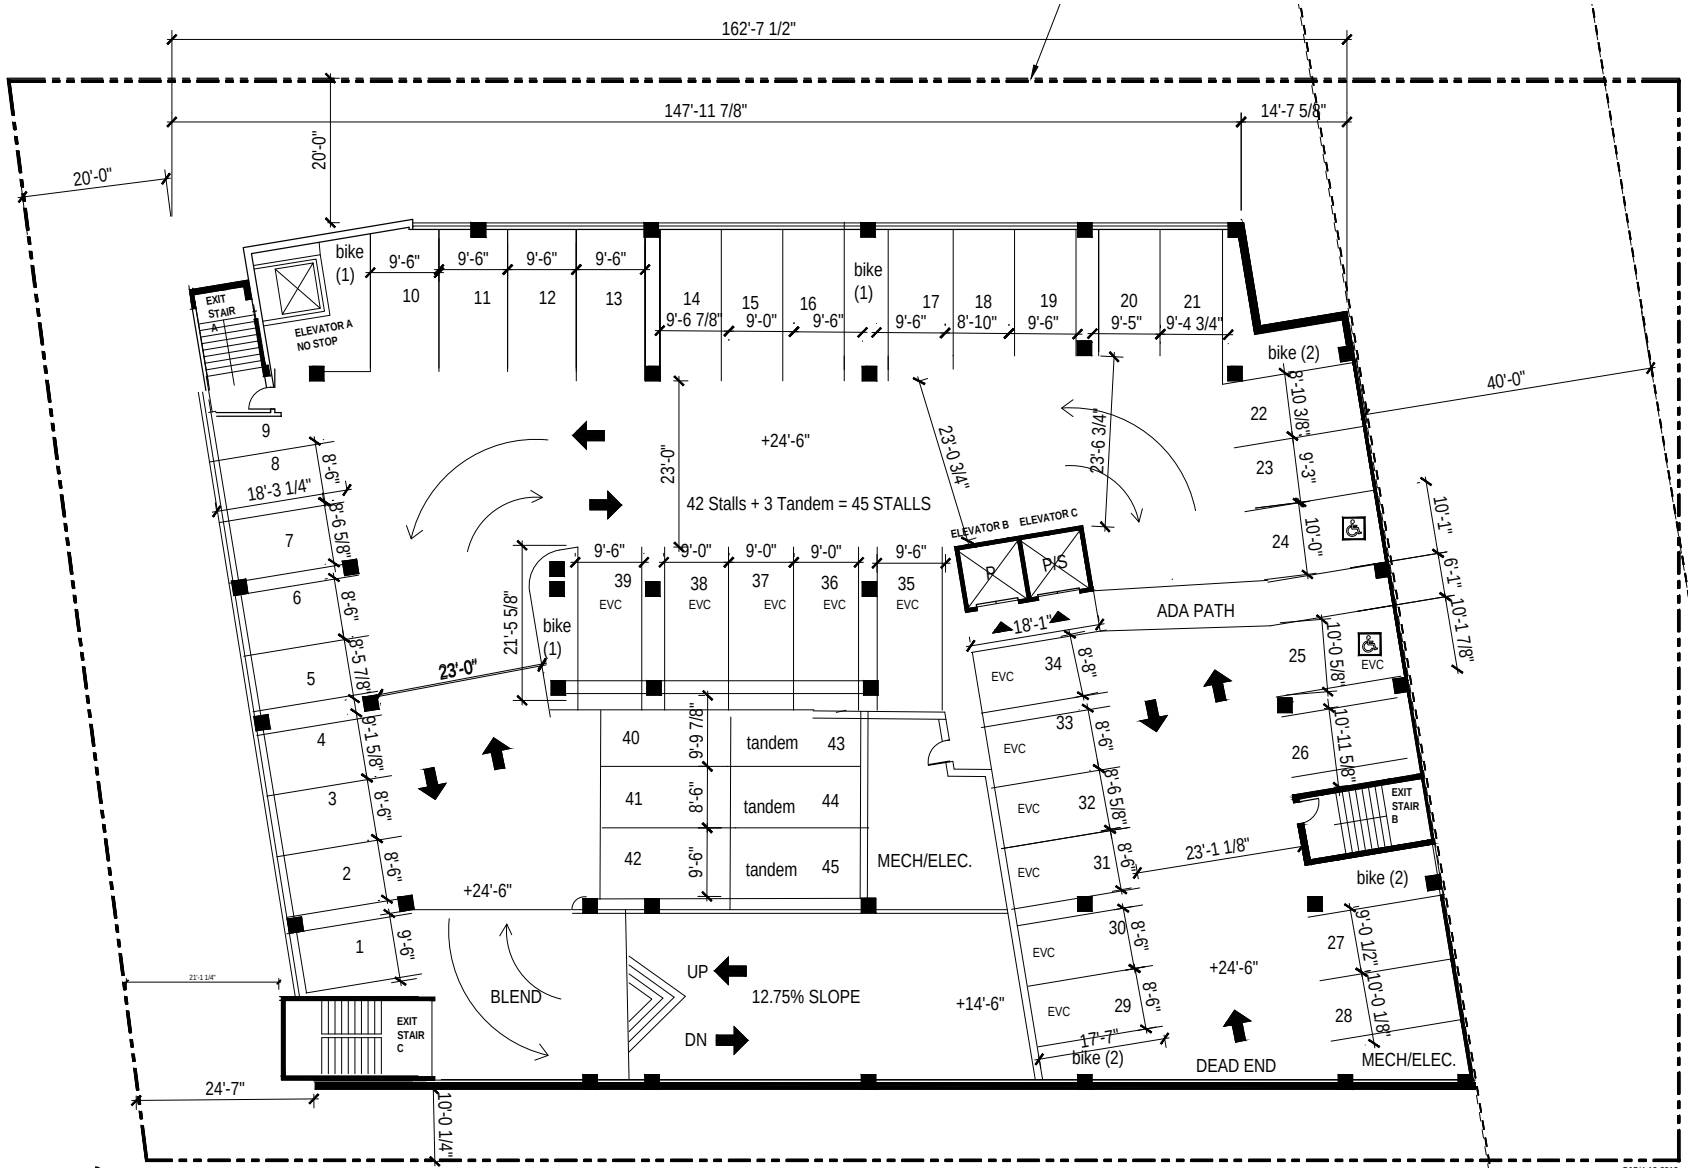

Figure 17
Garage - Level 3

NORTH
Not to Scale

Driveway Operations

The driveway on Haven Avenue would be 24-feet wide and would meet City of Menlo Park's two-way driveway width standard. The proposed hotel is expected to generate 62 vehicles (36 inbound and 26 outbound) during the AM peak hour and 78 vehicles (40 inbound and 38 outbound) during the PM peak hour, which would be less than one vehicle in each direction every minute. Under cumulative (2040) plus project conditions, the driveway would operate at LOS C with the exiting vehicles experiencing an average delay of 21.2 seconds per vehicle during the AM peak hour and 18.8 seconds per vehicle during the PM peak hour.

Sight Distance

Currently, on-street parking is not allowed on Haven Avenue near the driveway. There is a bus stop for Samtrans Route 270, which has 60-minute headways, located immediately south of the driveway. Since the bus frequency is low, most outbound hotel trips would not be affected. However, on rare occasions a stopped bus may obstructs a driver's ability to see down the road on Haven Avenue from the hotel driveway. Thus, it is recommended that the project applicant and the City work with Samtrans to determine if the bus stop can be shifted approximately 150 feet to the south to ensure adequate sight distance at the proposed hotel driveway and the driveway immediately south of the project site. The advisory speed limit along Haven Avenue near the project site is 15 mph due to a 90-degree curve located approximately 100 feet north of the proposed hotel driveway. The Caltrans recommended stopping sight distance at this speed is 100 feet. Vehicles exiting the hotel would be able to see approaching traffic from the north for a distance of approximately 150 feet. Thus, there is sufficient stopping sight distance north of the driveway. The project driveway shown on the site plan will be free and clear of any obstructions to optimize sight distance, thereby ensuring that exiting vehicles can see pedestrians on the sidewalk and other vehicles traveling on Haven Avenue.

Vehicular On-Site Circulation

On-site circulation was reviewed in accordance with generally accepted traffic engineering standards. On-site parking for the proposed project would be provided via a three-level parking garage. The garage would have 90-degree parking spaces with a minimum width of 8-feet 5.8 inches and a minimum two-way drive aisle width of 23-feet. The proposed dimensions fall short of the City of Menlo Park's design guidelines, which require a minimum parking stall width of 8 feet 6 inches and a drive aisle width of 24 feet. Given the parking garage is proposed to operate with full-time valet only parking, the proposed dimensions would be adequate.

A covered drop-off area near the driveway entrance, would be provided. The drop-off area is approximately 28-feet in length and can accommodate only one car. The drop off space should be extended to accommodate two vehicles and the hotel should ensure sufficient valet staff are on hand to avoid back-ups onto the street during peak periods. With full-time valet only parking services on site, guests exiting the site would also need to pick up their vehicles. The site plan does not show a pick-up zone for the vehicles. The site plan should be modified to provide more room for valet operations. Opposite the loading area would be a turn-out, which is designated as a parking space in the site plan. It is recommended that this turn-out be modified into a pick-up zone and extended to accommodate two vehicles. A pedestrian connection should be added between the hotel lobby and the pick-up zone. Furthermore, the drop-off and pick-up area will also be used by ridesharing taxi services. Sufficient space should be provided for the taxi to turnaround and exit the site after pick-up/drop-off.

The proposed project would provide 90-degree parking throughout the ground level and upper levels of the parking garage. There is one dead-end drive aisle on each level of the garage. The dead-end driveway aisle on level 2 and level 3 is located next to the garage wall. There are back-up spaces provided next to the dead-end drive aisle on the upper levels, which would facilitate backing out of the last parking stalls in those rows. Full time valet service should prevent vehicles from needing to turn

around after proceeding down a fully parked dead-end aisle. The dead-end drive aisle on the ground level has four parking stalls (total 8 stacked spaces) at the end of the aisle. This would not be a problem with the proposed valet parking.

After the drop-off area would be the entrance to level 1 of the garage following which would be a ramp to level 2 and level 3 of the garage. Level 1 of the garage would have 20 parking spaces, which would provide stacked parking for 40 cars through an automated parking system. One regular parking space would also be provided next to the stacked parking spaces.

Outside of the garage along the north edge of the building, one service parking space would also be provided adjacent to a service access used for trash pick-up. The service parking space as well as the service access area would be accessed from Haven Avenue by an emergency vehicle access drive aisle. The service access area would have access to the parking garage internally via a service corridor.

The slope of the ramp in the garage would be between 10 percent and 13 percent, which is adequate. Level 2 and level 3 of the garage would not have any stacked parking spaces. They would have regular parking spaces plus three tandem parking spaces on each level. Typically, tandem parking spaces are allowed in a hotel if full-time valet service is provided as would be in the proposed development.

On level 3 of the garage, the wall of Exit Stair A is extended into the parking space designated as number 9. It is recommended that the parking space near Exit Stair A be removed or the exit be redesigned to allow for sufficient space to park a vehicle.

Vehicles driving up the garage ramp would not be able to see a vehicle backing out of the tandem parking space immediately adjacent to the top of the garage ramp. A mirror should be placed at an appropriate location at the top of the ramp to improve the visibility at this location. Likewise, valet staff should be instructed to reduce speed and check the mirror when traveling up the ramp.

Pedestrian, Bicycle and Transit Analysis

Pedestrian facilities near the project site consist of sidewalks, crosswalks, and pedestrian signals at signalized intersections. As shown on the site plan, the proposed project will provide new sidewalks, a nature trail, and a front plaza area along its frontage on Haven Avenue. Pedestrian access to the project site will be via the new sidewalks along Haven Avenue.

The proposed project will also offer a ground floor coffee shop which can be directly accessed from the street and sidewalk, as opposed to entering through the hotel. The project is expected to generate limited pedestrian walking trips between the project site and the nearby bus stops. New transit trips generated by the hotel can be well-served by the existing pedestrian facilities.

The existing bicycle facilities in the project vicinity provide some connection for bicycles along major thoroughfares. These bicycle facilities do not provide immediate access to the project site. However, due to low traffic volumes, Haven Avenue immediately adjacent to the project site is conducive to bicycle traffic (see Figure 3 in Chapter 2). The proposed project is expected to generate limited bicycle traffic. Overall, the existing bicycle facilities provide adequate connectivity to the project site.

The City is working on the Haven Avenue streetscape project that would provide new bicycle and pedestrian facilities to Haven Avenue, connecting Menlo Park, San Mateo County and Redwood City residents and employees. The planned new bicycle and pedestrian facilities will provide a direct connection to the San Francisco Bay Trail and will function as an interim gap closure of the Bay Trail between Bedwell Bayfront Park and Seaport Boulevard, better serving both commute and recreational needs. As part of this proposed project, a new bicycle and pedestrian bridge over the Atherton Channel

will be constructed to extend the bike lane and sidewalk on Haven Avenue to Marsh Road. These additions to the existing transportation network will greatly improve pedestrian and bike access to the site.

The project site is located about 3.3 miles east of the Menlo Park Caltrain Station and about 4.5 miles southeast of the Redwood City Caltrain Station, which are considered beyond walking distance. Samtrans Route 270, which has a stop adjacent to the hotel driveway provides a connection to the Redwood City Caltrain Station. The proposed hotel, as part of its TDM plan will also provide a free shuttle service to the hotel guests. The new transit ridership generated by the proposed project could be accommodated by the existing and planned transit services.

Intersection Vehicle Queuing

The analysis of intersection levels of service was supplemented with a vehicle queuing analysis for intersection turning movements where the proposed project would add a substantial number of trips. This analysis provides a basis for estimating future storage requirements at the intersections (see Table 10). Vehicle queues were estimated using a Poisson probability distribution, described in Chapter 1. The following turn movements were selected for evaluation:

- Eastbound left-turn at US 101 Southbound Ramp and Marsh Road
- Westbound right-turn at US 101 Northbound Ramp and Marsh Road
- Eastbound right turn at Haven Avenue/Bayfront Expressway and Marsh Road

Locations where the estimated 95th percentile queues would exceed the available storage capacity for the movement are discussed below.

Eastbound Left-Turn at US 101 Southbound Ramps and Marsh Road

Under all scenarios, the eastbound left-turn queues on the US 101 southbound off-ramp at Marsh Road are projected to be less than the available storage capacity during the AM and PM peak hours. No improvements are needed.

Westbound Right-Turn at US 101 Northbound Ramps and Marsh Road

Under all scenarios, the westbound right-turn queues on the US 101 northbound off-ramp at Marsh Road are projected to be less than the available storage capacity during the AM and PM peak hours. No improvements are needed.

Eastbound Right-Turn at Haven Avenue/Bayfront Expressway and Marsh Road

The existing vehicle storage for the eastbound right turn pocket on Haven Avenue at Bayfront Expressway is only 150 feet, which provides enough storage for about six vehicles. Under existing conditions, the 95th percentile queue exceeds the storage length of the turn pocket by 13 vehicles during the AM peak hour and 8 vehicles during the PM peak hour. The addition of the project would add only one vehicle to the 95th percentile queue during both peak hours.

During the AM peak hour and PM peak hour, under near-term (2022) conditions, the 95th percentile queue would exceed the storage length of the turn pocket by 14 vehicles during the AM peak hour and by 9 vehicles during the PM peak hour. Under near-term (2022) plus project condition, the addition of project traffic would cause the 95th percentile queue to increase by one vehicle during the AM peak hour. The proposed project would not cause a noticeable increase in vehicle queues during the PM peak hour.

The planned Haven Avenue Streetscape project would restripe the eastbound approach to include a shared through-left lane, a shared through-right lane, and a right-turn only lane. The improvement

would allow right-turns from two lanes and thus reduce the queues for the eastbound right-turn movement to be less than the available storage capacity.

Notes:
WB = westbound; EB = eastbound
RT = right turn movement; LT = left turn movement
[1] Vehicle queue calculations based on cycle length for signalized intersections.
[2] Assumes 25 feet per vehicle queued.

Parking Analysis

On-site parking was reviewed based on the City of Menlo Park Municipal Code parking requirements.

Vehicle Parking

According to the City of Menlo Park Zoning Code, Ordinance No. 1024 Section 16.43.090, a hotel located in the office district requires a minimum of 0.75 spaces per room and a maximum of 1.1 spaces per room. With 163 rooms, the hotel is required to provide 122 to 179 spaces. The project proposes to provide 134 vehicle spaces, which meets the City's requirements. The on-site parking supply includes stacker parking spaces on the first level and a few tandem parking spaces on the 2nd and 3rd levels. These spaces would not be available for self-parking and the applicant will provide full-time valet only parking services.

Accessible Parking

Accessible parking stalls shall be provided in accordance with the 2016 California Building Code (CBC) Table 11B-208.2. The project proposes 134 parking spaces; therefore, the project would be required to provide five ADA accessible spaces, including one van accessible space. The site plan shows 5 ADA spaces in the parking garage. It is recommended that one of the ADA accessible spaces be designated as a van space.

Bicycle Parking Requirements

Based on the City's bicycle parking requirements, the hotel should provide one bicycle parking for every 5,000 square feet of gross built area. 80 percent of the bicycle parking spaces should be designated long-term bicycle parking and 20 percent of the bicycle parking spaces should be designated short-term bicycle parking. The total proposed gross square footage of the hotel is 57,953 square feet. Therefore, the proposed project is required to provide 12 bicycle parking spaces. At least 10 of the required bicycle parking spaces should be long-term bicycle parking and 2 should be short-term bicycle parking. The proposed project would provide 5 short-term bicycle parking spaces located on the plaza along the Haven Avenue frontage and 23 long-term bicycle parking spaces located in the parking garage for a total of 28 bicycle parking spaces, which meets the City's requirements. It is recommended that bike parking in the upper levels of the garage be shifted to the ground floor or signage be installed to discourage bikes from riding on the parking garage ramps.

TDM Measures

A TDM plan (see Appendix C) was prepared for the project by Walker Consultants (dated December 14, 2020). The plan includes a broad range of TDM measures designed to reduce single-occupant vehicle trips through a combination of appropriate measures to promote alternative forms of transportation. The recommended implementation has been broken down into two phases.

Phase 1:

- Subsidizing transit passes for employees
- Secure bicycle storage racks
- Preferential parking for carpoolers
- Operation of a dedicated shuttle service
- Install and maintain alternative transportation kiosk at lobby
- Survey employees and guests to monitor use

TDM measures included in Phase 1 have the potential to meet or exceed the goal of reducing 20 percent of trips.

Phase 2:

- Subsidizing employees that walk or bike to work
- Operation of commute assistance center at concierge/reception desk
- Provide access to motor vehicles on site for employee/guest use
- Join Commute.org's guaranteed ride home (GRH) program

Implementation of these measures can be treated as optional if the 20 percent trip reduction goal is met, or as additional implementation measures to strengthen the TDM program if reduction goals have not been met.

12/21/2020

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Marsh Rd (SR 84)/US 101 SB Offramp	Signalized	HCM 6th Edition	SEB Right	0.838	19.0	B
15	Bayfront Expy (SR 84) /University Ave (SR 109)	Signalized	HCM 6th Edition	NWB Left	0.727	11.4	B
16	Bayfront Expy (SR 84)/Willow Rd (SR 114)	Signalized	HCM 6th Edition	NB Thru	0.967	106.0	F
110	Marsh Road and US 101 NB Ramps	Signalized	HCM 6th Edition	NWB Right	0.727	15.8	B
163	Bayfront Expy/Marsh Rd	Signalized	HCM 6th Edition	NB Left	0.816	50.5	D
195	Bayfront Expy/Chilco St	Signalized	HCM 6th Edition	NB Right	0.808	12.7	B
196	Bayfront Expy/Chrysler Drive	Signalized	HCM 6th Edition	WB Left	0.621	8.4	A

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Level Of Service Report
Intersection 1: Marsh Rd (SR 84)/US 101 SB Offramp

Control Type:	Signalized	Delay (sec / veh):	19.0
Analysis Method:	HCM 6th Edition	Level Of Service:	B
Analysis Period:	15 minutes	Volume to Capacity (v/c):	0.838

Intersection Setup

12/21/2020

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Marsh Rd (SR 84)/US 101 SB Offramp	Signalized	HCM 6th Edition	SEB Left	0.705	17.0	B
15	Bayfront Expy (SR 84) /University Ave (SR 109)	Signalized	HCM 6th Edition	NWB Right	1.043	94.2	F
16	Bayfront Expy (SR 84)/Willow Rd (SR 114)	Signalized	HCM 6th Edition	NB Right	1.250	168.0	F
110	Marsh Road/101 NB Ramps	Signalized	HCM 6th Edition	WB Right	0.776	13.4	B
163	Bayfront Expy/Marsh Rd	Signalized	HCM 6th Edition	SB Right	0.842	32.1	C
195	Bayfront Expy/Chilco St	Signalized	HCM 6th Edition	NB Right	0.862	16.0	B
196	Bayfront Expy/Chrysler Drive	Signalized	HCM 6th Edition	WB Left	0.780	13.2	B

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Level Of Service Report
Intersection 1: Marsh Rd (SR 84)/US 101 SB Offramp

Control Type:	Signalized	Delay (sec / veh):	17.0
Analysis Method:	HCM 6th Edition	Level Of Service:	B
Analysis Period:	15 minutes	Volume to Capacity (v/c):	0.705

Intersection Level Of Service Report
Intersection 15: Bayfront Expy (SR 84)/University Ave (SR 109)

Control Type:	Signalized	Delay (sec / veh):	113.1
Analysis Method:	HCM 6th Edition	Level Of Service:	F
Analysis Period:	15 minutes	Volume to Capacity (v/c):	1.097

Intersection Setup

Name	Bayfront Expressway (SR84)		Bayfront Expressway (SR84)		University Avenue (SR109)	
Approach	Northeastbound		Southwestbound		Northwestbound	
Lane Configuration						
Turning Movement	Thru	Right	Left	Thru	Left	Right
Lane Width [ft]	12.00	12.00	12.00	12.00	12.00	12.00
No. of Lanes in Entry Pocket	0	1	2	0	0	1
Entry Pocket Length [ft]	100.00	100.00	830.00	100.00	100.00	100.00
No. of Lanes in Exit Pocket	0	0	0	0	0	1
Exit Pocket Length [ft]	0.00	0.00	0.00	0.00	0.00	100.00
Speed [mph]	55.00		55.00		35.00	
Grade [%]	0.00		0.00		0.00	
Curb Present	No		No		No	
Crosswalk	Yes		No		Yes

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Marsh Rd (SR 84)/US 101 SB Offramp	Signalized	HCM 6th Edition	SEB Left	0.797	17.8	B
15	Bayfront Expy (SR 84) /University Ave (SR 109)	Signalized	HCM 6th Edition	NWB Right	1.097	113.2	F
16	Bayfront Expy (SR 84)/Willow Rd (SR 114)	Signalized	HCM 6th Edition	NB Right	1.317	180.9	F
110	Marsh Road/101 NB Ramps	Signalized	HCM 6th Edition	WB Right	0.816	13.5	B
163	Bayfront Expy/Marsh Rd	Signalized	HCM 6th Edition	EB Right	0.941	36.4	D
195	Bayfront Expy/Chilco St	Signalized	HCM 6th Edition	NB Right	0.943	25.3	C
196	Bayfront Expy/Chrysler Drive	Signalized	HCM 6th Edition	WB Left	0.864	20.3	C

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Level Of Service Report
Intersection 1: Marsh Rd (SR 84)/US 101 SB Offramp

Control Type:	Signalized	Delay (sec / veh):	17.8
Analysis Method:	HCM 6th Edition	Level Of Service:	B
Analysis Period:	15 minutes	Volume to Capacity (v/c):	0.797

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
163	Bayfront Expy/Marsh Rd	Signalized	HCM 6th Edition	NB Left	0.780	43.8	D

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Generated with PTV VISTRO

3723 Haven Avenue
Menlo Park, CA
Walker Project Number 33-2123.00

Dear Ms. Mielbye,

Walker is pleased to submit for your review the Transportation Demand Management (TDM) Plan for a new hotel at 3723 Haven Avenue in Menlo Park, CA.

We appreciate the opportunity to be of service to you on this project. We look forward to discussing the report at your earliest convenience.

Sincerely,

WALKER CONSULTANTS

Manuel A. Soto
Consultant

EXECUTIVE SUMMARY

FPG Hospitality Inc. is proposing to build a hotel at 3723 Haven Avenue in Menlo Park, CA. and Walker has been tasked with development of a Transportation Demand Management (TDM) Plan to comply with City of Menlo Park requirements for project approval. City regulations ask for a TDM Plan that can reduce peak hour trips by at least 20 percent.

Walker conducted a parking analysis of the proposed hotel to determine typical peak day and peak hour demand for parking, and we developed an estimate of trip generation for the project based on the latest edition (10th edition) of the ITE's Trip Generation Manual to determine peak hour trips and establish a baseline for the TDM Plan.

The TDM measures and strategies that are recommended for the project were selected based on the physical attributes of the site and the proposed building, the transportation facilities and services currently planned and available near the site, and applicability of measures to hotel guests and employees. TDM measures fall into two categories:

- **Design elements**: TDM measures that the developer of the property, FPG Hospitality Inc., will put into place in the architectural design and construction of the project. These measures include direct access to the hotel lobby from the sidewalk, hotel façade and gardens facing the street, bike parking, and a coffee shop and co-working space fronting Haven Avenue, that will become neighborhood amenities and increase the utility of alternative modes of transportation to access the development land uses.
- **Program operations**: TDM measures that would be tailored to the end user (employees and hotel guests) to incentivize and change transportation behaviors, and that may change or adapt during the life of the project, such as providing a shuttle service to transport guests to nearby destinations and connect both employees and guests with nearby transportation centers like the Menlo Park Caltrain Station. TDM program operations would be required of the property manager and future tenants throughout the life of the project.

The TDM measures that were identified and recommended for implementation add up to 70 trip credits (based on City of Menlo Park TDM Guidelines) and have the potential to largely exceed the 20 percent peak hour trip reduction that is required by the City for this site and development proposal.[1] Thus, their recommended implementation has been broken down into two phases of implementation:

- **Phase 1** – TDM measures included in this phase add up to 35 trip credits and have the potential to meet or exceed the goal of reducing 20 percent of trips.
- **Phase 2** – TDM measures included in this phase also add up to 35 trip credits. Implementation of these measures can be treated as optional if the 20 percent trip reduction goal is met, or as additional implementation measures to strengthen the TDM program if reduction goals have not been met.

[1] It is important to note that trip credits are not the same as trip reductions. Trip credits are intended to quantify a proposed project's capacity to reduce the demand for new peak hour trips and are not used to directly subtract from the project trips. Consequently, it is important to have a good monitoring program in place to report on the TDM program success in achieving the 20 percent peak-hour trip reductions.

The hotel manager or property owner will be required to submit an annual monitoring report to the City of Menlo Park summarizing the success of the TDM programs for hotel guests and employees. The details of the reporting will be determined in collaboration with the City but could include metrics of success related to parking occupancy and single occupancy vehicle (SOV) mode share, to ensure that parking occupancy does not exceed demand for a typical day, and that driving ratios meet or exceed a 20 percent reduction target.

1. PROJECT DESCRIPTION

INTRODUCTION

This plan describes the TDM program that is recommended for a proposed hotel development at 3723 Haven Avenue in Menlo Park, California. The purpose of the TDM plan is to document a series of design and operational programs that are recommended for the project, and to provide an estimate of peak-hour trip reductions associated with the TDM plan, to comply with City of Menlo Park development requirements.

The plan includes a series of commonly used TDM measures to offer guests and employees of the hotel a menu of transportation programs that would make it easier and more convenient to use transportation modes other than driving alone. These measures include those to address the mobility needs of guests while visiting the hotel and the commute-to-work needs of employees.

The plan also serves as a guide for how the property owner intends to implement TDM measures and monitor their progress and effectiveness over time. The plan includes design elements that are incorporated in the architectural design of the development (provided by the developer), and programmatic elements that will be provided by the operator of the hotel. In this regard, the TDM plan is expected to be a living document that will be reviewed and updated over time to respond to changes in behavior and preferences of employees and guests of the hotel.

PROJECT DESCRIPTION

The project proposed at 3723 Haven Avenue will redevelop an existing site that contains a one-story building with office and light industrial land uses into an eight-story building that contains a 5-story boutique hotel on top of 3 levels of above-ground parking that includes the following program:

- 166 guest rooms
- 1,200 square foot indoor and outdoor bar with 38 seats
- 900 square foot indoor dining area with 36 seats
- 1,000 square foot indoor and outdoor coffee shop with 46 seats
- A 3-story parking garage that can accommodate up to 132 vehicles, including 6 tandem parking spaces and 20 parking stackers

Figure 1 below provides a view of the project's architectural design from Haven Avenue. The project proposes an urban building that fronts the street and is directly accessible from the sidewalk, as opposed to siting behind a parking lot and away from the street. Additionally, the project proposes a small coffee shop and co-working space on the ground floor that includes landscaping, outdoor sitting and bicycle parking that is directly accessible from the sidewalk. In this regard, the project design is proposing an urban feel and a much more attractive configuration for the operation and utilization of public transit and shuttle services, and access to the property on foot, a bicycle or electric scooter.

The main entrance of the building also fronts the street and is directly accessible from an off-street *porte cochère* where guests arriving in a taxi or ride-hailing service are dropped off, and those that choose to drive valet their cars. Car parking and access to the hotel project is controlled by operation of a valet, which can make more efficient use of parking capacity than would an entirely self-parking operation and which can also increase capacity of the parking garage through the use of tandem spaces and mechanical parking stackers.

Figure 2: Aerial view of proposed hotel project from Menlo-Atherton Storage & Tyson Kennels

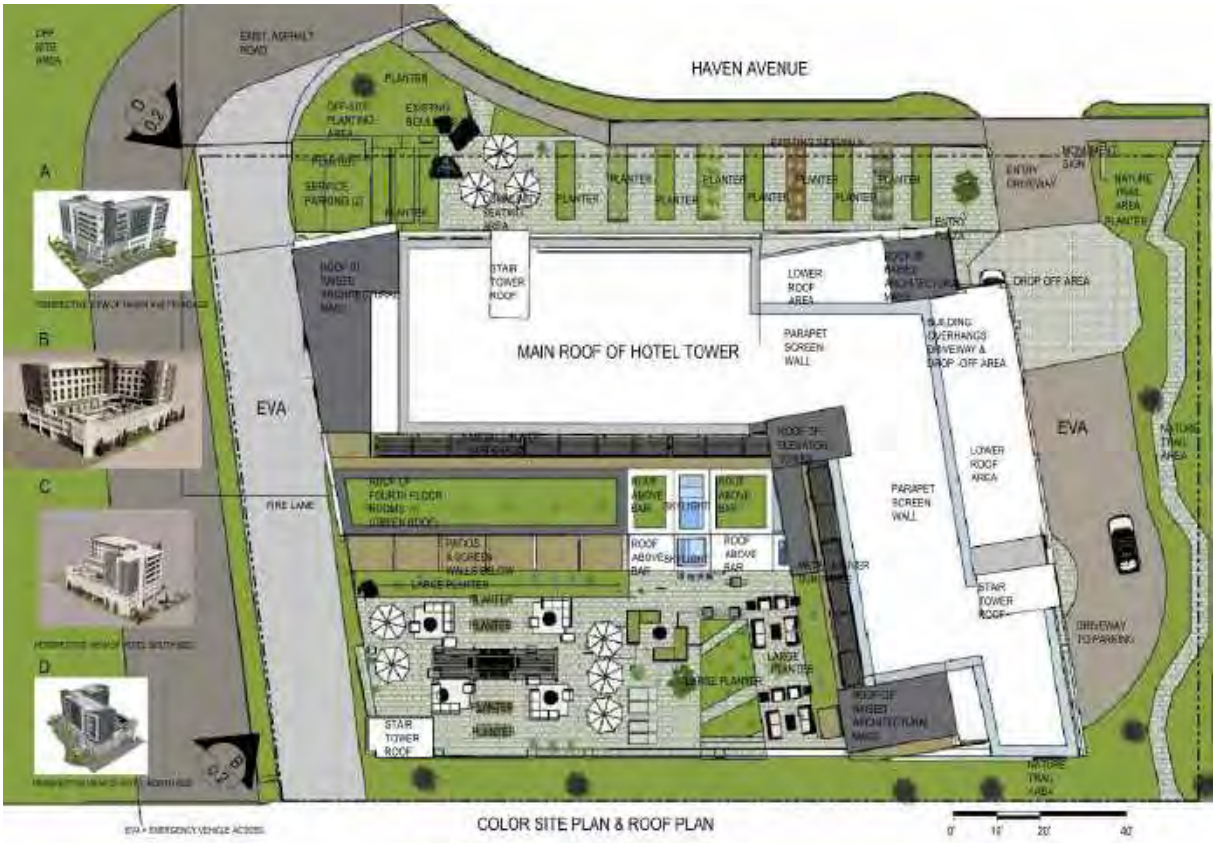
Source: FPG Hospitality Inc., Leo A. Daily Architects

Figure 2 below provides a view of the project from the opposite side (from Menlo-Atherton Storage and Tyson Kennels) showing the terrace and outdoor bar on the roof of the parking garage.

Both the bar and terrace will be publicly accessible through the reception lobby, which is also an added amenity to the residential apartments on the back side of the property, Elan Menlo Apartments (3645 Haven Avenue) and Anton Menlo Apartments (3639 Haven Avenue).

Figure 3 below provides a site plan of the hotel building showing its frontage on Haven Avenue and direct access relationship with the sidewalk, driveway and vehicular entrance, and guest drop-off area and access to valet parking.

Figure 3: Site plan and roof plan view of hotel project



Source: FPG Hospitality Inc., Leo A. Daily Architects

PROJECT LOCATION

The proposed project site is located within the City of Menlo Park on the boundary with Redwood City, just north of U.S. Highway 101 – Bayshore Freeway and one block from the intersection of U.S. Highway 101 (connecting with San Francisco and San Jose) and State Road 84 – Bayfront Expressway (connecting with Fremont via the Dumbarton Bridge). The exact location of the development is shown in Figure 4 below.

The property is in close proximity to Facebook World Headquarters and many office and light industrial business parks that house other technology and communications companies, which are reasonable to believe would be frequent destinations of hotel guests. The site is approximately 16 miles south of the San Francisco International Airport and 19 miles north of the Norman Y. Mineta San Jose International Airport.

The site is also close to several stations of the Caltrain commuter rail service that provides year-round service to downtown San Francisco and San Jose and extends as far south as Gilroy. The closest station is

Menlo Park, three miles away from the project site. The next closest stations are Palo Alto and Redwood City, about 4.5 miles away, but which offer more express trains to both San Francisco and San Jose.

Figure 4: Location of project site

Source: Google Maps, Walker Consultants

2. EXISTING PARKING AND MOBILITY CONDITIONS

PUBLIC TRANSIT SERVICE

The site is accessible via SamTrans bus route 270 operated by the San Mateo County Transit District. The Route 270 bus service runs every hour from the project site to the Redwood City Transit Center and Caltrain station, from 7:00 a.m. to 7:00 p.m. on weekdays and from 8:00 a.m. to 7:00 p.m. om Saturdays. Travel time to the Redwood City station is 15 minutes and 30 minutes coming back from the station.

COMMUTER SHUTTLES

Commute.org is San Mateo County's Transportation Demand Management Agency. The agency funds the Commute.org Shuttle Program which operates as a mini-transit agency that provides first/last mile transportation services during peak commute hours, linking commuters and residents to rail and transit stations throughout the county.

The vast majority of Commute.org shuttle passengers are employees who use the service between BART or Caltrain stations and their places of work. Additionally, the shuttles provide "reverse commute" service to residents that live near shuttle routes.

Commute.org operates one shuttle route that provides service along Haven Avenue, the Marsh Road Shuttle M3, which provides service between the Menlo Park Caltrain Station and business parks in Marsh Road and U.S. Highway 101 during weekdays. The service is free and open to everyone.

The M3 shuttle provides timed transfers with Caltrain service at the Menlo Park station for reverse commute service, useful for employees commuting to the project site, but not for guests wanting to reach Caltrain in the morning and return to the hotel in the evening.

- Morning rush hour service is from 7:00 to 10:00 a.m., departing Menlo Park Caltrain and arriving at the hotel 30 minutes later, on 7 different trips.
- Evening rush hour service is from 3:20 to 6:00 p.m., departing the hotel and arriving at Menlo Park Caltrain 25 minutes later, on 6 different trips.
- Hotel guests wanting to use the service can only use 5 trips in the morning, between 7:30 and 9:30 a.m. to Menlo Park Caltrain that take about 15 minutes.

COMMUTER RAIL SERVICE (CALTRAIN)

The hotel operator plans to supplement SamTrans and Commute.org services with its own shuttle operation to connect with Caltrain and other nearby destinations such as Facebook's Headquarters. Hotel shuttle service would provide convenient access to Caltrain trains. Below is a summary of rush hour service for the Palo Alto, Menlo Park and Redwood City stations, for trips to both San Francisco and San Jose.

SERVICE IN THE MORNING RUSH HOUR (6:00 – 9:30 A.M.)

Northbound departures to San Francisco:

- Palo Alto Station – every 15-20 minutes
- Menlo Park Station – every 30 minutes with M3 shuttle timed transfers
- Redwood City Station – every 15-20 minutes

Southbound departures to San Jose/Gilroy:

- Redwood City Station – every 15-20 minutes
- Menlo Park Station – every 20-25 minutes
- Palo Alto Station – every 15-20 minutes

SERVICE IN THE EVENING RUSH HOUR (4:00 – 7:30 P.M.)

Northbound departures to San Francisco:

- Palo Alto Station – every 15-20 minutes
- Menlo Park Station – every 20-25 minutes
- Redwood City Station – every 15-20 minutes

Southbound departures to San Jose/Gilroy:

- Redwood City Station – every 15-20 minutes
- Menlo Park Station – every 30 minutes with M3 shuttle timed transfers
- Palo Alto Station – every 15-20 minutes

BICYCLE FACILITIES

The project site is also close to good bicycle facilities that include:

- **Class 1 facility** – separated path along the Bayfront Expressway connecting Haven Avenue with Facebook Headquarters and Willow Road.

- **Class 2 facility** – clearly striped and buffered bike path along segments of Haven Avenue, and "preferred bike route" as suggested by the county bicycle coalition, along Haven Avenue between Woodside Road and Marsh Road.

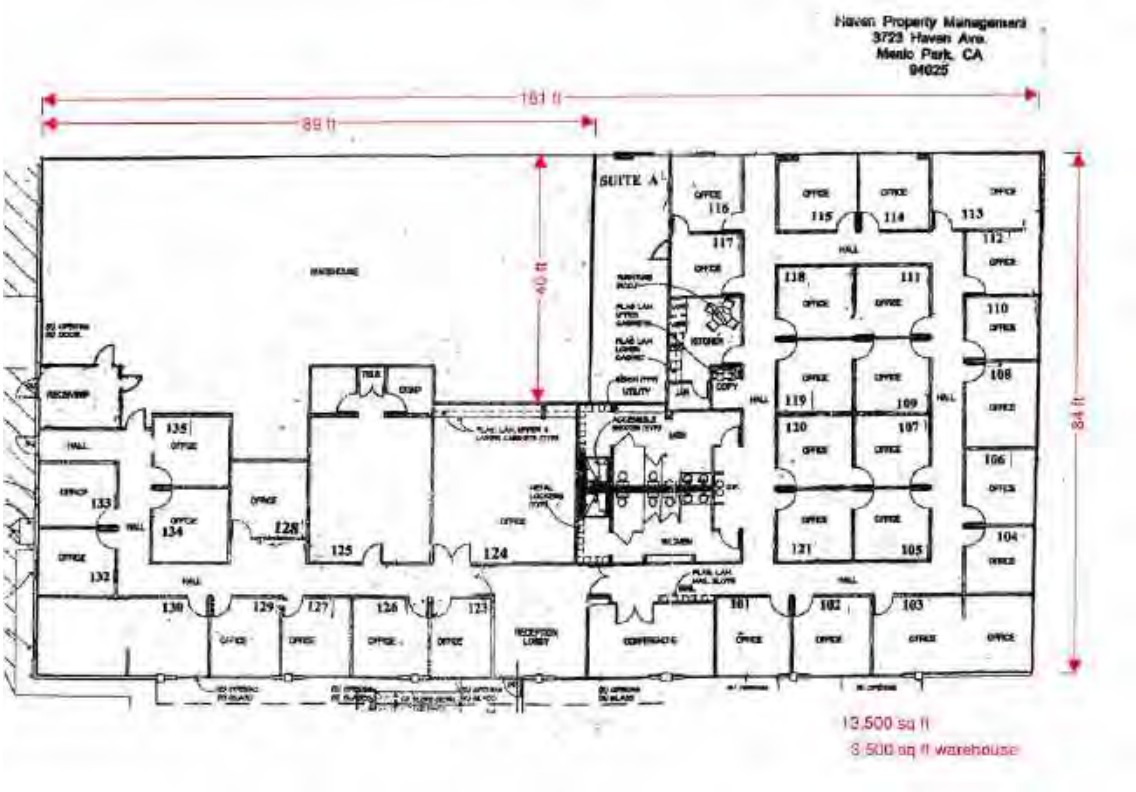
OTHER SERVICES

Facebook operates a shuttle service that runs along Haven Avenue providing commuter service to FB employees that live in the housing developments near the site, Anton Menlo Apartments at 3639 Haven Avenue and Elan Menlo Apartments at 3945 Haven Avenue, and that may be available to hotel guests conducting business at Facebook's Headquarters while staying at the hotel.

EXISTING LAND USE

The site is currently occupied by a one-story building that houses roughly 13,500 square feet of office space and 3,500 square feet of warehouse. The building floor plan has 35 private offices plus warehouse and common areas. Figure 5 below shows the existing building floor plan.

Figure 5: Existing building use and floor plan



Source: FPG Hospitality Inc., City of Menlo Park

Field observations conducted by Walker Consultants in the morning of Wednesday, June 5, 2019 show that 32 vehicles were parked on site at 10:30 a.m., right after the morning rush hour, an increase from two parked vehicles observed at 7:00 a.m. Using the 10th edition of the Institute of Transportation Engineers (ITE) Traffic Generation Manual, and methodology to determine trip generation, Walker estimates that existing uses at the site generate 15 trips in the peak hour of the morning and evening rush hour periods, which means the peak hour captures about 50 percent of the parking events observed at the site.

3. TDM PROGRAMMING

PROJECT TRIP GENERATION AND PARKING ANALYSIS

According to City of Menlo Park Zoning Code, Section 16.43.090 Parking Standards, a minimum of 0.75 parking spaces per hotel guest room is required, which results in a minimum requirement of 125 parking spaces (166 guest rooms x 0.75 spaces = 124.5 spaces). The development proposal is providing a total of 132 parking spaces, of which 6 are tandem spaces, which if subtracted from the total provide a supply of 126 spaces.

Walker Consultants conducted a parking analysis and estimated demand through a shared parking model, utilizing the 2nd edition of the Urban Land Institute (ULI) Shared Parking Model, to determine the recommended parking supply on a typical peak day (85th percentile), which is the level of parking demand for which Walker typically recommends the on-site parking supply be designed.

The shared parking model recommends that a typical peak day supply of 91 spaces be provided, or about 25 percent fewer parking spaces than in the development proposal. The model assumes that hotel guests will drive themselves 49 percent to 53 percent of the time on weekday and weekend days, respectively, similar to driving ratios recently observed at hotels near airports and major employment districts, such as major corporate centers in Silicon Valley (and documented by Walker and ULI in the development of the 3rd edition of the shared parking model that will be available in early 2020).

The model also assumes that hotel employees will drive themselves 80 percent of the time on both weekdays and weekends. A rate that is higher than commute-to-work estimates from the U.S. Census American Community Survey, which estimate driving alone at 69 percent for San Mateo County and 76 percent for Santa Clara County.

Finally, based on ITE's 10th edition of the Trip Generation Manual, standard trip generation rates for the project programming for the peak hour are 90 trips in the morning rush hour and 101 trips in the evening rush hour periods.

TDM PROGRAM APPROACH

The goal of this TDM Plan is to identify and recommend a suite of TDM measures that working in concert can reduce peak hour trips by at least 20 percent, as required by the City of Menlo Park for this site.

The TDM measures and strategies for 3723 Haven Avenue were selected based on the physical attributes of the site and the proposed building, the transportation facilities and services currently planned and available near the site, and applicability of measures to hotel guests and employees.

These measures follow and expand upon industry best practices, measures implemented in similar hotel developments in the Bay Area, and state of the practice and regulatory framework in San Mateo County. The goal is that the property owner and hotel operator will be able to build upon this TDM plan and provide strategies tailored to user needs and patterns of demand.

TDM measures fall into two categories:

- **Design elements**: TDM measures that the developer of the property – FPG Hospitality Inc., will put into place in the architectural design and construction of the project. These include such measures as direct access to hotel lobby from the sidewalk, hotel façade and gardens facing the street, bike

parking, and a coffee shop and co-working space fronting Haven Avenue, that will become neighborhood amenities and increase the utility of alternative modes of transportation to access the development land uses.

- **Program operations**: TDM measures that would be tailored to the end user (employees and hotel guests) to incentivize and change transportation behaviors, and that may change or adapt during the life of the project, such as providing a shuttle service to transport guests to nearby destinations and connect both employees and guests with nearby transportation centers like the Menlo Park Caltrain Station, or incentives to carpool and use public transit options for employees to reduce drive alone rates and parking demand on site. TDM program operations would be required of the property manager and future tenants throughout the life of the project.

A monitoring and evaluation program will need to be developed and put in place by property managers and future tenants to gauge the effectiveness of the TDM program overtime. This is described in more detail in Chapter 4.

RECOMMENDED TDM STRATEGIES

The Moxy Hotel brand appeals to a younger generation that values experiences, social interaction, sharing and environmental sustainability. In that regard, their views, values and consumption of alternative transportation options is different and higher than previous generations.

The TDM plan supports these values and culture by proposing a valet parking only experience and a passenger drop off and pick up area by the front door of the hotel, which makes it suitable for the use of ride-hailing services and access through alternative transportation modes, such as first/last mile shuttle operations, micro-transit services, public transit service, people riding bicycles and walking, shared scooters and other personal mobility devices.

The TDM strategies that are recommended to be offered by this development include measures to encourage transit use, walking, biking and car sharing for commute trips as well as trips off-site during the day. As the part of the ethos of the Moxy brand, it is recommended the hotel includes in its marketing efforts a strong emphasis on providing tools and information to employees and hotel guests to help them plan their commute by bike, transit, or ridesharing as well as encouraging them to use these modes for short-distance trips to nearby destinations.

Table 1 below shows a full list of TDM measures that have been selected from the City of Menlo Park TDM guidelines (which are based on San Mateo County C/CAG Guidelines for Congestion Management Program), that would be appropriate for implementation at the site, and compatible with the Moxy Hotel brand and vision for transportation sustainability.

The transportation outcomes of the selected TDM measures have the potential to largely exceed the 20 percent trip reduction required by the City of Menlo Park for this site and development proposal. Thus, their recommended implementation has been broken down in two phases of implementation:

- Phase 1 that can be implemented at the outset to achieve a 20 percent trip reduction.
- Phase 2 that is optional and can be implemented in the future, according to results and/or property management objectives.

TDM measures are identified by the implementing party and target user.

Table 1: TDM measures that are recommended for the site by implementation phase

#	TDM Measure	Implement by Owner or Manager	Target User		Description/Rationale	Phase
			Employee	Guest		
1	Subsidizing transit passes for employees.	X	X		Manager subsidizes cost of monthly pass on SamTrans ($96.00), or Caltrain 2-Zone ($163.50) to travel anywhere in Bay Area by bus or commuter rail.	1
2	Preferential parking for carpoolers.	X	X		Manager reserves a certain number of parking spaces for employees that carpool at least 3 times a week. Parking spaces will be clearly marked and in prime locations.	1
3	Operation of a dedicated shuttle service.	X	X	X	Manager will operate a shuttle service to provide transit service within 5 miles of hotel site to both guests and employees, connecting them with Caltrain stations, transit centers and major business districts.	1
4	Install and maintain alternative transportation kiosk at lobby.	X	X	X	Manager will provide information and collateral materials to all guests and employees, explaining how to get to hotel on alternative modes of transportation. All commute and travel information will also be available on a website and include: shuttle services, walking and biking routes, bike facilities and bus/rail transit schedules.	1
5	Survey employees and guests to monitor use.	X	X	X	Manager will survey employees once a year and guests twice a year to measure travel mode share and monitor progress toward reductions in parking demand.	1
6	Secure bicycle storage - racks.	X	X		Manager will provide secured bike storage for employees, such as a bike room or bike cage, for up to 12 bikes within the building.	2
7	Showers and changing room.	X	X		Manager will provide changing room facilities (showers and lockers) for employees that bike and walk to work.	2
8	Subsidizing employees that walk or bike to work.	X	X		Manager will reward employees that bike or walk to work to compensate for not using parking or requiring a transit subsidy.	2
9	Operation of commute assistance center at concierge/reception desk.	X	X	X	Manager will operate a workstation or desk where employees and guests can obtain personalized trip plans to travel to/from hotel on alternative transportation modes.	2
10	Provide access to motor vehicles on site for employee/guest use.	X	X	X	Manager will host 2 car-sharing vehicles for use of hotel guests and/or employees for trips to nearby destinations or personal errands during workday.	2
11	Join Commute.org's guaranteed ride home (GRH) program.	X	X		Manager will join the region's GRH program to provide employees with peace of mind. When a GRH Program is added to a TDM program, average use of alternative modes increases by about 50%.	2

ESTIMATED TRIP CREDITS

Based on the City of Menlo Park's development regulations, the project is required to submit a Transportation Demand Management program that will reduce its single-occupant vehicle (SOV) trip generation rate by a minimum of 20 percent of peak hour trips. Development of the TDM plan presented herein follows the City's TDM Program Guidelines for identification and evaluation of TDM measures, and for calculation of peak-hour trip reduction credits.

TDM Guidelines trip credits must sum to at least 20 percent of the project's trip generation for the peak-hour. Based on the 10th edition of ITE's Trip Generation Manual, the project's trip generation is 90 trips in the peak hour of the morning rush hour and 101 trips in the peak hour of the afternoon rush hour. Therefore, the TDM Guidelines trip credits outlined in Table 1 must add up to at least 20 trip credits.

As indicated earlier, the TDM measures that were identified and recommended for implementation add up to 70 trip credits and largely exceed the 20 trip credits required by the City of Menlo Park for this site and development proposal. Thus, their recommended implementation has been broken down into two phases of implementation. Tables 2 and 3 below show the TDM measures that are recommended for Phase 1 and TDM measures that are recommended for Phase 2.

- TDM measures included in Phase 1 add up to 35 trip credits and have the potential to meet or exceed the goal of reducing 20 percent of peak hour trips. The TDM program that is implemented by the property owner or hotel manager/operator will be required to include a monitoring program to evaluate whether the goal has been achieved or maintained over time.
- TDM measures included in Phase 2 also add up to 35 trip credits. Implementation of these measures can be treated as optional if the 20 percent peak hour trip reduction goal is met, or as additional implementation measures to strengthen the TDM program if reduction goals have not been met.

The hotel manager/operator can choose to implement all TDM measures in Phase 2 and other measures, if deemed appropriate to achieve other property management objectives and strengthen hotel brand identity.

Additional strategies that were considered in the project's TDM program that cannot be directly quantified in the TDM guidelines include:

- Providing an Employee Transportation Coordinator to promote TDM plan incentives and help employees change their commute habits
- Operating a bike share program for employees and guests
- Supporting and promoting on-demand ridesharing applications
- Allowing on-demand reservation of a shuttle trip and seat
- Providing smartphone apps to track shuttle vehicle location and get ETA notifications
- Providing credits for usage of Uber and Lyft for short distance trips to/from the hotel

Table 2: Phase 1 TDM Measures that are recommended for implementation

#	TDM Measure	Number of trips credited	No. of Units	Trips per Unit	Total Trips	Notes/Assumptions
1	Subsidizing transit passes for employees.	One peak hour trip will be credited for each transit pass that is subsidized at least $20 per month for one year.	5	1.00	5.0	Assume $100 Clipper Card subsidy per month for 5 employees to pay for any transit system.
2	Preferential parking for carpoolers.	Two peak hour trips will be credited for each parking spot reserved.	5	2.00	10.0	Assume 10 employees carpool and use 5 reserved spaces. Property manager will work to achieve this goal.
3	Operation of a dedicated shuttle service.	One peak hour trip will be credited for each peak-hour round trip seat on the shuttle. Increases to two trips if a Guaranteed Ride Home Program is also in place.	12	1.00	12.0	Assume one 7-seat van (including driver) making 2 roundtrips per hour (12 passenger seat trips per hour) to Menlo Park Caltrain Station or to Facebook headquarters.
4	Install and maintain alternative transportation kiosk at lobby.	Five trips will be credited for each kiosk.	1	5.00	5.0	One "Transit Screen" and one transportation information brochure rack to be provided in jump lobby.
5	Survey employees and guests to monitor use.	Three peak hour trips will be credited for a survey developed to be administered twice yearly.	1	3.00	3.0	Conduct at least once a year to both employees and guests; two separate surveys, one for each group. Recommendation is to survey guests at least twice a year.
	Subtotal Trip Credits				**35.0**	

Source: Walker Consultants, City of Menlo Park TDM Guidelines

Table 3: Phase 2 TDM measures that are for optional or future implementation

#	TDM Measure	Number of trips credited	No. of Units	Trips per Unit	Total Trips	Notes/Assumptions
6	Secure bicycle storage - racks.	One peak hour trip will be credited for every 3 new bike lockers/racks installed and maintained. Lockers/racks must be installed within 100 feet of the building.	12	0.33	4.0	Development includes storage space for at least 12 bicycles. Secure bike racks or cages can be added at a later time.
7	Showers and changing room.	Ten peak hour trips will be credited for each new combination shower and changing room installed.	1	10.00	10.0	Property manager can provide lockers, showers and changing room within property for bikers and walkers.
8	Subsidizing employees that walk or bike to work.	One peak hour trip will be credited for each employee that is subsidized at least $20 per month for one year.	5	1.00	5.0	Assume $50 incentive per month for 5 employees that walk or bike to work regularly, at least 3 times a week.
9	Operation of commute assistance center at concierge/reception desk.	One peak hour trip will be credited for each feature added to the information center; and an additional one peak hour trip will be credited for each hour the center is staffed with a live person, up to 20 trips per each 200 tenants.	4	1.00	4.0	Provide transit information brochure rack, computer access to plan trips, free bus passes and an additional "Transit Screen" on reception lobby (2nd floor).
10	Provide access to motor vehicles on site for employee/guest use.	Five trips will be credited for each vehicle provided.	2	5.00	10.0	Provide two carshare vehicles such as Zipcar or other service, on site. Consider implementation of an EV carsharing service.
11	Join Commute.org's guaranteed ride home (GRH) program.	Two peak hour trips will be credited for every 2 slots purchased in the program.	2	1.00	2.0	Commute.org's GRH program reimburses commuters who carpool, vanpool, take transit, shuttle, bike, or walk to work up to $60 per event, up to 4 times per calendar year. Alternatively, setup a reimbursement credit with Uber, Lyft and other ride-hailing services.
	Subtotal Trip Credits				**35.0**	

Source: Walker Consultants, City of Menlo Park TDM Guidelines

4. MONITORING AND REPORTING

MONITORING AND REPORTING

This TDM Plan identifies employee priorities and effective TDM strategies designed to achieve a reduction in drive-alone trips of 20 percent of the peak hour. However, it is anticipated that the TDM program may need to evolve over time as guests and employee travel habits change.

The property owner will be required to submit an annual monitoring report to the City of Menlo Park summarizing the success of the TDM programs for hotel guest and employees. The details of the reporting will be determined in collaboration with the City but could include metrics of success related to parking occupancy and SOV mode share, to ensure that both parking occupancy does not exceed shared model estimates for a typical day, and that guests and employees driving ratios meet or exceed model estimates.

For instance, the shared parking model estimates peak parking demand at 91 spaces for a typical weekend day (or the 15th busiest day of the year) at 7:00 a.m. or 11:00 p.m. when most guests are in the hotel and both restaurant and bar uses are in operation. And the model assumes that weekend driving ratios are 53 percent and 80 percent for guests and employees respectively.

Below are methods that can be used to help evaluate the effectiveness of the TDM program based on parking occupancy and SOV mode share metrics, on an annual basis.

- Hotel Employees
    - Provide a description of the current TDM programs and services offered to employees, and number of employees utilizing them on a monthly basis, as well as the cost of program and subsidies and incentives used.
    - Conduct an annual employee survey that captures data on how employees access the site and their attitudes toward alternative commute modes.
- Hotel Guests
    - Provide a description of the current TDM programs and services that are available to guests, and number of guests using them on a monthly basis, as well as the cost of program and subsidies and incentives used.
    - Conduct a guest survey twice a year, designed to capture data on how guests access the hotel, what transportation modes and services do they use during their visit.
- Hotel Manager/Operator
    - Compile a report summarizing programs cost and utilization, and results of employee and guests surveys and provide to the City of Menlo Park.
    - Conduct periodic parking occupancy counts to understand variation throughout the year and correspondence with hotel room occupancy and special events if any.

If the findings in the report show that the TDM reduction goal has not been met, the owner and future property manager/tenants would work with City staff to identify if there are additional TDM measures that could feasibly be implemented to further reduce trip generation from the project.
