Executive Summary

This report presents the results of the Transportation Impact Analysis (TIA) conducted for Parkline (Proposed Project) in Menlo Park, California. Lane Partners (Project Sponsor) is proposing to redevelop SRI International's existing 63.2-acre research campus adjacent to city hall and near Menlo Park's downtown and Caltrain station (Project Site). The Proposed Project would include a new office/research and development (R&D) campus with no increase in office/R&D square footage; up to 550 new rental dwelling units at a range of affordability levels (comprised of 450 multi-family units and townhomes, and a proposed land dedication to an affordable housing developer that could accommodate up to 100 affordable units); new bicycle and pedestrian connections; and approximately 26 acres of the Project Site to be available as open space. In total, the Proposed Project would result in approximately 1,768,802 square feet (sf) of mixed-use development, with approximately 1,093,602 sf of office/R&D uses and approximately 675,200 sf of residential uses. The Proposed Project would demolish all buildings on SRI International's Campus, excluding Buildings P, S, and T, which would remain onsite and be operated by SRI International. The proposed dwelling units would consist of studio units and one-, two-, and three-bedroom units that would be distributed throughout four residential multi-family buildings and 19 townhouses. Consistent with the city's inclusionary housing requirements, 15 percent of these dwelling units (68 dwelling units) would be below-market rate (BMR) housing. Beyond the BMR requirement, an additional 100 dwelling units to be developed by an affordable housing developer would all be affordable and located within one building. Access to the residential area would be provided via driveways on Laurel Street and on Ravenswood Avenue. Access to the office/R&D area would be provided via driveways on Ravenswood Avenue and Middlefield Road.

The existing road network is not laid out consistent with the cardinal directions. As a result, for the purpose of this report, streets that run parallel to US 101 are assumed to run in a north-south direction, such as Middlefield Road and El Camino Real. Streets that run perpendicular to US 101 are assumed to run in an east-west direction, such as Marsh Road, Ravenswood Avenue, Ringwood Avenue, and Willow Road.

Because future commercial tenants in the office/R&D area are not yet known, proposed commercial buildings in the office/R&D area are designed to accommodate either office uses, R&D or life science uses, or a combination of both. Therefore, this report evaluates two buildout scenarios within the office/R&D area: a 100% office scenario and a 100% R&D scenario. This ensures the Proposed Project's maximum potential impact and any future commercial tenant mix is within the scope of the TIA analysis. Office uses would generate more peak-hour trips than R&D uses or a mix of office and R&D uses. Therefore, the 100% office scenario is used to evaluate traffic conditions at study intersections. For the VMT analysis, office/R&D land use is evaluated based on a daily VMT per employee metric, which would be the same whether the land use is office or R&D. Therefore, the VMT analysis addresses the VMT impacts of either scenario.

In addition, a project variant could reasonably be approved instead of the Proposed Project: the Increased Development Variant (Project Variant). The Project Variant is a variation of the Proposed Project at the same Project Site (although the Project Site would be slightly expanded to include 201 Ravenswood Avenue), generally with the same objectives, background, and development controls but with the following differences:

1. The Project Site has been expanded to include the parcel at 201 Ravenswood Avenue to create a continuous Project frontage area along Ravenswood Avenue and increase the overall Project Site by approximately 43,762 square feet (sf) (approximately 1.0 acre), for a total of approximately 64.2 acres;
2. The Project Variant would include up to 250 additional residential rental dwelling units compared to the Proposed Project (an increase from 550 to 800 units, inclusive of up to 154 units to be developed by an affordable housing developer);
3. The Project Variant would reduce the underground parking footprint within the site, both by removing underground parking from the multifamily residential buildings in the residential area and removing the underground parking connection between office/research-and-development (R&D) Building O1 and Building O5. As a result, Parking Garage (PG) 1 and PG2 increase in square footage and height compared to the Proposed Project and the number of structured spaces increases by 400 (with no change in the total number of parking spaces proposed for the office/R&D buildings); and
4. The Project Variant would include an approximately 2- to 3-million-gallon emergency water reservoir that would be buried below grade in the northeast area of the Project Site, in addition to a small pump station, an emergency well, and related improvements that would be built at and below grade (i.e., emergency generator, disinfection system, surge tank) (referred to as "reservoir" throughout this document). It would be built and operated by the city of Menlo Park.

This TIA evaluates both the Proposed Project and the Project Variant. To provide a conservative estimate, the peak-hour trips estimate for the Project Variant assumes a 100% office scenario within the office/R&D area under the Project Variant. The 100% office scenario is used to evaluate traffic conditions at study intersections. For the VMT analysis, office/R&D land use is evaluated based on a daily VMT per employee metric, which would be the same whether the land use is office or R&D. Therefore, the VMT analysis addresses the VMT impacts of either scenario under the Project Variant.

CEQA Vehicle-Miles Traveled Analysis

IMPACT (TRA-2 in Transportation section of the Environmental Impact Report prepared for the Proposed Project): As shown in Table ES-1, the Proposed Project's office/R&D, and residential land uses would not generate VMT exceeding their respective thresholds. Therefore, the project's VMT impact would be less than significant.

**Table ES-1
Office/R&D and Residential VMT Evaluation**

Land Use	Regional Average	VMT Threshold	Project VMT ³	VMT Impact
Office/R&D ¹	15.9	13.6	13.5	No
Residential ²	13.1	11.2	9.7	No

Notes:
 * All data referenced the latest Menlo Park citywide travel demand forecast model.
 1. VMT for office/R&D land use is reported in VMT per employee.
 2. VMT for residential land use is reported in VMT per capita.
 3. Project VMT accounted for implementation of a TDM Plan with 28% trip reduction target for the office/R&D land use, and 25% trip reduction target for the residential land use.

Non-CEQA Levels of Service Transportation Analysis

The following intersections were adversely affected under either near-term plus project or cumulative plus project scenarios during at least one peak hour (see Table ES-2):

- 4. Florence Street/Bohannon Drive and Marsh Road**
- 6. Bay Road and Ringwood Avenue
- 7. US 101 Northbound Ramps and Willow Road
- 9. Bay Road and Willow Road
- 10. Durham Street and Willow Road
- 13. Middlefield Road and Willow Road
- 21. Laurel Street and Encinal Avenue**
- 22. Laurel Street and Glenwood Avenue
- 32. El Camino Real and Ravenswood Avenue/Menlo Avenue**
- 36. University Drive and Valparaiso Avenue**
- 38. Santa Cruz Avenue and Avy Avenue**
- 44. O'Brien Drive and Willow Road
- 45. Newbridge Street and Willow Road
- 46. Bayfront Expressway and University Avenue

Bold denotes intersections that would be non-compliant under cumulative plus project conditions during either AM or PM peak hours but are compliant under near-term plus project conditions during both peak hours.

A micro-simulation analysis was conducted for the study intersections on Middlefield Road and Ravenswood Avenue in the project vicinity to identify potential project effects and improvements along these corridors. The results of the micro-simulation analysis show that the following intersections would be adversely affected by the Proposed Project.

- 15. Middlefield Road and Ravenswood Avenue
- 16. Middlefield Road and D Street/Ringwood Avenue
- 17. Middlefield Road and A Street/Seminary Drive
- 19. Project Driveway B1 West and Ravenswood Avenue
- 20. Project Driveway/Pine Street and Ravenswood Avenue

Notes:
 * Denotes CMP Intersection
 AWSC - All Way Stop Control; TWSC - Two Way Stop Control.
¹ Average delay is reported for signalized and AWSC intersections. For TWSC intersections, the delay for the worst stop-controlled movement is reported.
² Average delay and level of service for the study intersections (7, 8, 41-45) were based off the microsimulation analysis conducted for the Willow Village project. Intersections that showed OVERSAT and LOS F were assumed to operate the same for this project and under project conditions. For intersections that were not shown OVERSAT and LOS F in the Willow Village project, the results from the VISTRO analysis done for this project are reported. "OVERSAT" indicates that the SimTraffic microsimulation model indicates that the intersection would experience capacity issues where the demand cannot be served by the intersection. Oversaturated intersections would operate at LOS F.
³ This assumes 100% office scenario.
⁴ The intersection delay for intersections under project conditions with improvement is compared to without project conditions.
⁵ Intersections fronting the project site are analyzed using a microsimulation model. A cumulative analysis is not completed. Certain intersections would experience capacity issues where the demand cannot be served by the intersection, and are indicated with OVERSAT. Oversaturated intersections would **Bold** indicate substandard level of service
Bold indicates noncompliance. The project exceeds thresholds in the City of Menlo Park's TIA Guidelines.

Adverse Effects and Recommended Improvements

Improvement options were studied for each intersection that were found to be non-compliant under the near-term plus project conditions, and cumulative plus project conditions, were compared to near-term no project, and cumulative no project conditions, respectively. Potential improvement strategies are shown in Table ES-3.

**Table ES-3
Recommended Improvements**

#	Intersection	Potential Improvement Considered	Recommendation
4	Bohannon Drive/Florence Street and Marsh Road	<ul style="list-style-type: none"> - Class II buffered bike lanes along Marsh Road from Bay Road to Scott Road (City's TIF program). - Physical intersection improvements. 	<p>The City's TIF program proposes Class II buffered bike lanes along Marsh Road from Bay Road to Scott Road in both directions, which could shift some motor vehicle traffic to alternative modes of travel and reduce congestion. Implementation of these multi-modal improvements would partially address the Proposed Project's share of the non-compliant operations at this intersection.</p> <p>Physical improvements to increase the intersection capacity are considered infeasible.</p>
6	Bay Road and Ringwood Avenue	<ul style="list-style-type: none"> - A traffic signal. - Physical intersection improvements. 	<p>A traffic signal is not recommended. To effectively operate the signalized intersection, it would be necessary to close off Sonoma Avenue from the intersection or convert Sonoma Avenue to one-way street, so the intersection would operate as a four-leg intersection. Restricting the access to Sonoma Avenue from the intersection is undesirable.</p> <p>Physical improvements to increase the intersection capacity are considered infeasible.</p>
9	Bay Road and Willow Road	<ul style="list-style-type: none"> - Modifying the southbound approach at this intersection to two left-turn lanes and one right-turn lane and modifying the westbound approach to add a right-turn lane (City's TIF program). 	<p>This improvement would require removing trees in the median and adjacent to the intersection, which is undesirable. Therefore, the improvement is not recommended.</p>
10	Durham Street and Willow Road	<ul style="list-style-type: none"> - Restriping southbound Hospital Plaza to include 1 left-turn, and 1 shared through-right lane. North/south legs operate with protected phasing. 	<p>With this improvement, the PM peak hour non-compliance would be eliminated. If this recommended improvement measure is implemented, the Project should contribute its fair share towards the improvement.</p>
7, 44, 45	US 101 NB Ramps, O'Brien Drive, Newbridge Street, at Willow Road	<ul style="list-style-type: none"> - An adaptive traffic signal coordination system on the Willow Road corridor to improve traffic flow (City's project). - Multi-modal improvements along the Willow Road corridor (City's TIF program). - Physical intersection improvements. 	<p>The TIF program proposes multi-modal improvements along this section of Willow Road, which could shift some motor vehicle traffic to alternative modes of travel and reduce congestion. With implementation of these multi-modal improvements, the intersection deficiencies could be further reduced and partially address the Proposed Project's share of the non-compliant operations along Willow Road.</p> <p>Physical improvements to increase the intersection capacity are considered infeasible.</p>
13	Middlefield Road and Willow Road	<ul style="list-style-type: none"> - Physical intersection improvements. - A roundabout. 	<p>It is infeasible to add lanes to increase the capacity of the intersection. A potential improvement is to provide a roundabout with a bypass lane for westbound right-turn traffic. However, the improvement would require additional detailed analysis to determine its feasibility.</p>

**Table ES-3 (Continued)
Recommended Improvements**

#	Intersection	Potential Improvement Considered	Recommendation
21	Laurel Street and Encinal Avenue	<ul style="list-style-type: none"> - Installing sidewalks or an asphalt pathway on western side of Laurel Street between Encinal Avenue and Glenwood Avenue (City's TIF program). - A traffic signal. - Physical intersection improvements. 	<p>The TIF program proposes to install sidewalks or an asphalt pathway on western side of Laurel Street between Encinal Avenue and Glenwood Avenue, which could shift some motor vehicle traffic to alternative modes of travel, reduce congestion, and partially address the Proposed Project's share of the non-compliant operations at this intersection.</p> <p>The City currently has no plans to install traffic signals at the intersection. Other physical improvements to increase the intersection capacity are considered infeasible.</p>
22	Laurel Street and Glenwood Avenue	<ul style="list-style-type: none"> - Installing sidewalks or an asphalt pathway on western side of Laurel Street between Encinal Avenue and Glenwood Avenue (City's TIF program). 	<p>The TIF program proposes to install sidewalks or an asphalt pathway on western side of Laurel Street between Encinal Avenue and Glenwood Avenue, which could shift some motor vehicle traffic to pedestrian modes of travel, reduce congestion, and partially address the Proposed Project's share of the non-compliant operations at this intersection.</p>
32	El Camino Real and Ravenswood Avenue/Menlo Avenue	<ul style="list-style-type: none"> - Multimodal improvements (City's TIF program). - Reducing project trips through land use and TDM. 	<p>The multi-modal improvements could shift some motor vehicle traffic to alternative modes of travel, reduce congestion, and partially address the Proposed Project's share of the non-compliant operations at this intersection.</p> <p>A sensitivity analysis shows that the 100% R&D scenario with 30% TDM trip reductions would be sufficient to avoid the adverse effect of the Proposed Project on intersection operations.</p>
36	University Drive and Valparaiso Avenue	<ul style="list-style-type: none"> - Physical intersection improvements. - A traffic signal. 	<p>Physical improvements to increase the intersection capacity are considered infeasible.</p> <p>Periodic monitoring of traffic operations at this intersection should be conducted to determine if signalization is needed. If warranted, implementation of the new traffic signal would address the Proposed Project's share of the non-compliant operation and bring the intersection into compliance with the TIA Guidelines.</p>
38	Santa Cruz Avenue and Ayo Avenue	<ul style="list-style-type: none"> - Reducing the curb radius at the southeast corner of intersection and bringing bicycle lane to the left side of the northbound Santa Cruz Avenue right-turn lane (City's TIF program). - Class II bicycle lanes on Ayo Avenue between Santa Cruz Avenue and Monte Rosa Drive by removing on-street parking (City's TIF program). - Reducing project trips through land use and TDM. 	<p>The TIF programs would improve bicycle travel through the intersection. Implementing these multi-modal facility improvements could shift some motor vehicle traffic to alternative modes of travel, reduce congestion, and partially address the Proposed Project's share of the non-compliant operations at this intersection.</p> <p>A sensitivity analysis shows that the 100% R&D scenario with 40% TDM trip reductions would be sufficient to avoid the adverse effect of the Proposed Project on intersection operations.</p>
46	Bayfront Expressway and University Avenue	<ul style="list-style-type: none"> - Evaluating the potential for grade separation to allow conflicting movements to occur simultaneously at the intersection (City's TIF program). - Restriping Bayfront Expressway to add bus-only lanes on the shoulders during peak periods and implementing signal timing improvements (MTC Dumbarton Forward project). 	<p>The TIF program could potentially improve traffic operation, the improvement is considered infeasible due to right-of-way constraints and/or adverse effects on adjacent wetlands and the Dumbarton Rail corridor.</p> <p>Specific details are unknown regarding the Dumbarton Forward project improvements at the intersection. The improvements' effectiveness in addressing the Project's adverse effect on traffic operations cannot be determined. Furthermore, since this project is not led by the City of Menlo Park, implementation cannot be guaranteed.</p>

**Table ES-3 (Continued)
Recommended Improvements**

#	Intersection	Potential Improvement Considered	Recommendation
15	Middlefield Road and Ravenswood Avenue	Based on the micro-simulation analysis, the following improvements were identified to improve traffic operations along Middlefield Road and Ravenswood Avenue in the immediate project vicinity:	
16	Middlefield Road and Ringwood Avenue	- Changing the east/west phasing at Middlefield Road and Ringwood Avenue (#16) from permitted to split phasing and modifying the signal timings at Middlefield Road & Ravenswood Avenue (#15). The analysis assumed half cycle length at the Middlefield/Ravenswood intersection during the PM peak hour.	
17	Middlefield Road and Seminary Drive	- A new traffic signal at Middlefield Road and Seminary Drive (#17) with protected north/south phasing and split east/west phasing and optimized cycle length. Through movements on Seminary Drive should be prohibited with physical islands.	
19	Project Driveway B1 West and Ravenswood Avenue	- Extension of the northbound left-turn storage length at Middlefield Road and Seminary Drive (#17) to 325 feet.	
20	Project Driveway/Pine Street and Ravenswood Avenue	- Adding medians with left-turn pockets or two-way left-turn lane along Ravenswood Avenue between the proposed project driveway at W First Street and Laurel Street.	

Intersection Queuing Analysis

The analysis of intersection levels of service was supplemented with a vehicle queuing analysis for intersection left-turning movements where the Proposed Project would add significant trips per lane in the vicinity of the Project Site and affect intersection operations. Locations where the estimated 95th percentile queues would exceed the available storage capacity for the movement are discussed below. Queuing issues are operational issues resulting from signal timing and queue storage provisions. Queuing issues are not considered a CEQA issue related to hazards because they are not related to a geometric design feature or incompatible use.

Southbound Left-Turn at Bay Road and Willow Road (#9)

Under near-term conditions, the 95th percentile queue would exceed the storage length of the turn lane by 7 vehicles during the AM peak hour. The Proposed Project would add one vehicle to the 95th percentile queue during the AM peak hour and cause the 95th percentile queue to exceed the storage length by 2 vehicles during the PM peak hour. The southbound approach on Bay Road is 24 feet wide for approximately 380 feet long north of Willow Road, which can be striped to provide 2 approach lanes with the inside lane being used by the left turn traffic. It should be noted that this improvement is not desired because it would require tree removal and lane widening.

Southbound Left-Turn at Middlefield Road and Willow Road (#13)

Under near-term conditions, the 95th percentile queue would exceed the storage length of the turn lane by 2 vehicles during the PM peak hour. The Proposed Project would add 9 vehicles to the 95th percentile queue during the PM peak hour and cause the 95th percentile queue to exceed the storage length by one vehicle during the AM peak hour. There is no room to further extend this left-turn lane. It is also infeasible to add a turn lane to increase the storage capacity for the southbound left-turn lane.

Southbound Left-Turn at El Camino Real and Ravenswood Avenue (#32)

The Proposed Project would cause the 95th percentile queue to exceed the storage length by 8 vehicles during the AM peak hour. There is no room to further extend this left-turn lane. It is also infeasible to add a turn lane to increase the storage capacity for the southbound left-turn lane.

Westbound Left-Turn at El Camino Real and Ravenswood Avenue (#32)

Under near-term conditions, the 95th percentile queue would exceed the storage of the left-turn lane by 3 vehicles in the AM peak hour and one vehicle in the PM peak hour. The Proposed Project would cause the 95th percentile queue to exceed the storage length by 4 vehicles during the AM peak hour and 5 vehicles in the PM peak hour. There is no room to further extend the left-turn lanes because this would require removing trees and the signage in the median. It is also infeasible to add a turn lane to increase the storage capacity for the left-turn movement.

Micro-Simulation Queueing Analysis

The micro-simulation analysis was conducted to evaluate traffic operations and vehicles queuing along the Middlefield Road and Ravenswood Avenue. Due to the close proximity of the study intersections on Middlefield Road and Ravenswood Avenue, the micro-simulation analysis showed that the Proposed Project would contribute to significant traffic congestion along Middlefield Road. The following study intersections along the corridors would experience 95th percentile queues that extend beyond the existing left-turn storage capacity during at least one of the peak hours under near-term plus project conditions. The 95th percentile queues for through lanes along Middlefield Road and Ravenswood Avenue are also estimated to extend from one intersection to an upstream intersection.

- Middlefield Road and Ravenswood Avenue (#15)
- Middlefield Road and Ringwood Avenue (#16)
- Middlefield Road and Seminary Drive (#17)
- Laurel Street and Ravenswood Avenue (#24)

With the identified improvements described in Table ES-3, traffic operations would improve significantly along Middlefield Road near the Project Site with reduced vehicle queues. However, 95th percentile queues would still extend beyond the existing left-turn storage capacity.

Freeway Facilities Analysis

A freeway analysis is conducted under cumulative plus project conditions. The Proposed Project would add traffic greater than 1% capacity to the following study freeway segments operating below its LOS standard:

- SR 84 – from Alameda County Line to University Avenue – AM Peak Hour
- US 101 – between Santa Clara County Line and Whipple Avenue – AM & PM Peak Hours

It should be noted that the cumulative plus project conditions model run assumed the US 101 express lane project in San Mateo County. Improvements to eliminate the adverse freeway effects on US 101 and on SR 84 within San Mateo County would require additional capacity improvements and/or additional TDM measures that would reduce peak-hour vehicle trip-making by more than 60%. San Mateo County currently has no plans to further improve US 101 beyond the identified express lane projects. There are also no identified plans to improve the Bayfront Expressway (SR 84) corridor. Such an aggressive TDM plan would also not be feasible.

The Proposed Project's adverse effects on US 101 and on SR 84 freeway segments in San Mateo County would remain.

Freeway Ramp Analysis

A freeway ramp analysis is conducted under near term plus project conditions to determine whether freeway ramps would continue to have sufficient capacity to serve the forecasted traffic demand. Under near term plus project conditions, all study freeway ramps would continue to have sufficient capacity to serve the anticipated demand.

Site Access, Circulation, and Parking

Hexagon recommends the following regarding the internal Project Site circulation:

- The Proposed Project should ensure any landscaping and signage will be located in such a way as to ensure an unobstructed view for drivers entering and exiting the site.
- Prior to final design, the Project Sponsor shall coordinate with City staff to ensure the site driveways, parking aisles, parking spaces, multimodal facility improvements are designed per City standards.

Project Variant Analysis

The Project Variant would not result in additional CEQA significant impacts or adverse transportation operational effects compared to the Proposed Project.

For intersection levels of service analysis, the improvements recommended for the Project Variant would be the same as those for the Proposed Project, as there are no additional improvements that can be recommended given the existing right-of-way.

1. Introduction

This report presents the results of the Transportation Impact Analysis (TIA) conducted for Parkline (Proposed Project) in Menlo Park, California (see Figure 1). Lane Partners (Project Sponsor) is proposing to redevelop SRI International's existing 63.2-acre research campus adjacent to city hall and near Menlo Park's downtown and Caltrain station (Project Site). The Proposed Project would include a new office/research and development (R&D) campus with no increase in office/R&D square footage; up to 550 new rental dwelling units at a range of affordability levels (comprised of 450 multi-family units and townhomes, and a proposed land dedication to an affordable housing developer that could accommodate up to 100 affordable units); new bicycle and pedestrian connections; and approximately 26 acres of the Project Site to be available as open space. In total, the Proposed Project would result in approximately 1,768,802 square feet (sf) of mixed-use development, with approximately 1,093,602 sf of office/R&D uses and approximately 675,200 sf of residential uses. The Proposed Project would demolish all buildings on SRI International's Campus, excluding Buildings P, S, and T, which would remain onsite and be operated by SRI International. The proposed dwelling units would consist of studio units and one-, two-, and three-bedroom units that would be distributed throughout four residential multi-family buildings and 19 townhouses. Consistent with the city's inclusionary housing requirements, 15 percent of these dwelling units (68 dwelling units) would be below-market rate (BMR) housing. Beyond the BMR requirement, an additional 100 dwelling units to be developed by an affordable housing developer would all be affordable and located within one building. Access to the residential area would be provided via driveways on Laurel Street and on Ravenswood Avenue (see Figure 2). Access to the office/R&D area would be provided via driveways on Ravenswood Avenue and Middlefield Road.

The existing road network is not laid out consistent with the cardinal directions. As a result, for the purpose of this report, streets that run parallel to US 101 are assumed to run in a north-south direction, such as Middlefield Road and El Camino Real. Streets that run perpendicular to US 101 are assumed to run in an east-west direction, such as Marsh Road, Ravenswood Avenue, Ringwood Avenue, and Willow Road.

Because future commercial tenants in the office/R&D area are not yet known, proposed commercial buildings in the office/R&D area are designed to accommodate either office uses, R&D or life science uses, or a combination of both. Therefore, this report evaluates two buildout scenarios within the office/R&D area: a 100% office scenario and a 100% R&D scenario. This ensures the Proposed Project's maximum potential impact and any future commercial tenant mix is within the scope of the TIA analysis. Office uses would generate more peak hour trips than R&D uses or a mix of office and R&D uses. Therefore, the 100% office scenario is used to evaluate traffic conditions at study intersections. For the VMT analysis, office/R&D land use is evaluated based on a daily VMT per employee metric,

which would be the same whether the land use is office or R&D. Therefore, the VMT analysis addresses the VMT impacts of either scenario.

In addition, a project variant could reasonably be approved instead of the Proposed Project: the Increased Development Variant (Project Variant). The Project Variant is a variation of the Proposed Project at the same Project Site (although the Project Site would be slightly expanded), generally with the same objectives, background, and development controls but with the following differences compared to the Proposed Project:

- 1) The Project Variant Site would include the Project Site and the parcel at 201 Ravenswood Avenue to create a continuous Project frontage area along Ravenswood Avenue and increase the size of the overall Project Site by approximately 43,762 sf (approximately 1.0 acre) to a total of approximately 64.2 acres;
- 2) The Project Variant would include up to 250 additional residential rental dwelling units compared to the Proposed Project (an increase from 550 to 800 units, inclusive of up to 154 units to be developed by an affordable housing developer);
- 3) The Project Variant would reduce the underground parking footprint within the site, both by removing underground parking from the multifamily residential buildings in the residential area and removing the underground parking connection between Building 1 (O1) and Building 05 in the office/R&D area. As a result, Parking Garage (PG) 1 and PG2 increase in square footage and height compared to the Proposed Project and the number of structured spaces increases by 400 (with no change in the total number of parking spaces proposed for the office/R&D buildings); and
- 4) The Project Variant would include an approximately 2 to 3-million-gallon emergency water reservoir that would be buried below grade at the northeast area of the Project Site, in addition to a small pump station and related improvements to be built at-grade. It would be built and operated by the city of Menlo Park.

This TIA evaluates both the Proposed Project and the Project Variant. To provide a conservative estimate, the peak hour trips estimate for the Project Variant assumes a 100% office scenario within the office/R&D area under the Project Variant. The 100% office scenario is used to evaluate traffic conditions at study intersections. For the VMT analysis, office/R&D land use is evaluated based on a daily VMT per employee metric, which would be the same whether the land use is office or R&D. Therefore, the VMT analysis addresses the VMT impacts of either scenario under the Project Variant. Chapter 4 includes an analysis of the Project Variant.

Scope of Study

The purpose of the transportation study is to identify any transportation operational issues in accordance with City of Menlo Park standards and procedures. This report includes a CEQA VMT analysis, multimodal analysis, non-CEQA level of service (LOS) analysis (or roadway congestion analysis), and on-site access and circulation review to inform local planning efforts per the City's TIA Guidelines.

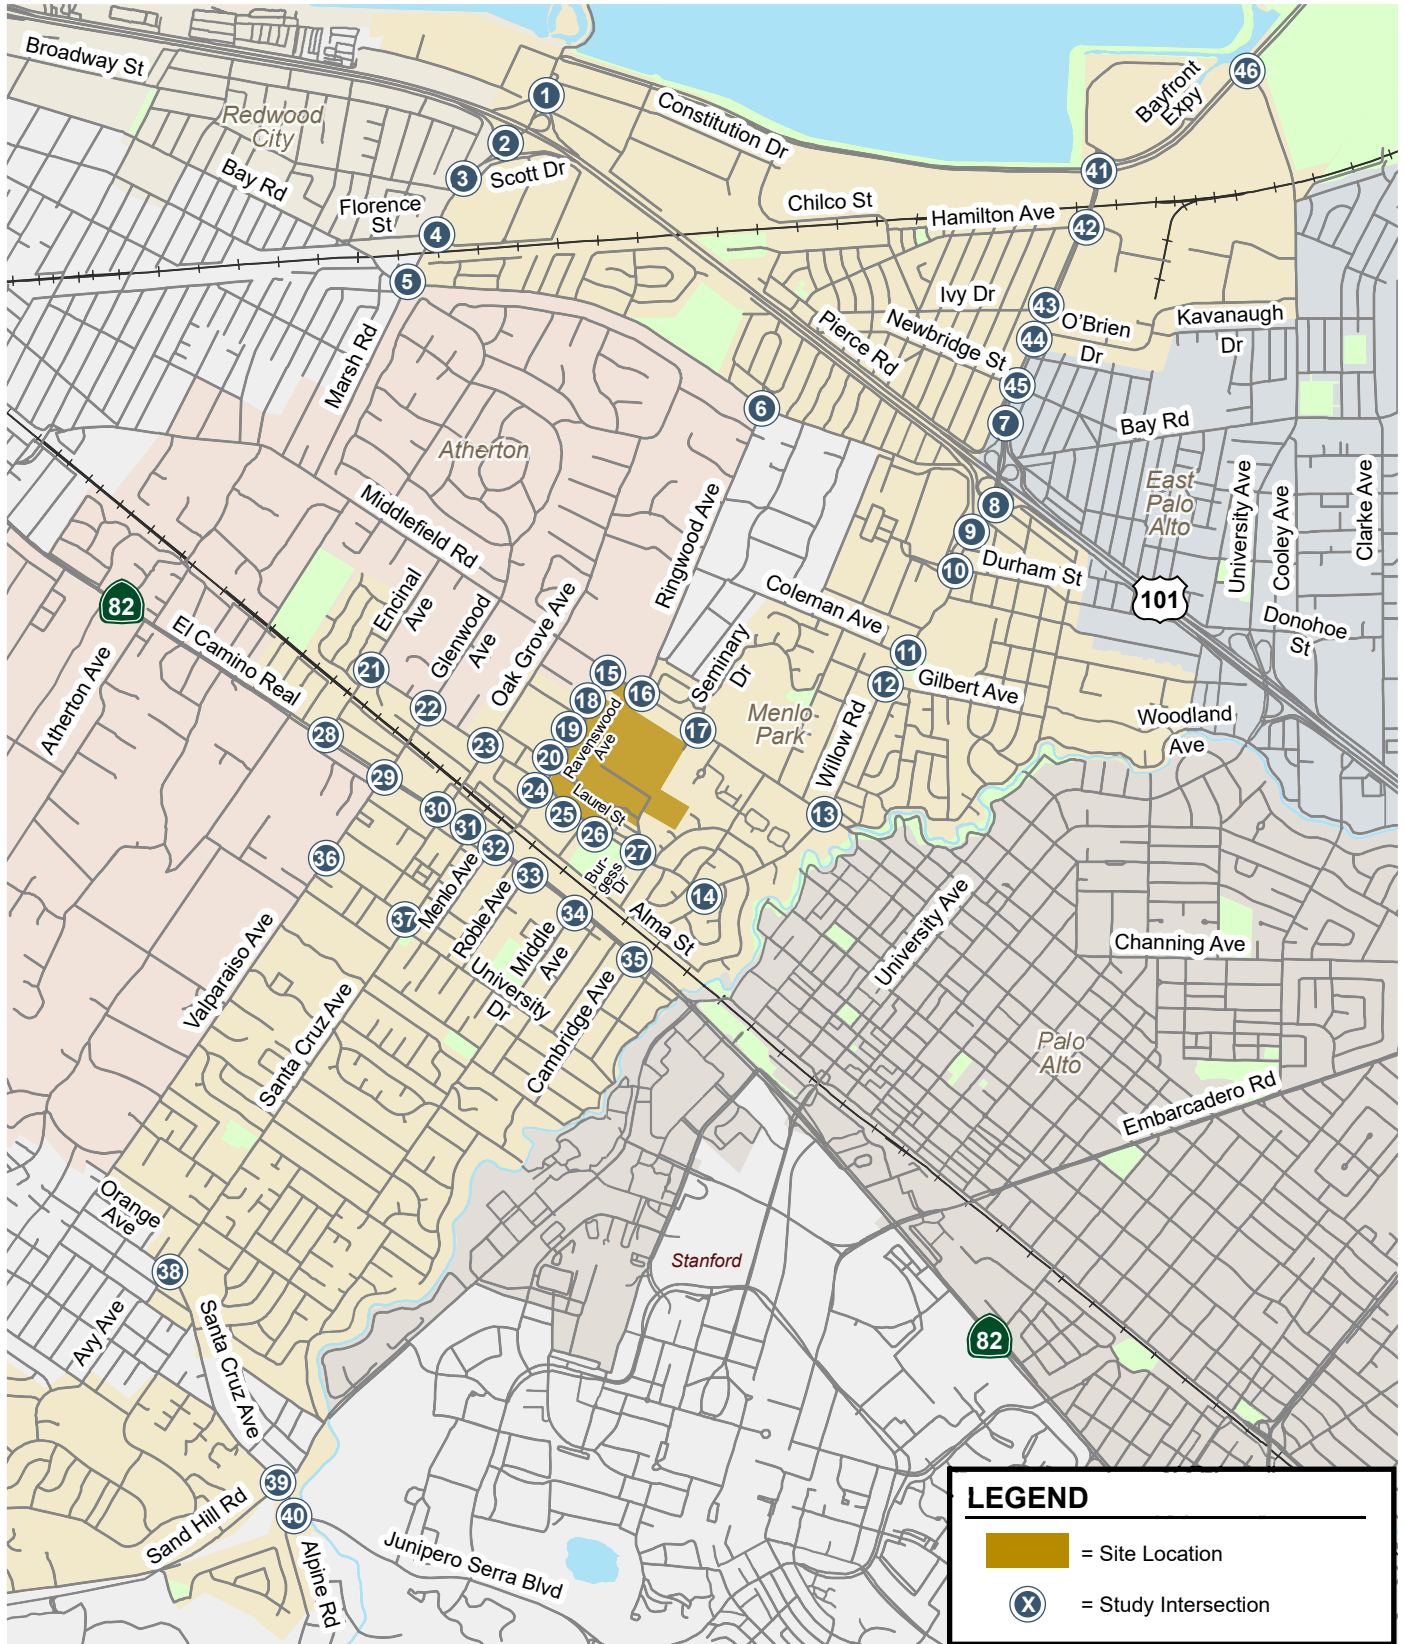

Figure 1
Site Location and Study Intersections

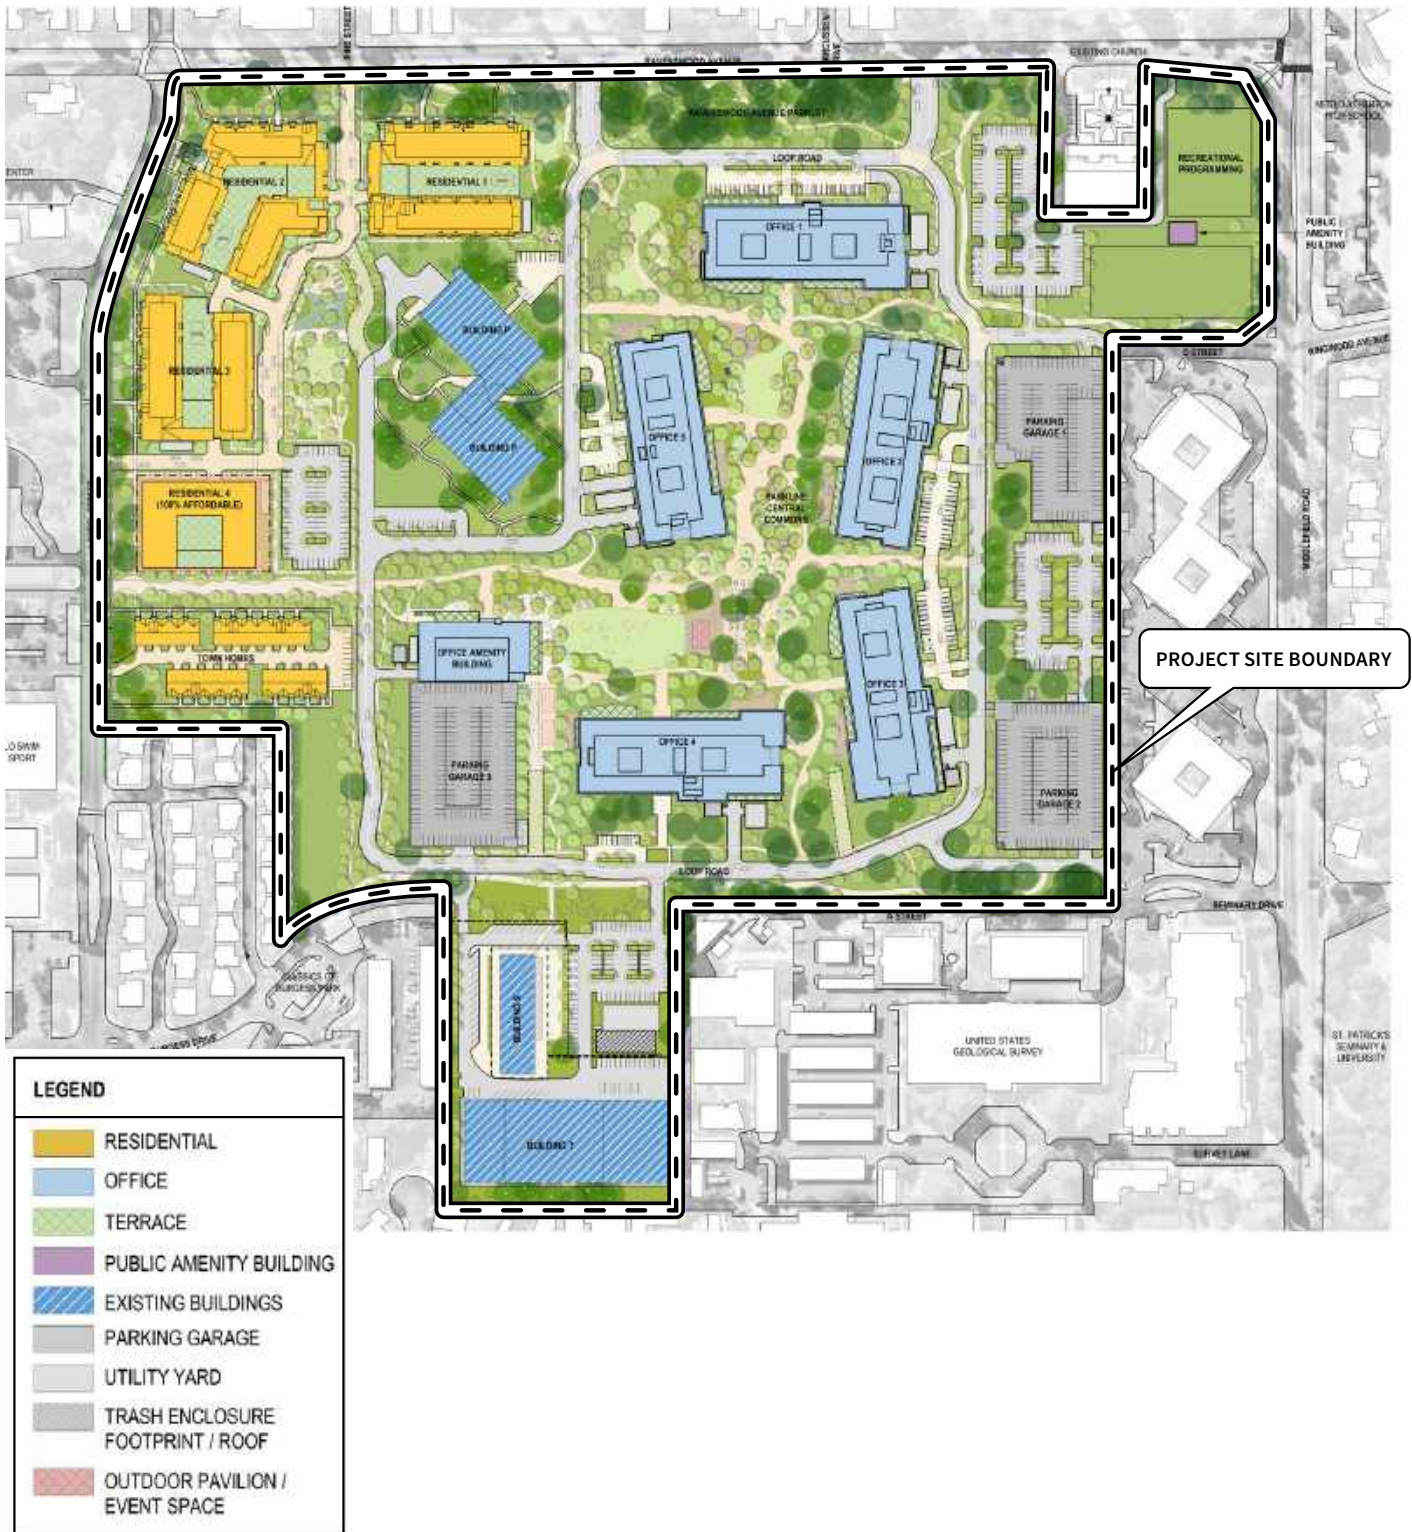

Figure 2
Project Site Plan

CEQA VMT Analysis

Per the City of Menlo Park VMT guidelines adopted in July 2020 and updated in January 2022, mixed-use projects will have each component analyzed independently against the appropriate thresholds. The Proposed Project would include office/R&D and residential land uses. OPR's *Technical Advisory on Evaluating Transportation Impacts in CEQA* recommends that VMT analysis for a mixed-use project should account for internal capture. Internal capture is defined as walking, bicycling, and tram trips between the various types of land use within the Project Site. By reducing external vehicle trips, internal capture reduces VMT for a mixed-use project in comparison to single-use developments. Each of the Proposed Project's land uses' VMT threshold of significance is listed below:

- An office/R&D project is considered to have a significant impact on VMT if the project's VMT exceeds a threshold of 15 percent below the regional average VMT per employee.
- A residential project is considered to have a significant impact on VMT if the project's VMT exceeds a threshold of 15 percent below the regional average VMT per capita.

Non-CEQA Level of Service (Roadway Congestion Analysis)

An LOS analysis was conducted to identify whether the Proposed Project would comply with local policies.

The traffic analysis is based on the AM and PM peak-hour level of service for 35 signalized intersections and 11 unsignalized intersections in the vicinity of the Project Site as illustrated in Figure 1. Traffic conditions at the study intersections were analyzed for the weekday AM and PM peak hours of adjacent street traffic. The AM peak hour is expected to occur between 7:00 AM and 9:00 AM, and the PM peak hour between 4:00 PM and 6:00 PM on a typical weekday. These are the hours during which most traffic congestion occurs on the roadways.

The Proposed Project would generate more than 100 peak-hour trips. The San Mateo County City/County Association of Governments (C/CAG) administers the Congestion Management Plan (CMP). Therefore, an analysis in accordance with the C/CAG CMP guidelines is included.

- Northbound on-ramp from eastbound Willow Road
- Southbound on-ramp from eastbound Willow Road
- Southbound off-ramp to Willow Road

Traffic conditions were evaluated for the following scenarios:

- Scenario 1:** *Existing Conditions.* Existing traffic volumes at the study intersections are based on 2022/2023 traffic counts conducted for the Proposed Project and/or previous studies for other nearby developments.
- Scenario 2:** *Near-term (2027) Conditions.* The near-term scenario assumed a year 2027 horizon¹ and was analyzed using the model. Traffic volumes were obtained from the Menlo Park Travel Demand Model and adjusted based on existing counts and model results. In addition, traffic and roadway improvements associated with the approved developments were assumed as directed by City Staff.
- Scenario 3:** *Near-term (2027) plus Project Conditions.* Project-generated traffic was added to the near-term condition traffic volumes. The near-term plus project scenario was evaluated relative to the near-term scenario.
- Scenario 4:** *Cumulative (2040) Conditions.* 2040 model run results for the City of Menlo Park were used to describe operating conditions at the study intersections under cumulative (2040) conditions. The City has determined that the Proposed Project was included in the Year 2040 model forecasts. Therefore, the cumulative (2040) no project traffic volumes were estimated by subtracting the trips generated by the Proposed Project from the cumulative (2040) plus project traffic volumes.
- Scenario 5:** *Cumulative (2040) Plus Project Conditions.* The cumulative plus project scenario was analyzed using the model. The cumulative plus project scenario was evaluated relative to the cumulative scenario.

Methodology

This section presents the methods used to determine the traffic conditions at study intersections for each scenario described above. It includes descriptions of the data requirements, the analysis methodologies, and the applicable level of service standards and criteria used to determine if a project is compliant with local policies.

Data Requirements

The data required for the analysis were obtained from the City of Menlo Park, field observations, and previous studies. The following data were obtained from these sources:

- existing peak-hour intersection turning-movement volumes,
- existing lane configurations,
- signal timing and phasing, and
- list of approved and pending projects.

Existing counts and field observations were conducted prior to the COVID19 pandemic. No adjustments to the data were made based on pandemic conditions.

¹ 2027 is the earliest year for expected occupancy when this analysis started. The expected occupancy has since been revised to year 2031. However, as discussed in detail later in this study, there would be no substantive changes to any conclusions whether the near-term scenario is studied with a horizon year of 2027 or 2031.

Intersection Level of Service Methodologies

Traffic conditions were evaluated using level of service (LOS). Level of service is a qualitative description of operating conditions ranging from LOS A, or free-flow conditions with little or no delay, to LOS F, or forced-flow conditions with extreme delays.

As stated above, LOS is no longer a CEQA threshold. However, the General Plan and City's TIA Guidelines require that the TIA also analyze LOS for local planning purposes (per General Plan Program Circ-3.A Transportation Impact Metrics):

Supplement Vehicle Miles Traveled (VMT) and greenhouse gas emissions per service population (or other efficiency metric) metrics with Level of Service (LOS) in the transportation impact review process, and utilize LOS for identification of potential operational improvements, such as traffic signal upgrades and coordination, as part of the Transportation Master Plan.

The LOS analysis would determine whether the project traffic would cause an intersection LOS to exceed the City's LOS thresholds or cause either the average delay or average critical delay to exceed the City's intersection delay thresholds under near term and cumulative conditions. The LOS and delay thresholds vary depending on the street classifications as well as whether the intersection is on a State route or not.

The City's TIA Guidelines further require an analysis of the Proposed Project in relation to relevant policies of the Circulation Element and consideration of specific measures to address noncompliance with local policies which may occur as a result of the addition of project traffic. The TIA identifies measures that could be applied as conditions of approval that would bring operations back to pre-project levels. Although not included in the TIA, an analysis may be prepared separately to determine if there are potential measures that could bring the Proposed Project into conformance with the LOS goals of Circulation Policy 3.4. Implementation of any such measures would require review and approval by City decision makers.

Macroscopic Analysis of Signalized Intersections

Traffic operations at the signalized study intersections in the City of Menlo Park were evaluated using the VISTRO software based on the level of service method described in the Highway Capacity Manual (HCM) 7th Edition. Table 1 shows the level of service definitions for signalized intersections.

Microscopic Simulation of Study Intersections

Six study intersections on Middlefield Road and Ravenswood Avenue in the immediate vicinity of the Project Site (intersections #15, #16, #17, #19, #20, and #24) were analyzed using the Synchro/SimTraffic software (version 12), see Appendix B. These site-accessing intersections would be closely spaced. Potential improvements such as signalization at certain intersections could generate queuing issues that would not be adequately reflected if intersections were studied in isolation using the VISTRO software. Unlike macroscopic models of isolated intersection operations such as the Highway Capacity Manual methodology, SimTraffic is a microscopic model that measures the full impact of queuing and blocking of intersections. This software also provides a visual animation of the traffic operations. Simulated delay values were correlated to the level of service definitions set forth in the Highway Capacity Manual (HCM) 7th Edition methodology.

The SimTraffic model was calibrated and validated to existing conditions based on existing lane geometry, existing AM and PM peak hour traffic counts, observed peak-hour vehicular queues, and the observed signal timing.

Unsignalized Intersections

Peak-hour levels of motor vehicle delay at the unsignalized study intersections in the City of Menlo Park were evaluated using the VISTRO software based on the HCM 7th Edition. With these methods, operations are defined by the average control delay per vehicle (measured in seconds) for each movement that must yield the right-of-way. At side-street controlled intersections (two-way or one-way stop control), the control delay (and LOS) is reported for the approach with the highest delay. For all-way stop-controlled intersections, the average delay (and LOS) for all movements is reported. Table 2 summarizes the relationship between average control delay per vehicle and LOS for unsignalized intersections.

Traffic Signal Warrant Analysis

An assessment of the need for signalization was conducted for unsignalized study intersections. For this study, the need for signalization was assessed on the basis of the peak-hour volume signal warrant (Warrant #3) described in the 2014 California Manual on Uniform Traffic Control Devices (CA MUTCD). This method provides an indication of whether traffic conditions and peak-hour traffic levels are, or would be, sufficient to justify the installation of a traffic signal. It should be noted that it is just one of the factors/warrants used to indicate whether installation of a traffic control signal is justified.

**Table 1
Signalized Intersection Level of Service Definitions Based on Control Delay**

Level of Service	Description	Average Control Delay Per Vehicle (sec.)
A	Signal progression is extremely favorable. Most vehicles arrive during the green phase and do not stop at all. Short cycle lengths may also contribute to the very low vehicle delay.	10.0 or less
B	Operations characterized by good signal progression and/or short cycle lengths. More vehicles stop than with LOS A, causing higher levels of average vehicle delay.	10.1 to 20.0
C	Higher delays may result from fair signal progression and/or longer cycle lengths. Individual cycle failures may begin to appear at this level. The number of vehicles stopping is significant, though many still pass through the intersection without stopping.	20.1 to 35.0
D	The influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable signal progression, long cycle lengths, or high volume-to-capacity (V/C) ratios. Many vehicles stop and individual cycle failures are noticeable.	35.1 to 55.0
E	This is considered to be the limit of acceptable delay. These high delay values generally indicate poor signal progression, long cycle lengths, and high volume-to-capacity (V/C) ratios. Individual cycle failures occur frequently.	55.1 to 80.0
F	This level of delay is considered unacceptable by most drivers. This condition often occurs with oversaturation, that is, when arrival flow rates exceed the capacity of the intersection. Poor progression and long cycle lengths may also be major-contributing causes of such delay levels.	greater than 80.0

Table 2
Unsignalized Intersection Level of Service Definition Based on Average Delay

Level of Service	Description	Average Control Delay Per Vehicle (sec.)
A	Little or no traffic delay	10.0 or less
B	Short Traffic delays	10.1 to 15.0
C	Average traffic delays	15.1 to 25.0
D	Long traffic delays	25.1 to 35.0
E	Very long traffic delays	35.1 to 50.0
F	Extreme traffic delays	greater than 50.0

Source: Transportation Research Board, *Highway Capacity Manual 7th Edition* (Washington, D.C., 2010)

Freeway Segments

Freeway segments within the County of San Mateo are evaluated by using the volume-to-capacity (V/C) ratio method according to the City/County Association of Governments (C/CAG) CMP guidelines. The CMP specifies varying capacities be used based on the number of lanes and the free-flow travel speed. The County of San Mateo freeway segment V/C ratio is correlated to level of service as shown in Table 3.

Freeway Ramps

A freeway ramp analysis was performed in order to verify that the freeway ramps would have sufficient capacity to serve the expected traffic volumes with and without the Proposed Project. This analysis consisted of a volume-to-capacity ratio evaluation of the freeway ramps at the study interchanges. The ramp capacities were obtained from the *Highway Capacity Manual 2000*, and considered the free-flow speed, number of lanes on the ramp, and ramp metering.

**Table 3
Freeway Segment Level of Service Definition**

Level of Service	Description	San Mateo County ¹
		Maximum V/C Ratio
A	Average operating speeds at the free-flow speed generally prevail. Vehicles are almost completely unimpeded in their ability to maneuver within the traffic stream.	0.28
B	Speeds at the free-flow speed are generally maintained. The ability to maneuver within the traffic stream is only slightly restricted, and the general level of physical and psychological comfort provided to drivers is still high.	0.46
C	Speeds at or near the free-flow speed of the freeway prevail. Freedom to maneuver within the traffic stream is noticeably restricted, and lane changes require more vigilance on the part of the driver.	0.67
D	Speeds begin to decline slightly with increased flows at this level. Freedom to maneuver within the traffic stream is more noticeably limited, and the driver experiences reduced physical and psychological comfort levels.	0.85
E	At this level, the freeway operates at or near capacity. Operations in this level are volatile, because there are virtually no usable gaps in the traffic stream, leaving little room to maneuver within the traffic stream.	1
F	Vehicular flow breakdowns occurs. Large queues form behind breakdown points.	greater than 1

Level of Service Standards and Adverse Effect Criteria

City of Menlo Park Definition of Adverse Effect

The following thresholds are from the City of Menlo Park’s TIA Guidelines and the Proposed Project’s compliance with local policies was evaluated based on these thresholds.

- A project is considered potentially noncompliant with local policies if the addition of project traffic causes an intersection on a collector street operating at LOS “A” through “C” to operate at an unacceptable level (LOS “D,” “E” or “F”) or have an increase of 23 seconds or greater in average vehicle delay, whichever comes first. Potential noncompliance shall also include a project that causes an intersection on arterial streets or local approaches to State controlled signalized intersections operating at LOS “A” through “D” to operate at an unacceptable level (LOS “E” or “F”) or have an increase of 23 seconds or greater in average vehicle delay, whichever comes first.
- A project is also considered potentially noncompliant if the addition of project traffic causes an increase of more than 0.8 seconds of average delay to vehicles on all critical movements for

intersections operating at a near-term LOS “D” through “F” for collector streets and at a near-term LOS “E” or “F” for arterial streets. For local approaches to State controlled signalized intersections, a project is considered to be potentially noncompliant if the addition of project traffic causes an increase of more than 0.8 seconds of delay to vehicles on the most critical movements for intersections operating at a near-term LOS “E” or “F.”

State (Caltrans) Controlled Intersection Definition of Adverse Effect

For signalized intersections involving two state routes, the Proposed Project is considered potentially non-compliant with local policies if for any peak hour:

- The level of service degrades from an acceptable LOS D or better under existing conditions to an unacceptable LOS E or F under existing plus project conditions, and the average delay per vehicle increases by four seconds or more, or
- The level of service is an unacceptable LOS E or F under existing conditions and the addition of project trips causes an increase in the average control delay at the intersection by four seconds or more.

Unsignalized Intersection Definition of Adverse Effect

At an unsignalized intersection, the Proposed Project is considered to have an adverse effect if it:

- Causes operations to degrade from LOS D or better to LOS E or F; or
- Exacerbates LOS E or F conditions by increasing control delay by five or more seconds; and
- Causes volumes under project conditions to exceed the Caltrans Peak-Hour Volume Warrant Criteria.

Intersection Vehicle Queuing Analysis

For selected high-demand movements at the study intersections, the estimated maximum vehicle queues were compared to the existing or planned storage capacity. The queuing analysis is used to determine the appropriate storage lengths for the high-demand turn lanes where the Proposed Project would add a substantial number of trips to these movements. Vehicle queues were estimated using VISTRO for intersections analyzed with this software.

The basis of the analysis is as follows: (1) VISTRO is used to estimate the 95th percentile maximum number of queued vehicles per signal cycle for a particular movement; (2) the estimated maximum number of vehicles in the queue is translated into a queue length, assuming 25 feet per vehicle; and (3) the estimated maximum queue length is compared to the existing or planned available storage capacity for the movement.

For signalized intersections, the 95th percentile queue length value indicates that during the peak hour, a queue of this length or less would occur on 95th percent of the signal cycles. In other words, a queue length larger than the 95th percentile queue would only occur on five percent of the signal cycles (about three cycles during the peak hour for a signal with a 60-second cycle length). Therefore, left-turn storage pocket designs based on the 95th percentile queue length would ensure that storage space would be exceeded only five percent of the time. The 95th percentile queue length is also known as the “design queue length.”

2. CEQA VMT Analysis

Project VMT is defined as the total distance traveled by vehicles traveling to and from the Proposed Project over a typical day. In order to estimate VMT for the various land use components, the citywide travel demand forecast model was used. The citywide model is the best available model to represent travel within the City of Menlo Park, and serves as the primary forecasting tool for the City. The model is a mathematical representation of travel within the nine Bay Area counties, as well as the Santa Cruz, San Benito, Monterey and San Joaquin counties. The base model structure was developed by the Metropolitan Transportation Commission (MTC) and further refined by the City/County Association of Governments and Santa Clara Valley Transportation Authority for use within San Mateo County and Santa Clara County. The City further refined this model for application with Menlo Park to add more detail to the zone structure and transportation network. The model has a base year of year 2019.

There are four main components of the model: 1) trip generation, 2) trip distribution, 3) mode choice, and 4) trip assignment. The model uses socioeconomic inputs (i.e., population, income, employment) aggregated into geographic areas, called transportation analysis zones (TAZ) to estimate travel within the model area. There are 81 TAZs within the model to represent the City of Menlo Park. The model was used to estimate the Proposed Project's effect on VMT in accordance with the City's VMT guidelines.

VMT Evaluation

According to the City's VMT guidelines, office/R&D land use is evaluated based on a daily VMT per employee metric, which would be the same whether the land use is office or R&D. Using the model, this metric is calculated only for home-based work trips, per OPR's Technical Advisory on Evaluating Transportation Impacts in CEQA. Based on the latest citywide travel demand model, the regional average office/R&D VMT is 15.9 per employee. Therefore, City's office/R&D VMT impact threshold, at 15% below regional average, would be 13.6 daily VMT per employee.

According to City's VMT guidelines, the evaluation of residential land use is based on a daily VMT per capita metric. Using the model, this metric is calculated only for home-based trips, per OPR's technical advisory. Based on the latest citywide travel demand model, regional average residential VMT is 13.1 per capita. Therefore, the City's residential VMT impact threshold, at 15% below regional average, would be 11.2 daily VMT per capita.

The travel demand model calculated the daily VMT per employee to be 17.9 for the office/R&D component of the project, which is above the threshold of 13.6. However, the model does not account for the project's internalization. The Proposed Project would include office/R&D and residential land uses. OPR's *Technical Advisory on Evaluating Transportation Impacts in CEQA* recommends that VMT analysis for a mixed-use project should account for internal capture. Internal capture is defined as

walking and bicycling trips between the various types of land use within the Project Site. As discussed in Chapter 3 below, the Proposed Project’s daily internalization is estimated at 4.7 percent.

The model also does not fully account for the project’s Transportation Demand Management (TDM) plan. Menlo Park will require a TDM plan for the office/R&D component of the project that achieves a 28% trip reduction from standard ITE trip generation rates. Therefore, the model VMT estimate of 17.9 daily VMT per employee needs to be adjusted downward to accurately represent the Proposed Project.

Per the Institute of Transportation Engineers (ITE) *Trip Generation Handbook, 3rd Edition (p38)*, ITE’s trip generation rates reflect a drive-alone mode share of 95 percent. For the proposed office/R&D uses, the required 28% TDM reduction plus internalization will reduce the drive alone mode share to 65.2% [(1-5% of inherent non-driving mode) * (1-4.7% of internalization) * (1-28% of TDM reduction) = 65.2%]. The model estimated the drive-alone mode share for the office/R&D component of the project to be 86.4%. Thus, the model-calculated VMT per employee of 17.9 can be reduced by 24.5% (1 – 65.2%/86.4% = 24.5%) to arrive at an estimate of 13.5 daily home-based VMT per employee (13.5 = 17.9 * [1-24.5%]) after accounting for the internalization and the required TDM plan.

For the residential component, the travel demand model calculated the residential VMT at 11.1 home-based VMT per resident. However, as with the office/R&D component, this doesn’t account for internalization or the TDM plan. Menlo Park will require a TDM plan to achieve a 25% reduction from ITE rates for the residential component. For the proposed residential uses, the 25% TDM reduction from gross ITE trip generation (after crediting internalization) is equivalent to a drive alone mode share of 67.9% [(1-5% of inherent non-driving mode) * (1-4.7% of internalization) * (1-25% of TDM reduction) = 67.9%] The model estimated the residential component’s drive alone mode share at 77.3%. Since the residential component with the TDM plan reductions would have a drive alone mode share of 67.9%, the model-estimated drive alone mode share was reduced by 12.2% (1 – 67.9%/77.3% = 12.2%). As a result, the proposed residential component of the project would have 9.7 home-based VMT per resident (9.7 = 11.1 * [1-12.2%]).

As shown in Table 4, the Proposed Project’s residential and office/R&D land uses would generate VMT below the City’s respective VMT impact thresholds and would thus not have a VMT impact.

**Table 4
Office/R&D and Residential VMT Evaluation**

Land Use	Regional Average	VMT Threshold	Project VMT ³	VMT Impact
Office/R&D ¹	15.9	13.6	13.5	No
Residential ²	13.1	11.2	9.7	No

Notes:
 * All data referenced the latest Menlo Park citywide travel demand forecast model.
 1. VMT for office/R&D land use is reported in VMT per employee.
 2. VMT for residential land use is reported in VMT per capita.
 3. Project VMT accounted for implementation of a TDM Plan with 28% trip reduction target for the office/R&D land use, and 25% trip reduction target for the residential land use.

Impacts on Pedestrian, Bicycle and Transit Facilities

The Proposed Project is consistent with all applicable pedestrian, bicycle and transit related plans, ordinances and policies, as listed below:

- City of Menlo Park Circulation Element of the General Plan

- City of Menlo Park Municipal Code, Sections 16.43.100 and 16.45.090
- City of Menlo Park Transportation Master Plan
- City of Menlo Park Transportation Impact Fee

Pedestrian and Bicycle Facilities

The Proposed Project proposes multiple pedestrian and bicycle connections between the Project Site and the surrounding roadway network and within the Project Site:

- Class I multi-use path along the Project Site frontage on Ravenswood Avenue
- Class I multi-use path connecting Laurel Street and the Loop Road north of the proposed townhomes
- Class I multi-use path along the southern project boundary, and transitions into a Class II or Class III bicycle facility running along Burgess Drive west to Laurel
- Class II bicycle lanes along all roadways inside the Project Site
- Class IV bicycle facility along Laurel Street from Burgess Drive to Ravenswood Avenue

The details of these proposed designs have not been finalized yet. Prior to final design, the Project Sponsor shall coordinate with City staff to ensure the proposed pedestrian and bicycle facilities are designed to appropriate standards. The proposed multimodal improvements would represent an overall improvement to the walking and biking facilities in the immediate project vicinity.

Menlo Park's Traffic Impact Fee (TIF) program also proposes the following bicycle and pedestrian facilities in the immediate vicinity of the Project Site which would improve connections between the Project Site and the surrounding neighborhoods. It should be noted that these improvements are not part of the Proposed Project. Their implementations are contingent on numerous factors such as funding availability, and project prioritization.

- Class II bike lanes on Laurel Street between Burgess Street and Willow Road
- Class III bike route on Seminary Drive between Middlefield Road and Santa Monica Avenue
- Class III bike route on Santa Monica Avenue between Middlefield Road and Coleman Avenue
- Class III bike route on Linfield Drive between Waverley Street to Laurel Street
- Class III bike route on Alma Street between Oak Grove Avenue and Ravenswood Avenue
- Intersection improvements at Middlefield Road and Ravenswood Avenue – Remove eastbound channelizing island, install crosswalk and cross-bike markings in north leg, and install bike signal.
- Intersection improvements at Middlefield Road and Ringwood Avenue – Remove southbound channelizing island, reconstruct crosswalks in north and west legs, and install two-stages queue boxes for southbound left-turn cyclists.
- Ravenswood Caltrain Crossing

Pedestrian and Bicycle Access to Schools

Schools in the immediate vicinity of the Project Site include Nativity Catholic School, Menlo-Atherton High School, Lydian Academy, Encinal Elementary School, Menlo School, and Laurel Elementary School. Bicycle and pedestrian access to each school is described below:

- **Nativity Catholic School.** This school is located approximately 0.3 miles north of the residential site at the northeast corner of Laurel Street and Oak Grove Avenue. Pedestrian and bicycle

access from the Project Site to the school would be via Laurel Street, which has continuous sidewalks and existing Class II bicycle lanes on both sides of the road.

- **Menlo-Atherton High School.** This school is located approximately 0.6 mile east of the residential site at the east side of the Middlefield Road/Ravenswood Avenue intersection. Pedestrian and bicycle access from the Project Site to the school would be via Ravenswood Avenue, which has continuous sidewalks and existing Class II bicycle lanes.
- **Lydian Academy.** This school is located approximately 0.5 mile west of the residential site. Pedestrian and bicycle access from the Project Site to the school would be via Ravenswood Avenue and El Camino Real. There are continuous sidewalks along both streets. Ravenswood Avenue has Class II bicycle lanes between Middlefield Road and El Camino Real. There are no designated bicycle facilities on El Camino Real.
- **Encinal Elementary School.** This school is located approximately one mile north of the residential site at the northwest corner of Middlefield Road and Encinal Avenue. Pedestrian and bicycle access from the Project Site to the school would be via Laurel Street and Encinal Avenue or via Ravenswood Avenue and Middlefield Road. Both routes Class II bicycle lanes on both sides of the road. This section of Middlefield Road is primarily in Atherton, and does not provide continuous sidewalks.
- **Menlo School.** This school is located approximately one mile northwest of the residential site on Valparaiso Avenue. Pedestrian and bicycle access from the Project Site to the school would be via Laurel Street, Glenwood Avenue, and Valparaiso Avenue, which have continuous sidewalks and existing Class II bicycle lanes on both sides of these roads.
- **Laurel Elementary School.** This school is located approximately one mile east of the residential site on Ringwood Avenue. Pedestrian and bicycle access from the Project Site to the school would be via Ravenswood Avenue, Middlefield Road, and Ringwood Avenue. Ravenswood Avenue and Middlefield Road have continuous sidewalks and Class II bicycle lanes on both sides of the roads. Ringwood Avenue has Class II bicycle lanes on both sides of the road. There are sidewalks on the north side of Ringwood Avenue.

Transit Facilities

The Proposed Project is located within walking and bicycle distance to the Menlo Park Caltrain station. The Proposed Project is expected to generate an increase in transit demand, which could be accommodated by the available capacity of the SamTrans bus service. The SamTrans routes 81, 82, 83, 296, 397, ECR, M1 Crosstown Shuttle, M3 Marsh Road Shuttle, and M4 Willow Road shuttle serve the immediate vicinity of the Project Site during the AM and PM peak commute hours. Bus stops are within a typical walking distance (one-quarter mile or 5 minutes) of the Project Site. The Proposed Project would make no change to existing public transit facilities.

However, by adding vehicle trips and increasing delays at intersections along bus routes, it would increase bus travel time. Intersection improvements to reduce intersection delay as discussed in this report would help to reduce some bus delay along these routes.

The Caltrain electrification project would enable Caltrain to provide more frequent train service at the Menlo Park, Palo Alto, and Redwood City Caltrain stations. Caltrain predicts an initial capacity increase of over 30%. It is expected that the Caltrain electrification project would accommodate the potential increase in transit ridership generated by the Proposed Project.

3.

Non-CEQA Level of Service Transportation Analysis

This chapter describes the existing conditions level of service and observed traffic conditions at roadway facilities in the vicinity of the site. It also describes the method by which project traffic is estimated and any adverse effects to intersection levels of service caused by the Proposed Project under existing, near-term (2027), cumulative (2040), and cumulative (2040) with Dumbarton rail conditions.

Existing Intersection Lane Configurations and Traffic Volumes

The existing lane configurations at the study intersections were confirmed by observations in the field and are shown on Figure 3. Existing traffic volumes were obtained from new peak-hour counts collected in year 2022 and year 2023. The existing AM and PM peak hour intersection volumes are shown in Figure 4. Intersection turning-movement count data are presented in Appendix A.

At the time that the counts and field observations were conducted, Middlefield Road had two northbound lanes at the intersection of Seminary Drive, which is reflected in the existing conditions analysis. However, the city recently restriped Middlefield Road to consist of one northbound lane at the intersection of Middlefield Road and Seminary Drive, which is reflected in the near-term conditions analysis.

Existing Intersection Levels of Service

The results of the intersection level-of-service analysis under existing conditions show that the following study intersections currently operate at an unacceptable level of service during at least one peak hour (see Table 5 and Figure 5):

7. US 101 Northbound Ramps and Willow Road (PM peak hour)
41. Bayfront Expressway and Willow Road (PM peak hour)
42. Hamilton Avenue and Willow Road (PM peak hour)
44. O'Brien Drive and Willow Road (PM peak hour)
45. Newbridge Street and Willow Road (AM and PM peak hours)
46. Bayfront Expressway and University Avenue (PM peak hour)

As described in Chapter 1, the existing traffic operations for the study intersections #15, #16, #17, #19, #20, and #24 on Middlefield Road and Ravenswood Avenue are based on the results of the SimTraffic micro-simulation analysis, which show that the six study intersections currently operate at acceptable conditions during both peak hours. The micro-simulation methodology, assumptions, and analysis results are documented in Appendix B. The intersection level of service calculation sheets for the intersection analyzed using the VISTRO software are included in Appendix C.

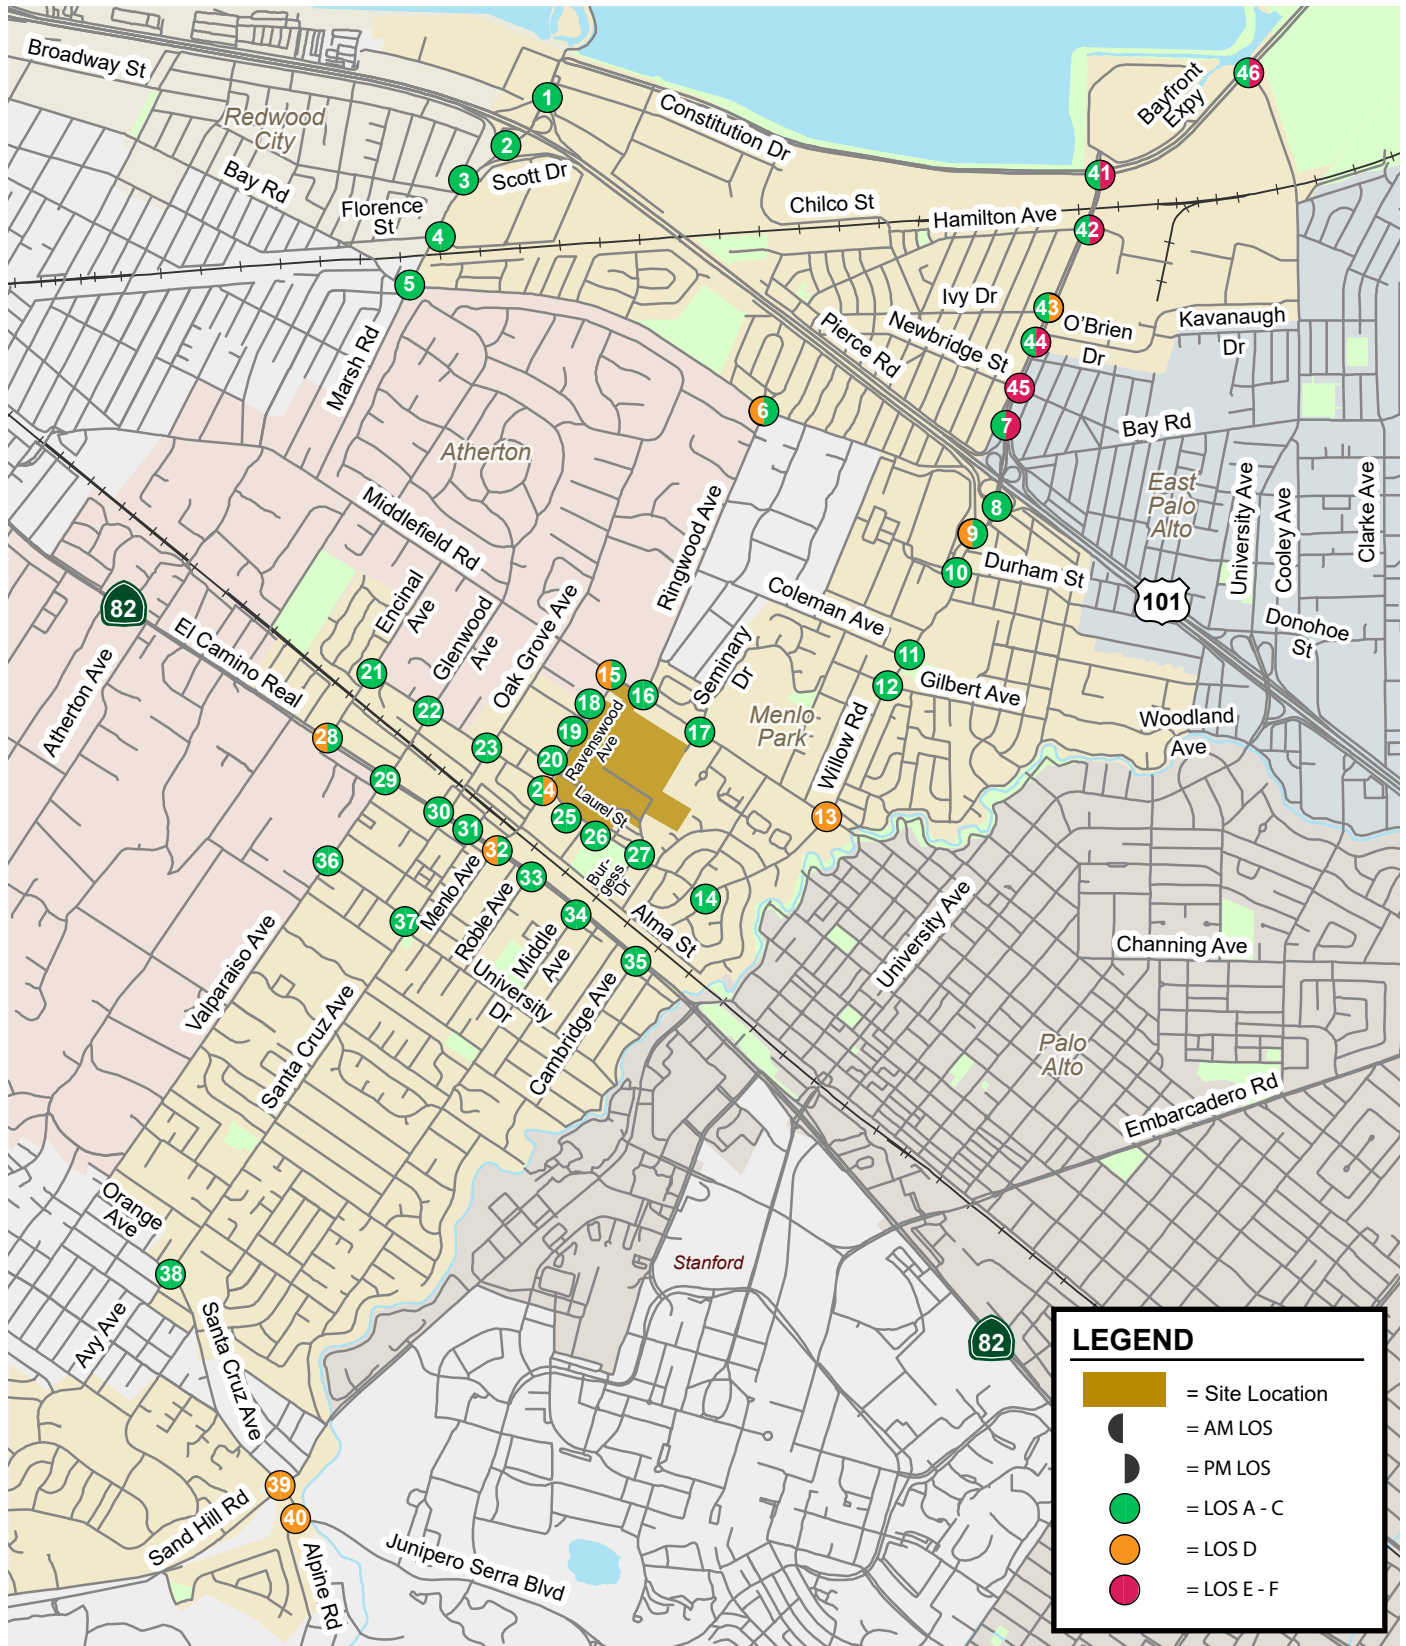

Figure 5
Existing Level of Service Summary

Existing Freeway Levels of Service

Existing weekday AM and PM peak hour traffic volumes on the study freeway segments were obtained from the *San Mateo County Congestion Management Program 2019* for segments within San Mateo County. The latest available Congestion Management Report at the time of this study details 2021 freeway conditions. However, year 2021 conditions were affected by the pandemic. Thus, as a conservative approach, the 2019 conditions were reported as existing conditions. As shown on Table 6, the following freeway segments are currently operating below their respective level of service standards, or at LOS F:

- SR 84 – between University Avenue and Alameda County Line, AM & PM Peak Hours
- US 101 – between Santa Clara County Line and Whipple Avenue, AM & PM Peak Hours

Table 6

Bold indicates non-compliant LOS

Existing Freeway Ramp Capacity Analysis

This analysis consists of a volume-to-capacity ratio evaluation of the study freeway ramps. The ramp capacities were obtained from the *Highway Capacity Manual 2000 (Chapter 25)*, which considers both the free-flow speed and the number of lanes on the study ramps. It was assumed that if ramp meter equipment is present, on-ramps on northbound US 101 would be metered during the AM peak hour, and on-ramps on southbound US 101 would be metered during the PM peak hour. Metered ramps are analyzed with a capacity of 900 vehicles per hour for the mixed-flow lanes. As shown on Table 7, the existing ramps currently have sufficient capacity to serve the existing traffic volumes.

**Table 7
Freeway Ramp Capacity**

Interchange	Ramp	Peak		Lanes			Existing Conditions		
		Hour	Type	Mixed	HOV	Meter ¹	Capacity ²	Volume ³	V/C
US 101/Marsh Road	SB off-ramp to Marsh Road	AM	Diagonal	2	-	-	3,800	1,402	0.37
		PM	Diagonal	2	-	-	3,800	1,932	0.51
	SB on-ramp from EB Marsh Rd	AM	Diagonal	1	1	-	2,000	650	0.33
		PM	Diagonal	1	1	YES	1,800	830	0.46
	NB off-ramp to Marsh Road	AM	Diagonal	1	-	-	2,000	1,127	0.56
		PM	Diagonal	1	-	-	2,000	782	0.39
NB on-ramp from EB Marsh Rd	AM	Loop	1	-	YES	900	381	0.42	
	PM	Loop	1	-	-	1,900	388	0.20	
US 101/Willow Road	NB off-ramp to Willow Road	AM	Diagonal	2	-	-	3,800	1,031	0.27
		PM	Diagonal	2	-	-	3,800	1,115	0.29
	NB on-ramp from EB Willow Road	AM	Loop	1	1	YES	1,800	258	0.14
		PM	Loop	1	1	-	1,900	608	0.32
	SB on-ramp from EB Willow Road	AM	Diagonal	1	1	-	2,000	646	0.32
		PM	Diagonal	1	1	YES	1,800	364	0.20
SB off-ramp to Willow Road	AM	Diagonal	2	-	-	3,800	509	0.13	
	PM	Diagonal	2	-	-	3,800	867	0.23	

Notes:
 NB = Northbound; SB = Southbound; EB = Eastbound; WB = Westbound
 1. Northbound on-ramps are assumed metered during the AM peak hour. Southbound on-ramps are assumed metered during the PM peak hour.
 2. Ramp capacities were obtained from *Highway Capacity Manual 2000*, and considered the free-flow speed, the number of lanes on the ramp, and ramp metering.
 3. Existing volumes referenced intersection counts collected in 2022/2023.

Observed Existing Traffic Conditions

Traffic conditions were observed in the field at each study intersection in order to identify existing operational deficiencies and to confirm the accuracy of the calculated level of service. The purpose of this effort was (1) to identify any existing traffic problems that may not be directly related to level of service, (2) identify any locations where the level of service analysis does not accurately reflect existing traffic conditions. Hexagon conducted field observations on a regular weekday during the AM and PM peak periods in May 2023.

Marsh Road between US 101 NB Off-Ramp and Bay Road

There were no progression issues observed along this corridor during the AM peak hour. Two left-turn movements along this corridor were observed to have queues that did not always clear within one cycle, including the westbound left-turn movement from Marsh Road onto Scott Drive and the eastbound left-turn movement from Marsh Road onto Florence Street.

Some queuing was observed along this corridor during the PM peak hour, but queues were generally able to clear within one signal cycle. Through traffic queues sometimes affected traffic flow at upstream intersections. Vehicles were observed to favor the outer lanes in order to access the US 101 SB and

NB on-ramps. Some left-turn movements along this corridor were observed to have queues that did not always clear within one cycle, including the eastbound left-turn movement from Marsh Road onto Florence Street and the northbound left-turn movement from the US 101 NB off-ramp onto Marsh Road.

Ringwood Avenue & Bay Road

During the AM peak hour, many vehicles, bicycles, and pedestrians were observed to travel toward westbound Ringwood Avenue. Northbound queues were observed to extend past Menlo Oaks Drive and southbound queues extended toward Del Norte Avenue. Traffic was able to flow fairly efficiently, however there was some confusion observed among drivers when more than three of the five approaches were full, especially with the frequent bike and pedestrian activity. Vehicles were observed to ease into the intersection at the same time as other vehicles as there appeared to be confusion about who had the right-of-way.

During the PM peak hour, long queues were observed on eastbound Ringwood Avenue, but traffic was able to move quickly since there weren't as many vehicles on the other approaches.

Willow Road between US 101 NB Ramps and Middlefield Road

Queuing was observed in the westbound direction along this corridor during the AM peak hour. Queues were observed to stem from downstream intersections and sometimes impact westbound traffic flow, especially at the Willow Road & Bay Road intersection. Westbound traffic at the US 101 northbound and southbound ramps was observed to flow freely, except for vehicles using the US 101 southbound loop on-ramp. US 101 southbound was observed to be congested, which created queues in the outermost westbound lane on Willow Road that extended through the US 101 northbound ramp intersection. Two left-turn movements along this corridor were observed to have queues that did not always clear within one cycle, including the southbound left-turn movement from the US 101 southbound off-ramp onto Willow Road and the southbound left-turn movement from Bay Road onto Willow Road.

During the PM peak hour, queuing was observed in the eastbound direction. Queues from downstream intersections spilled back to the US 101 northbound ramps intersection and frequently impacted traffic flow. Queues on the US 101 northbound off-ramp extended onto the freeway. West of the US 101 northbound ramps, eastbound queues were usually able to clear within one signal cycle. Two left-turn movements along this corridor were observed to have queues that did not always clear within one cycle, including the southbound left-turn movement from the US 101 southbound off-ramp onto Willow Road and the northbound left-turn movement from the US 101 northbound off-ramp onto Willow Road.

Middlefield Road between Ravenswood Avenue and Seminary Drive

During the AM peak hour, the northbound left turn queue from Middlefield Road to westbound Ravenswood Avenue often reached the Ringwood Avenue intersection. During the peak time, the northbound left turn green time increased to allow more vehicles through the intersection. The first cycle with a long northbound left turn queue resulted in 10 vehicles waiting for a second cycle. However, the cycles after that had increased green time and allowed the entire queue to clear in one cycle.

During the PM peak hour, the southbound left turn queue at the downstream intersection of Ringwood Avenue/Middlefield Road often reached close to the Ravenswood Avenue intersection. Vehicles expecting to continue southbound on Middlefield Road were able to go around the queue into the second lane. Therefore, not all southbound vehicles were able to clear the intersection in one cycle.

Ravenswood Avenue and Laurel Avenue

During the AM peak hour, the downstream westbound queue at the Alma Street/Ravenswood Avenue intersection occasionally reached the Laurel Avenue intersection. This caused the northbound left turn queue to wait for the queue to begin clearing the receiving lane. However, the green time allowed all vehicles to clear the intersection.

During the PM peak hour, Hexagon observed the Caltrain gates were down during one of the cycles. The Caltrain came during the eastbound/westbound through green time, which caused the queue to back up into the Laurel Avenue intersection. However, the green time allowed all vehicles to clear the intersection.

El Camino Real between Encinal Avenue and Santa Cruz Avenue

During the AM peak hour, southbound from Encinal Avenue to Santa Cruz Avenue would occasionally spillback into upstream intersections. However, most vehicles were able to clear the intersection within one signal cycle. Occasionally, the side streets required two signal cycles to clear.

El Camino Real and Ravenswood Avenue/Menlo Avenue

During the PM peak hour, the eastbound queues would extend approximately 400 feet to 500 feet upstream and would frequently fail to clear the intersection in one green cycle. Also, the southbound left-turn queues would occasionally spillback out of the storage lane and when this occurred the southbound left-turn traffic would fail to clear the intersection in one cycle.

El Camino Real between Roble Avenue and Cambridge Avenue

During the PM peak hour, heavy traffic congestion on northbound El Camino Real was observed. The spillback from vehicles traveling north along El Camino Real often extended past Cambridge Avenue. The northbound left-turn movement is frequently blocked by the northbound through queue and required two signal cycles to clear.

University Drive and Santa Cruz Avenue

This is an offset intersection with University Drive intersects with Santa Cruz Avenue (east-west) at two locations which are approximately 190 feet apart. The east intersection is an all-way-stop control intersection. No traffic issues were observed during the AM and PM peak hours.

The west intersection is a signalized intersection. During the AM peak hour, the eastbound right turn traffic queue on Santa Cruz Avenue intermittently spills over from the right turn pocket but the queue cleared during one signal cycle.

During the PM peak hour, the eastbound right turn traffic queue on Santa Cruz Avenue intermittently spills over from the right turn pocket but the queue cleared during one signal cycle.

Santa Cruz Avenue and Sand Hill Road

During the AM peak hour, southbound traffic on Santa Cruz Avenue occasionally required two signal cycles to clear.

During the PM peak hour, heavy congestion and excessive delays were observed on the westbound Sand Hill Road and northbound Santa Cruz Avenue approaches. The westbound through movement on Sand Hill Road fails to clear in one signal cycle and vehicle queues constantly extend beyond upstream intersection at Oak Avenue. Due to heavy traffic on the northbound Santa Cruz Avenue approach, northbound queues on Santa Cruz Avenue constantly extend to the upstream intersection at Junipero Serra Boulevard. Southbound queues from upstream intersection at Junipero Serra Boulevard also

constantly extend back to this intersection. As a result, all traffic movements (i.e. the eastbound right turn, the westbound left turn, and the southbound through) that turn onto the southbound receiving lanes of Santa Cruz Avenue experience extended delays of more than one signal cycle.

Santa Cruz Avenue/Alpine Road and Junipero Serra Boulevard

During the AM peak hour, heavy northbound traffic on Alpine Road was observed that frequently required two signal cycles to clear.

During the PM peak hour, the northbound Santa Cruz Avenue and westbound Junipero Serra Boulevard movement experience considerable delays due to congestion extending from the downstream intersection at Santa Cruz Avenue and Sand Hill Road. The westbound right turn movement on Junipero Serra Boulevard and northbound through movement on Santa Cruz Avenue experience heavy delays. Queues for these movements frequently do not clear during the respective green phase due to downstream congestion. The westbound approach was observed to have long queues extending onto Fremont Road intermittently.

Willow Road from Newbridge Street to Bayfront Expressway

During the AM peak hour, westbound Willow Road sometimes queues from Newbridge Street past Ivy Drive, requiring vehicles multiple signal cycles to clear this section of Willow Road. Heavy northbound through and left-turn traffic were observed at the Bayfront Expressway intersection. The northbound traffic generally required more than one signal cycle to clear the Willow Road intersection as a result.

During the PM peak hour, heavy traffic congestion on eastbound Willow Road was observed from Bayfront Expressway extending west past Newbridge Street. This is mainly because of the heavy congestion on southbound Bayfront Expressway south of Willow Road. Vehicles often required more than one signal cycle to clear each intersection along this section of Willow Road.

Bayfront Expressway and University Avenue

During the AM peak hour, northbound Bayfront Expressway consistently queued well onto the Dumbarton Bridge. The northbound left-turn movement also consistently filled the turn pocket. While the left-turn pocket was able to clear within each cycle, it's also immediately filled by left-turn vehicles that couldn't access the pocket.

During the PM peak hour, southbound Bayfront Expressway consistently queued north to Willow Road. The eastbound right-turn movement at University Avenue was consistently heavy and queued towards Purdue Avenue and required two signal cycles to clear. In general, the eastbound right-turn movement and the southbound through movement received the majority of the green time at this intersection, but progression on the Dumbarton Bridge was slow, causing lengthy backups on southbound Bayfront Expressway that affected upstream intersection operations.

Project Trip Estimates

Trip generation estimates for the mixed-use development are based on standard trip generation rates published in the Institute of Transportation Engineers (ITE) *Trip Generation Manual*, 11th Edition. Below is a general discussion of the trip generation estimation methodology. Because future commercial tenants in the office/R&D area are not yet known, proposed commercial buildings in the office/R&D area are designed to accommodate either office uses, R&D or life science uses, or a combination of both. Therefore, this report evaluates two buildout scenarios within the office/R&D area: a 100% office scenario and a 100% R&D scenario. Table 8 shows the trip generation estimates for the 100% office scenario and Table 9 shows the trip generation estimates for the 100% R&D scenario. These estimates show that the 100% office scenario would generate more peak hour trips than a 100% R&D or a mix of

office and R&D scenarios. Therefore, the 100% office scenario is used to identify the Proposed Project's traffic operational effects and intersection improvements.

Gross Project Trip Generation

A description of the source of trip generation rates for each land-use is provided below:

- **Office.** Initial trip estimates for office and amenity uses are based on "ITE Land Use code 710: General Office Building".
- **R&D.** Initial trip estimates for R&D and amenity uses are based on "ITE Land Use code 760: Research and Development Center".
- **Market-Rate Multifamily Residential.** Initial trip estimates are based on the "ITE Land Use code 221: Multifamily Housing (Mid-Rise)", which includes apartments and condominiums located within the same building that has between four to ten levels.
- **Market-Rate Townhouse.** The Proposed Project would include three-bedroom townhouses. Initial trip estimates for the townhouses are based on the "ITE Land Use code 215: Single-Family Attached Housing", which includes townhouses/rowhouses.
- **Affordable BMR Housing.** Initial trip estimates are based on the "ITE Land Use code 223: Affordable Housing".
- **Publicly Accessible Park.** The Proposed Project would include active recreational areas in the Ravenswood Avenue Parklet on the northern edge of the Project Site. Trip estimates are based on "ITE Land Use code 488: Soccer Complex". The programmatic design of the park has not been determined. In order to provide a conservative estimate of potential traffic generation and allow for flexible programming for the Proposed Project through the project review process, it is assumed that the park will have play structures and open field areas for warm-ups or casual play.

Trip Reductions from Internal Capture

Since this Proposed Project is mixed-use in nature, a portion of the trips generated by the Proposed Project would both begin and end within the development, referred to as internal capture. Internal capture trip estimates were made for each of the Proposed Project's land uses based on the specific mix of uses, sizes, and location within the Project Site utilizing a combination of two internal capture methodologies: the Transportation Research Board (TRB) *National Cooperative Highway Research Program (NCHRP) Report 684: Enhancing Internal Trip Capture Estimation for Mixed-Use Developments*, and US EPA *Mixed Use Trip Generation Model v.4 (MXD)*, 2010.

NCHRP Report 684 includes an assessment of on-site land-use categories including office, residential, retail, restaurants, theaters, and hotels within the site land use mix when generating internal capture. The EPA MXD method does not explicitly differentiate subcategories such as restaurants, theaters, and hotels but it does account for location factors influencing the Proposed Project, including regional location, transit availability, density of development, walkability factors, and the sociodemographic profile of site residents and businesses. Local area characteristics inputs into the EPA MXD model are included in Appendix D. Given the strengths and weaknesses of both methodologies, an integrated approach for internal capture was developed as described in *Getting Trip Generation Right: Eliminating the Bias Against Mixed-Use Development, PAS Memo, American Planning Association, May 2013*. In accordance with the PAS memo, the full EPA MXD methodology and NCHRP 684 methodology were applied to estimate internal capture from each method. The results of the two methods were then

combined using proportioning factors provided in the PAS Memo (see Appendix D). The resulting internalization rate for the proposed project is approximately 4.7%.

Transportation Demand Management (TDM)

The Proposed Project would include a project-specific TDM plan for both the residential and commercial uses to reduce the total number of single-occupancy vehicle trips associated with the Proposed Project by 28% for the office/R&D land use, and 25% for the residential land use. At the time of this analysis, the TDM plan only included a 25% TDM reduction. However, a sensitivity analysis assuming a TDM plan with up to 40% trip reduction showed no differences in the analysis conclusions. Therefore, this study is presented with the original 25% TDM reduction assumption. This reduction would be applied to the net project trip generation after accounting for internalization. The Proposed Project's draft TDM Plan is included in Appendix F.

Net Project Trip Generation

As shown in Table 8 for the 100% office scenario, the Proposed Project trips generated by the proposed land uses after accounting for the internal trip capture and proposed TDM plans would be 10,367 daily trips, 1,368 AM peak hour trips, and 1,316 PM peak hour trips.

As shown in Table 9 for the 100% R&D scenario, the Proposed Project trips generated by the proposed land uses after accounting for the internal trip capture and proposed TDM plans would be 10,554 daily trips, 979 AM peak hour trips, and 950 PM peak hour trips.

Net project trip generation represents the number of new project trips added to the surrounding roadway network. The trips generated by the existing uses are credited from the site generated trips to derive the net project trip generation.

Existing Uses

Trips associated with the existing uses on the Project Site were credited against the new trip generation. The trips generated by the existing buildings on the site were estimated based on driveway counts conducted over three days in October 2021 by Fehr & Peers for the SRI International Campus. Of the 1,100 employees on the SRI International Campus, Buildings P, S, T had 700 employees. The trip credit for the Proposed Project (excluding Buildings P, S, T) is proportioned based on employees. Therefore, the existing buildings on the Project Site generated an average of 518 daily trips, including 46 trips in the AM peak hour (38 inbound and 8 outbound trips), and 43 trips in the PM peak hour (11 inbound and 32 outbound trips).

As shown in Table 8 for the 100% office scenario, the net new trips generated by Proposed Project on the roadway network would be 9,849 daily trips, including 1,322 AM peak hour trips (1,065 inbound trips and 257 outbound trips), and 1,273 PM peak hour trips (286 inbound trips and 987 outbound trips).

As shown in Table 9 for the 100% R&D scenario, the net new trips generated by Proposed Project on the roadway network would be 10,036 daily trips, including 933 AM peak hour trips (674 inbound trips and 259 outbound trips), and 907 PM peak hour trips (216 inbound trips and 691 outbound trips).

Trip Distribution and Assignment

The trip distribution pattern and trip assignment for the proposed uses were estimated based on the Menlo Park Travel Demand Model and local peak hour commute patterns. All project driveways are assumed as full-access driveways, except the eastern project driveway on Ravenswood Avenue, which is assumed as right-in-right-out only driveway. The model estimated trip distribution pattern is summarized in Figure 6. The Proposed Project's net trip assignment is shown on Figure 7.

**Table 8
Project Trip Generation Estimates – 100% Office Scenario**

Land Use	ITE Code ¹	Size	Daily			AM Peak Hour			PM Peak Hour

Future Traffic Volumes

Both near-term (year 2027) and cumulative (year 2040) scenario forecasts of intersection turning movements, freeway traffic and ramp volumes were completed using the latest Menlo Park travel demand forecast model (citywide travel demand forecast model). The citywide model is the best available model to represent travel within the City of Menlo Park, and serves as the primary forecasting tool for the City. The model is a mathematical representation of travel within the nine Bay Area counties, as well as the Santa Cruz, San Benito, Monterey and San Joaquin counties. The base model structure was developed by the Metropolitan Transportation Commission (MTC) and further refined by the City/County Association of Governments and Santa Clara Valley Transportation Authority for use within San Mateo County and Santa Clara County. The City further refined this model for application with Menlo Park to add more detail to the zone structure and transportation network. There are 81 transportation analysis zones (TAZs) within the model to represent the City of Menlo Park.

Year 2027 was the earliest year for expected occupancy when this analysis first started. The expected occupancy has since been revised to year 2031. However, a comparison of the Project-generated intersection non-compliances under the near-term and cumulative conditions (see Tables 11 and 12) showed that the Proposed Project would not generate more intersection non-compliance under the near-term scenario compared to the cumulative scenario. Therefore, it is not expected that a year 2031 analysis would show any intersection non-compliance not already discussed under the cumulative conditions.

Near-Term Traffic Volumes

Land use growth assumptions for Bay Area regions outside of Menlo Park for the near-term scenario (year 2027) are provided by the Association of Bay Area Governments (ABAG) and refined by VTA/C/CAG. Approved developments within the City of Menlo Park were added to the existing land use to represent the year-2027 land use. The following approved projects within the City of Menlo Park were included to represent a 2027 scenario:

- Menlo Gateway
- 1285 El Camino Real
- 133 Encinal Avenue
- 1010-1026 Alma Street
- 650-660 Live Oak Avenue
- 1275 El Camino Real
- Facebook Expansion Project
- TIDE Academy (New Magnet High School)
- Guild Theatre
- 1540 El Camino Real
- 506-556 Santa Cruz Avenue
- 1125 Merrill Street
- Springline
- 500 El Camino Real
- 1021 Evelyn Street
- 40 Middlefield Road
- 115 El Camino Real
- 409 Glenwood Avenue
- 1350 Adams Court (1315 O'Brien Drive)
- 1350 Willow Road (Facebook Willow Village)
- 111 Independence Drive

- 706-716 Santa Cruz Avenue
- 1345 Willow Road
- 201 El Camino Real
- 141 Jefferson Drive
- 1162 El Camino Real
- 3723 Haven Avenue
- 110 Constitution Drive
- 301 Constitution Drive
- 1550 El Camino Real
- 165 Jefferson Drive (Menlo Flats)

Cumulative Traffic Volumes

For the cumulative scenario, the City of Menlo Park land use assumed the buildout of the General Plan as well as the latest Housing Element Update. Land use growth for other Bay Area regions for year 2040 were taken from Association of Bay Area Governments (ABAG) projections and refined by VTA and C/CAG. Table 10 shows the socioeconomic model inputs for the entire Bay Area by county.

**Table 10
Socioeconomic Model Inputs for Bay Area**

County	Year 2040 Project Conditions Model Land Use Data			
	Total Households	Total Population	Employed Residents	Total Employments
San Francisco	447,340	1,076,365	559,923	759,509
San Mateo	326,094	924,720	452,413	486,586
Santa Clara	819,477	2,409,156	1,159,411	1,230,952
Alameda	705,337	1,965,356	891,473	947,642
Contra Costa	464,151	1,328,458	579,757	467,333
Solano	168,706	494,363	224,059	179,946
Napa	56,312	158,792	69,450	89,554
Sonoma	220,740	591,546	284,856	257,466
Marin	112,046	274,489	136,554	129,150
City of Menlo Park	23,371	59,260	26,957	65,181

Within the City of Menlo Park, the year 2040 General Plan land use data was further refined by ensuring the following pending developments were included in the model.

- 1125 O'Brien Drive
- 162-164 Jefferson Drive (formerly 151 Commonwealth Drive)
- 555 Willow Road (Former boarding house proposal now 3 MFR units)
- 123 Independence Drive
- 2245 Avy Avenue - Philips Brooks School Gymnasium/Flex Building
- 1220 Hoover Street
- 3705 Haven
- 1030 O'Brien
- 795 Willow
- 1075 O'Brien Drive
- 2111-2121 Sand Hill Road
- 995-1005 O'Brien Drive and 1320 Willow Road

In addition to the above land use projects, the High Speed Rail project is also assumed under the Year 2040 scenario. While this project is not a land use project, it could also alter travel patterns.

For the purpose of the transportation analysis, the Proposed Project is also included in the Year 2040 model forecasts to generate a cumulative with project model scenario. Therefore, project trips were subtracted from cumulative plus project traffic volumes to generate cumulative no project conditions.

The forecasted intersection turning movements under all future scenarios were adjusted based on existing volumes to generate traffic volumes for near-term conditions (see Figure 8), near-term plus project conditions (see Figure 9), cumulative conditions (see Figure 10), and cumulative plus project conditions (see Figure 11).

Although the Project Site could be occupied by office, R&D, or a mix of office and R&D uses. As discussed under Project Trip Estimates, the 100% office scenario would generate more trips than a 100% R&D or a mix of office and R&D scenarios. Therefore, the 100% office scenario is used to identify the Proposed Project's traffic operational effects. The traffic volumes for with-project conditions are based on the 100% office scenario.

Future Transportation Networks

Near-Term (2027) Conditions

The roadway network under the near-term (2027) scenarios is assumed to include the following improvements. The roadway network for other study intersections is assumed to be the same as under existing conditions.

- **17. Middlefield Road and Seminary Drive:** At the time field observations were conducted, Middlefield Road had two northbound lanes at the intersection. However, the City recently restriped Middlefield Road to reduce to one northbound lane at the intersection, which is reflected in the near-term conditions analysis.
- **45. Newbridge Street and Willow Road:** The Menlo Park Traffic Impact Fee (TIF) program proposes to modify the signal timing to a protected left-turn phasing operation on Newbridge Street, provide a leading left-turn phase on the southbound movement and a lagging left-turn phase on the northbound movement, and optimize signal timing.

Near-Term (2027) plus Project Conditions

Under project conditions, access to the Project Site would be provided via two driveways along Middlefield Road and three driveways along Ravenswood Avenue. The Project driveways were analyzed with the following characteristics.

- **16. Middlefield Road and Ringwood Avenue:** The Project driveway is proposed to be the west leg of the signalized intersection. The Project driveway approach would have one shared left-through lane and one right-turn lane. The lane configurations for the other approaches would remain the same. The signal was analyzed with the existing timing and phasing (permitted left turns for eastbound and westbound approaches on Ringwood Avenue).
- **17. Middlefield Road and Seminary Drive:** The Project driveway is proposed to be the west leg of the unsignalized intersection as a stop-controlled approach. The Project driveway approach would have one shared left-through lane and one right-turn lane. The lane configurations for the other approaches would remain the same.

- **18. Project Driveway B1 East and Ravenswood Avenue:** The Project driveway is proposed to be the south leg of the unsignalized intersection as a stop-controlled approach with right turns only for trips in and out of the driveway. The Project driveway approach would have one right-turn lane. The lane configurations for the other approaches would remain the same.
- **19. Project Driveway B1 West and Ravenswood Avenue:** The Project driveway is proposed to be the south leg of the unsignalized intersection as a stop-controlled approach. The Project driveway approach would have one left-turn lane and one right-turn lane. The lane configurations for the other approaches would remain the same.
- **20. Pine Street and Ravenswood Avenue:** The Project driveway is proposed to be the south leg of the unsignalized intersection as a stop-controlled approach. The Project driveway approach would have one shared left-right lane. There would be no through movement from the Project driveway to Pine Street. The lane configurations for the other approaches would remain the same.

Cumulative (2040) Conditions

The transportation network under cumulative (2040) conditions is assumed to include the improvements under near-term conditions. The following additional road improvement proposed by the Willow Village Campus is also assumed:

- **Hamilton Avenue and Willow Road:** Hamilton Avenue would be realigned, and a south leg that would provide access to the Willow Village Project Site would be added to the intersection. The south leg is identified as Main Street. The proposed lane configuration for the intersection would be modified to a northbound left-turn lane and shared through-right lane, a southbound left-turn lane and shared through-right lane, an eastbound left-turn lane, through lane, and shared through-right lane, and two westbound left-turn lanes, a through lane, and a shared through-right turn lane.

Cumulative (2040) plus Project Conditions

The transportation network under cumulative (2040) plus project conditions is assumed to include the Proposed Project improvements described under the near-term plus project conditions. The roadway network for other study intersections is assumed to be the same as under cumulative (2040) conditions.

Near-Term (2027) Intersection Levels of Service

The results of the intersection level of service analysis under near-term conditions show that following study intersections would operate at an unacceptable level of service during at least one peak hour (see Table 11 and Figure 12):

6. Bay Road and Ringwood Avenue (AM peak hour)
7. US 101 Northbound Ramps and Willow Road (AM and PM peak hours)
8. US 101 Southbound Ramps and Willow Road (AM and PM peak hours)
9. Bay Road and Willow Road (AM and PM peak hours)
10. Durham Street and Willow Road (AM and PM peak hours)
41. Bayfront Expressway and Willow Road (AM and PM peak hours)
42. Hamilton Avenue and Willow Road (AM and PM peak hours)
43. Ivy Drive and Willow Road (AM and PM peak hours)
44. O'Brien Drive and Willow Road (AM and PM peak hours)
45. Newbridge Street and Willow Road (AM and PM peak hours)
46. Bayfront Expressway and University Avenue (PM peak hour)

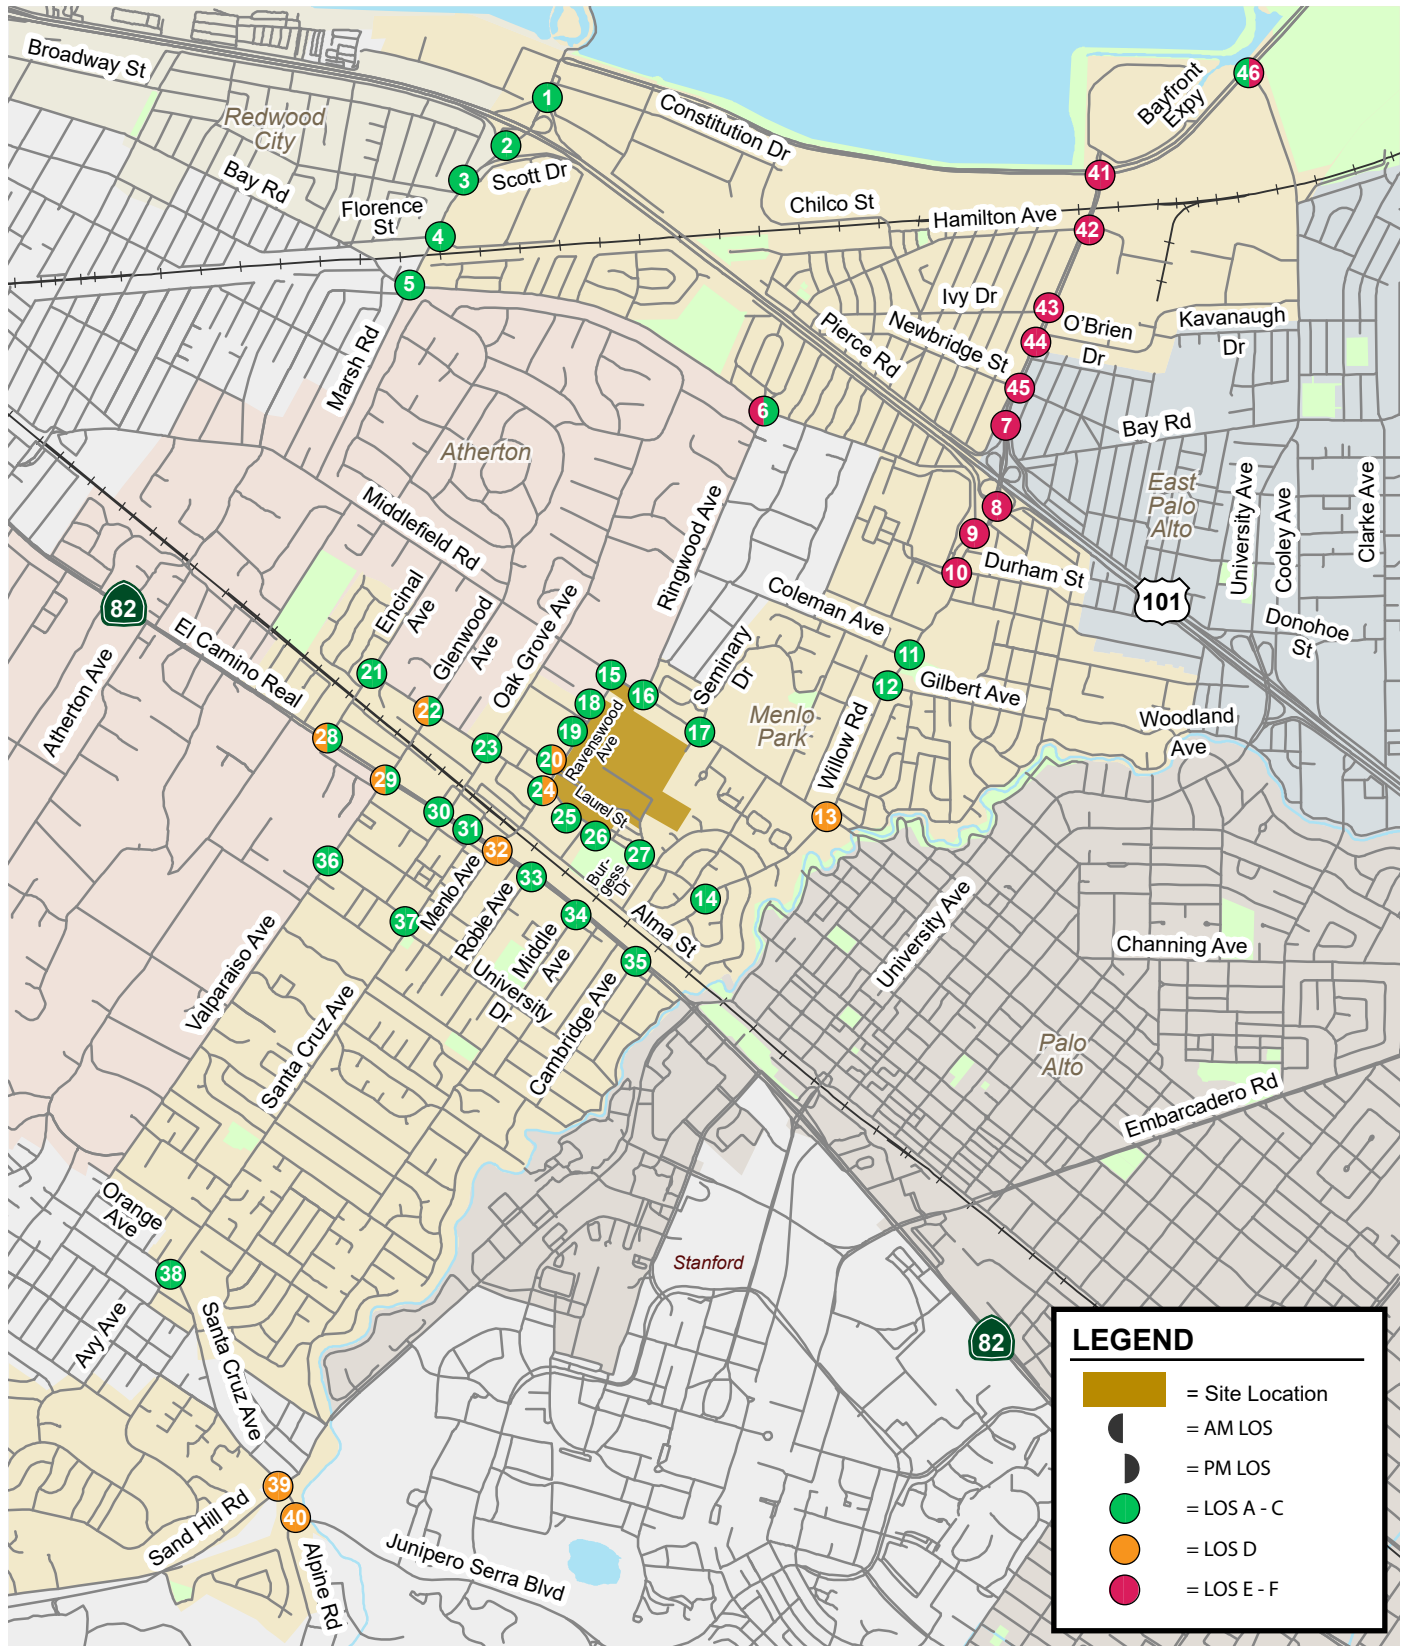

Figure 12
Near-Term Intersection Level of Service Summary

The intersection level of service calculation sheets for the intersection analyzed using the VISTRO software are included in Appendix C.

It should be noted that based on previous micro-simulation analysis conducted along the Willow Road corridor in 2019/2020 timeframe, operations along Willow Road could quickly deteriorate from acceptable levels of service to a severely congested state with the addition of more peak direction traffic in the near-term scenario. A severely congested corridor would result in the actual traffic demand at the intersection not being able to get pass through the intersection within an hour. Therefore, based on results from the previous Willow Road corridor simulation analysis, the Willow Road study intersections in this report are assumed to operate at an oversaturated state under near-term conditions. These intersections would operate at LOS F and are indicated using 'OVERSAT' in the level of service summary tables below.

The results of the SimTraffic micro-simulation analysis for traffic operations on Middlefield Road and Ravenswood Avenue show that the study intersections #15, #16, #17, #19, #20, and #24 would operate at acceptable conditions during both peak hours.

Near-Term (2027) Plus Project Intersection Levels of Service

The results of the intersection level of service analysis under near-term (2027) plus project conditions show that the following intersections (see Table 11 and Figure 13) would be non-compliant with local policies and would be adversely affected during either the AM or the PM peak hour as compared to near-term conditions:

- 6. Bay Road and Ringwood Avenue (AM peak hour)**
- 7. US 101 Northbound Ramps and Willow Road (AM peak hour)**
- 9. Bay Road and Willow Road (AM and PM peak hours)**
- 10. Durham Street and Willow Road (AM and PM peak hours)**
- 13. Middlefield Road and Willow Road (AM and PM peak hours)
- 22. Laurel Street and Glenwood Avenue (AM peak hour)
- 44. O'Brien Drive and Willow Road (AM and PM peak hours)**
- 45. Newbridge Street and Willow Road (PM peak hour)**
- 46. Bayfront Expressway and University Avenue (PM peak hour)**

Bold indicates intersections that already operate unacceptably under near-term conditions.

The results of the micro-simulation analysis for traffic operations on Middlefield Road and Ravenswood Avenue show that the following intersections would degrade from acceptable conditions to unacceptable conditions during at least one of the peak hours with the Proposed Project. Therefore, these intersections would be non-compliant with local policies and would be adversely affected by the Proposed Project. The micro-simulation methodology, assumptions, and analysis results are documented in Appendix B.

- 15. Middlefield Road and Ravenswood Avenue (AM and PM peak hours)
- 16. Middlefield Road and D Street/Ringwood Avenue (AM and PM peak hours)
- 17. Middlefield Road and Seminary Drive (AM and PM peak hours)
- 19. Project Driveway B1 West and Ravenswood Avenue (PM peak hour)
- 20. Project Driveway/Pine Street and Ravenswood Avenue (PM peak hour)

The intersection level of service calculation sheets for the intersection analyzed using the VISTRO software are included in Appendix C.

Willow corridor improvements + Multimodal improvements

Notes:

* Denotes CMP Intersection

AWSC - All Way Stop Control; TWSC - Two Way Stop Control.

¹ Average delay is reported for signalized and AWSC intersections. For TWSC intersections, the delay for the worst stop-controlled movement is reported.

² Average delay and level of service for the study intersections (7, 8, 41-45) were based off the microsimulation analysis conducted for the Willow Village project. Intersections that showed OVERSAT and LOS F were assumed to operate the same for this project and under project conditions. For intersections that were not shown OVERSAT and LOS F in the Willow Village project, the results from the VISTRO analysis done for this project are reported. "OVERSAT" indicates that the SimTraffic microsimulation model indicates that the intersection would experience capacity issues where the demand cannot be served by the intersection. Oversaturated intersections would operate at LOS F.

³ This assumes 100% office scenario.

⁴ The intersection delay for intersections under project conditions with improvement is compared to without project conditions.

⁵ Intersections fronting the project site are analyzed using a microsimulation model. A cumulative analysis is not completed. Certain intersections would experience capacity issues where the demand cannot be served by the intersection, and are indicated with OVERSAT. Oversaturated intersections would operate at LOS F.

Bold indicates substandard level of service

Bold indicates noncompliance. The project exceeds thresholds in the City of Menlo Park's TIA Guidelines.

It should be noted that at some intersections the average delay is shown to decrease with the addition of Project traffic. This occurs because the intersection delay is a weighted average of all intersection movements. When traffic is added to movements with delays lower than the average intersection delay, the average delay for the entire intersection can decrease. Furthermore, the congestion and queue spillback at an adjacent intersection can constrain the traffic volume at some intersections resulting in a small decrease in average delay.

Adverse Effects and Recommended Improvements

The intersection effects and recommended modifications to improve the intersections to pre-Project conditions or better are described below. It should be noted that the intersection analysis accounts for the Proposed Project's 25% TDM trip reductions from ITE trip generation after crediting internalization.

The office component's proposed TDM reduction of 28% would result in approximately 48 fewer trips during the AM peak hour and 46 fewer trips during the PM peak hour for the 100% office scenario. This level of trip reduction would not address any intersection adverse effects alone.

A sensitivity analysis was conducted to test whether assuming R&D land use, and/or a higher TDM trip reduction would eliminate any adverse effects. The scenarios tested included the following:

- 100% R&D land use instead of office land use
- Higher TDM trip reduction (up to 40%)
- A combination of the two

The analysis showed that the tested scenarios would not eliminate any adverse effects. Potential physical intersection improvements are discussed below.

Bay Road and Ringwood Avenue (#6)

This intersection is expected to operate at an unacceptable LOS F during the AM peak hour and an acceptable LOS B during the PM peak hour under near-term conditions. The addition of Project traffic would cause the average critical delay to increase by more than 0.8 seconds during the AM peak hour. The intersection would continue to operate at an acceptable LOS C during the PM peak hour. This constitutes non-compliance during the AM peak hour according to the thresholds established by the City of Menlo Park.

Since the intersection currently operates as all-way-stop-controlled, potential modification to bring the intersection to pre-project conditions would be to signalize it. The intersection would meet the MUTCD signal warrant during both peak hours under project conditions (see Appendix E). However, to effectively operate the signalized intersection, it would be necessary to close off Sonoma Avenue from the intersection or convert Sonoma Avenue/Ringwood Avenue to one-way streets, so the intersection would operate as a four-leg intersection. Restricting the access to Sonoma Avenue from the intersection would require additional outreach and a traffic signal is not recommended at this time. Other physical improvements to increase the intersection capacity are considered infeasible due to right-of-way constraints and/or adverse effects on pedestrian and bicycle travel at the intersection.

Willow Road Corridor (#7, #9, #10, #44, #45)

Willow Road between Bayfront Expressway and Durham Street/Hospital Plaza is expected to experience capacity issues due to unserved demand at the intersections. These intersections would operate unacceptably under near-term conditions during both peak hours. With the addition of Project traffic, intersections along the corridor would continue to operate unacceptably during both peak hours.

The intersections of Willow Road and US 101 northbound ramps would experience an increase in delay of over four seconds with the addition of project traffic in the AM peak hour and PM peak hour, respectively, and would be non-compliant per Menlo Park's guidelines for state-controlled intersections.

The intersections of Bay Road and Durham Street at Willow Road would experience an increase in average critical delay of over 0.8 seconds with the addition of project traffic in both peak hours, the intersection of O'Brien Drive at Willow Road would experience an increase in delay of over 0.8 seconds with the addition of Project traffic on the local approach to the intersection in both peak hours, and the intersection of Newbridge Street at Willow Road would experience an increase in delay of over 0.8 seconds with the addition of Project traffic on the local approach to the intersection during the PM peak hour, which would be non-compliant per Menlo Park's guidelines.

The City of Menlo Park is implementing an adaptive traffic signal coordination system on the Willow Road corridor to improve traffic flow. Adaptive traffic control is a technology that automatically adjusts traffic signal timing based on actual traffic demand at an intersection. This measure will improve the intersection operations and could reduce the intersection delay. The reduction in delay due to adaptive signal coordination is not expected to bring the corridor intersections into compliance with the City's TIA guidelines or to substantially reduce the delay caused by the Proposed Project.

Physical intersection improvements that would improve intersection operations at the non-compliant intersections are:

- **Willow Road and Bay Road (#9)** – The City's TIF program proposes to modify the southbound approach at this intersection to two left-turn lanes and one right-turn lane and to modify the westbound approach to add a right-turn lane. However, this improvement would require removing trees in the median and adjacent to the intersection, which is undesirable. Therefore, the improvement is not recommended.
- **Durham Street and Willow Road (#10)** – The recommended improvement measure for this intersection is restriping southbound Hospital Plaza to include one left-turn and one shared through-right lane. The excess space could be repurposed for a right-turn lane (and the shared through-right lane would become a dedicated through lane), or redesigned for pedestrian infrastructure such as widened sidewalk or a bulb-out. North/south legs would operate with protected phasing instead of split phasing. Signal modifications would be needed. The northbound and southbound left-turns may require lead/lag depending on the final design of the intersection if there is insufficient space for both left-turns to turn at the same time. With this improvement, the AM peak hour would continue to be non-compliant, but the Project's non-compliance during the PM peak hour would be eliminated. If this recommended improvement measure is implemented, the Project should contribute its fair share towards the improvement. Fair share is calculated as the percentage of net project traffic generated of the overall cumulative traffic growth at this intersection.

Physical improvements are considered infeasible due to right-of-way constraints and/or adverse effects on pedestrian and bicycle travel at the intersections of US 101 northbound ramps, O'Brien Drive, and Newbridge Street at Willow Road.

The TIF program also proposes multi-modal improvements along this section of Willow Road. These include an eastbound Willow Road one-way Class IV separated bikeway between Hamilton Avenue and the US 101/Willow Road Interchange, a westbound Willow Road one-way Class IV separated bikeway between the Dumbarton Rail Corridor and the US 101/Willow Road Interchange, high-visibility crosswalks and pedestrian signals on all legs at the intersection of Willow Road and O'Brien Drive, Class II bicycle lanes on eastbound Willow Road from O'Keefe Street to Bay Road, and Class II bicycle lanes on westbound Willow Road from Bay Road to Durham Street. The Class IV bike lanes on Willow

Road would be at same elevation as the sidewalks, which would improve bicycle safety on Willow Road by removing bicycles from vehicular traffic.

Implementing recommended multi-modal facilities along the corridor (from the City's TIF program) could shift some motor vehicle traffic to alternative modes of travel and reduce congestion. With implementation of these multi-modal improvements, the intersection deficiencies could be further reduced and partially address the Proposed Project's share of the non-compliant operations along Willow Road.

Middlefield Road and Willow Road (#13)

This intersection is expected to operate at an acceptable LOS D in both peak hours under near term conditions. The addition of Project traffic would cause the level of service at the intersection to worsen to an unacceptable LOS E in both peak hours. The deterioration of LOS from D to E constitutes non-compliance according to the thresholds established by the City of Menlo Park.

It is infeasible to add lanes to increase the capacity of the intersection. A potential improvement is to convert the traffic signal to a roundabout. However, the improvement would require additional detailed analysis to determine its feasibility. Pedestrian and bicycle travel through a roundabout also needs to be carefully designed.

Laurel Street and Glenwood Avenue (#22)

This intersection is expected to operate at an unacceptable LOS D during the AM peak hour and an acceptable LOS A during the PM peak hour under near-term conditions. With the addition of Project traffic, the intersection would operate at an unacceptable LOS F during the AM peak hour. The intersection would continue to operate at an acceptable LOS B during the PM peak hour. This constitutes non-compliance during the AM peak hour according to the thresholds established by the City of Menlo Park.

Since the intersection currently operates as all-way-stop-controlled, potential modification to bring the intersection to pre-project conditions would be to signalize it. The intersection would meet the MUTCD signal warrant in the AM peak hour under project conditions (see Appendix E). A traffic signal is not currently desired at this time. There are no other feasible improvements at this intersection within the existing right-of-way.

The City's TIF program also proposes to install sidewalks or an asphalt pathway on western side of Laurel Street between Encinal Avenue and Glenwood Avenue, which could shift some motor vehicle traffic to pedestrian modes of travel, reduce congestion, and partially address the Proposed Project's share of the non-compliant operations at this intersection.

Bayfront Expressway and University Avenue (#46)

This intersection is expected to operate at an acceptable LOS B during the AM peak hour and an unacceptable LOS F during the PM peak hour under near-term conditions. The addition of Project traffic would cause the average critical delay to increase by more than 0.8 seconds during the PM peak hour. The intersection would continue to operate at an acceptable LOS B during the AM peak hour. This constitutes non-compliance during the PM peak hour according to the thresholds established by the City of Menlo Park.

The City's TIF program proposes to evaluate the potential for grade separation to allow conflicting movements to occur simultaneously at the intersection. Although the improvement could potentially improve traffic operation, the improvement is beyond the scope of a single development project.

The Metropolitan Transportation Commission (MTC) Dumbarton Forward project would restripe Bayfront Expressway to add bus-only lanes on the shoulders during peak periods and implement signal timing improvements. The bus-only lanes would generally help the progression of shuttles and buses along the corridor. The signal timing improvements are also assumed to help with the general progression along Bayfront. However, specific details are unknown at this time regarding the improvements at the University Avenue and Bayfront Expressway intersection. The improvements' effectiveness in addressing the Project traffic generated adverse effect on traffic operations at this intersection cannot be determined. Furthermore, since this project is not led by the City of Menlo Park, implementation cannot be guaranteed.

Middlefield Road and Ravenswood Avenue Corridors (#15, #16, #17, #19, #20)

Based on the micro-simulation analysis (included in Appendix B), the following improvements were identified to improve traffic operations along Middlefield Road and Ravenswood Avenue in the immediate project vicinity:

- Changing the east/west phasing at Middlefield Road and Ringwood Avenue (#16) from permitted to split phasing and modifying the signal timings at Middlefield Road & Ravenswood Avenue (#15). The analysis assumed half cycle length at the Middlefield/Ravenswood intersection during the PM peak hour.
- A new traffic signal at Middlefield Road and Seminary Drive (#17) with protected north/south phasing and split east/west phasing and optimized cycle length. See discussion below regarding additional recommendations to prevent cut-through traffic.
- Extension of the northbound left-turn storage length at Middlefield Road and Seminary Drive (#17) from 50 feet to 325 feet.
- Adding center medians with left-turn pockets or two-way left-turn lane along Ravenswood Avenue between the proposed project driveway at W First Street and Laurel Street.

The analysis results show that implementation of these improvements would generally improve traffic flow along the Middlefield Road and Ravenswood Avenue corridors. Intersection average delays and queuing would also generally decrease as a result. The analysis showed overall improvements in percentage of traffic served at the intersections with the identified improvements.

The City of Menlo Park and County of San Mateo are evaluating complete streets improvements along Ringwood Avenue and Coleman Avenue within the vicinity of the project site. These improvements would in general improve road user safety and improve bicycle and pedestrian connectivity. Since the proposed project is located within close proximity to this study area, the Project would also benefit from these improvements. It is recommended that the Project Sponsor coordinate with City staff regarding this corridor study and contribute its fair share towards the identified improvements.

With the proposed signalization of Middlefield Road and Seminary Drive, the likelihood of Seminary Drive becoming a cut-through route for project traffic increases. Seminary Drive is designated as a Bicycle Boulevard in the City's General Plan. Traffic calming measures could be installed to discourage the use of Seminary Drive as a cut-through route. If a traffic signal is installed at Middlefield Road and Seminary Drive, it is recommended that forced turn islands are also installed to restrict through movements along Seminary Drive.

Cumulative (2040) Intersection Levels of Service

The results of the intersection level of service analysis under cumulative conditions are summarized in Table 12. The intersection LOS calculation sheets are included in Appendix C. The following study

intersections (see Figure 14) would operate at an unacceptable level of service during at least one peak hour:

4. Florence Street/Bohannon Drive and Marsh Road (AM peak hour)
6. Bay Road and Ringwood Avenue (AM peak hour)
7. US 101 Northbound Ramps and Willow Road (AM and PM peak hours)
8. US 101 Southbound Ramps and Willow Road (AM and PM peak hours)
9. Bay Road and Willow Road (AM and PM peak hours)
10. Durham Street and Willow Road (AM and PM peak hours)
13. Middlefield Road and Willow Road (AM and PM peak hours)
21. Laurel Street and Encinal Avenue (AM peak hour)
22. Laurel Street and Glenwood Avenue (AM peak hour)
28. El Camino Real and Encinal Avenue (AM peak hour)
36. University Drive and Valparaiso Avenue (AM peak hour)
41. Bayfront Expressway and Willow Road (AM and PM peak hours)
42. Hamilton Avenue and Willow Road (AM and PM peak hours)
43. Ivy Drive and Willow Road (AM and PM peak hours)
44. O'Brien Drive and Willow Road (AM and PM peak hours)
45. Newbridge Street and Willow Road (AM and PM peak hours)
46. Bayfront Expressway and University Avenue (PM peak hour)

Cumulative (2040) Plus Project Intersection Levels of Service

The results of the intersection level of service analysis under cumulative (2040) plus project conditions show that the following intersections would be non-compliant with local policies during either the AM or the PM peak hour as compared to cumulative conditions (see Table 12 and Figure 15).

- 4. Florence Street/Bohannon Drive and Marsh Road (AM peak hour)**
6. Bay Road and Ringwood Avenue (AM and PM peak hours)
7. US 101 Northbound Ramps and Willow Road (AM peak hour)
9. Bay Road and Willow Road (AM peak hour)
10. Durham Street and Willow Road (AM and PM peak hours)
13. Middlefield Road and Willow Road (AM and PM peak hours)
- 21. Laurel Street and Encinal Avenue (AM peak hour)**
22. Laurel Street and Glenwood Avenue (AM peak hour)
- 32. El Camino Real and Ravenswood Avenue/Menlo Avenue (AM peak hour)**
- 36. University Drive and Valparaiso Avenue (AM and PM peak hours)**
- 38. Santa Cruz Avenue and Avy Avenue (PM peak hour)**
44. O'Brien Drive and Willow Road (AM and PM peak hours)
45. Newbridge Street and Willow Road (AM and PM peak hours)
46. Bayfront Expressway and University Avenue (PM peak hour)

Bold denotes intersections that would be non-compliant under cumulative plus project conditions during either AM or PM peak hours but are compliant under near-term plus project conditions during both peak hours.

It should be noted that at some intersections the average delay is shown to decrease with the addition of Project traffic. This occurs because the intersection delay is a weighted average of all intersection movements. When traffic is added to movements with delays lower than the average intersection delay, the average delay for the entire intersection can decrease. Furthermore, the congestion and queue spillback at an adjacent intersection can constrain the traffic volume at some intersections resulting in a small decrease in average delay.

Notes:

* Denotes CMP Intersection

AWSC - All Way Stop Control; TWSC - Two Way Stop Control.

¹ Average delay is reported for signalized and AWSC intersections. For TWSC intersections, the delay for the worst stop-controlled movement is reported.

² Average delay and level of service for the study intersections (7, 8, 41-45) were based off the microsimulation analysis conducted for the Willow Village project. Intersections that showed OVERSAT and LOS F were assumed to operate the same for this project and under project conditions. For intersections that were not shown OVERSAT and LOS F in the Willow Village project, the results from the VISTRO analysis done for this project are reported. "OVERSAT" indicates that the SimTraffic microsimulation model indicates that the intersection would experience capacity issues where the demand cannot be served by the intersection. Oversaturated intersections would operate at LOS F.

³ This assumes 100% office scenario.

⁴ The intersection delay for intersections under project conditions with improvement is compared to without project conditions.

⁵ Intersections fronting the project site are analyzed using a microsimulation model. A cumulative analysis is not completed. Certain intersections would experience capacity

Bold indicates substandard level of service

Bold indicates noncompliance. The project exceeds thresholds in the City of Menlo Park's TIA Guidelines.

As described in Chapter 1, a SimTraffic micro-simulation analysis was conducted for the study intersections #15, #16, #17, #19, #20, and #24 on Middlefield Road and Ravenswood Avenue to identify potential project effects and improvements along these corridors. While the simulation analysis did not evaluate a cumulative scenario for these intersections, it is expected that the improvements recommended under near-term conditions to be the same as those under cumulative conditions, as there are no additional improvements that can be recommended given the existing right-of-way constraints.

Adverse Effects and Recommended Improvements

For intersections that are non-compliant under both near-term plus project conditions and cumulative plus project conditions, the recommended improvements proposed under near-term plus project conditions would be sufficient to address cumulative non-compliance. Improvements for intersections that are non-compliant only under cumulative plus project conditions are described below.

A sensitivity analysis was conducted to test whether assuming R&D land use, and/or a higher TDM trip reduction would eliminate any adverse effects. The scenarios tested included the following:

- 100% R&D land use instead of office land use
- Higher TDM trip reduction (up to 40%)
- A combination of the two

The analysis showed that the following intersection adverse effects can be eliminated if a lower trip generation level is assumed. The specific lowered trip generation levels are discussed below.

- El Camino Real & Ravenswood Avenue
- Santa Cruz Avenue & Avy Avenue

Bohannon Drive/Florence Street and Marsh Road (#4)

This intersection is expected to operate at an unacceptable LOS E during the AM peak hour and an acceptable LOS D during the PM peak hour under cumulative conditions. The addition of Project traffic would cause the average critical delay to increase by more than 0.8 seconds during the AM peak hour. The intersection would continue to operate at an acceptable LOS D during the PM peak hour. This constitutes non-compliance during the AM peak hour according to the thresholds established by the City of Menlo Park.

Modification of the westbound approach at this intersection to a left-turn lane, two through lanes, and a right-turn lane would improve the average delay to better than cumulative no project conditions. However, these improvements are considered infeasible due to right-of-way constraints and adverse effects on pedestrian and bicycle travel.

Menlo Park's TIF program proposes Class II buffered bike lanes along Marsh Road from Bay Road to Scott Road in both directions, which includes this intersection. Implementing recommended multi-modal facilities along the corridor (from the City's TIF program) could shift some motor vehicle traffic to alternative modes of travel and reduce congestion. Implementation of these multi-modal improvements would partially address the Proposed Project's share of the non-compliant operations at this intersection.

Laurel Street and Encinal Avenue (#21)

This intersection is expected to operate at an unacceptable LOS E during the AM peak hour and an acceptable LOS B during the PM peak hour under cumulative conditions. The addition of Project traffic would cause the average critical delay to increase by more than 0.8 seconds during the AM peak hour. The intersection would continue to operate at an acceptable LOS B during the PM peak hour. This

constitutes non-compliance during the AM peak hour according to the thresholds established by the City of Menlo Park.

Since the intersection currently operates as all-way-stop-controlled, potential modification to bring the intersection to pre-project conditions would be to signalize it. The intersection would meet the MUTCD signal warrant in the AM peak hour under project conditions (see Appendix E). However, the City currently has no plans to install traffic signals at the intersection. Other physical improvements to increase the intersection capacity are considered infeasible due to right-of-way constraints.

The City's TIF program proposes to install sidewalks or an asphalt pathway on western side of Laurel Street between Encinal Avenue and Glenwood Avenue, which could shift some motor vehicle traffic to alternative modes of travel, reduce congestion, and partially address the Proposed Project's share of the non-compliant operations at this intersection.

El Camino Real and Ravenswood Avenue/Menlo Avenue (#32)

This intersection is expected to operate at an acceptable LOS D in both peak hours under cumulative conditions. The addition of Project traffic would cause the level of service at the intersection to worsen to an unacceptable LOS E in the AM peak hour. The intersection would continue to operate at an acceptable LOS D during the PM peak hour. The deterioration of LOS from D to E in the AM peak hour constitutes non-compliance according to the thresholds established by the City of Menlo Park.

The City's TIF program proposes the following multimodal improvements at the intersection:

- On El Camino Real from Santa Cruz Avenue to Ravenswood Avenue/Menlo Avenue, remove parking along west side of street and designate Class III bicycle route northbound along the segment.
- On El Camino Real from Ravenswood Avenue/Menlo Avenue to Roble Avenue, remove median for entire length of the segment and widen sidewalk facility on east side of the street to 15 feet for a Class I multi-use path.
- Install northbound El Camino Real right-turn overlap and bike signal and prohibit right-turn on red movements.
- Remove median on south leg of the intersection and install an additional northbound El Camino Real right-turn lane.
- Transition bicycle lane into bicycle route and install green-backed sharrows on right-turn lane and green conflict striping approaching the right-turn lane on southbound El Camino Real.
- Install high-visibility crosswalk across all legs.

A sensitivity analysis shows that the 100% R&D scenario with 30% TDM trip reductions would be sufficient to avoid the adverse effect of the Proposed Project on intersection operations.

University Drive and Valparaiso Avenue (#36)

This intersection is expected to operate at an unacceptable LOS F during the AM peak hour and an acceptable LOS D during the PM peak hour under cumulative conditions. The addition of Project traffic would cause the average critical delay to increase by more than 0.8 seconds during the AM peak hour and degrade the operations to an unacceptable LOS E during the PM peak hour. This constitutes non-compliance during both peak hours according to the thresholds established by the City of Menlo Park.

Physical improvements at this intersection are considered infeasible due to right-of-way constraints, potential tree removal, and/or adverse effects to pedestrian and bicycle travel.

Santa Cruz Avenue and Avy Avenue (#38)

This intersection is expected to operate at an unacceptable LOS C during the AM peak hour and an acceptable LOS D during the PM peak hour under cumulative conditions. With the addition of Project traffic, the intersection would operate at an unacceptable LOS E during the PM peak hour. The intersection would continue to operate at an acceptable LOS C during the AM peak hour. This constitutes non-compliance during the PM peak hour according to the thresholds established by the City of Menlo Park.

Since the intersection currently operates as all-way-stop-controlled, potential modification to bring the intersection to pre-project conditions would be to signalize it. The intersection would meet the MUTCD signal warrant in both peak hours under project conditions (see Appendix E). Periodic monitoring of traffic operations at this intersection should be conducted to determine if signalization is needed. If warranted, implementation of the new traffic signal would address the Proposed Project's share of the non-compliant operation and bring the intersection into compliance with the TIA Guidelines. There are no other feasible improvements at this intersection within the existing right-of-way.

The City's TIF program proposes to reduce the curb radius at the southeast corner of intersection and bring bicycle lane to the left side of the northbound Santa Cruz Avenue right-turn lane, which would improve bicycle travel through the intersection. The City's TIF program also proposes to establish Class II bicycle lanes on Avy Avenue between Santa Cruz Avenue and Monte Rosa Drive by removing on-street parking. Implementing these multi-modal facility improvements could shift some motor vehicle traffic to alternative modes of travel, reduce congestion, and partially address the Proposed Project's share of the non-compliant operations at this intersection.

A sensitivity analysis shows that the 100% R&D scenario with 40% TDM trip reductions would be sufficient to avoid the adverse effect of the Proposed Project on intersection operations.

Intersection Vehicle Queuing

The analysis of intersection levels of service was supplemented with a vehicle queuing analysis for intersection left-turning movements where the Proposed Project would add significant trips per lane in the vicinity of the Project Site and affect intersection operations (see Figure 16). This analysis provides a basis for estimating future storage requirements at these intersections. Vehicle queues were estimated using the methodology described in Chapter 1. The following left-turn movements were selected for evaluation and the vehicle queuing analysis results based on the VISTRO software are summarized in Table 13:

- Northbound left-turn at US 101 Northbound Ramps and Willow Road (#7)
- Southbound left-turn at Bay Road and Willow Road (#9)
- Southbound left-turn at Middlefield Road and Willow Road (#13)
- Southbound and westbound left-turn at El Camino Real and Ravenswood Avenue (#32)

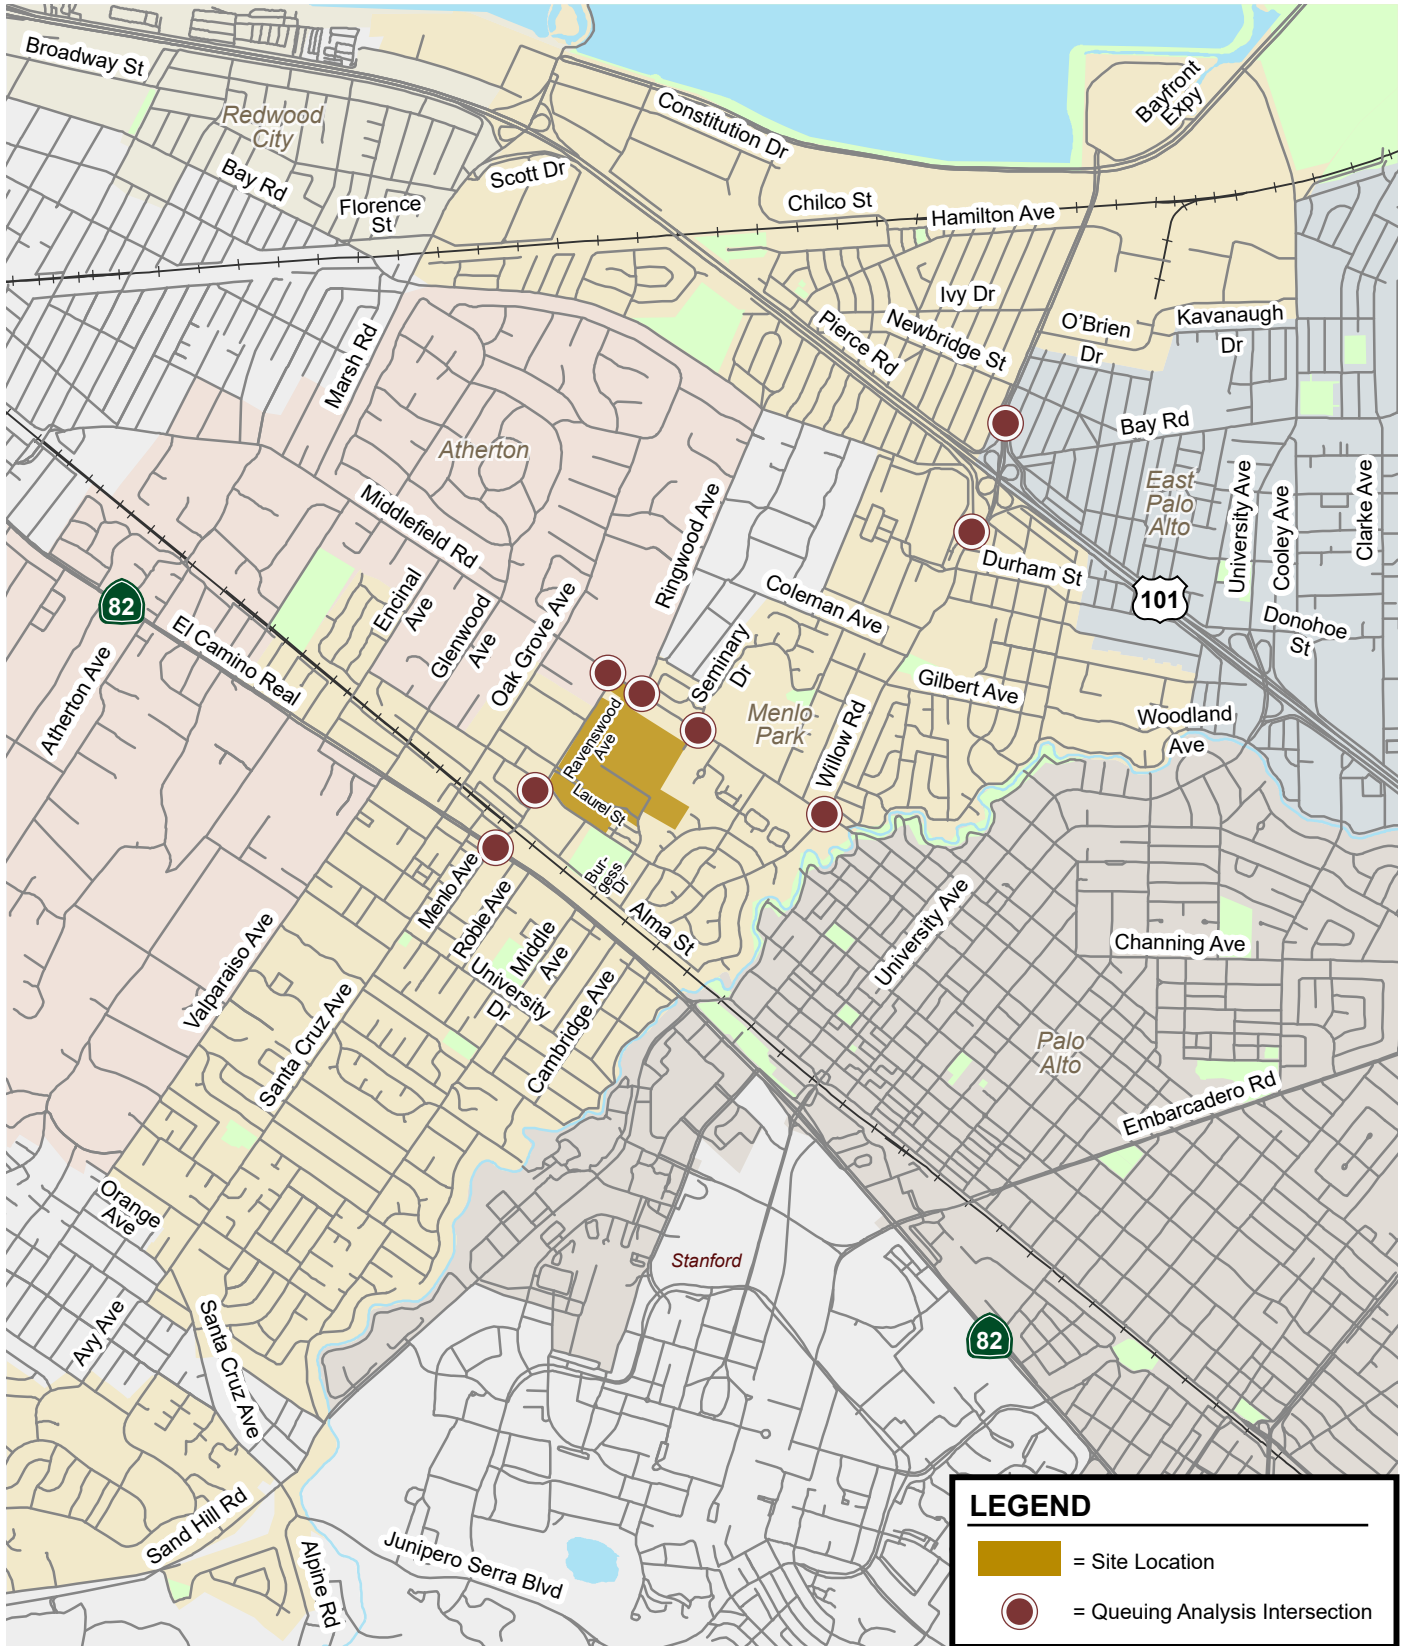

Figure 16
Queuing Analysis Locations

Vehicle queuing for the following intersections were analyzed based on the SimTraffic micro-simulation analysis and the vehicle queuing analysis results are summarized in the Micro-Simulation Queuing Analysis section below.

- Middlefield Road and Ravenswood Avenue (#15)
- Middlefield Road and Ringwood Avenue (#16)
- Middlefield Road and Seminary Drive (#17)
- Laurel Street and Ravenswood Avenue (#24)

Notes:										
NBL = northbound left-turn; SBL = southbound left-turn; WBL = westbound left-turn										
¹ Vehicle queues are from Vistro outputs and are rounded up to the next whole number. Assumes one vehicle equals 25 feet of queue.										

Locations where the estimated 95th percentile queues would exceed the available storage capacity for the movement are discussed below. Queuing issues are operational issues resulting from signal timing and queue storage provisions. Queuing issues are not considered a CEQA issue related to hazards.

Southbound Left-Turn at Bay Road and Willow Road (#9)

The existing vehicle storage for the southbound left-turn lane on Bay Road at Willow Road is 175 feet, which provides enough space for about 7 vehicles. Under existing conditions, the 95th percentile queue would exceed the storage of the left-turn lane by 4 vehicles in the AM peak hour. Under near-term

conditions, the 95th percentile queue would exceed the storage length of the turn lane by 7 vehicles during the AM peak hour. The Proposed Project would add one vehicle to the 95th percentile queue during the AM peak hour and cause the 95th percentile queue to exceed the storage length by 2 vehicles during the PM peak hour. The southbound approach on Bay Road is 24 feet wide for approximately 380 feet long north of Willow Road, which can be striped to provide 2 approach lanes with the inside lane being used by the left turn traffic. It should be noted that this improvement is not desired because it required tree removal and lane widening.

Southbound Left-Turn at Middlefield Road and Willow Road (#13)

The existing vehicle storage for the southbound left-turn lane on Middlefield Road at Willow Road is 275 feet, which provides enough space for about 11 vehicles. Under existing conditions, the 95th percentile queue would exceed the storage of the left-turn lane by one vehicle in the PM peak hour. Under near-term conditions, the 95th percentile queue would exceed the storage length of the turn lane by 2 vehicles during the PM peak hour. The Proposed Project would add 9 vehicles to the 95th percentile queue during the PM peak hour and cause the 95th percentile queue to exceed the storage length by one vehicle during the AM peak hour.

It is infeasible to add lanes to increase the capacity of the intersection. A potential improvement is to provide a roundabout. However, the improvement would require additional detailed analysis to determine its feasibility. Pedestrian and bicycle travel through a roundabout also need to be carefully designed.

Southbound Left-Turn at El Camino Real and Ravenswood Avenue (#32)

The existing vehicle storage for the southbound left-turn lane on El Camino Real at Ravenswood Avenue is 250 feet, which provides enough space for about 10 vehicles. Under existing and near-term conditions, the 95th percentile queue would not exceed the storage of the left-turn lane in the AM and PM peak hours. The Proposed Project would cause the 95th percentile queue to exceed the storage length by 8 vehicles during the AM peak hour. There is no room to further extend this left-turn lane because of the short block between Ravenswood Avenue and Santa Cruz Avenue. It is also infeasible to add a turn lane to increase the storage capacity for the southbound left-turn lane.

Westbound Left-Turn at El Camino Real and Ravenswood Avenue (#32)

The existing vehicle storage for the westbound left-turn lanes on Ravenswood Avenue at El Camino Real is 225 feet per lane, which provides enough space for about 9 vehicles per lane. Under existing and near-term conditions, the 95th percentile queue would exceed the storage of the left-turn lane by 3 vehicles in the AM peak hour and one vehicle in the PM peak hour. The Proposed Project would cause the 95th percentile queue to exceed the storage length by 4 vehicles during the AM peak hour and 5 vehicles in the PM peak hour.

There is no room to further extend the left-turn lanes because this would require removing trees and the signage in the median. It is also infeasible to add a turn lane to increase the storage capacity for the left-turn movement.

Note: Queue lengths are approximate.

Micro-Simulation Queueing Analysis

The SimTraffic micro-simulation analysis was conducted to evaluate traffic operations and vehicles queuing along the Middlefield Road and Ravenswood Avenue corridors between Oak Grove Avenue and Seminary Drive and between Middlefield Road and Laurel Street, respectively (see Appendix B). Due to the close proximity of the study intersections on Middlefield Road and Ravenswood Avenue, the micro-simulation analysis showed that the Proposed Project would contribute to significant traffic congestion along Middlefield Road. The following study intersections along the corridors would experience 95th percentile queues that extend beyond the existing left-turn storage capacity during at least one of the peak hours under near-term plus project conditions. The 95th percentile queues for through lanes along Middlefield Road and Ravenswood Avenue are also estimated to extend from one intersection to an upstream intersection.

- Middlefield Road and Ravenswood Avenue (#15)
- Middlefield Road and Ringwood Avenue (#16)
- Middlefield Road and Seminary Drive (#17)
- Laurel Street and Ravenswood Avenue (#24)

With the identified improvements described under Near-Term (2027) Plus Project Intersection Levels of Service, traffic operations would improve significantly along Middlefield Road near the Project Site with reduced vehicle queues. However, 95th percentile queues would still extend beyond the existing left-turn storage capacity. The 95th percentile queues for through lanes along Middlefield Road and Ravenswood Avenue would still extend from one intersection to an upstream intersection (see Figures 17 to 20, also see Appendix B).

Freeway Facilities Analysis

In analyzing the freeway segments, the citywide travel demand forecast model was used to forecast the increase in traffic volumes between existing and cumulative plus project conditions. For the purpose of this study, freeway levels of service under cumulative conditions are calculated based on volume to capacity (V/C) ratio. A freeway segment is assumed to operate at LOS F under future conditions if,

- The freeway segment already operates at LOS F under existing conditions, or
- The ConnectMenlo model forecasts the freeway segment to operate at a V/C ratio above 1 under future conditions.

Definition of Adverse Freeway Effects

Within San Mateo County, a project is said to create an adverse effect on traffic conditions on a freeway segment if for either peak hour:

1. The analysis indicates that the combination of the Project and future traffic demand will result in the freeway segment operating at a level of service that exceeds the standard adopted by the current CMP and the Proposed Project increases traffic demand on the freeway segment by an amount equal to one percent (1%) or more of the segment capacity, or
2. The Project will add traffic demand equal to one percent (1%) or more of the segment capacity if the freeway segment is currently not in compliance with the adopted LOS standard.

Freeway Analysis

As shown on Table 14, the Proposed Project would add traffic greater than 1% capacity to the following study freeway segments operating below its LOS standard:

- SR 84 – from Alameda County Line to University Avenue – AM Peak Hour
- US 101 – between Santa Clara County Line and Whipple Avenue – AM & PM Peak Hours

Freeway Improvements

It should be noted that the cumulative plus project conditions model run assumed the US 101 express lane project in San Mateo County. Improvements to eliminate the adverse freeway effects on US 101 and on SR 84 within San Mateo County would require additional capacity improvements and/or additional TDM measures that would reduce peak-hour vehicle trip-making by more than 60%. San Mateo County currently has no plans to further improve US 101 beyond the identified express lane projects. There are also no identified plans to improve the Bayfront Expressway (SR 84) corridor. Such an aggressive TDM plan would also not be feasible.

The Proposed Project's adverse effects on US 101 and on SR 84 freeway segments in San Mateo County would remain.

Freeway Ramp Analysis

A freeway ramp analysis is conducted under cumulative plus project conditions to determine whether freeway ramps would continue to have sufficient capacity to serve the forecasted traffic demand. For the purpose of this study, a project is said to create an adverse effect on a freeway ramp if:

- The project would cause the volume-to-capacity (V/C) ratio of the freeway ramp to exceed 1.0;
or
- The project would increase the amount of traffic on a freeway ramp that is already exceeding its capacity by more than one percent (1%) of the ramp's capacity.

As shown on Table 15, under cumulative plus project conditions, all study freeway ramps would continue to have sufficient capacity to serve the anticipated demand.

Site Access, Circulation, and Parking

Site access and on-site circulation were evaluated using commonly accepted transportation principles. This review is based on the site plan prepared by STUDIOS Architecture dated June 28, 2023.

Vehicle Site Access and Circulation

The Proposed Project has a residential component and a commercial component. The two components are separated from a vehicle site access and circulation perspective. The residential component has a townhome portion, which has a dedicated driveway on Laurel Street. The apartment buildings consist of four separate buildings and are all connected via one driveway on Ravenswood Avenue opposite of Pine Street, and one driveway on Laurel Street. These two driveways both provide access to parking garages and parking lots for the apartment buildings.

The commercial component of the Proposed Project consists of multiple office buildings accessed by four driveways. Two of the driveways are on Ravenswood Avenue, while the other two driveways are at the east property boundary, and connect to D Street and Seminary Drive, respectively. All driveways provide access to an internal loop road on site, which connects to 3 parking garages and multiple parking lots. There would also be a programmable park at the northeast corner of the Project Site, east of the existing church. There is a right-turn-in-only driveway just east of the church that would provide access to this park.

**Table 14
Freeway Analysis**

CMP Facility	Roadway Segment	Dir.	Pk Hr	LOS Standard	Capacity	Existing LOS	Yr 2040 + Project

	PM				-	3,800	867	0.23	1,124	0.30	

Notes:

NB = Northbound; SB = Southbound; EB = Eastbound; WB = Westbound

1. Northbound on-ramps are assumed metered during the AM peak hour. Southbound on-ramps are assumed metered during the PM peak hour.
2. Ramp capacities were obtained from *Highway Capacity Manual 2000*, and considered the free-flow speed, the number of lanes on the ramp, and ramp metering.
3. Existing volumes referenced intersection counts collected in 2022/2023.

Sight Distance

The proposed driveway locations were evaluated to determine if the sight distance at the new driveways would be adequate. The Proposed Project driveways should be free and clear of any obstructions to optimize sight distance, thereby ensuring that exiting vehicles can see pedestrians on the sidewalk and other vehicles traveling on the street. Adequate sight distance reduces the likelihood of a collision at driveways and provides drivers with the ability to locate sufficient gaps in traffic to exit the driveway. Sight distance of a driveway is evaluated based on the stopping sight distance recommended by Caltrans for a given design speed.

The speed limit along Laurel Street near the Project Site is 25 miles per hour (mph). The speed limit along Ravenswood Avenue near the Project Site is 30 mph. The Caltrans recommended stopping sight distance is 150 feet on Laurel Street, and 200 feet on Ravenswood Avenue. There are no on-street parking or considerable roadway curves that would block a driver's ability at any of the Proposed Project driveways along Laurel Street or Ravenswood Avenue to see up to the recommended stopping sight distances. The Proposed Project should ensure any landscaping and signage will be located in such a way as to ensure an unobstructed view for drivers entering and exiting the site.

The Proposed Project also has one driveway that would extend into D Street. Since the driveway would become a continuation of D Street, there would be no sight distance issues at that location.

The Proposed Project also has one driveway that would intersect Seminary Drive. This intersection has three other driveways from other non-project parcels all connected to it. It should be noted that the Project Sponsor is working with City staff to improve the geometric design and simplify intersection operations at this location. It is expected that the improvement would provide adequate sight distance for drivers traveling through the intersection.

On-Site Circulation

The site plan does not provide specific dimensions for driveway widths, parking aisles, parking space dimensions, etc. The site plan does not specify loading and trash locations. Prior to final design, the Project Sponsor shall coordinate with City staff to ensure the site is designed per City standards.

Pedestrian and Bicycle Facilities

The Proposed Project proposes multiple pedestrian and bicycle connections between the Project Site and the surrounding roadway network and within the Project Site:

- Class I multi-use path along the Project Site frontage on Ravenswood Avenue
- Class I multi-use path connecting Laurel Street and the Loop Road north of the proposed townhomes
- Class I multi-use path along the southern project boundary, running along Burgess Drive west to Laurel, and east to Seminary Drive
- Class II bicycle lanes along all roadways inside the Project Site
- Class IV bicycle facility along Laurel Street from Burgess Drive to Ravenswood Avenue

The details of these proposed designs have not been finalized yet. Prior to final design, the Project Sponsor shall coordinate with City staff to ensure the proposed pedestrian and bicycle facilities are designed to appropriate standards. The proposed multimodal improvements would represent an overall improvement to the walking and biking facilities in the immediate vicinity of the Project Site.

Parking

Several potential strategies for structuring the entitlements are being considered. The specific entitlement strategies and regulations for the applicable zoning district will be further developed in coordination with the city. Thus, no applicable parking requirements for the Proposed Project have been established. The Project Site is located proximate to the Menlo Park Caltrain station and proposes various Transportation Demand Management (TDM) measures to reduce vehicle trip making and lower parking demands. Table 16 shows that the Proposed Project proposes to provide 519 parking spaces for the residential component, and 2,800 parking spaces for the office/R&D component.

Public parking for the recreational field and community building would be provided on evenings and weekends in the northeast parking lot. This parking area would meet certain ongoing private parking obligations, as reflected in an easement from the church property at 201 Ravenswood Avenue. Shared parking is also anticipated to be available for residential visitors on evenings and weekends in office/R&D area surface lots and structures.

**Table 16
Proposed Parking Spaces**

Building	Parking Ratio	Parking Spaces
Residential		
Multi-family Dwelling Units	1 space per unit	431
Townhouses	2 spaces per unit	38
100 Percent Affordable BMR Dwelling Units	0.5 space per unit	50
Total Parking Spaces		519
Office/R&D		
Surface Parking		500
Parking Garage 1		690
Parking Garage 2	2 space /1,000 sf	710
Parking Garage 3		640
Building 1 (Below grade)		120
Building 5 (Below grade)		120
Total Parking Spaces		2,800
Total Proposed Parking Spaces		3,319 spaces

4. Variant Analysis

This chapter describes and analyzes the transportation impacts for the Project Variant to the Proposed Project. The Project Variant is a variation of the Proposed Project at the same Project Site (although the Project Site would be slightly expanded to include 201 Ravenswood Avenue), generally with the same objectives, background, and development controls but with the following differences:

1. The Project Site has been expanded to include the parcel at 201 Ravenswood Avenue to create a continuous Project frontage area along Ravenswood Avenue and increase the size of the overall Project Site by approximately 43,762 square feet (sf) (approximately 1.0 acre), for a total of approximately 64.2 acres;
2. The Project Variant would include up to 250 additional residential rental dwelling units compared to the Proposed Project (an increase from 550 to 800 units, inclusive of up to 154 units to be developed by an affordable housing developer);
3. The Project Variant would reduce the underground parking footprint within the site, both by removing underground parking from the multifamily residential buildings in the residential area and removing the underground parking connection between office/research-and-development (R&D) Building O1 and Building O5. As a result, Parking Garage (PG) 1 and PG2 increase in square footage and height compared to the Proposed Project and the number of structured spaces increases by 400 (with no change in the total number of parking spaces proposed for the office/R&D buildings); and
4. The Project Variant would include an approximately 2- to 3-million-gallon emergency water reservoir that would be buried below grade in the northeast area of the Project Site, in addition to a small pump station, an emergency well, and related improvements that would be built at and below grade (i.e., emergency generator, disinfection system, surge tank) (referred to as "reservoir" throughout this document). It would be built and operated by the city of Menlo Park.

The Project Variant would not differ from many of the basic characteristics of the Proposed Project particularly with respect to the commercial component. For example, total office/R&D development would remain the same as under the Proposed Project. Certain residential uses, including the affordable housing site and a limited number of townhome units, would shift to the corner of the site nearest to the intersection of Middlefield Avenue and Ravenswood Avenue. In addition, the existing buildings associated with First Church of Christ, Scientist and Alpha Kids Academy (Chapel buildings) located at 201 Ravenswood would be demolished.

The Project Variant would include approximately 800 dwelling units, 250 more than the Proposed Project, through increased height and expansion of the Project Site. The additional dwelling units would be located along the western and northeastern portions of the Project Site. In the western portion of the site, Residential Buildings 1 (R1), R2, and R3 would be replaced with two multifamily buildings (Buildings R1 and R2), which would accommodate 300 units each, for a total of 600 multifamily rental

units; the 19 townhomes along Laurel Avenue included in the Proposed Project would be maintained (referred to as TH1).

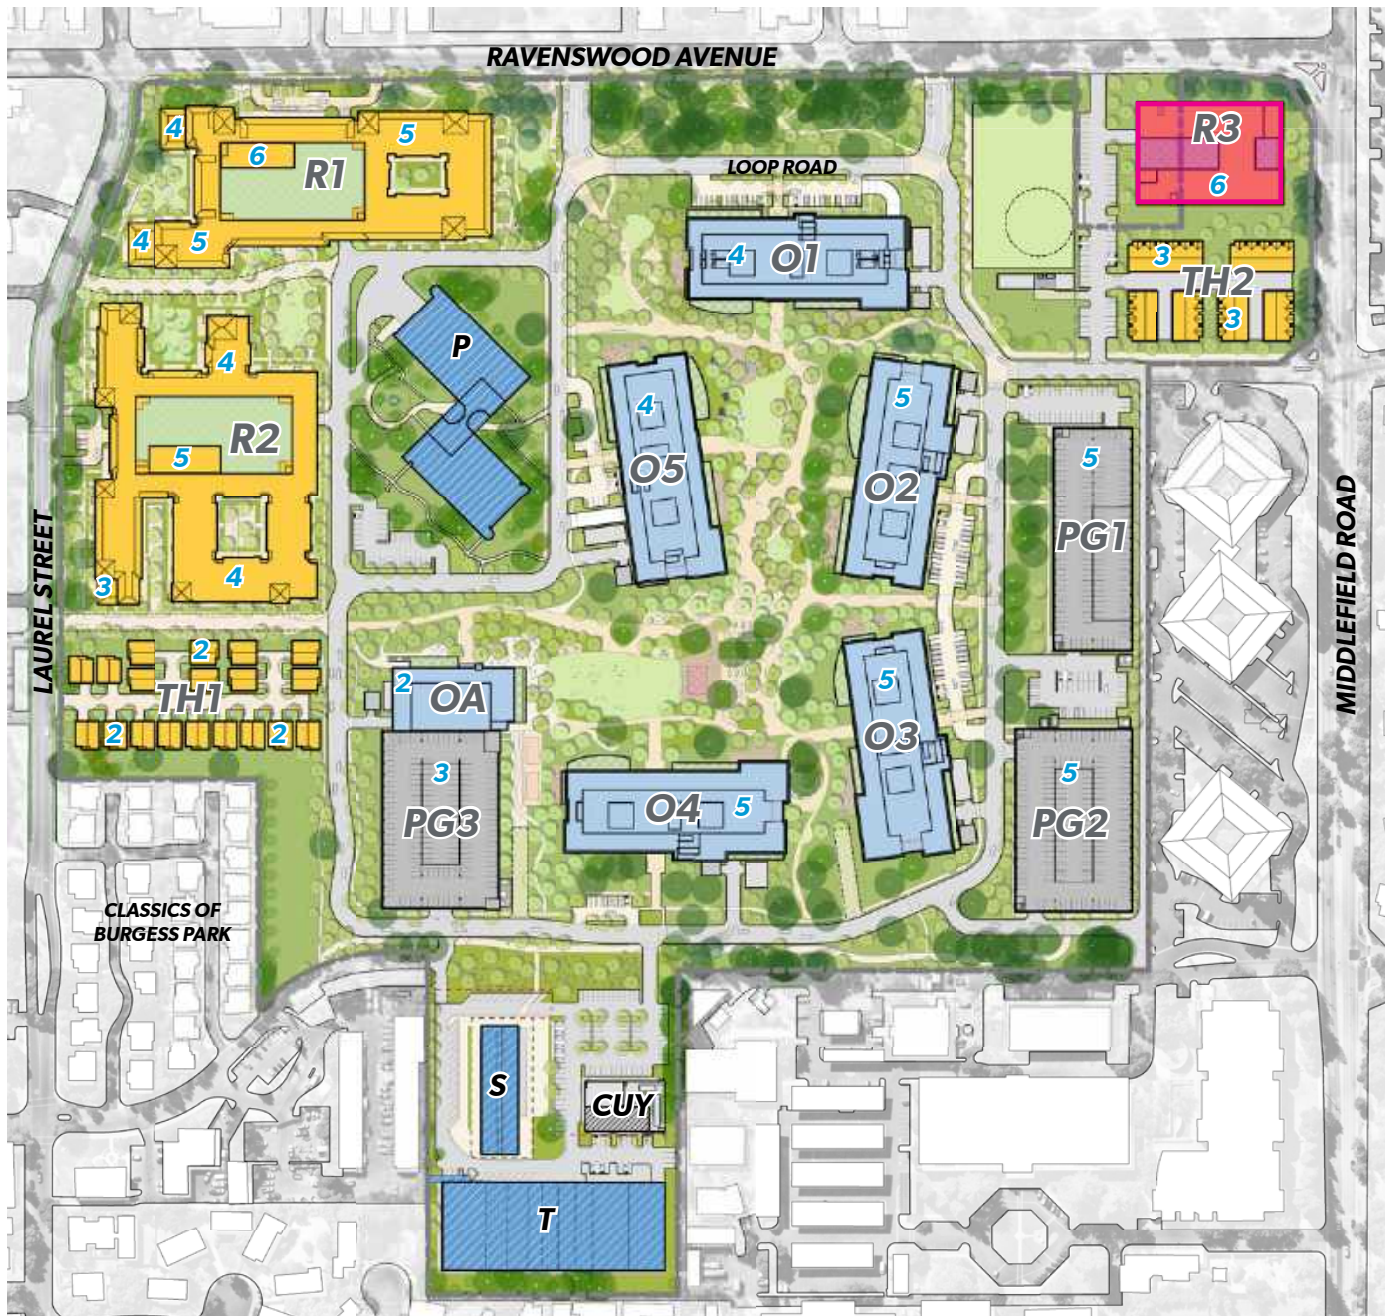

In the northeastern portion of the Project Site, a multifamily six-story, 100 percent affordable building with up to 154 units (Building R3), to be separately developed by an affordable housing developer, would be located at the corner of Ravenswood Avenue and Middlefield Road; in addition, 27 attached townhomes would be located immediately south of Building R3 (referred to as TH2). In total, the number of BMR units would increase from 68 to 97 by applying the city's 15 percent inclusionary requirement to the 646 units within the mixed-income component of the Project Variant. The number of units to be included within the separate 100 percent affordable building would increase from 100 to 154. In total, there would be 251 BMR units and 549 market-rate residential units under the Project Variant. The Project Variant would increase the average square footage of residential area per unit because the Project Variant would include more three- and four-bedroom units than the Proposed Project.

The Project Variant would reduce the underground parking footprint within the site, both by removing underground parking from the residential buildings and removing the underground parking connection between Buildings Office/R&D 1 and Office/R&D 2. As a result, the commercial parking garages PG1 and PG2 increase in square footage and one-level of height (from 4- to 5-stories) as compared to the Proposed Project.

Under the Proposed Variant, the total number of commercial parking spaces remains unchanged at 2,800 spaces, whereas the residential parking increases to 919 spaces. The increased residential parking results from providing parking within Buildings R1 and R2 at 1.25 spaces per unit and providing for additional townhome parking of 2 spaces per unit for TH1 and TH2 (Project Variant includes 54 townhomes, compared to 19 townhomes under the Proposed Project). Parking for the 100% affordable building (Building R3) will remain at 0.5 spaces per unit, with the option to utilize parking spaces within PG1 and PG2 during nights and weekends. Parking for the R1, R2 and R3 multifamily buildings is provided within each of those buildings; parking for the up to 46 townhomes is provided within each unit.

Under the Project Variant, similar site access and vehicular, bicycle, and pedestrian circulation would occur as under the Proposed Project, with the following differences. R1 ingress and egress is located on Ravenswood Avenue and via the internal road that connects to the Loop Road, but there will be no access from Laurel Avenue. R2 ingress is located on Laurel Ave and via the internal road that connects to the Loop Road and the driveways on Ravenswood Avenue and Middlefield Road. R2 egress is provided only via the internal road to the driveways on Ravenswood Avenue and Middlefield Road. There will be no R2 egress to Laurel Avenue. As a consequence, residential trips associated with R1 and R2 would largely be shifted to the driveways on Ravenswood Avenue and Middlefield Road, and fewer trips would be using Laurel Avenue. The TH1 townhomes are accessible only from Laurel Ave. R3 (Affordable) and the TH2 townhomes (TH2) are accessible from Ravenswood Avenue and Middlefield Road.

This assessment considers the environmental impacts associated with the Project Variant. For some environmental topics, the impacts under the Project Variant would be the same as those of the Proposed Project. For these topics, further analysis is not needed, as explained in this chapter. However, for the intersection levels of service, the adverse effects of the Project Variant could differ from the adverse effects identified for the Proposed Project in Chapter 3. The differences between the Proposed Project and the Project Variant are analyzed quantitatively in this chapter. Unless otherwise stated, all recommended improvements described in Chapter 3 that would be required to reduce adverse effects associated with the Proposed Project would also be applicable to the Project Variant.

100% AFFORDABLE HOUSING

**Figure 21
Project Variant Site Plan**

CEQA Transportation Analysis

CEQA VMT Analysis

It is assumed that the Project Variant will implement a TDM Plan that achieves the same trip reduction as the Proposed Project. A VMT analysis for the Project Variant similar to the Proposed Project (see Chapter 2 above) is conducted. As shown in Table 17 below, the Project Variant with an additional 250 units would continue to generate VMT at levels below the City’s respective VMT thresholds for residential and office/R&D uses.

**Table 17
Project Variant VMT Analysis**

Land Use	Regional Average	VMT Threshold	Project Variant VMT	VMT Impact
Office/R&D ¹	15.9	13.6	13.5	No
Residential ²	13.1	11.2	9.6	No

Notes:
 * All data referenced the latest Menlo Park citywide travel demand forecast model.
 1. VMT for office/R&D land use is reported in VMT per employee.
 2. VMT for residential land use is reported in VMT per capita.
 3. Project VMT accounted for implementation of a TDM Plan with 28% trip reduction target for the office/R&D land use, and 25% trip reduction target for the residential land use.

Impacts on Pedestrian, Bicycle and Transit Facilities

Under the Project Variant, similar site access and vehicular, bicycle, and pedestrian circulation would occur as under the Proposed Project, with some differences. R1 ingress and egress would be located on Ravenswood Avenue and via the internal road that connects to the Loop Road, but there would be no access from Laurel Avenue. R2 ingress is located on Laurel Avenue and via the internal road that connects to the Loop Road and the driveways on Ravenswood Avenue and Middlefield Road. R2 egress would be provided only via the internal road to the driveways on Ravenswood Avenue and Middlefield Road. No R2 egress to Laurel Avenue would be provided. The TH1 townhomes would be accessible only from Laurel Avenue. R3 (Affordable) and TH2 townhomes would be accessible from Ravenswood Avenue and Middlefield Road.

The proposed pedestrian, bicycle and transit facilities would remain the same as the Proposed Project notwithstanding the Project Variant’s increase in housing units. Similar to the Proposed Project, the multimodal improvements proposed by the Project Variant would represent an improvement over existing conditions. Therefore, the Project Variant would continue to be consistent with all applicable pedestrian, bicycle and transit related plans, ordinances and policies.

Non-CEQA Level of Service Transportation Analysis

Project Variant Trip Estimates

The additional 250 units assumed under the Project Variant is expected to have minimal effect on internalization rates. As a conservative approach, it is assumed that the Proposed Project’s trip generation rates and trip reduction percentages can be applied to the Project Variant. Furthermore, it is assumed that the Proposed Project TDM measures will continue to achieve the same effectiveness in terms of trip reduction percentages. As shown in Table 18 below, the Project Variant would generate a

total of 10,722 new daily trips, 1,395 new trips during the AM peak hour, and 1,350 new trips during the PM peak hour. Compared to the Proposed Project, this variant would increase trips generated by the project by 873 daily trips, including 73 AM peak-hour trips and 77 PM peak-hour trips.

The trip distribution pattern and trip assignment for the Project Variant are the same as those described in Chapter 3 for the Proposed Project. The Project Variant's net trip assignment is shown on Figure 22. The project trips were added to the near-term and cumulative traffic volumes to derive traffic volumes for near-term plus project variant conditions (see Figure 23) and cumulative plus project variant conditions (see Figure 24).

Intersection Levels of Service

The results of the intersection level of service analysis show that comparing to the Proposed Project, the additional 250 units would cause a higher increase in average critical delay at the study intersections as compared to the Proposed Project (see Tables 19 and 20). However, the additional increase in average critical delay would not create additional deficiencies. The intersection level of service calculation sheets are included in Appendix G.

Trips added by the additional 250 units are expected to travel in different directions once they exit the Project Site. Their effect on intersection levels of service at non site-accessing intersections is expected to be minimal. Level of service conclusions for the other study intersections are expected to remain the same as the Proposed Project.

**Table 18
Project Variant Trip Generation Estimates**

Land Use	Size			Daily		AM Peak Hour			PM Peak Hour					
				Rate	Trips	Rate	In	Out	Total	Rate	In	Out	Total

Existing Uses (non P, S, T Buildings) ⁴					(518)		(38)	(8)	(46)		(11)	(32)	(43)	
Net Project Trips on Project Network					10,722		1,083	312	1,395		333	1,017	1,350	

Notes:

ksf = 1,000 square feet; du = dwelling unit

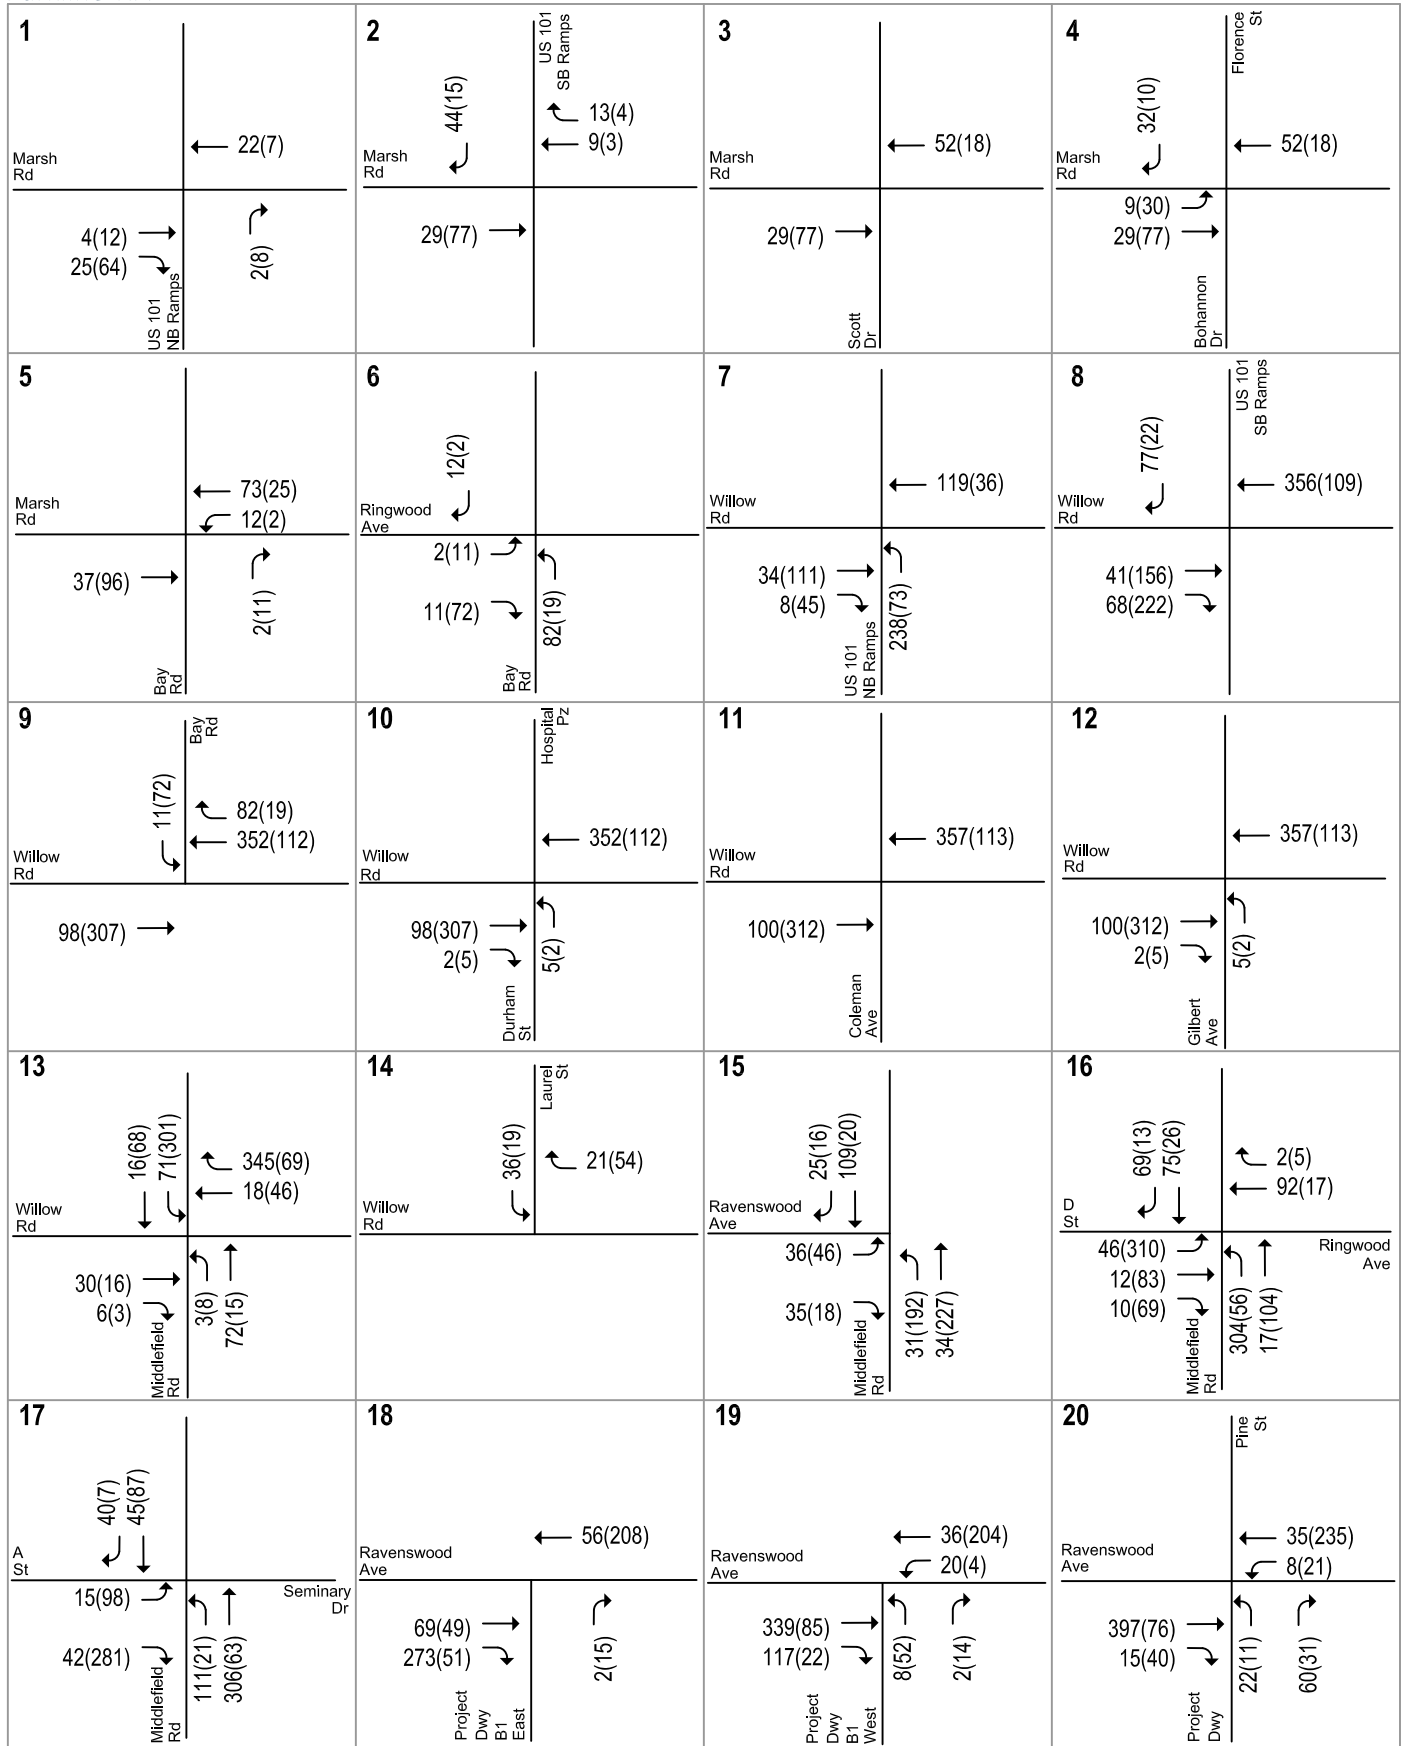

¹ Daily, AM, and PM peak hour average rates published in *ITE Trip Generation Manual, 11th Edition, 2021* were used for each land use.

² Internal Capture developed using *National Cooperative Highway Research Program (NCHRP) Report 684: Enhancing Internal Trip Capture Estimation for Mixed-Use Developments* and *US EPA Mixed Use Trip Generation Model v.4, 2010* per the methodology described in *Getting Trip Generation Right: Eliminating the Bias Against Mixed-Use Development, PAS Memo*, American Planning Association, 2020.

³ *ITE Trip Generation Manual, 11th Edition, 2021* provides trip rates per field for a soccer complex. The Proposed Project would include active recreational areas in the Ravenswood Avenue Parklet. It is assumed that the park would have play structures and open field areas for warm-ups or casual play. The number of soccer fields on the park was estimated based on the size of a standard soccer field.

⁴ Existing use Trip Estimates based on driveway counts conducted by Fehr & Peers in 2021. Of the 1,100 employees on-site, Buildings P, S, T had 700 employees. The trip generation for these buildings is proportioned based on employees.

Notes:

* Denotes CMP Intersection

AWSC - All Way Stop Control; TWSC - Two Way Stop Control.

¹ Average delay is reported for signalized and AWSC intersections. For TWSC intersections, the delay for the worst stop-controlled movement is reported.

² Average delay and level of service for the study intersections (7, 8, 41-45) were based off the microsimulation analysis conducted for the Willow Village project. Intersections that showed OVERSAT and LOS F were assumed to operate the same for this project and under project conditions. For intersections that were not shown OVERSAT and LOS F in the Willow Village project, the results from the VISTRO analysis done for this project are reported. "OVERSAT" indicates that the SimTraffic microsimulation model indicates that the intersection would experience capacity issues where the demand cannot be served by the intersection. Oversaturated intersections would operate at LOS F.

³ This assumes 100% office scenario.

* Intersections fronting the project site are analyzed using a microsimulation model. A cumulative analysis is not completed. Certain intersections would experience capacity issues where the demand cannot be served by the intersection, and are indicated with OVERSAT. Oversaturated intersections would operate at LOS F.

Bold indicates substandard level of service

Bold indicates noncompliance. The project exceeds thresholds in the City of Menlo Park's TIA Guidelines.

Intersection Vehicle Queuing

The results of the intersection queuing analysis show that compared to the Proposed Project, the additional 250 units would only increase the 95th percentile queue by vehicle for two turning movements during the AM peak hour (see Table 21). The 95th percentile queue for the northbound left turn from the US 101 off-ramp to Willow Road would increase by 325 feet during the AM compared to the Proposed Project. The queue would be accommodated within the storage. The 95th percentile queue for the southbound left movement from El Camino Real to Ravenswood Avenue would increase by 475 feet during the AM peak hour compared to the Proposed Project. The queue length for the movements would exceed the storage capacity under the Proposed Project and would continue to do so under the Project Variant. Similar to the Proposed Project, there is no room to further extend this left-turn lane because of the short block between Ravenswood Avenue and Santa Cruz Avenue. It is also infeasible to add a turn lane to increase the storage capacity for the southbound left-turn lane.

As described in Chapter 3, the SimTraffic micro-simulation analysis was conducted to evaluate traffic operations and vehicles queuing along the Middlefield Road and Ravenswood Avenue corridors adjacent to the Project Site. There are no additional improvements that can be recommended given the existing right-of-way.

Table 21
Queueing Comparison for Project Variant

Measurement	US 101 NB Ramps/ Willow Rd		Middlefield Rd/ Willow Rd		El Camino Real/ Ravenswood Ave			
	NBL		SBL		SBL		WBL	
	AM	PM	AM	PM	AM	PM	AM	PM
Near-Term plus Proposed Project								
Volume (vph)	660	332	316	601	240	167	393	489
95th %. Queue (veh/ln) ¹	12	11	12	20	18	10	13	14
95th %. Queue (ft/ln)	300	275	300	500	450	250	325	350
Storage (ft/ln)	1265	1265	275	275	250	250	225	225
Adequate (Y/N)	Y	Y	N	N	N	Y	N	N
Near-Term plus Project Variant								
Volume (vph)	663	342	346	617	242	171	404	494
95th %. Queue (veh/ln) ¹	13	11	13	20	19	10	13	14
95th %. Queue (ft/ln)	325	275	325	500	475	250	325	350
Storage (ft/ln)	1265	1265	275	275	250	250	225	225
Adequate (Y/N)	Y	Y	N	N	N	Y	N	N
Notes:								
NBL = northbound left-turn; SBL = southbound left-turn; WBL = westbound left-turn								
¹ Vehicle queues are from Vistro outputs and are rounded up to the next whole number. Assumes one vehicle equals 25 feet of queue.								

Freeway Segments and Freeway Ramps

The additional 250 residential units would generate an additional 50 peak direction (outbound) trips during the AM peak hour, and 44 peak direction (inbound) trips during the PM peak hour. This equates to at most 11 more trips on the freeways and freeway ramps in the peak directions (see Figure 6 for trip distribution), which would have a minimal effect on the studied freeway segments and ramps. Therefore, the analysis conclusions under the Proposed Project description for freeway segments and freeway ramps would remain the same under the Project Variant.

Appendix B
Middlefield Road and Ravenswood Avenue Microsimulation

Memorandum

Date: July 10, 2024
To: Ms. Jessica Viramontes, ICF
From: Trisha Dudala, Katie Riutta
Subject: Traffic Operations Analysis for the Proposed Parkline Project in Menlo Park, CA

Hexagon Transportation Consultants, Inc. has completed a traffic operations analysis for the proposed Parkline project in Menlo Park, CA. The project site, located at 333 Ravenswood Avenue, is currently occupied by the existing SRI International campus. The proposed project would include a new office/research and development (R&D) campus with no increase in office/R&D square footage; up to 550 new dwelling units at a range of affordability levels (comprised of 450 multi-family units and townhomes, and a proposed land dedication to an affordable housing developer that could accommodate up to 100 affordable units); and new bicycle and pedestrian connections. In total, the proposed project would result in approximately 1,768,802 square feet (s.f.) of mixed-use development, with approximately 1,093,602 s.f. of office/R&D uses and approximately 675,200 s.f. of residential uses. The proposed project would demolish all buildings on SRI International's Campus, excluding Buildings P, S, and T, which would remain onsite and be operated by SRI International.

The residential area would have three access points that would serve the residential uses using existing and/or relocated driveways at the following locations:

- Ravenswood Avenue, toward the west side of the Project Site;
- Laurel Street, toward the middle of the residential area, for the multi-family residential buildings; and
- Laurel Street, toward the south end of the residential area, for the townhouses.

The office/R&D area would have four access points that would serve the commercial portion of the site by using existing and/or relocated driveways at the following locations:

- Ravenswood Avenue, toward the west end of the office/R&D area;
- Ravenswood Avenue, toward the east end of the office/R&D area;
- Middlefield Road at Ringwood Avenue; and
- Middlefield Road at Seminary Drive.

The proposed project is expected to generate 1,368 AM peak hour trips and 1,316 PM peak hour trips after applying a 25% TDM¹ reduction.

The project also proposes a variant, called the "Increased Development Variant", which is a variation of the proposed project at the same Project Site (although the Project Site would be slightly expanded to include 201 Ravenswood Avenue), generally with the same objectives, background, and development controls but with the following differences:

¹ After initiation of this simulation analysis, the Proposed Project's TDM reduction was revised to a 28% trip reduction for the office/R&D land use and a 25% trip reduction for the residential land use. This study is therefore considered slightly conservative because it did not assume the extra 3% trip reduction for the office/R&D land use.

1. The Project Site has been expanded to include the parcel at 201 Ravenswood Avenue to create a continuous Project frontage area along Ravenswood Avenue and increase the size of the overall Project Site by approximately 43,762 s.f. (approximately 1.0 acre), for a total of approximately 64.2 acres;
2. The Project Variant would include up to 250 additional residential rental dwelling units compared to the Proposed Project (an increase from 550 to 800 units, inclusive of up to 154 units to be developed by an affordable housing developer);
3. The Project Variant would reduce the underground parking footprint within the site, both by removing underground parking from the multifamily residential buildings in the residential area and removing the underground parking connection between office/research-and-development (R&D) Building O1 and Building O5. As a result, Parking Garage (PG) 1 and PG2 increase in square footage and height compared to the Proposed Project and the number of structured spaces increases by 400 (with no change in the total number of parking spaces proposed for the office/R&D buildings); and
4. The Project Variant would include an approximately 2- to 3-million-gallon emergency water reservoir that would be buried below grade in the northeast area of the Project Site, in addition to a small pump station, an emergency well, and related improvements that would be built at and below grade (i.e., emergency generator, disinfection system, surge tank) (referred to as “reservoir” throughout this document). It would be built and operated by the city of Menlo Park.

As part of this variant, the project would relocate some housing units to the Middlefield Road/Ravenswood Avenue corner of the project site, and reconfigure the site circulation so that the majority of residential vehicles would need to use the office/R&D driveways. In addition to the proposed driveways on Middlefield Road listed above, access to the project site would be provided on Ravenswood Avenue at W 1st Street and four new driveways between Laurel Street and W 1st Street. Two of these driveways are the same office driveways as the main project. The other two driveways would be located just north and south of Pine Street for the residential land use. The proposed variant is expected to generate 1,441 AM peak hour trips and 1,393 PM peak hour trips after applying a 25% TDM² reduction.

This report presents the results of the simulation analysis conducted along Middlefield Road between Oak Grove Avenue and Seminary Drive and along Ravenswood Avenue between Middlefield Road and Laurel Street. Existing traffic congestion and long queues were observed during peak traffic periods along the project frontages on Middlefield Road and Ravenswood Avenue. The project would add a considerable amount of traffic to Ravenswood Avenue and Middlefield Road. As such, a Synchro/SimTraffic traffic operations model was used to identify and test improvements that would reduce project congestion. Presented in this report are the results of a detailed analysis of the traffic operations issues along Middlefield Road and Ravenswood Avenue and identification and evaluation of potential feasible improvements to improve traffic congestion and flow along these corridors. The analysis considers traffic operations under existing conditions, background conditions, background plus project conditions, and background plus variant conditions. The results and recommendations of this analysis is referenced in the Transportation Impact Analysis report prepared for this project. A map of the study area is shown on Figure 1.

² After initiation of this simulation analysis, the Project Variant’s TDM reduction was revised to a 28% trip reduction for the office/R&D land use and a 25% trip reduction for the residential land use. This study is therefore considered slightly conservative because it did not assume the extra 3% trip reduction for the office/R&D land use.

Figure 1
Site Location and Study Intersections

Scope of Study

This study was conducted for the purpose of documenting existing, background, background plus project, and background plus variant conditions and identifying potential feasible improvements to improve traffic congestion and flow along Middlefield Road and Ravenswood Avenue. This corridor study includes an analysis of weekday AM (7-9 AM) and PM (4-6 PM) peak hour traffic conditions for the following nine study intersections. These intersections are shown on Figure 1.

Study Intersections

1. Middlefield Road & Oak Grove Avenue [Atherton, signal]
2. Middlefield Road & Ravenswood Avenue [signal]
3. Middlefield Road & Ringwood Avenue/D Street [Project Driveway, signal]
4. Middlefield Road & Seminary Drive/A Street [Project Driveway, unsignalized]
5. Marcussen Drive & Ravenswood Avenue [unsignalized]
6. Pine Street/4th St & Ravenswood Avenue [Project Driveway, unsignalized]
7. Laurel Street & Ravenswood Avenue [signal]
8. W 1st Street & Ravenswood Avenue [Project Driveway, unsignalized]
9. Loop Road & Ravenswood Avenue [Project Driveway, unsignalized]

Traffic conditions were evaluated for the following scenarios:

Scenario 1: Existing Conditions. Existing AM and PM peak-hour traffic volumes were obtained from manual turning-movement counts conducted in May 2023. The simulation model requires that the volumes between intersections in the network be balanced to ensure that vehicles do not appear or disappear between intersections. Therefore, the counts were balanced between adjacent intersections.

Scenario 2: Year 2027 Background Conditions. The background scenario assumed a year 2027 horizon³ and was analyzed using the model. Traffic volumes were obtained from the Menlo Park Travel Demand Model and adjusted based on existing counts and model results. In addition, traffic and roadway improvements associated with the approved developments were assumed as directed by City Staff.

Scenario 3: Year 2027 Background Plus Project Conditions. Background plus project conditions reflect the projected traffic volumes with the completion of the project and future developments. Project-generated traffic was added to the background condition traffic volumes. The background plus project scenario was evaluated relative to the background scenario.

Scenario 4: Year 2027 Background Plus Variant Conditions. Background plus variant conditions reflect the projected traffic volumes with the completion of the variant and future developments. Variant-generated traffic was added to the background conditions traffic volumes. The background plus variant scenario was evaluated relative to the background plus project scenario.

³ 2027 is the earliest year for expected occupancy when this analysis started. The expected occupancy has since been revised to year 2031. However, as discussed in detail in the *Parkline Transportation Impact Analysis* report, there would be no substantive changes to any conclusions whether the near-term scenario is studied with a horizon year of 2027 or 2031.

Analysis Methodology

This section describes the methods and performance criteria used to evaluate traffic operations along the Middlefield Road and Ravenswood Avenue corridors between Oak Grove Avenue and Seminary Drive and between Middlefield Road and Laurel Street, respectively.

Analysis Method

Due to the close proximity of the study intersections, a simulation analysis was conducted using Synchro/SimTraffic (version 12). Unlike macroscopic models of isolated intersection operations, such as the *Highway Capacity Manual* intersection level of service methodology, SimTraffic is a microscopic model that measures the full impact of queuing and blocking attributed to closely spaced intersections.

The existing conditions SimTraffic model was calibrated and validated to existing conditions based on existing lane geometry, existing AM and PM peak hour traffic counts, observed peak-hour vehicular queues, and the observed signal timing.

Level of Service Criteria

The average delay time (measured in seconds per vehicle) calculated by the simulation model was correlated to Level of Service (LOS) based on the thresholds contained in the *Highway Capacity Manual*. Level of Service is a qualitative description of operating conditions ranging from LOS A, or free-flow conditions with little or no delay, to LOS F, or jammed conditions with excessive delays. The correlation between delay and level of service is shown on Table 1 for signalized intersections and Table 2 for unsignalized intersections.

Table 1
Signalized Intersection Level of Service Definitions Based on Average Delay

Level of Service	Description	Average Control Delay Per Vehicle (sec.)
A	Signal progression is extremely favorable. Most vehicles arrive during the green phase and do not stop at all. Short cycle lengths may also contribute to the very low vehicle delay.	10.0 or less
B	Operations characterized by good signal progression and/or short cycle lengths. More vehicles stop than with LOS A, causing higher levels of average vehicle delay.	10.1 to 20.0
C	Higher delays may result from fair signal progression and/or longer cycle lengths. Individual cycle failures may begin to appear at this level. The number of vehicles stopping is significant, though some vehicles may still pass through the intersection without stopping.	20.1 to 35.0
D	The influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable signal progression, long cycle lengths, or high volume-to-capacity (V/C) ratios. Many vehicles stop and individual cycle failures are noticeable.	35.1 to 55.0
E	This is considered to be the limit of acceptable delay. These high delay values generally indicate poor signal progression, long cycle lengths, and high volume-to-capacity (V/C) ratios. Individual cycle failures occur frequently.	55.1 to 80.0
F	This level of delay is considered unacceptable by most drivers. This condition often occurs with oversaturation, that is, when arrival flow rates exceed the capacity of the intersection. Poor progression and long cycle lengths may also be major contributing causes of such delay levels.	greater than 80.0

Source: Transportation Research Board, *Highway Capacity Manual*.

Table 2
Unsignalized Intersection Level of Service Definitions Based on Control Delay

Level of Service	Description	Average Delay Per Vehicle (Sec.)
A	Little or no traffic delay	10.0 or less
B	Short traffic delays	10.1 to 15.0
C	Average traffic delays	15.1 to 25.0
D	Long traffic delays	25.1 to 35.0
E	Very long traffic delays	35.1 to 50.0
F	Extreme traffic delays	greater than 50.0

Source: Transportation Research Board, *Highway Capacity Manual*.

Existing Conditions

Hexagon collected existing roadway geometry, peak hour intersection turning movement volumes, and intersection queuing characteristics within the study area. Most traffic congestion in the study area was observed to occur during the morning (7:00 – 9:00 AM) and evening (4:00 – 6:00 PM) peak commute hours. The existing lane geometry at the study intersections are shown on Figure 2. At the time field observations were conducted, Middlefield Road had two northbound lanes at the intersection of Seminary Drive, which is reflected in the existing conditions analysis. However, the city recently restriped Middlefield Road to consist of one northbound lane at the intersection of Middlefield Road and Seminary Drive, which is reflected in the background conditions analysis.

Intersection Turning Movements Volumes

Existing AM and PM peak-hour traffic volumes were obtained from the May 2023 manual turning-movement counts. The existing traffic volumes are shown on Figure 3.

Parkline Project Traffic Operations Analysis

Figure 2
Existing Lane Configurations

Parkline Project Traffic Operations Analysis

Figure 3
Existing Traffic Volumes

Field Observations

Hexagon conducted field observations of traffic congestion and vehicle queuing at the study intersections during the AM and PM peak periods in May of 2023. Field observations showed that some operational problems currently occur during the peak commute hours. These issues are described below.

Middlefield Road & Ravenswood Avenue

During the AM peak hour, the northbound left turn queue from Middlefield Road to westbound Ravenswood Avenue often reached the Ringwood Avenue intersection. During the peak time, the northbound left turn green time increased to allow more vehicles through the intersection. The first cycle with a long northbound left turn queue resulted in 10 vehicles waiting for a second cycle. However, the cycles after that had increased green time and allowed the entire queue to clear in one cycle.

During the PM peak hour, the southbound left turn queue at the downstream intersection of Ringwood Avenue/Middlefield Road often reached close to the Ravenswood Avenue intersection. Vehicles expecting to continue southbound on Middlefield Road were able to go around the queue into the second lane. Therefore, all southbound vehicles were able to clear the intersection in one cycle.

Middlefield Road & Ringwood Avenue

During the AM peak hour, the downstream northbound left turn queue at Ravenswood Avenue often reached the Ringwood Avenue intersection. This created a long westbound right turn queue at Ringwood Avenue. However, because the northbound left turn signal at Ravenswood Avenue turned green when the westbound movement turned green at Ringwood Avenue, the queues were able to clear in one cycle.

During the PM peak hour, the southbound left turn queue often reached close to the upstream intersection at Ravenswood Avenue/Middlefield Road. Vehicles expecting to continue southbound on Middlefield Road were able to go around the queue into the second lane. Therefore, all southbound vehicles were able to clear the intersection in one cycle.

Middlefield Road & Seminary Drive

There were no traffic operational deficiencies observed during the AM and PM peak hours. The upstream and downstream signals provided gaps for traffic on Seminary Drive to turn onto Middlefield Road.

Ravenswood Avenue & Laurel Street

During the AM peak hour, the downstream westbound queue at the Alma Street/Ravenswood Avenue intersection occasionally reached the Laurel Street intersection. This caused the northbound left-turn queue to wait for the queue to begin clearing the receiving lane. However, the green time allowed all vehicles to clear the intersection.

During the PM peak hour, Hexagon observed the Caltrain running during one of the cycles. The Caltrain came during the eastbound/westbound through green time, which caused the queue to back up into the Laurel Street intersection. However, the green time allowed all vehicles to clear the intersection.

Model Development and Calibration

The Synchro model was developed by drawing the roadway network using an aerial photo of the study area as a background image. Geometric information such as number of lanes, curvature, turn restrictions, and location of lane drops and lane additions were based on aerial photographs and field observations. Intersection signal operations were based on measuring the cycle lengths and splits at each of the study intersections in the field. The existing AM and PM peak hour counts were used as input volumes to develop the existing conditions model.

Model Validation

During the validation process, the model estimates were compared to the field data to measure the model's accuracy. The following criteria were used:

- Turning movement volumes for more than 85% of the cases should have a GEH (Geoffrey E. Havers) statistic of less than 5. GEH statistic is a measure of goodness of fit named after the statistician who developed it. The model served volume at each of the nine study intersections were compared to the raw turning movement counts. The GEH statistic for the individual turning movements was calculated to be less than 5 and the GEH statistic for the total volume through the intersection calculated to be less than 3.
- The visual queuing shown in the model should match queues observed in the field. Queues shown in the model matched field observations. During the AM peak hour, the model showed long queues on northbound Middlefield Road at Ravenswood Avenue and on westbound Ravenswood Avenue near Laurel Street. During the PM peak hour, the model showed long queues on southbound Middlefield Road at Ringwood Avenue. The model queues matched the queues observed in the field.

Existing Conditions Level of Service Analysis

The calibrated and validated SimTraffic model was used to analyze traffic operations at the nine study intersections along the corridors. Table 3 shows the average delay and the corresponding LOS during the AM and PM peak hour periods under existing conditions. The average delay (measured in seconds per vehicle) calculated by the microscopic simulation model was correlated to LOS based on the thresholds contained in the *Highway Capacity Manual*.

The results of the level of service analysis show that all study intersections currently operate at acceptable conditions during both peak hours.

Table 3
Existing Conditions Level of Service Analysis

9	Loop Rd & Ravenswood Ave	OWSC	AM	05/24/23	5.1	A
			PM	05/24/23	0.0	A

Notes:
Avg Delay = Average Delay in seconds; LOS = Level of Service; TWSC = Two Way Stop Control; OWSC = One Way Stop Control

¹ At signalized intersections, delay shown is the weighted average delay for all vehicles entering the intersection calculated using the calibrated SimTraffic model. At unsignalized intersections, the delay is shown for the worst stop controlled approach or uncontrolled left-turn movement, whichever is greater.

Existing Conditions Queuing Analysis

The analysis of intersection levels of service was supplemented with a vehicle queuing analysis. The queues (measured in feet per lane) were calculated by the microscopic simulation model. Table 4 shows the existing storage lengths, 95th percentile and average queues for all intersection movements during the AM and PM peak hour periods under existing conditions. Where there are no turn pockets, the storage length was assumed to be the distance to the adjacent upstream intersection.

Table 4

² Based on average queues reported by SimTraffic software.

The results of the queuing analysis show that the following lanes at the study intersections experience 95th percentile queues that extend beyond the existing storage capacity during at least one of the peak hours as described below.

AM Peak Hour

- Middlefield Road & Oak Grove Avenue
 - Westbound Left-Turn
 - Westbound Shared Through-Right
 - Northbound Left-Turn
 - Southbound Left-Turn
- Middlefield Road & Ravenswood Avenue
 - Eastbound Left-Turn
 - Eastbound Right-Turn
 - Northbound Left-Turn
- Middlefield Road & Ringwood Avenue
 - Northbound Right-Turn
 - Southbound Left-Turn
 - Southbound Shared Through-Right
- Laurel Street & Ravenswood Avenue
 - Eastbound Shared Through-Right
 - Westbound Shared Through-Right
 - Northbound Left-Turn

PM Peak Hour

- Middlefield Road & Oak Grove Avenue
 - Westbound Shared Through-Right
 - Northbound Left-Turn
 - Southbound Left-Turn
- Middlefield Road & Ravenswood Avenue
 - Eastbound Left-Turn
 - Eastbound Right-Turn
- Middlefield Road & Ringwood Avenue
 - Northbound Right-Turn
 - Southbound Left-Turn
 - Southbound Shared Through-Right
- Laurel Street & Ravenswood Avenue
 - Eastbound Shared Through-Right
 - Westbound Shared Through-Right
 - Northbound Left-Turn

Background Conditions

The background scenario assumed a year 2027 horizon⁴ and was analyzed using the model. Traffic volumes were obtained from the Menlo Park Travel Demand Model and adjusted based on existing counts and model results. The traffic volumes under background conditions are shown on Figure 4. Under background conditions, the existing lane striping, which reflects one lane in each direction on Middlefield Road south of Seminary Drive was assumed.

Background Conditions Level of Service Analysis

Table 5 shows the average delay and the corresponding LOS during the AM and PM peak hour periods under background conditions. The results of the level of service analysis show that all study intersections would operate at similar acceptable conditions as the existing scenario during both peak hours.

⁴ 2027 is the earliest year for expected occupancy when this analysis started. The expected occupancy has since been revised to year 2031. However, as discussed in detail in the *Parkline Transportation Impact Analysis* report, there would be no substantive changes to any conclusions whether the near-term scenario is studied with a horizon year of 2027 or 2031.

Parkline Project Traffic Operations Analysis

9	Loop Rd & Ravenswood Ave	OWSC	AM	5.1	A	5.0	A
			PM	0.0	A	0.0	A

Notes:

Avg Delay = Average Delay in seconds; LOS = Level of Service; TWSC = Two Way Stop Control; OWSC = One Way Stop Control

¹ At signalized intersections, delay shown is the weighted average delay for all vehicles entering the intersection calculated using the calibrated SimTraffic model. At unsignalized intersections, the delay is shown for the worst stop controlled approach or uncontrolled left-turn movement, whichever is greater.

Background Conditions Queuing Analysis

The analysis of intersection levels of service was supplemented with a vehicle queuing analysis. The queues (measured in feet per lane) were calculated by the microscopic simulation model. Table 6 shows the 95th percentile and average queues at all intersection movements during the AM and PM peak hour periods under background conditions.

Table 6

Bold indicates that the queue length exceeds the storage capacity.

Table 6 (continued)
Background Conditions Queuing Analysis

#	Intersection	Movement	Peak Period	Existing Storage Length (ft/ln)	Background Conditions	
					95th Percentile Queue (ft/ln) ¹	Average Queue (ft/ln) ²
8	W 1st St/Project Driveway & Ravenswood Ave	EBTR	AM	365	97	0
			PM		91	15
		WBLT	AM	365	64	0
			PM		31	0
		NBLR	AM	255	28	0
			PM		46	18
9	Loop Rd/Project Driveway & Ravenswood Ave	EBTR	AM	525	50	0
			PM		0	0
		WBLT	AM	175	93	21
			PM		19	0

Notes:
 NB = northbound, SB = southbound, EB = eastbound, WB = westbound
 L = left-turn movement, T = through movement, R = right-turn movement
¹ Based on 95th percentile queues reported by SimTraffic software.
² Based on average queues reported by SimTraffic software.

The results of the queuing analysis show that all lanes that currently have 95th percentile queues extend beyond the storage capacity under existing conditions would continue to have queues exceed the storage capacity under background conditions.

Background Plus Project Conditions

Under background plus project conditions, access to the proposed project site would be provided via two driveways along Middlefield Road and three driveways along Ravenswood Avenue. The project driveways were analyzed with the following characteristics. The project lane configurations are shown on Figure 5.

- Middlefield Road & Ringwood Avenue – The project driveway is proposed to be the west leg of the signalized intersection. The project driveway approach would have one shared left-through lane and one right-turn lane. The lane configurations for the other approaches would remain the same. The signal was analyzed with the existing timing and phasing (permitted left turns for eastbound and westbound approaches on Ringwood Avenue).
- Middlefield Road & Seminary Drive – The project driveway is proposed to be the west leg of the unsignalized intersection as a stop-controlled approach. The project driveway approach would have one shared left-through lane and one right-turn lane. The lane configurations for the other approaches would remain the same.
- Pine Street & Ravenswood Avenue – The project driveway is proposed to be the south leg of the unsignalized intersection as a stop-controlled approach. The project driveway

approach would have one shared left-through-right lane. The lane configurations for the other approaches would remain the same.

- W 1st Street & Ravenswood Avenue – The project driveway is proposed to be the south leg of the unsignalized intersection as a stop-controlled approach. The project driveway approach would have one right-turn lane and would be restricted to right-in-right-out only movements.
- Loop Road & Ravenswood Avenue – The project driveway is proposed to be the south leg of the unsignalized intersection as a stop-controlled approach. The project driveway approach would have one left-turn lane and one right-turn lane. The lane configurations for the other approaches would remain the same.

Intersection Turning Movements Volumes

Background plus project conditions reflect the projected traffic volumes with the completion of the project and future developments. Project-generated traffic was added to the background condition traffic volumes. The background plus project traffic volumes are shown on Figure 6.

Parkline Project Traffic Operations Analysis

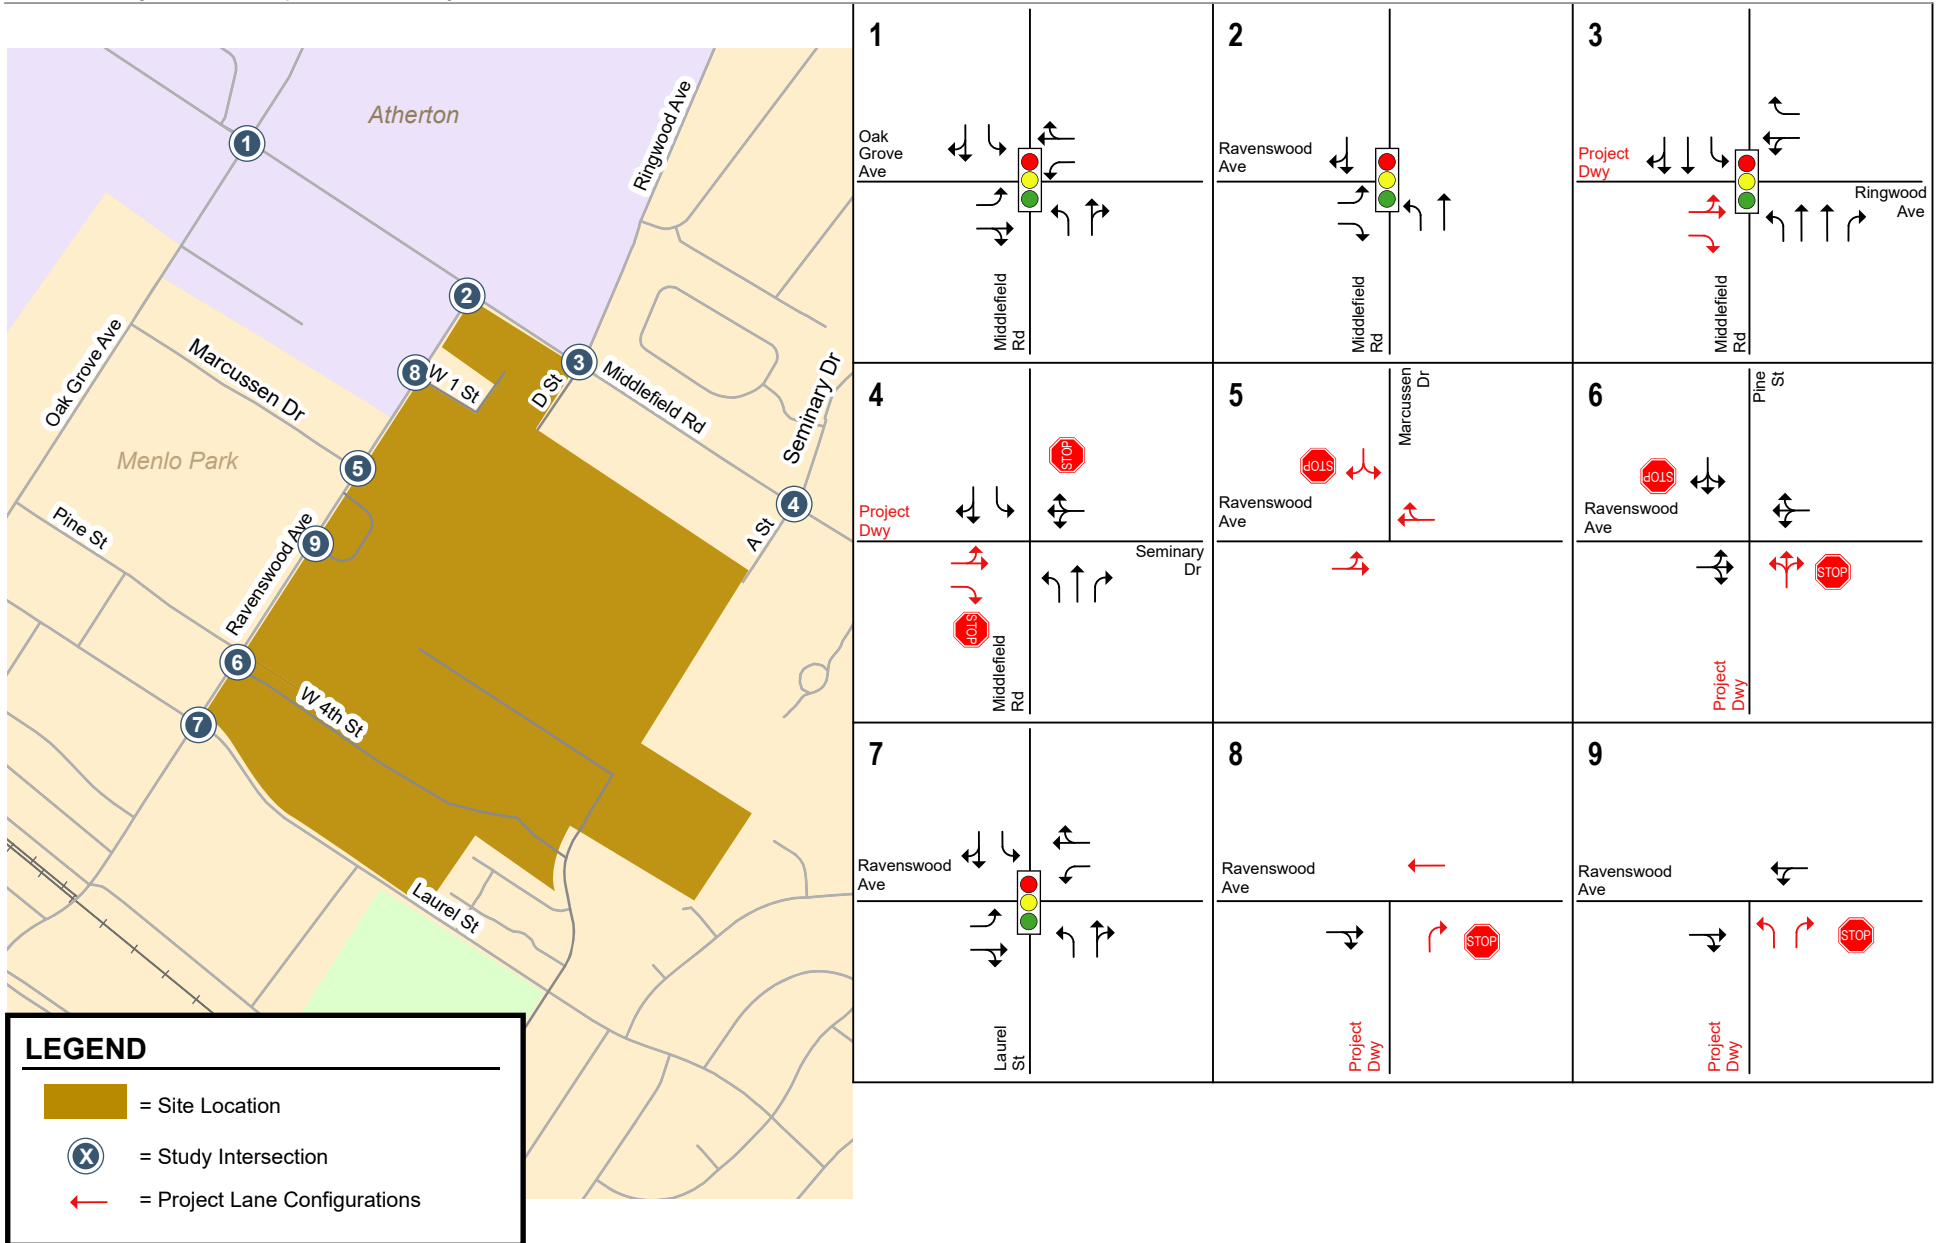

Figure 5
Project Lane Configurations

Parkline Project Traffic Operations Analysis

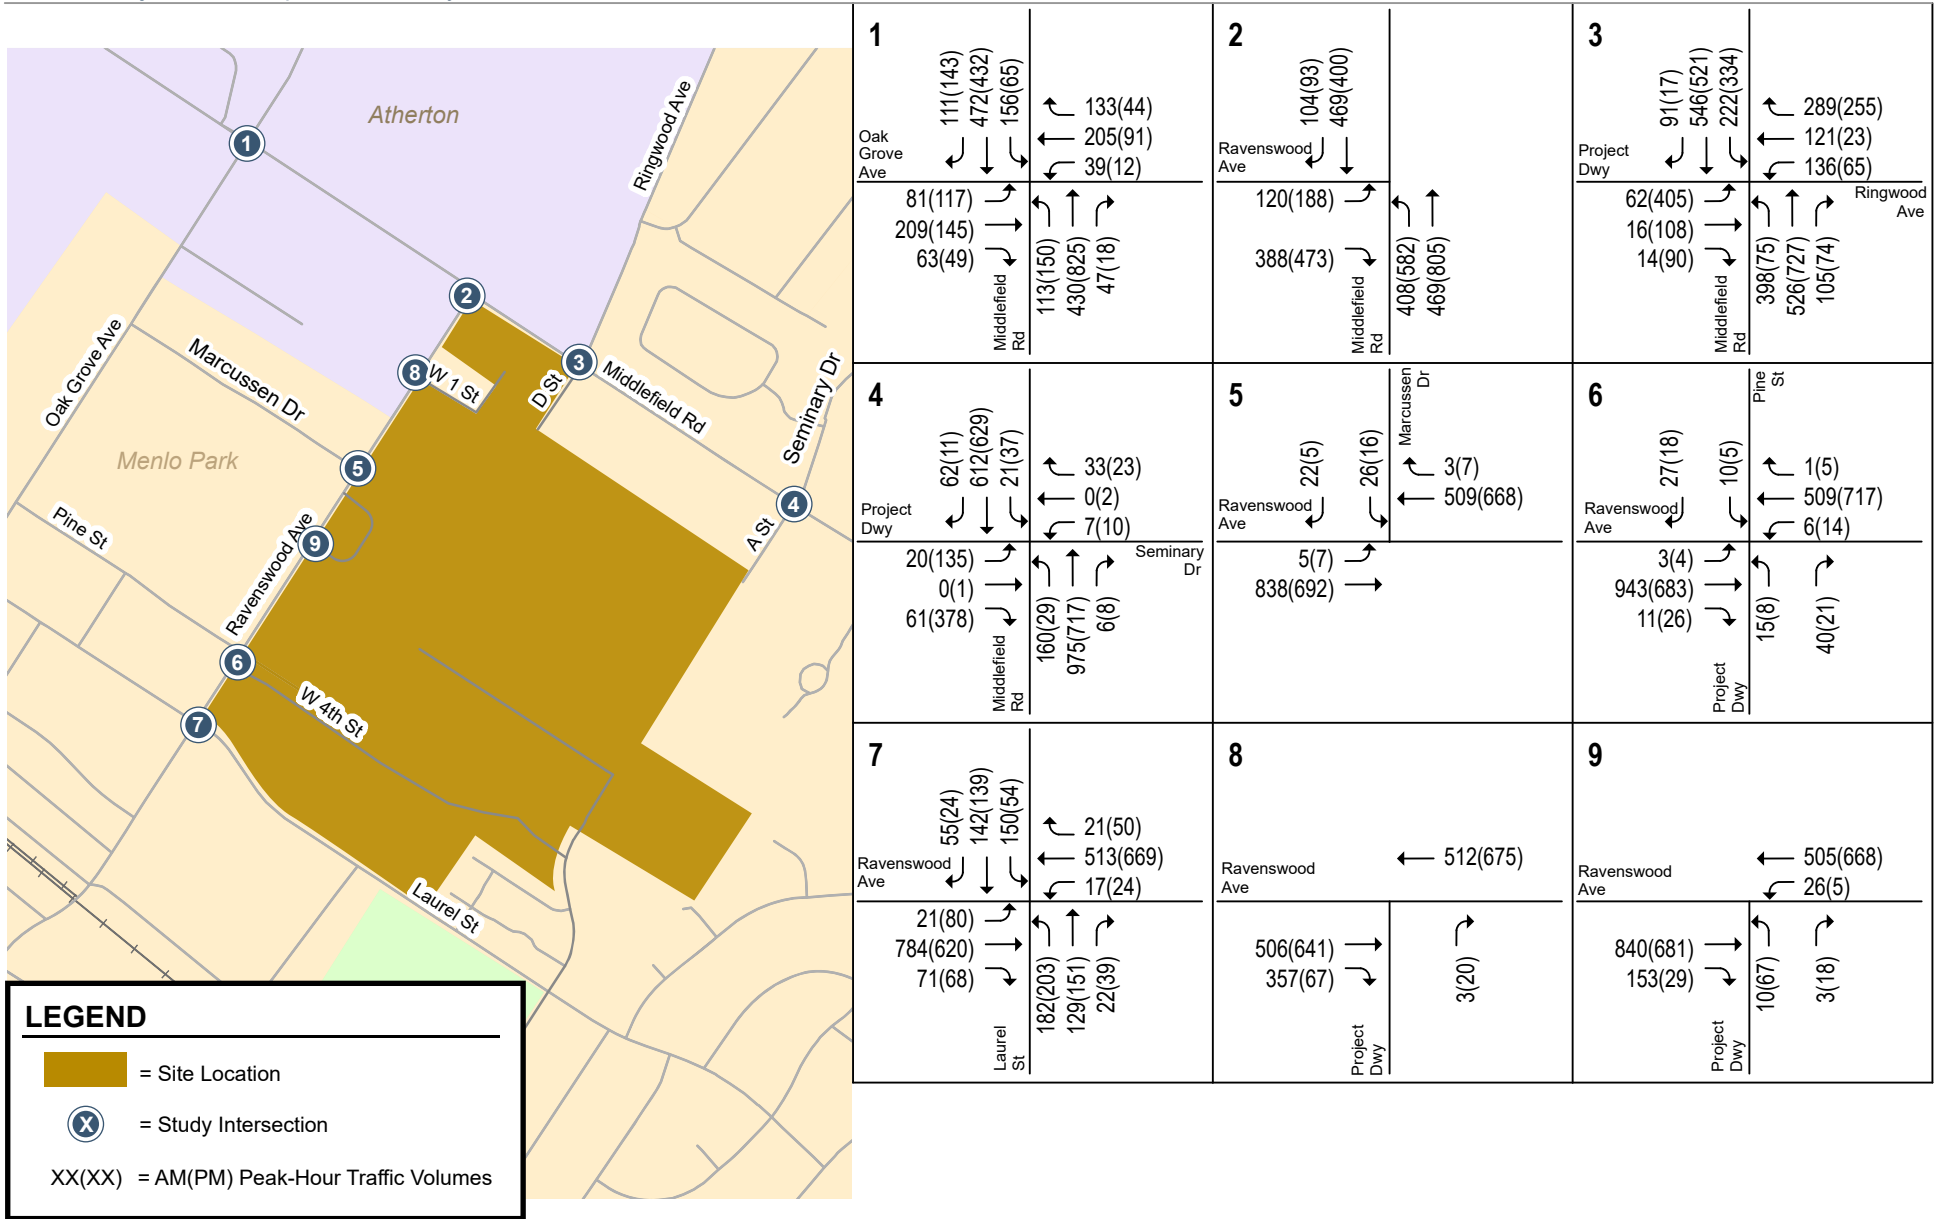

Figure 6
Background Plus Project Traffic Volumes

Background Plus Project Conditions Level of Service Analysis

Table 7 shows the average delay and the corresponding LOS during the AM and PM peak hour periods under background plus project conditions. The results show that six study intersections would operate at unacceptable conditions during at least one of the peak hours under background plus project conditions.

Table 7
Background Plus Project Conditions Level of Service Analysis

#	Intersection	Control	Peak Hour	Background Conditions		Background + Project Conditions	
				Avg. Delay ¹	LOS	Avg. Delay ¹	LOS
1	Middlefield Rd & Oak Grove Ave	Signal	AM	40.0	D	103.5	F
			PM	37.0	D	79.6	E

			PM		39	0

Notes:

NB = northbound, SB = southbound, EB = eastbound, WB = westbound

L = left-turn movement, T = through movement, R = right-turn movement

¹ Based on 95th percentile queues reported by SimTraffic software.

² Based on average queues reported by SimTraffic software.

Bold indicates that the queue length exceeds the storage capacity.

Project Effects

The results of the level of service and queuing analyses show that the following intersections would operate at unacceptable conditions during at least one of the peak hours under background plus project conditions as described below.

Middlefield Road & Oak Grove Avenue

During the AM peak hour, the analysis shows that this intersection would operate at an unacceptable LOS F under background plus project conditions. The simulation shows that the 95th percentile queues would be longer for most lanes compared to background conditions. Queues would be particularly long for the westbound through/right and southbound through/right movements. The analysis shows shorter queue lengths for the northbound lanes under project conditions due to traffic being metered at upstream intersections. For example, at the Middlefield Road and Ringwood Avenue intersection, the analysis shows that the northbound left-turning traffic would spill out of the turn pocket and extend into the adjacent through lane, thus affecting the throughput on northbound Middlefield Road.

During the PM peak hour, the analysis shows that this intersection would operate at an unacceptable LOS E under background plus project conditions and queues would be particularly

long for the northbound and southbound approaches on Middlefield Road compared to background no project conditions.

Middlefield Road & Ravenswood Avenue

During the AM peak hour, the analysis shows that this intersection would operate at LOS F under background plus project conditions. Queues would be significantly long for the southbound approach on Middlefield Road.

During the PM peak hour, the analysis shows that this intersection would operate at an LOS E under background plus project conditions. The simulation shows that the 95th percentile queues would be longer for northbound and southbound approaches on Middlefield Road compared to background conditions.

Middlefield Road & Ringwood Avenue

During the AM peak hour, the analysis shows that this intersection would operate at LOS E under background plus project conditions and the 95th percentile queues for the northbound left-turn, westbound left-turn and southbound left-turn movements would exceed their storage capacities. The project would add approximately 400 vehicles during the AM peak hour to the northbound left-turn movement and the analysis shows that only 27% of the left-turning traffic could be served during the AM peak hour with the current signal timing and phasing.

During the PM peak hour, the analysis shows that this intersection would operate at LOS F and the 95th percentile queue for the northbound left-turn, northbound through, southbound left-turn and westbound right-turn would exceed their storage capacities. The project would add approximately 550 vehicles to the eastbound approach and the analysis shows that only 40% of the eastbound traffic could be served during the PM peak hour with the current signal timing and phasing.

Middlefield Road & Seminary Drive

During the AM and PM peak hours, this intersection would operate at LOS F under background plus project conditions. The simulation analysis shows that the northbound vehicular queue at the downstream intersection of Middlefield and Ringwood Avenue would extend beyond Seminary Drive resulting in long delays for traffic on the minor street approaches.

Pine Street/Project Driveway and Ravenswood

During the PM peak hour, this intersection would operate at LOS F under background plus project conditions based on the delay experienced by traffic on the minor street approaches. Due to increased traffic levels on Ravenswood Avenue, traffic on Pine Street and the project driveway would experience long delays in finding gaps to turn onto Ravenswood Avenue.

Loop Road/Project Driveway and Ravenswood

During the PM peak hour, this intersection would operate at LOS F under background plus project conditions based on the delay experienced by traffic exiting the project site. Due to increased traffic levels on Ravenswood Avenue, traffic on the project driveway would experience long delays in finding gaps to turn onto Ravenswood Avenue.

Background Plus Project (With Improvements) Conditions

The following improvements were identified to improve traffic operations along Middlefield Road and Ravenswood Avenue:

- A new traffic signal at Middlefield Road & Seminary Drive with protected north/south phasing and split east/west phasing and optimized cycle length. Split phasing was used in favor of permitted phasing due to the lack of space for opposing left-turning vehicles to travel simultaneously and to reduce delays to the left-turning traffic.
- Extension of the northbound left-turn storage length at Middlefield Road & Seminary Drive from 50 feet to 325 feet.
- Adding forced-turn islands on the east and west approaches of the Middlefield Road & Seminary Drive intersection to eliminate through movements and prevent future cut-through traffic on Seminary Drive.
- Changing the east/west phasing at Middlefield Road & Ringwood Avenue from permitted to split phasing and modifying the signal timings at Middlefield & Ravenswood Avenue. The analysis assumed half cycle length at the Middlefield/Ravenswood intersection during the PM peak hour.
- Adding a center median with left-turn pockets or two-way left-turn lane along Ravenswood Avenue between the proposed project driveway at W 1st Street and Laurel Street.

Background Plus Project (With Improvements) Conditions Level of Service Analysis

Table 9 shows the average delay and the corresponding LOS during the AM and PM peak hour periods under background plus project conditions with the identified improvements listed above. The results show that implementation of these improvements would result in acceptable levels of service during one of the peak hours at four of the six intersections that would operate at unacceptable levels with the project traffic. However, the following intersections would continue to operate at LOS E or LOS F during at least one of the peak hours.

- Middlefield Road & Oak Grove Avenue (AM)
- Middlefield Road & Ravenswood Avenue (AM)
- Middlefield Road & Ringwood Avenue (AM & PM)
- Middlefield Road & Seminary Drive (AM)
- Pine Street & Ravenswood Avenue (AM & PM)

Background Plus Project (With Improvements) Conditions Queuing Analysis

The analysis of intersection levels of service was supplemented with a vehicle queuing analysis. The queues (measured in feet per lane) were calculated by the microscopic simulation model. Table 10 shows the 95th percentile and average queues at all intersection movements during the AM and PM peak hour periods under background plus project (with improvements) conditions.

Notes:

Avg Delay = Average Delay in seconds; LOS = Level of Service; TWSC = Two Way Stop Control; OWSC = One Way Stop Control; OVR = Delay exceeds 120 seconds

¹ At signalized intersections, delay shown is the weighted average delay for all vehicles entering the intersection calculated using the calibrated SimTraffic model. At unsignalized intersections, the delay is shown for the worst stop controlled approach or uncontrolled left-turn movement, whichever is greater.

Bold indicates LOS "E" or "F".

Effects of Identified Improvements

A comparison of the percentage of traffic served at each intersection under existing, background, background plus project and background plus project (with improvements) for AM and PM peak hour scenarios based on the simulation analysis is shown in Table 11. The effects of the identified improvements on the traffic operations at each of the study intersections are also discussed below.

Table 11
Percentage of Traffic Served – Project Conditions

#	Intersection	Percentage of Traffic Served

9	Loop Rd & Ravenswood Ave	100%	100%	85%	87%	2%
		99%	100%	94%	96%	2%

Middlefield Road & Oak Grove Avenue

During the AM peak hour, the analysis shows that with the identified improvements, the Middlefield Road & Oak Grove Avenue intersection would continue to operate at LOS F but with a lower delay. The queuing analysis shows longer vehicular queues for the eastbound and westbound approaches on Oak Grove Avenue and a shorter queue for the southbound approach on Middlefield Road. The percentage of traffic served under background plus project conditions would improve from 83% to 97% with improvements.

During the PM peak hour, the analysis shows that the identified improvements would reduce the intersection delay and improve the LOS from E to a C. The queuing analysis shows shorter northbound and southbound queues on Middlefield Road with the proposed improvements. The percentage of traffic served under background plus project conditions would improve from 92% to 95% with improvements.

Middlefield Road & Ravenswood Avenue

During the AM peak hour, the analysis shows that the identified improvements would reduce the delay at the Middlefield Road & Ravenswood Avenue intersection and improve the LOS from F to

an E. The percentage of traffic served under background plus project conditions would improve from 74% to 94% with improvements.

During the PM peak hour, the analysis shows that the identified improvements would reduce the intersection delay and improve the LOS from E to a C. The percentage of traffic served under background plus project conditions would improve from 90% to 93% with improvements.

Middlefield Road & Ringwood Avenue

At the Middlefield Road & Ringwood Avenue intersection, the project would add approximately 400 vehicles to the northbound left-turn during the AM peak hour and approximately 550 vehicles to the eastbound approach during the PM peak hour. With a new traffic signal identified as a potential improvement at the intersection of Middlefield Road & Seminary Drive, which also provides access to the project, it was assumed that 50% of the project traffic would use the Ringwood Avenue traffic signal and 50% would use the Seminary Drive traffic signal. The improvements also assume that split phasing would be implemented for the eastbound and westbound approaches on Ringwood Avenue.

During the AM peak hour, the analysis shows that with the identified improvements, the intersection would continue to operate at LOS E. The percentage of traffic served under background plus project conditions would improve from 65% to 96% with improvements.

During the PM peak hour, the analysis shows that with the identified improvements, the intersection would continue to operate at LOS F. The queuing analysis shows shorter queues on northbound Middlefield Road and longer queues on southbound Middlefield Road. Overall, the percentage of traffic served under background plus project conditions would improve from 86% to 91% with improvements.

Middlefield Road & Seminary Drive

During the AM peak hour, the analysis shows that with a traffic signal at Middlefield Road & Seminary Drive, the average intersection delay would decrease, and the LOS would improve from F to an E. The queuing analysis shows a significant reduction in vehicular queues for the eastbound and westbound approaches and a longer queue for the southbound approach. The percentage of traffic served under background plus project conditions would improve from 45% to 97% with improvements.

During the PM peak hour, the analysis shows that the identified improvements would reduce the intersection delay, and the LOS would improve from F to a D. The queuing analysis shows a significantly shorter queue for the eastbound approach (project driveway) as vehicles can exit onto Middlefield Road with a traffic signal and longer queues for the northbound and southbound approaches on Middlefield Road as traffic would have to stop due to the traffic signal. Overall, the percentage of traffic served under background plus project conditions would improve from 92% to 99% with improvements.

Marcussen Drive & Ravenswood Avenue

The intersection of Marcussen Drive and Ravenswood Avenue would continue to operate at acceptable LOS C or better during both the AM and PM peak hours. The percentage of traffic served under background plus project conditions with improvements would increase from 85% to 88% and from 93% to 95% during the AM and PM peak hours, respectively.

Pine Street/Project Driveway & Ravenswood Avenue

During the AM peak hour, the analysis shows that with the identified improvements, including exclusive eastbound and westbound left-turn lanes on Ravenswood Avenue, vehicles on southbound Pine Street would experience longer delays (LOS E) due to the improved traffic throughput on Ravenswood Avenue. The percentage of traffic served under background plus project conditions would improve from 85% to 87% with improvements.

During the PM peak hour, the analysis shows that with the identified improvements, the intersection would continue to operate at LOS F. The percentage of traffic served under background plus project conditions would improve from 94% to 96% with improvements.

Laurel Street & Ravenswood Avenue

The analysis shows that with the identified improvements, the intersection of Laurel Street and Ravenswood Avenue would continue to operate at LOS D during the AM and PM peak hours. During the PM peak hour, the percentage of traffic served under background plus project conditions would improve from 95% to 97% with improvements.

W 1st Street/Project Driveway & Ravenswood Avenue

The intersection of W 1st Street/Project Driveway and Ravenswood Avenue would continue to operate at acceptable LOS C or better during both the AM and PM peak hours with the identified improvements. The percentage of traffic served under background plus project conditions with improvements would increase from 85% to 90% and from 93% to 95% during the AM and PM peak hours, respectively.

Loop Road/Project Driveway & Ravenswood Avenue

During the AM peak hour, the analysis shows that with the identified improvements, including an exclusive westbound left-turn lane on Ravenswood Avenue, the LOS would improve from D to a C. The percentage of traffic served under background plus project conditions would improve from 85% to 87% with improvements.

During the PM peak hour, the analysis shows that the identified improvements would reduce the intersection delay and the LOS would improve from F to a D. Overall, the percentage of traffic served under background plus project conditions would improve from 94% to 96% with improvements.

Background Plus Variant Conditions

Under background plus variant conditions, access to the proposed project site would be provided via two signalized driveways along Middlefield Road and five unsignalized driveways along Ravenswood Avenue. The variant was analyzed with all improvements that were analyzed for the project conditions discussed in the previous section. The project driveways were analyzed with the following characteristics. The variant lane configurations are shown on Figure 7.

- **Middlefield Road & Ringwood Avenue** – The project driveway is proposed to be the west leg of the signalized intersection. The lane configurations of the intersection would remain the same as existing conditions. The signal was analyzed with the same timing and phasing as background plus project (with improvements).
- **Middlefield Road & Seminary Drive** – The project driveway is proposed to be the west leg of the signalized intersection. The lane configurations and signal timing would be the same as background plus project (with improvements).

- W 1st Street & Ravenswood Avenue – The project driveway is proposed to be the south leg of the unsignalized intersection as a stop-controlled approach. The project driveway approach would have one right-turn lane and would be restricted to right-in-right-out only movements.
- Loop Road & Ravenswood Avenue – Two project driveways would be connected via Loop Road and would intersect Ravenswood Avenue east and west of Marcussen Drive. The driveway approaches are proposed to be the south legs of the unsignalized intersections as stop-controlled approaches. The project driveway approaches would each have one shared left-right lane and the driveways would allow all turning movements.
- R1 Driveways & Ravenswood Avenue – Two project driveways would be connected in a similar fashion as Loop Road and would intersect Ravenswood Avenue east and west of Pine Street. The driveway approaches are proposed to be the south legs of the unsignalized intersections. The western driveway would have one inbound lane and be restricted to right-in only. The eastern driveway would have one stop-controlled approach with one right-turn lane and be restricted to right-out only.

Intersection Turning Movements Volumes

Background plus variant conditions reflect the projected traffic volumes with the completion of the variant and future developments. Variant-generated traffic was added to the background condition traffic volumes. The background plus variant traffic volumes are shown on Figure 8.

Parkline Project Traffic Operations Analysis

Background Plus Variant Traffic Volumes

Background Plus Variant Conditions Level of Service Analysis

Table 12 shows the average delay and the corresponding LOS during the AM and PM peak hour periods under background plus variant conditions.

Table 12
Background Plus Variant Conditions Level of Service Analysis

#	Intersection	Control	Peak Hour	Background + Project With Improvements		Background + Variant Conditions	
				Avg. Delay ¹	LOS	Avg. Delay ¹	LOS
1	Middlefield Rd & Oak Grove Ave	Signal	AM	101.3	F	91.0	F
			PM	29.2	C	29.8	C
2	Middlefield Rd & Ravenswood Ave	Signal	AM	57.5	E	52.0	D
			PM	31.8	C	31.7	C
3	Middlefield Rd & Ringwood Ave/Project Dwy	Signal	AM	71.6	E	68.2	E
			PM	OVR	F	OVR	F
4	Middlefield Rd & Seminary Dr/Project Dwy	Signal	AM	63.2	E	60.1	E
			PM	49.2	D	46.9	D
5	Marcussen Dr & Ravenswood Ave	OWSC	AM	14.9	B	24.7	C
			PM	24.0	C	32.1	D
6	Pine St & Ravenswood Ave	OWSC	AM	39.8	E	67.5	F
			PM	58.1	F	OVR	F
7	Laurel St & Ravenswood Ave	Signal	AM	38.7	D	37.0	D
			PM	46.6	D	45.6	D
8	W 1st St/Project Dwy & Ravenswood Ave	OWSC	AM	8.1	A	11.0	B
			PM	21.5	C	24.0	C
9	East Loop Rd & Ravenswood Ave	OWSC	AM	-	-	20.9	C
			PM	-	-	31.8	D
10	West Loop Rd & Ravenswood Ave	OWSC	AM	-	-	40.0	E
			PM	-	-	OVR	F
11	East R1 Dwy & Ravenswood Ave	OWSC	AM	-	-	12.4	B
			PM	-	-	5.7	A

Notes:

Avg Delay = Average Delay in seconds; LOS = Level of Service; OWSC = One Way Stop Control; OVR = Delay exceeds 120 seconds

¹ At signalized intersections, delay shown is the weighted average delay for all vehicles entering the intersection calculated using the calibrated SimTraffic model. At unsignalized intersections, the delay is shown for the worst stop controlled approach or uncontrolled left-turn movement, whichever is greater.

Bold indicates LOS "E" or "F".

The results show that the following four study intersections would operate at LOS E or F during at least one of the peak hours under background plus variant conditions.

- Middlefield Road & Oak Grove Avenue (AM)
- Middlefield Road & Ringwood Avenue (AM & PM)
- Middlefield Road & Seminary Drive (AM)
- Pine Street & Ravenswood Avenue (AM & PM)
- West Loop Road & Ravenswood Avenue (AM & PM)

At the Pine Street and Ravenswood Avenue intersection, the analysis shows that the intersection delay would increase, and the LOS would decline from E to an F during the AM peak hour under background plus variant conditions compared to project conditions. During the PM peak hour, the analysis shows that the intersection delay would increase, and the LOS would continue to operate at LOS F. The increase in delay at the Ravenswood/Pine intersection under the variant could be attributed to the additional driveways provided in close proximity along Ravenswood Avenue.

Under background plus variant conditions, there would be additional driveways on Ravenswood Avenue. The intersection at the East Loop Road driveway and Ravenswood Avenue would operate at LOS C during the AM peak hour and LOS D during the PM peak hour. The intersection at the West Loop Road driveway and Ravenswood Avenue would operate at LOS E during the AM peak hour and LOS F during the PM peak hour. The intersection at the East R1 driveway and Ravenswood Avenue would operate at LOS B during the AM peak hour and LOS A during the PM peak hour.

Background Plus Variant Conditions Queuing Analysis

The analysis of intersection levels of service was supplemented with a vehicle queuing analysis. The queues (measured in feet per lane) were calculated by the microscopic simulation model. Table 13 shows the 95th percentile and average queues at all intersection movements during the AM and PM peak hour periods under background plus variant conditions. A comparison of the 95th percentile and average queues for existing, background, background plus project, background plus project (with improvements), and background plus variant is illustrated on Figures 9 – 16.

Variant Effects

A comparison of the percentage of traffic served at each intersection under background plus project (with improvements) and background plus variant for the AM and PM peak hour scenarios based on the simulation analysis is shown in Table 14. As shown in this table, the peak hour traffic operations under background plus variant conditions would be similar or marginally better compared to background plus project (with improvements) conditions.

Table 14
Percentage of Traffic Served – Variant Conditions

#	Intersection	Control	Peak Hour	Percentage of Traffic Served		
				Background + Project With Improvements	Background + Variant	Difference
1	Middlefield Rd & Oak Grove Ave	Signal	AM	97%	97%	0%
			PM	95%	99%	4%

11	East R1 Dwy & Ravenswood Ave	OWSC	AM	-	89%	-
			PM	-	98%	-

Conclusions

A simulation analysis of traffic operations was conducted for the proposed Parkline project in Menlo Park. The project proposes to redevelop the approximately 63-acre site to include 550 new housing units (including affordable housing), 1.1 million s.f. of replacement office and R&D uses, and new community-oriented retail space. Access to the project site would be provided via driveways on Middlefield Road at Seminary Drive and Ringwood Avenue and on Ravenswood Avenue at W 1st Street, Pine Street/4th Street, and Loop Road.

The proposed project is expected to generate 1,368 AM peak hour trips and 1,316 PM peak hour trips after applying a 25% TDM reduction. An evaluation of traffic operations on Middlefield Road and Ravenswood Avenue near the project site showed that the project would contribute to significant traffic congestion along Middlefield Road. The following improvements were identified to improve traffic operations along Middlefield Road and Ravenswood Avenue:

- A new traffic signal at Middlefield Road & Seminary Drive with protected north/south phasing and split east/west phasing and optimized cycle length.
- Extension of the northbound left-turn storage length at Middlefield Road & Seminary Drive from 50 feet to 325 feet.
- Adding forced-turn islands on the east and west approaches of the Middlefield Road & Seminary Drive intersection to eliminate through movements and prevent future cut-through traffic on Seminary Drive.
- Changing the east/west phasing at Middlefield Road & Ringwood Avenue from permitted to split phasing and modifying the signal timings at Middlefield Road & Ravenswood Avenue. The analysis assumed half cycle length at the Middlefield/Ravenswood intersection during the PM peak hour.
- Adding a center median with left-turn pockets or two-way left-turn lane along Ravenswood Avenue between the proposed project driveway at W 1st Street and Laurel Street.

With these improvements, the analysis showed that traffic operations would improve significantly along Middlefield Road near the project site.

A simulation analysis was also conducted for the proposed variant which would incorporate the existing church site into the project, relocate some housing units to the Middlefield Road corner of the project site, and reconfigure the site circulation so that the majority of residential vehicles would need to use the office/R&D driveways. In addition to the proposed driveways on Middlefield Road listed above, access to the project site would be provided on Ravenswood Avenue at W 1st Street and four new driveways between Laurel Street and W 1st Street. The variant was analyzed with all the improvements discussed above.

The proposed variant is expected to generate 1,441 AM peak hour trips and 1,393 PM peak hour trips after applying a 25% TDM reduction. Based on the analysis, the peak hour traffic operations under background plus variant conditions would be similar to background plus project (with improvements) conditions.

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Level Of Service Report
Intersection 1: Marsh Rd (SR 84)/US 101 SB Offramp

Control Type:	Signalized	Delay (sec / veh):	20.6
Analysis Method:	HCM 7th Edition	Level Of Service:	C
Analysis Period:	15 minutes	Volume to Capacity (v/c):	0.754

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Level Of Service Report
Intersection 1: Marsh Rd (SR 84)/US 101 SB Offramp

Control Type:	Signalized	Delay (sec / veh):	22.2
Analysis Method:	HCM 7th Edition	Level Of Service:	C
Analysis Period:	15 minutes	Volume to Capacity (v/c):	0.791

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Level Of Service Report
Intersection 1: Marsh Rd (SR 84)/US 101 SB Offramp

Control Type:	Signalized	Delay (sec / veh):	25.4
Analysis Method:	HCM 7th Edition	Level Of Service:	C
Analysis Period:	15 minutes	Volume to Capacity (v/c):	0.826

Intersection Settings

Located in CBD	No
Signal Coordination Group	-
Cycle Length [s]	90
Active Pattern	Free Running
Coordination Type	<i>Free Running</i>
Actuation Type	<i>Fully actuated</i>
Offset [s]	0.0
Offset Reference	Lead Green - Beginning of First Green
Permissive Mode	SingleBand
Lost time [s]	4.00
