VICINITY MAP

Chapter 5 Area and Construction Type Analysis:

Mixed use, Separated Occupancy Building per CBC 508.4

Occupancies: B, M, R-2, S-2.

Construction Type: VA

Permitted Height, Stories & Area by Occupancy Type for Buildings with S Increase for Area (SM):

Height:	B,M,S:	50'
	R-2	50'
Stories:	B	3
	M	3
	R-2	3
	S	4
Area:	B	54,000
	M	42,000
	R-2	36,000
	S-2	63,000

Proposed Building Height: 38'

Proposed Stories:

B	1
M	1
R-2	3

Proposed Area, First Floor:

B	3,000
M	4,484
R-2	1,215
Total:	9,025

Proposed Area, Second Floor:

R-2	9,138

Proposed Area, Third Floor:

R-2	7,741

For each story area, Aggregated sum of the Ratios:

1st. $\frac{3,000}{54,000} + \frac{4,484}{42,000} + \frac{1,215}{36,000} = 0.196 < 1.0$

2nd. $\frac{9,138}{36,000} = 0.253 < 1.0$

3rd. $\frac{7,741}{36,000} = 0.215 < 1.0$

For Total Building Area, Aggregated sum of the Ratios: 0.664 < 2.0

Per Section 506.1.3, Basements need not be included in the total allowable floor area of a building provided the total area of such basements does not exceed the area permitted for a one-story above grade plan building.

Proposed Area, Basement Level 1:

S-2	13,944

Proposed Area, Basement Level 2:

S-2	13,944

Total Basement Area: 27,888 > 63,000

Planning Permit #: PLN2018-00061

APN/Parcel ID: 071-413-200, 370, 380

General Notes:
The project is subject to the California Building Standards Code at the time of Building permit application.
The project is subject to the California Green Building Standards Code (Cal Green) in effect at the time of Building permit submittal and any local amendments to the Code. Other forms of green building checklist will not be accepted in-lieu of the Cal Green requirements.
All deferred submittals other than trusses are to be approved by the Building Official prior to Building Permit application.

MEP Notes:
All sanitary sewer lines shall have a slope of 2% unless otherwise approved by the Building Official.
All sanitary sewer lines will gravity feed to the sewer mains in the public right of way unless otherwise approved by the Building Official.
HVAC equipment Shall not exceed the threshold levels as established in Chapter 8.06 of the City of Menlo Park Municipal Code.
Do not run condensate water run into the storm drain systems.

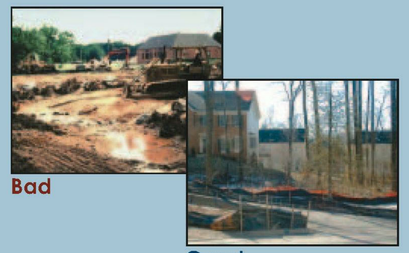
ECO FUNCTIONAL ARCHITECTURE

Stormwater and the Construction Industry

Protect Natural Features



Bad

Good

Minimize clearing.

Minimize the amount of exposed soil.

Identify and protect areas where existing vegetation, such as trees, will not be disturbed by construction activity.

Protect streams, stream buffers, wild woodlands, wetlands, or other sensitive areas from any disturbance or construction activity by fencing or otherwise clearly marking these areas.

Construction Phasing

Bad

Good

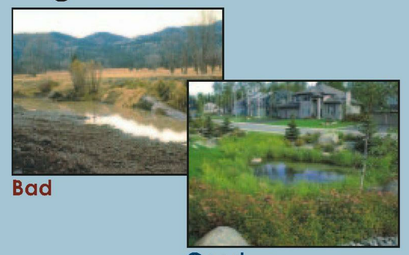
Sequence construction activities so that the soil is not exposed for long periods of time.

Schedule or limit grading to small areas.

Install key sediment control practices before site grading begins.

Schedule site stabilization activities, such as landscaping, to be completed immediately after the land has been graded to its final contour.

Vegetative Buffers



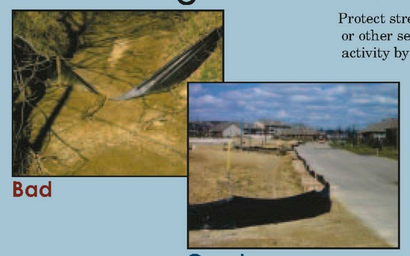
Bad

Good

Protect and install vegetative buffers along waterbodies to slow and filter stormwater runoff.

Maintain buffers by mowing or replanting periodically to ensure their effectiveness.

Silt Fencing



Bad

Good

Inspect and maintain silt fences after each rainstorm.

Make sure the bottom of the silt fence is buried in the ground.

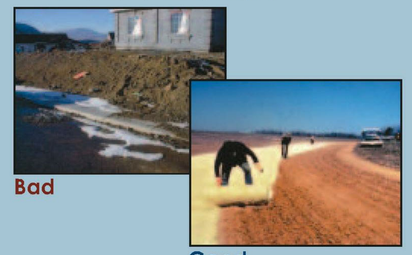
Securely attach the material to the stakes.

Don't place silt fences in the middle of a waterway or use them as a check dam.

Make sure stormwater is not flowing around the silt fence.

Maintain your BMPs!

Site Stabilization



Bad

Good

Vegetate, mulch, or otherwise stabilize all exposed areas as soon as land alterations have been completed.

Construction Entrances

Bad

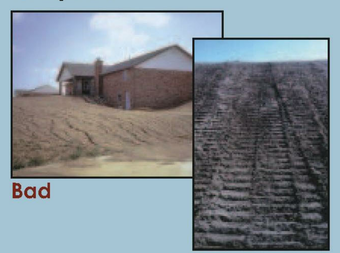
Good

Remove mud and dirt from the tires of construction vehicles before they enter a paved roadway.

Properly size entrance BMPs for all anticipated vehicles.

Make sure that the construction entrance does not become buried in soil.

Slopes



Bad

Good

Rough grade or terrace slopes.

Break up long slopes with sediment barriers, or under drain, or divert stormwater away from slopes.

Dirt Stockpiles

Bad

Good

Cover or seed all dirt stockpiles.

ONLY RAIN IN THE STORM DRAIN

SAN MATEO COUNTYWIDE STORMWATER POLLUTION PREVENTION PROGRAM (STOPPP)
A program of C/CAG
www.flowstobay.org

Storm Drain Inlet Protection

Bad

Good

Use rock or other appropriate material to cover the storm drain inlet to filter out trash and debris.

Make sure the rock size is appropriate (usually 1 to 2 inches in diameter).

If you use inlet filters, maintain them regularly.

Stormwater and the Construction Industry

Planning and Implementing Erosion and Sediment Control Practices

The construction industry is a critical participant in the nation's efforts to protect streams, rivers, lakes, wetlands, and oceans. Through the use of best management practices (BMPs), construction site operators are the key defense against erosion and sedimentation.

As stormwater flows over a construction site, it picks up pollutants like sediment, debris, and chemicals. High volumes of stormwater can also cause stream bank erosion, and destroy downstream aquatic habitat. Preventing soil erosion and sedimentation is an important responsibility at all construction sites.

In addition to the environmental impact, uncontrolled erosion can have a significant financial impact on a construction project. It costs money and time to repair gullies, replace vegetation, clean sediment-clogged storm drains, replace poorly installed BMPs, and mitigate damage to other people's property or to natural resources.

Best Management Practice (BMP)
A BMP is a method used to prevent or control stormwater runoff and the discharge of pollutants, including sediment, into local waterbodies. Silt fences, inlet protection, and site-stabilization techniques are typical BMPs on a construction site.

Operator
An operator is someone who has control over and the ability to modify construction plans and specifications (e.g. owner, general contractor)

or

Someone who has control over the day-to-day operations at a site (e.g., owner, general contractor) that are necessary to ensure compliance with the permit requirements. It is the responsibility of a construction site owner or operator to contain stormwater runoff and prevent erosion during **all** stages of a project.

There may be more than one person at a site who meets these definitions and must apply for permit coverage. (States may have different definitions of the term "operator.")

So what's being done about polluted runoff?

The Clean Water Act includes the National Pollutant Discharge Elimination System (NPDES) permitting program. As of January 2003, 44 states and territories are authorized to issue NPDES stormwater permits. If your state isn't authorized to operate the NPDES stormwater permit program, EPA issues the permits. Permits vary from state to state, so contact your state or EPA for specific information. Your permitting authority has specific information on your state's NPDES stormwater permit program. In general, construction permits require construction operators to do all of the following:

- Develop and implement a stormwater pollution prevention plan
- Submit a permit application or notice of intent (NOI)
- Comply with the permit, including maintaining BMPs and inspecting the site

Under the NPDES program, construction activities that disturb 1 or more acres are required to obtain stormwater permit coverage. States have different names for the plans that construction operators must develop, such as

- Stormwater pollution prevention plan
- Erosion and sediment control plan
- Erosion control and stormwater management plan
- Stormwater management plan
- Water pollution control plan
- Pollution prevention plan

This document uses the term "*Plan*."

I think I need a permit... Where do I start?

All land-disturbing activities, including clearing, grading, and excavation, that disturb **1 or more acres** are required to be covered under a state or EPA-issued NPDES construction stormwater permit **prior to land disturbance**. Permit requirements vary by state. Begin by researching the specific requirements in your state. You might already be subject to local erosion and sediment control requirements, but that doesn't release you from the requirements of the NPDES program at the state or EPA level. Although you must comply with both sets of requirements, in most cases they have been designed to be complementary. Contact your permitting authority to find out exactly what you need to do. A good place to start your search is the Construction Industry Compliance Assistance web site at http://www.envcap.org/cica.

The NPDES permit requirements include small construction activities that are part of a larger common plan of development or sale, such as a single lot within a larger subdivision. For developments with multiple operators, all operators must have permit coverage for their individual parts of the larger development, no matter how large or small each operation happens to be. When there are multiple operators at one site, they're encouraged to develop and share one comprehensive Plan and obtain permit coverage as co-permitees.

The **owner or operator** of the construction site is responsible for complying with the requirements of the permit. Responsibilities include developing a Plan, obtaining permit coverage, implementing BMPs, and stabilizing the site at the end of the construction activity.

Construction sites that discharge unpermitted stormwater are in violation of the Clean Water Act and may be subject to fines of up to $27,500 a day per violation.

Determine your eligibility

All construction activity that disturbs 1 or more acres of land, as well as activity that disturbs less than 1 acre but is part of a larger common plan of development, must obtain permit coverage.

Read and understand your stormwater permit requirements

Get a copy of the permit for construction activities and a permit application (or notice of intent form) from your state or EPA permitting authority.

Develop a Plan

Most states do not require you to submit your Plan. However, you do need to keep the Plan on site. If that's impractical, you may post a notice that tells where the Plan is kept so it can be accessed by the permitting authority and other interested parties.

You'll need to post a copy of your completed application on site. Put it in a place where the public can see it so they'll know your site is covered by an NPDES permit!

Apply for permit coverage

Once you understand your permit requirements and have developed a Plan, you can submit a stormwater permit application (or notice of intent) to your permitting authority. This must be done before beginning any land disturbance on the site. Some states require a few days of lead time, so check with your permitting authority. Once you've submitted the application, you must satisfy the conditions of the permit.

Implement the Plan

Be prepared to implement the BMPs in your Plan before construction begins. Ensure that BMPs are properly maintained, and upgrade and repair them as necessary.

Developing and Implementing a Plan

You must have a Plan that includes erosion and sediment control and pollution prevention BMPs. These Plans require

- Advance planning and training to ensure proper implementation of the BMPs
- Erosion and sediment control BMPs in place until the area is permanently stabilized
- Pollution prevention BMPs to keep the construction site "clean"
- Regular inspection of the construction site to ensure proper installation and maintenance of BMPs

Fortunately, the practices and measures that must be included in your Plan are already part of the standard operating procedures at many construction sites.

Six steps are associated with developing and implementing a stormwater Plan. There's a wealth of information available on developing pollution prevention plans. Please contact your permitting authority for help in finding additional guidance materials, or visit www.epa.gov/npdes/stormwater. A sample construction plan is available at www.epa.gov/npdes/pubs/sample_swppp.pdf.

1. Site Evaluation and Design Development

- **Collect site information**
- **Develop site plan design**
- **Prepare pollution prevention site map**

The first step in preparing a Plan is to define the characteristics of the site and the type of construction that will occur. This involves collecting site information, identifying natural features that should be protected, developing a site plan design, describing the nature of the construction activity, and preparing a pollution prevention site map.

2. Assessment

- **Measure the site area**
- **Determine the drainage areas**
- **Calculate the runoff coefficient**

The next step is assessing the impact the project will have on stormwater runoff. Determine the drainage areas and estimate the runoff amounts and velocities. For more information on calculating the runoff coefficient, go to www.epa.gov/npdes/pubs/chap02_conguide.pdf, page 11.

3. Control Selection and Plan Design

- **Review and incorporate state or local requirements**
- **Select erosion and sediment controls**
- **Select other controls**
- **Select stormwater management controls**
- **Indicate the location of controls on the site map**
- **Prepare an inspection and maintenance plan**
- **Coordinate controls with construction activity**
- **Prepare sequence of major activities**

In the third step you'll actually document your procedures to prevent and control polluted stormwater runoff. You must delineate areas that will not be disturbed, including critical natural areas like streamside areas, floodplains, and trees. You must also identify the measures (or BMPs) you'll use to protect these areas.

Phasing your project to minimize the amount of exposed soil at any given time is a highly effective way to prevent erosion. Erosion control measures designed to prevent soil from being mobilized include diversions to route stormwater away from exposed soils and stabilization with vegetation, mulch, and geotextiles. Sedimentation control measures designed to remove sediment from stormwater or prevent it from leaving the site include silt fences, sediment traps, and diversions.

You'll need to select erosion and sediment controls—including stabilization measures for protecting disturbed areas and structural controls for diverting run-off and removing sediment—that are appropriate for your particular site. The appropriateness of the control measures will depend on several factors, but will be influenced most directly by the site characteristics. Some stabilization measures you might consider are temporary seeding, permanent seeding, and mulching. Structural control measures include earth dikes, silt fences, and sediment traps. No single BMP will meet all of the erosion and sedimentation control needs of a construction site. A combination of BMPs is necessary. For more information on the types of BMPs appropriate for your construction site, see the BMP fact sheet series available at www.epa.gov/npdes/menuofbmps.

Soil erosion control tips...

- Design the site to infiltrate stormwater into the ground and to keep it out of storm drains. Eliminate or minimize the use of stormwater collection and conveyance systems while maximizing the use of stormwater infiltration and bioretention techniques.
- Minimize the amount of exposed soil on site.
  - To the extent possible, plan the project in stages to minimize the amount of area that is bare and subject to erosion. The less soil exposed, the easier and cheaper it will be to control erosion.
  - Vegetate disturbed areas with permanent or temporary seeding immediately upon reaching final grade.
  - Vegetate or cover stockpiles that will not be used immediately.
- Reduce the velocity of stormwater both onto and away from the project area.
  - Interceptors, diversions, vegetated buffers, and check dams are a few of the BMPs that can be used to slow down stormwater as it travels across and away from the project site.
  - Diversion measures can also be used to direct flow away from exposed areas toward stable portions of the site.
  - Silt fences and other types of perimeter filters should never be used to reduce the velocity of runoff.
- Protect defined channels immediately with measures adequate to handle the storm flows expected.
  - Sod, geotextile, natural fiber, riprap, or other stabilization measures should be used to allow the channels to carry water without causing erosion. Use softer measures like geotextile or vegetation where possible to prevent downstream impacts.
- Keep sediment on site.
  - Place aggregate or stone at construction site vehicle exits to accommodate at least two tire revolutions of large construction vehicles. Much of the dirt on the tires will fall off before the vehicle gets to the street.
  - Regular street sweeping at the construction entrance will prevent dirt from entering storm drains. Do not hose paved areas.
  - Sediment traps and basins are temporary structures and should be used in conjunction with other measures to reduce the amount of erosion.
- Maintaining all BMPs is critical to ensure their effectiveness during the life of the project.
  - Regularly remove collected sediment from silt fences, berms, traps, and other BMPs.
  - Ensure that geotextiles and mulch remain in place until vegetation is well established.
  - Maintain fences that protect sensitive areas, silt fences, diversion structures, and other BMPs.

Other BMPs and Activities to Control Polluted Runoff

You'll need to select other controls to address potential pollutant sources on your site. Construction materials, debris, trash, fuel, paint, and stockpiles become pollution sources when it rains. Basic pollution prevention practices can significantly reduce the amount of pollution leaving construction sites. The following are some simple practices that should be included in the Plan and implemented on site:

- Keep potential sources of pollution out of the rain as practicable (e.g., inside a building, covered with plastic or tarps, or sealed tightly in a leak-proof container).
- Clearly identify a protected, lined area for concrete truck washouts. This area should be located away from streams, storm drain inlets, or ditches and should be cleaned out periodically.
- Park, refuel, and maintain vehicles and equipment in one area of the site to minimize the area exposed to possible spills and fuel storage. This area should be well away from streams, storm drain inlets, or ditches. Keep spill kits close by and clean up any spills or leaks immediately, including spills on pavement or earthen surfaces.
- Practice good housekeeping. Keep the construction site free of litter, construction debris, and leaking containers. Keep all waste in one area to minimize cleaning.
- Never hose down paved surfaces to clean dust, debris, or trash. This water could wash directly into storm drains or streams. Sweep up materials and dispose of them in the trash. Never bury trash or debris!
- Dispose of hazardous materials properly.

4. Certification and Notification

- **Certify the Plan**
- **Submit permit application or notice of intent**

Once the Plan has been developed, an authorized representative must sign it. Now is the time to submit the permit application or notice of intent. Your permit might require that the Plan be kept on site, so be sure to keep it available for the staff implementing the Plan.

Erosion and sedimentation control practices are only as good as their installation and maintenance.

5. Implementing and Maintaining a Plan

- **Implement controls**
- **Inspect and maintain controls**
- **Update/change the Plan**
- **Report releases of hazardous materials**

A Plan describes the practices and activities you'll use to prevent stormwater contamination and meet the NPDES permit requirements. Make sure that the Plan is implemented and that the Plan is updated as necessary to reflect changes on the site.

Erosion and sedimentation control practices are only as good as their installation and maintenance. Train the contractors that will install the BMPs and inspect immediately to ensure that the BMPs have been installed correctly.

Regularly inspect the BMPs (especially before and after rain events) and perform any necessary repairs or maintenance immediately. Many BMPs are designed to handle a limited amount of sediment. If not maintained, they'll become ineffective and a source of sediment pollution.

It's also important to keep records of BMP installation, implementation, and maintenance. Keep track of major grading activities that occur on the site, when construction activities cease (temporarily or permanently), and when a site is temporarily or permanently stabilized.

If construction plans change at any time, or if more appropriate BMPs are chosen for the site, update the Plan accordingly.

6. Completing the Project: Final Stabilization and Termination of the Permit

- **Final stabilization**
- **Notice of Termination**
- **Record retention**

Many states and EPA require a Notice of Termination (NOT) or other notification signifying that the construction activity is completed. An NOT is required when

- Final stabilization has been achieved on all portions of the site for which the permittee is responsible.
- Another operator has assumed control over all areas of the site that have not been finally stabilized. That operator would need to submit a new permit application to the permitting authority.
- For residential construction only, temporary stabilization of a lot has been completed prior to transference of ownership to the homeowner, with the homeowner being made aware of the need to perform final stabilization.

Permittees must keep a copy of their permit application and their Plan for at least 3 years following final stabilization. This period may be longer depending on state and local requirements.

Preconstruction Checklist

- A site description, including
  - Nature of the activity
  - Intended sequence of major construction activities
  - Total area of the site
  - Existing soil type and rainfall runoff data
  - A site map with:
    - Drainage patterns
    - Approximate slopes after major grading
    - Area of soil disturbance
    - Outline of areas which will not be disturbed
    - Location of major structural and nonstructural soil erosion controls
    - Areas where stabilization practices are expected to occur
    - Surface waters
    - Stormwater discharge locations
  - Name of the receiving water(s)
- A description of controls:
  - Erosion and sediment controls, including
    - Stabilization practices for all areas disturbed by construction
    - Structural practices for all drainage/discharge locations
  - Stormwater management controls, including
    - Measures used to control pollutants occurring in stormwater discharges after construction activities are complete
    - Velocity dissipation devices to provide nonerosive flow conditions from the discharge point along the length of any outfall channel
  - Other controls, including
    - Waste disposal practices that prevent discharge of solid materials
    - Measures to minimize offset tracking of sediments by construction vehicles
    - Measures to ensure compliance with state or local waste disposal, sanitary sewer, or septic system regulations
  - Description of the timing during the construction when measures will be implemented
- State or local requirements incorporated into the Plan
- Inspection and maintenance procedures for control measures identified in the Plan
- Contractor certification and Plan certification

Implementation Checklist

- Maintain records of construction activities, including
  - Dates when major grading activities occur
  - Dates when construction activities temporarily cease on the site or a portion of the site
  - Dates when construction activities permanently cease on the site or a portion of the site
  - Dates when stabilization measures are completed on the site
- Prepare inspection reports summarizing
  - Name of person conducting BMP inspections
  - Qualifications of person conducting BMP inspections
  - BMPs/areas inspected
  - Observed conditions
  - Necessary changes to the Plan
- Report releases of reportable quantities of oil or hazardous materials
  - Notify the National Response Center at 800-424-8802 immediately
  - Report releases to your permitting authority immediately, or as specified in your permit. You must also provide a written report within 14 days.
  - Modify the Plan to include
    - The date of release
    - Circumstances leading to the release
    - Steps taken to prevent reoccurrence of the release
- Modify Plan as necessary
  - Incorporate requests of the permitting authority to bring the Plan into compliance
  - Address changes in design, construction operation, or maintenance that affect the potential for discharge of pollutants

An ounce of prevention is worth a pound of cure! It's far more efficient and cost-effective to prevent pollution than it is to try to correct problems later. Installing and maintaining simple BMPs and pollution prevention techniques on site can greatly reduce the potential for stormwater pollution and can also save you money!

DAIKIN

Submittal Data Sheet
3 Ton VRV-IV S Heat Pump Unit
RXTQ36TAVJU

FEATURES

- Variable Refrigerant Temperature (VRT) technology allows VRV IV S series to deliver improved efficiencies and year round comfort
- Improved efficiencies with SEER values up to 19.0 and HSPF values up to 10.0
- Engineered with highly reliable Daikin Swing compressors
- All inverter compressors to increase efficiency and avoid starting current rush
- Can provide heating down to -4°F
- Added safety with optional auto changeover to auxiliary heat
- Easier installation with over 50% weight reduction compared to VRV III S

BENEFITS

- Single-phase technology enables installation in light commercial and residential applications
- Broader diversity with up to 10 indoor units connectivity
- Space saving compact design
- Design flexibility with long piping lengths up to 984ft total and 49ft vertical between outdoor and indoor units
- Designed with reduced MOP to optimize installation costs
- Backed by best-in-class 10-years Parts Limited Warranty and 10-years Replacement Compressor Limited Warranty*

SD-CHS6-0513

Reverse Cycle Heat Pump

STANDARD FEATURES

- Dual System Programmable Compressor (Two Separate Refrigerant Circuits)
- Simple Piping & Plumbing
- Easily Zoned
- 30% Larger Condenser Coil than Traditional Units
- Self Diagnostic Control – Carel Factory Programmed – Field Adjustable
- Low Current (AMP) Requirements
- Simplified Installation & Ease of Service
- Quiet Operation – "Soft Start" Package
- Highest R-410A COP and EER
- No Refrigerant Handling
- Refrigerant Stays Outside the Building
- Low Ambient Antifreeze Protection
- 30% Less Refrigerant than Conventional Split System
- Durable Baked Enamel Finish
- Low Ambient Cooling Enabled
- Automatic Lead/Lag between Compressors
- Easy Service Access

Designation	Unit Type				Capacity			Series	Refrigerant type
Values	**SCM** = SpacePak Heat Pump/Chiller Module				**036** = 3 ton nominal **060** = 5 ton nominal			**A** = Series "A"	**4** = R410A
Examples	**SCM-036-A-4** = 3 ton nominal, series A, using R410A referigerant, SpacePak Heat Pump/Chiller Module **SCM-060-A-4** = 5 ton nominal, series A, using R410A referigerant, SpacePak Heat Pump/Chiller Module								

Standard equipment

- Heat pump/chiller, including two refrigeration systems, factory-programmed controller, fans and all required internal components
- Powder-coated enclosure
- Auxiliary electric immersion heater (3 KW, 230V/1/60) — requires separate electrical power circuit, 15-amp minimum breaker

Additional components required

- Pump and piping by others
- Expansion tank, properly sized for system volume
- SpacePak Chiller Interface Module

Model **SCM** Air to Water Heat Pump — Installation, Operation & Maintenance Manual

Section 4: LOCATION & MOUNTING

WARNING Failure to comply with all of the guidelines IN THE FOLLOWING could result in death, serious injury or substantial property damage.

NOTICE The installation must comply with all applicable local codes.

Prepare the unit

- Inspect the unit for shipping damage. DO NOT use if there is a risk that the damage could affect unit operation.
- Make sure all required components are available.
- Install optional immersion heater, if used. See instructions provided with the heater.

Location

- DO NOT locate where the unit could be sprayed by sprinklers.
- DO NOT locate near swimming pools, spas or any location that could cause chlorine or other contaminant to enter the unit.
- DO NOT locate where water run-off from adjacent structures could impinge on the unit.
- Maintain the clearances shown in Figure 5.
- LOW AMBIENT conditions — Contact SpacePak Technical Support to obtain low ambient adjustment instructions if cooling operation below 55°F is required.
- CORROSIVE ENVIRONMENTS — Do not install the unit in an area subject to sea air or other potential corrosive contaminants.
- INDOOR INSTALLATION — If the unit is installed inside a building, the building must be equipped with air openings sufficient to ensure free discharge of heated (or cooled) air generated by the heat pump/chiller. All clearances must be maintained to ensure free air flow into and out of the enclosure. Make sure no other equipment located in the space will be affected by the unit's air flow.

Handling

- See Figure 4.
- Place padding at pressure points to prevent damage to the enclosure.
- Use caution when handling. The unit is heavy and could cause severe injury or damage if dropped or handled incorrectly.

Figure 4 Handling with cables

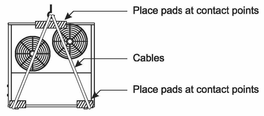

Figure 5 Maintain clearances below

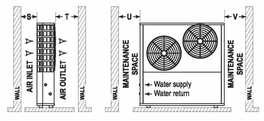

Minimum clearances (inches)			
S	**T**	**U**	**V**
20	59	40	20

Mounting pad

- The SpacePak heat pump/chiller must be mounted on a level corrosion- and weather-resistant mounting surface, preferably concrete. The structural support must be suitable for the operating weight of the unit and attached components, its mounting pad, snow loading and any other expected loads.
- The mounting pad must not be attached directly to a structure where noise transmission would be objectionable.
- Vibration isolators supplied with the chiller may be installed when desired to reduce transmitted vibration.
- The unit must be bolted securely to the pad. Where required by local jurisdiction, the mounting must also be analyzed for seismic loading capability.
- The mounting must ensure that there will be no debris accumulation which might block air flow through the enclosure openings. ***The lower edge of the lower fan opening must be above the typical snow line, including allowance for drifting.***
- There must be no accumulation of water that could reach the bottom of the unit's enclosure.

FABBIO DESIGN

Falegnameria Fabbio was founded in San Biagio di Callalta (TV) in 1957 by Gino Fabbio as an artisan wood shop with focus on manufacturing high quality windows and doors.
The business has been run since then with creativity and passion; in 1980 Luigino Fabbio enters the family business and starts developing an old world window model that is the perfect replacement in the many renovations of historical buildings in the Veneto area. The historical line is still built today as it was once by using old dove tail techniques, original architectural design, antiquing processes and natural oils and wax.
Thank to Luigino's knowledge and passion for history and details over the years Fabbio has developed various lines of product that are used in restoration of buildings from the XVII-XVIII-XIX century.

In 2005 the new Fabbio Design is born with the intent of completing the historical line with a contemporary line more suitable for today's modern architecture. The new innovative Extrema has a frameless design with a "clean" look and is a perfect match for modern design. Fabbio Design has grown over the years adding new lines like the "Fly" that maintains all the quality details of a Fabbio Design product in today's competitive market or the "Museo" which has been developed for a custom project and with its unique bronze exterior clad represent a top of the line product.
To manufacture a great window you must start with high quality wood; Fabbio Design uses only the best woods sourced from Forest Stewardship Council (FSC) sources, as well as being FSC certified themselves. The finishing oils, stains, waxes are chosen for both their high quality and eco-friendly characteristics.

In pursuing the philosophy of innovation and on-going commitment to provide a better service to the customer in 2013 Fabbio Design inaugurated the new headquarters in San Biagio di Callalta near Venice – Italy, with over 32,000 sf of manufacturing capabilities, including state of the art CNC machines, and the new Fabbio USA LLC with headquarters in San Francisco, CA

Flexibility is the essence of Fabbio Design. No project is too big or too small, weather our customers want something simple or something highly customized, something antique or something modern we are here to help and we can do it with a quality of craftsmanship that is second to none.

PROJECT NARRATIVE: Enduring Human-Centered Building

This project is intended to 1) enhance occupants' well-being and quality of life, 2) minimize long-term operations and maintenance costs, and 3) support a healthy natural environment. This narrative outlines overarching goals for the project and is intended to provide high-level guidance to the ownership, design and construction team on best practices and performance goals. Specific methods, systems, materials, and products will be specified in design development and construction documents.

Integrated Design Approach

The team will invest in an integrated design process throughout the entire project lifecycle to facilitate communication and collaborative problem solving. This approach requires the project team to consider the whole building as an integrated collection of its systems, considering how each decision impacts other disciplines and overall project goals. To support this approach, we will schedule a design charrette during the conceptual design phase. A charrette is an interdisciplinary session involving all key disciplines and can help facilitate efficient, common-sense, achievable strategies for optimizing a project's environmental performance.

Site integration and community activation

Native drought-tolerant landscaping that integrates rain gardens and bioswales create an attractive, environmentally responsible, integrated storm water management system for the site. Attractive streetscapes, seating, pedestrian-scale landscaping, decorative light fixtures, awnings and trellises, public art, and other features create an inviting, lively sidewalk experience. Convenient and plentiful short-term and long-term bicycle parking, gear storage areas, strong connections to sidewalks and bike lanes, and other design features encourage biking, walking and other outdoor activities.

Space and material efficiency

A compact, efficient building layout maximizes residential density while providing inviting homes and community gathering spaces. Prefabricated building components, resource-efficient design approaches, careful material takeoffs, and reuse of waste materials where appropriate minimize on site construction waste. Prefabricated components could also significantly reduce construction time, reducing carrying costs and allowing residents to move into their homes months earlier.

Energy efficiency

Passive design strategies including above-code levels of insulation, highly airtight enclosures verified with blower door testing, heat-recovery ventilation, and high-performance windows are prioritized. Optimizing efficiency of the building envelope minimizes heat loss in winter and heat gains in summer and maximizes comfort while

significantly reducing peak heating and cooling loads. This allows the mechanical system to be downsized greatly reducing energy use for the lifetime of the building.

Windows are optimized for daylight penetration deep into spaces, and external window shading provides effective sun control on south and west façades to minimize overheating and the need for active cooling. Ceiling fans in common rooms, living areas and bedrooms provide low-tech comfort. 100% LED lighting, occupancy sensors, and ENERGY STAR appliances round out the energy efficiency strategy.

Whole-building energy modeling will be performed to assess proper levels of investment in the building envelope and equipment efficiency. Analyses will reveal projected performance of various options with regard to heating and cooling loads, energy usage, and utility costs.

Electricity monitoring systems will be integrated to allow for troubleshooting of problem equipment, controls or management practices; and supports ongoing understanding of energy usage for continuous feedback and improvement.

Renewables and zero energy

With a passive design approach, a zero energy goal may be within reach. We are interested in exploring opportunities to design the project to be "zero energy ready," or integrate solar photovoltaic (PV) panels or solar thermal water heating to achieve zero energy.

Water quality and conservation

Native drought-tolerant landscaping that integrates rain gardens and bioswales create an attractive, environmentally responsible, integrated storm water management system for the site. High-efficiency toilets, low-flow showerheads, on-demand hot water circulation, and drip irrigation with weather-based controllers will conserve water and save money for owners.

Certification Programs

Certification Programs are a tool to help a project team create a building that has a positive impact on the users and the environment. Rather than focus on achieving a certain level or number of points the project aims to use the program to support the holistic building goals. Programs that may be a good fit for the project include:

- LEED – Healthy, highly efficiency and cost savings green buildings
- Living Building Challenge – Rigorous proven performance standard based on regenerative design framework
- WELL – Advancing health and well-being
- Fitwel – Optimizes buildings to support health
- GPR – Healthy, comfortable, durable and resource efficient homes

DESCRIPTION

The TopTier™ parking garage, canopy and low-bay luminaire is an innovative solution that delivers an unparalleled combination of performance and visual comfort. The patented WaveStream™ optical technology blocks the line of sight from the LED light sources to the observer, while extending the maximum amount of light on task. This unique optical design is the ideal solution for parking garage facilities that enhances safety in the application environment. The TopTier luminaire is UL/cUL listed for wet locations, IP66 and 3G vibration rated.

SPECIFICATION FEATURES

Construction
One-piece, low copper die-cast aluminum housing provides a clean and symmetric housing. Formed aluminum top is sloped to shed water and debris. Tool-less electrical tray allows for easy electrical access for field servicing.

Optics
Precise optical distributions are accomplished using various combinations of reflective backing plates and WaveStream optical technology. The optical Waveguide lens is manufactured of Acrylic Injection molded acrylic. The optics contain features that form a repeatable and redundant pattern to direct light in a precisely prescribed distribution. The drive lane distribution is specifically designed to maximize the travel direction of travel to optimally direct light in the same direction of travel for maximum glare control. For additional glare control and improved uniformity in the distribution, specify the SG option which adds a Soiletti glass lens that works in combination with the Wavegiude lens and reflective backing plate.

Offered standard in 4000K (wh 2700) CCT, optional 3000K, 5000K and 6000K. Minimum 70 CRI. Optional daylight feature provides a dedicated light engine (17W) to compensate for natural light in daylit fixtures and reduces cave effect. Nominal uplight output is 800 lumens and ranges from 10%-30% total light output depending on the lumen package.

Electrical
LED driver(s) are mounted to metal electrical tray for optimal thermal performance. 120V, 208V, 240V, 347V 60Hz or 480V 60Hz operation. 480V is compatible for use with 480Y Wye systems only. Standard with 0-10V dimming driver(s), specify ELTD for Fifth Light DALI driver(s). Shipped standard with 6kV surge protection and designed to withstand 10kV of transient line surge. Greater than 90% lumen maintenance expected at 60,000 hours, based off LM-80 data and TM-21. For 50°C (122°F) ambient temperature applications from -40°C (-40°F) to 40°C (104°F), for 50°C (122°F) applications, specify the HA high ambient option. IP66 rated against the ingress of dust and water.

Mounting
Standard fixture mounts to a square or octagonal 4" surface or recessed j-box via keyhole quick mount bracket. Optional accessories include a pole trunnion mount and wall mount. With the addition of a field supplied wet location j-box, the luminaire can be pendant mounted using 1/2" NPT conduit entry. Decorative pendant mount kit or a suitable field supplied pendant.

Finish
Housing finished in white super durable TGIC polyester powder coat paint with 2.5 mil nominal thickness for superior protection against fade and wear. Optional colors include black, bronze, grey, dark platinum and graphite metallic. Custom color matches available. Consult the McGraw-Edison Architectural Colors brochure for the complete selection.

Warranty
Five-year warranty.

TT TOPTIER LED

CONTROL OPTIONS

0-10V
This fixture is offered standard with 0-10V dimming driver(s). External 0-10V dimming wire leads are provided for use with a lighting control panel or other control methods except when PER7, SLTD, MS/DIM or LWR is specified.

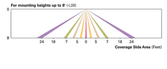
Photocontrol (F, R and PER7)
Optional button-type photocontrol (R) and photocontrol receptacles (R and PER7) provide a flexible solution to enable "dusk-to-dawn" lighting by sensing light levels. Advanced control systems compatible with NEMA 7-pin standards can be utilized with the PER7 receptacle.

Dimming Occupancy Sensor (MS/DIM-LXX)
These sensors are factory installed in the luminaire housing. When the MS/DIM-LXX sensor option is selected, the occupancy sensor is connected to a dimming driver and the entire luminaire dims when there is no activity detected. When activity is detected, the luminaire returns to full light output. The MS/DIM sensor is factory preset to dim down to approximately 50 percent power with a time delay of five minutes.

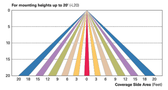
These occupancy sensors include an integral photocell that can be activated with the FSIR-100 accessory for "dusk-to-dawn" control or daylight harvesting. The factory preset is OFF. The FSIR-100 is a wireless tool utilized for changing the dimming level, time delay, sensitivity and other parameters.

A variety of sensor lenses are available to optimize the coverage pattern for mounting heights from 8'-40'.

For mounting heights up to 8' (-LDS)



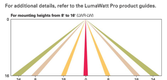
For mounting heights up to 20' (-LDL)



LumaWatt Pro Wireless Control and Monitoring System (LWR-LW and LWR-LN)
The LumaWatt Pro system is a peer-to-peer wireless network of luminaire-integral sensors for any sized project. Each sensor is capable of motion and photo sensing, metering power draw, occupancy and wireless communication. The end-user can securely create and manage sensor profiles with browser-based management software. The software will automatically broadcast to the sensors via wireless gateways for zone-based and daylight harvesting control. The software also provides the ability to monitor energy usage, run reports and view data via a dashboard and analytic capabilities such as improved energy savings, traffic flow analysis, building management software integration and more.

For additional details, refer to the LumaWatt Pro product guides.

For mounting heights from 8' to 16' (LWR-LW)



For mounting heights from 16' to 40' (LWR-LN)

Description:
The Nulite SA LED series is a specification grade strip utilizing the latest LED technology. This product is ideal for commercial, retail and industrial applications.

Specifications:

Construction: Die formed 20 gauge cold rolled steel housing. Finish is white polyester powder coat paint after fabrication. Consult factory for custom colors. Optional aluminum (painted white) or stainless steel (natural finish) housing.

Lens: Extruded frosted acrylic snap-on lens. Optional extended square or round lens.

Reflector / Driver: Reflector / driver cover is finished with high reflectance white paint. Standard constant current electronic driver with 0-10V dimming input; dimming range from 100% down to 1%. Universal (UNV) voltage is from 120 - 277V, 50/60 Hz. Optional drivers available.

LED Module: Distributed LED array in a variety of lumen output packages. LED color is available in 3000K, 3500K or 4000K and in 80CRI or 90CRI. Module is replaceable. L90 ≥ 100,000 hrs.

Mounting: Surface

Labels: ETL listed, conforms to UL Standard 1598 / 8750 and CSA Standard C22.2. Damp location.

Warranty: 5-year limited warranty on LED and Driver.

DESCRIPTION

The TopTier™ parking garage, canopy and low-bay luminaire is an innovative solution that delivers an unparalleled combination of performance and visual comfort. The patented WaveStream™ optical technology blocks the line of sight from the LED light sources to the observer, while extracting the maximum amount of light on task. This unique optical design is the ideal solution for parking garage facilities that enhances safety in the application environment. The TopTier luminaire is UL/cUL listed for wet locations, IP66 and 3G vibration rated.

SPECIFICATION FEATURES

Construction
One-piece, low copper die-cast aluminum housing provides a clean and symmetric housing. Formed aluminum top is sloped for water shedding. Single hinge electrical tray allows for easy electrical access for field servicing.

Optics
Precise optical distributions are accomplished using various combinations of reflective backing plates and WaveStream optical technology. The optical Wavegaurde lens is manufactured of Injection molded acrylic. The optics contain features that form a repeatable and redundant pattern to direct light in a precisely prescribed distribution. The drive lane distribution is specifically designed to maximize light in the direction of travel to optimally direct light in the same direction of travel for maximum glare control. For additional glare control and improved uniformity in the distribution, specify the SG option which adds a Soiltech® glass lens that works in combination with the Wavegaurde lens and reflective backing plate.

Offered standard in 4000K (wt. 2700) CCT, optional 3000K, 5000K and 6000K. Minimum 70 CRI. Optional gull-light feature provides a dedicated light engine (17W) to illuminate the underside of canopy fixtures and reduces cave effect. Nominal uplight output is 800 lumens and ranges from 10%-30% total light output depending on the lumen package.

Electrical
LED driver(s) are mounted to metal electrical tray for optimal thermal performance. 120V, 208V, 240V, 347V 60Hz or 480V 60Hz operation. 480V is compatible for use with 480Y Wye systems only. Standard with 0-10V dimming driver(s), specify ELTD for Fifth Light DALI driver(s). Shipped standard with 10kV surge protection device(s) designed to withstand 10kV of transient line surge. Greater than 90% lumen maintenance expected at 60,000 hours, based off LM-80 data and TM-21. 50°C (122°F) ambient temperature applications from -40°C (-40°F) to 40°C (104°F). For 50°C (122°F) applications, specify the HA high ambient option. IP66 rated against the ingress of dust and water.

Mounting
Standard fixture mounts to a square or octagonal 4" surface or recessed j-box via keyway-style quick mount bracket. Optional accessories include a pole/ trunnion mount and wall mount. With the addition of a field supplied wet location j-box, the luminaire can be pendant mounted using 1/2" NPT conduit (supplied by others) or pendant mount kit or a suitable field supplied pendant.

Finish
Housing finished in white super durable TGIC polyester powder coat paint with 2.5 mil nominal thickness for superior protection against fade and wear. Optional colors include black, bronze, grey, dark platinum and graphite metallic. Special architectural matches available. Consult the McGraw-Edison Architectural Colors brochure for the complete selection.

Warranty
Five-year warranty.

CONTROL OPTIONS

0-10V
This fixture is offered standard with 0-10V dimming driver(s). External 0-10V dimming wire leads are provided for use with a lighting control panel or other control methods except when PER7, SLTD, MS/DIM or LWR is specified.

Photocontrol (F, R and PER7)
Optional button-type photocontrol (R) and photocontrol receptacles (R and PER7) provide a flexible solution to enable "dusk-to-dawn" lighting by sensing light levels. Advanced control systems compatible with NEMA 7-pin standards can be utilized with the PER7 receptacle.

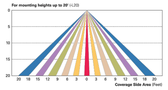
Dimming Occupancy Sensor (MS/DIM-LXX)
These sensors are factory installed in the luminaire housing. When the MS/DIM-LXX sensor option is selected, the occupancy sensor is connected to a dimming driver and the entire luminaire dims when there is no activity detected. When activity is detected, the luminaire returns to full light output. The MS/DIM sensor is factory preset to dim down to approximately 50 percent power with a time delay of five minutes.

These occupancy sensors include an integral photocell that can be activated with the FSIR-100 accessory for "dusk-to-dawn" control or daylight harvesting. The factory preset is OFF. The FSIR-100 is a wireless tool utilized for changing the dimming level, time delay, sensitivity and other parameters.

A variety of sensor lenses are available to optimize the coverage pattern for mounting heights from 8'-40'.

For mounting heights up to 8' (<2.5m)

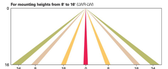
For mounting heights up to 20' (<6.0)



LumaWatt Pro Wireless Control and Monitoring System (LWR-LW and LWR-LN)
The LumaWatt Pro system is a peer-to-peer wireless network of luminaire-integral sensors for any sized project. Each sensor is capable of motion and photo sensing, metering power drawn, daylight harvesting and wireless communication. The end-user can securely create and manage sensor profiles with browser-based management software. The software will automatically broadcast to the sensors via wireless gateways for zone-based and daylight harvesting control. The LumaWatt Pro system is also capable of providing energy data to the user via the software's user dashboard and analytic capabilities such as improved energy savings, traffic flow analysis, building management software integration and more.

For additional details, refer to the LumaWatt Pro product guides.

For mounting heights from 8' to 16' (LWR-LW)



For mounting heights from 16' to 40' (LWR-LN)

NULITE™

SA LED Series

Type:	Project:	Qty:
	Date:	
Catalog #:		

Description:

The Nulite SA LED series is a specification grade strip utilizing the latest LED technology. This product is ideal for commercial, retail and industrial applications.

Specifications:

Construction: Die formed 20 gauge cold rolled steel housing. Finish is white polyester powder coat paint after fabrication. Consult factory for custom colors. Optional aluminum (painted white) or stainless steel (natural finish) housing.

Lens: Extruded frosted acrylic snap-on lens. Optional extended square or round lens.

Reflector / Driver: Reflector / driver cover is finished with high reflectance white paint. Standard constant current electronic driver with 0-10V dimming input; dimming range from 100% down to 1%. Universal (UNV) voltage is from 120 - 277V, 50/60 Hz. Optional drivers available.

LED Module: Distributed LED array in a variety of lumen output packages. LED color is available in 3000K, 3500K or 4000K and in 80CRI or 90CRI. Module is replaceable. L90 ≥ 100,000 hrs.

Mounting: Surface

Labels: ETL listed, conforms to UL Standard 1598 / 8750 and CSA Standard C22.2. Damp location.

Warranty: 5-year limited warranty on LED and Driver.
