Appendix 1

Notice of Preparation and Comments Received on the NOP

NOTICE OF PREPARATION
ENVIRONMENTAL IMPACT REPORT
WILLOW VILLAGE MASTER PLAN PROJECT
CITY OF MENLO PARK

Date: September 18, 2019

To: State Clearinghouse
State Responsible Agencies
State Trustee Agencies
Other Public Agencies
Interested Organizations

From: Kyle Perata
Principal Planner
City of Menlo Park
701 Laurel Street
Menlo Park, CA 94025

Subject: **Notice of Preparation (NOP) of the Environmental Impact Report for the Willow Village Master Plan Project**

Lead Agency: City of Menlo Park Planning Division

Project Title: Willow Village Master Plan Project

Project Area: City of Menlo Park

Notice is hereby given that the City of Menlo Park (City) will be the lead agency and will prepare an Environmental Impact Report (EIR) for the proposed Willow Village Master Plan Project (Proposed Project). The EIR will address the Proposed Project's potential physical environmental effects on each of the environmental topics outlined in the California Environmental Quality Act (CEQA), with the exception of agricultural or forestry resources, mineral resources, and wildfire. The City of Menlo Park is requesting comments on the scope and content of this EIR.

A scoping session will be held as part of the Planning Commission meeting on **October 7, 2019,** at **7:00 p.m.** at the Menlo Park City Council Chambers, located at 701 Laurel Street, Menlo Park, CA 94025. The scoping session is part of the EIR scoping process and is the time when the City solicits input from the public and other agencies on specific topics they believe should be addressed in the environmental analysis. The focus of the scoping meeting will be the content that will be studied in the EIR. Written comments on the scope of the EIR may also be sent to:

Kyle Perata, Principal Planner
City of Menlo Park
Community Development Department, Planning Division
701 Laurel Street
Menlo Park, CA 94025
ktperata@menlopark.org
Phone: 650.330.6721
Fax: 650.327.1653

Comments on the NOP are due no later than the close of the NOP review period at 5:00 p.m. on **October 18, 2019**. However, we would appreciate your response as soon as possible. Please send your written comments to Kyle Perata at the address shown above or via email to ktperata@menlopark.org with "Proposed Willow Village Master Plan Project EIR" as the subject. Public agencies providing comments are asked to include a contact person for the agency.

PROJECT LOCATION AND EXISTING CONDITIONS: The approximately 59-acre Menlo Science and Technology Park (Project Site) is located north of US 101 in the City of Menlo Park. The Project Site is bounded by the currently inactive Dumbarton Rail Corridor to the north, an existing life science complex to the east and south (Menlo Park Labs Campus), the Hetch Hetchy right-of-way corridor and Mid-Peninsula High School to the south, and Willow Road to the west. North of the currently inactive Dumbarton Rail Corridor, across State Route (SR) 84, are tidal mudflats and marshes along San Francisco Bay, the Don Edwards San Francisco Bay National Wildlife Refuge, and Ravenswood Slough. The Project Site is located within the vicinity of the existing Facebook campuses, which consist of the Classic Campus (East Campus) encompassing Buildings 10–19, located north of SR 84 on the former Sun Microsystems campus, and the West Campus encompassing Buildings 20, 21, 22 (expected to be operational by early 2020), and 23, located west of Willow Road on the former TE Connectivity campus. Figure 1 depicts the location of the Project Site.

The Project Site currently contains 20 buildings with a mix of office, research and development (R&D), and warehousing uses at the following addresses: 1350–1390 Willow Road, 925–1098 Hamilton Avenue, and 1005–1275 Hamilton Court. The existing site contains approximately 1 million gross square feet (gsf). Currently, Facebook occupies a number of the buildings for a variety of uses, including office space, employee amenities, research and development, and an employee health clinic. Other tenants occupy buildings pursuant to short-term leases, including the Menlo Park Fire Protection District (which uses an existing warehouse facility for storage and training), Satellite Healthcare (which operates a dialysis clinic), and Community Legal Services of East Palo Alto (which rents temporary office space). In total, approximately 3,500 people are currently employed at the Project Site.

PROJECT DESCRIPTION: The Proposed Project would demolish existing onsite buildings and landscaping and construct new buildings within a Town Square District, a Residential/Shopping District, and a Campus District. The Proposed Project would result in a net increase of approximately 1 million square feet (sf) of nonresidential uses (office space and non-office commercial/retail), for a total of approximately 2 million sf of nonresidential uses at the Project Site. In addition, the Proposed Project would include multi-family housing units, a hotel, indoor space dedicated for community facilities/uses, park building/improvements and open space.

The approximately 22-acre Residential/Shopping District would be located in the southwestern portion of the Project Site. The approximately 5-acre Town Square District would be located in the northwestern portion of the Project Site. Together, these two districts would include: approximately 1,735 residential units, which would include a minimum of 15 percent affordable/below market-rate units (approximately 261 units); up to approximately 200,000 sf of retail, including a grocery store, pharmacy, and restaurants (of which approximately 25,000 sf would be located on the ground floor along the east side of Main Street in the Campus District and would be open to the public); an approximately 175,000-sf hotel with 200-250 rooms and food services; an approximately 500 space parking structure intended to accommodate visitors/vendors to the office campus and hotel guests during normal business hours and provide retail overflow parking during evening and weekend time periods; and an approximately 10,000 sf indoor space dedicated to community facilities/uses adjacent to a 4-acre public park. In addition, an approximately 0.7-acre Town Square and 0.3-acre dog park would be accessible to the public.

The approximately 32-acre Campus District, located in the eastern portion of the Project site, would include approximately 1.75 million sf of office uses and employee-serving amenity space, along with two above-ground parking structures with approximately 3,100 parking spaces. Both parking structures would include

a ground-level Transit Hub to support private campus commuter shuttles and trams. Open spaces would include a chain of publicly-accessible spaces and gardens along Main Street, a landscaped area off O'Brien Drive, and various secure, interior open spaces for the Campus District users.

The Proposed Project is anticipated to be developed in three phases, with the first phase consisting of approximately 595,000 sf of offices, 767 residential units, and 3,000 sf of retail; the second phase consisting of approximately 633,000 sf of offices, 633 residential units, and 35,000 sf of retail; and the third phase consisting of approximately 522,000 sf of offices, 335 residential units, the hotel, and 137,000 sf of retail. The Project Site would generally be developed beginning along the southern portion of the site and moving north with the northwest portion being completed last.

The Project Site would be bisected by the proposed north-south Main Street, which would provide access to all three districts. The Project Site would include a circulation network for vehicles, bicycles, and pedestrians inclusive of both public rights-of-way and private streets, generally aligned in an east-to-west and a north-to-south grid. The exact amount of dedicated public rights-of-way will be determined through the City review process. Modifications to the total area of dedicated rights-of-way could affect the overall development potential at the Project Site and the Proposed Project would be adjusted accordingly.

PROJECT APPROVALS AND ANALYSIS: The Proposed Project would require a Zoning Map Amendment to modify the circulation within the Project Site and the proposed site connections to the surrounding roadway network. The Proposed Project would require a General Plan Amendment to the Circulation Element for the associated circulation changes. At the time of the release of this NOP, the City has received development applications for approximately 457 hotel rooms, which would exceed the development cap of 400 hotel rooms set by the General Plan; therefore, the Proposed Project could require a General Plan Amendment to the Land Use Element to increase the development cap for hotel rooms to accommodate the proposed 250 room hotel, unless the proposed hotel room count for this Proposed Project or the other projects are reduced. In addition, the following City discretionary approvals or analysis would be required prior to development at the Project Site:

- Conditional Development Permit
- Subdivision Map/Vesting Tentative Map
- Right-of-Way Abandonment
- Rezoning to Incorporate X Overlay
- Development Agreement
- Environmental Review
- Fiscal Impact Analysis
- Architectural Control/Future Design Review
- Tree Removal Permits
- Below-Market-Rate Housing Agreement
- Appraisal/Community Amenity Value Analysis

RESPONSIBLE AND OTHER AGENCIES: The agencies listed below are expected to review the Draft EIR to evaluate the Proposed Project:

- Bay Area Air Quality Management District (BAAQMD)
- California Department of Transportation (Caltrans)
- California Regional Water Quality Control Board (RWQCB)/San Mateo Countywide Water Pollution Prevention Program
- City/County Association of Governments (C/CAG)
- San Mateo County Transportation Authority (SMCTA)
- Department of Toxic Substance Control (DTSC)
- Menlo Park Fire Protection District
- San Mateo County Environmental Health Division
- West Bay Sanitary District

- Native American Heritage Commission
- San Francisco Public Utilities Commission (SFPUC)

INTRODUCTION TO EIR: The purpose of an EIR is to inform decision-makers and the general public of the environmental effects of a proposed project. The EIR process is intended to provide environmental information for evaluating a proposed project and its potential to cause significant effects on the environment, examine methods of reducing adverse environmental impacts, and identify alternatives to a proposed project. The Willow Village Master Plan Project EIR will be prepared and processed in accordance with CEQA and the State CEQA Guidelines in effect at the time of the release of this NOP. Where appropriate the EIR for the Proposed Project will incorporate by reference analyses, discussions and mitigation measures from the program EIR certified on November 29, 2016 by the City Council for the ConnectMenlo General Plan Update. The EIR will include the following:

- Summary of the Proposed Project and its potential environmental effects
- Description of the Proposed Project
- Description of the existing environmental setting, potential environmental impacts of the Proposed Project, and mitigation measures to reduce significant environmental effects of the Proposed Project
- Variants to the Proposed Project
- Alternatives to the Proposed Project
- Cumulative impacts
- CEQA conclusions

PROBABLE ENVIRONMENTAL EFFECTS: The EIR will analyze whether the Proposed Project would have significant environmental impacts in the following areas:

- Aesthetics
- Air Quality
- Biological Resources
- Cultural and Tribal Resources
- Energy
- Geology and Soils
- Greenhouse Gas Emissions
- Hazards and Hazardous Materials
- Hydrology and Water Quality
- Land Use and Planning
- Noise
- Population and Housing
- Public Services and Recreation
- Utilities
- Transportation

To help prepare several of these sections and analyze the impacts, a transportation study will be prepared. The transportation study will focus on intersections, residential and non-residential roadway segments, and Routes of Regional Significance.

ENVIRONMENTAL EFFECTS NOT LIKELY TO REQUIRE FURTHER ANALYSIS: The Proposed Project is not anticipated to result in significant environmental effects in the following areas:

- Agricultural or Forestry Resources
- Mineral Resources
- Wildfire

The Project site is fully developed in an urbanized area and located near SR 84 and US 101. As such, agricultural and mineral resources do not exist on the site and wildfires are not a concern. A detailed analysis of these topics will not be included in the EIR.

VARIANTS: The Proposed Project could include additional and/or alternative access to/from the Proposed Project Site, along with other onsite features than currently proposed. All potential variants to the Proposed Project will be analyzed in the EIR. Variants that could be analyzed currently include: realignment of Hamilton Avenue and relocation of the existing gas station; a grade-separated crossing over or under the currently inactive Dumbarton Rail Corridor/Willow Road for bicycles, pedestrians, and Facebook trams; an onsite emergency water storage tank; and a recycled water system for either public use or onsite use only. In addition, the EIR will analyze two housing variants: an increase in housing units up to a maximum of 2,000 housing units and a decrease in housing units to a minimum of 1,500 housing units. The ConnectMenlo program EIR analyzed up to 2,000 residential units at the Project Site; however, with the anticipated right-of-way dedication, the maximum number of residential units would be approximately 1,860 units. The analysis will also consider a variant to the programming of the proposed onsite park. The proposed 4-acre park is currently identified as being programmed with playing fields and a playground but could be programmed differently than currently proposed with potentially passive recreational uses instead of active uses. Any environmental impacts associated with the potential Proposed Project variants will be disclosed in the EIR.

ALTERNATIVES: Based on the significance conclusions determined in the EIR, alternatives to the Proposed Project will be analyzed to reduce identified impacts. Section 15126.6(e) of the State CEQA Guidelines requires the evaluation of a No Project Alternative. Other alternatives may be considered during preparation of the EIR and will comply with the State CEQA Guidelines, which call for a "range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project." The EIR will analyze a Reduced Intensity Alternative, the No Project Alternative, along with any other feasible alternatives that are proposed during the scoping process.

EIR PROCESS: Following the close of the NOP comment period, a draft EIR will be prepared that will consider all NOP comments. In accordance with State CEQA Guidelines Section 15105(a), the draft EIR will be released for public review and comment for the required 45-day review period. Following the close of the 45-day public review period, the City will prepare a final EIR, which will include responses to all substantive comments received on the draft EIR. The draft EIR and final EIR and will be considered by the Planning Commission and City Council in making the decision to certify the EIR and approve or deny the Proposed Project.

MEMORANDUM

Date: 11/18/2019
To: Planning Commission
From: Kyle Perata, Principal Planner
Re: Edits to transcript of October 7, 2019 environmental impact report scoping session for proposed Willow Village Master Plan project

At the November 4, 2019 Planning Commission meeting, the Commission voted 5-0-1, with Commissioner Kahle abstaining and Commissioner DeCardy absent to approve the transcript for the environmental impact report (EIR) scoping session public hearing for the proposed Willow Village Master Plan project, with edits suggested by Commissioner Riggs.

Following the meeting, Planning Division staff relayed Commissioner Riggs's edits to the contracted court reporter for review and inclusion into a revised transcript, if applicable (based on review and consistency with the audio recording). Upon further review of the transcript, staff determined that portions of the transcript needed clarification by the court reporter to ensure that the transcript accurately reflected the discussion at the meeting. Staff subsequently asked the court reporter to review the audio recording and update the transcript for consistency.

A number of small edits were made to the transcript for consistency with the discussion at the meeting. The following list identifies more detailed edits to the transcript that were made to improve accuracy:

1) On pages 45-47 of the transcript, public comments were reviewed and updated to more accurately capture the public commenter's verbal remarks on the scope and content of the EIR. The edits to the transcript were limited to clarifications for consistency between the transcript and the audio recording.
2) On pages 80-83, commissioner comments were reviewed and updated to accurately capture comments on the scope and content of the EIR. These edits were also limited to changes for consistency between the transcript and the audio recording.
3) Commissioner Riggs's suggested edits are included in the revised transcript when they are consistent with the audio recording.

Given the changes to the transcript after the Planning Commission's approval of the transcript on November 4, 2019, staff requests that the Planning Commission review and approve the changes to the updated transcript. The revised transcript is attached for the Commission's review and approval.

BE IT REMEMBERED that, pursuant to Notice of the Meeting, and on October 7, 2019, 7:305 PM at the Menlo Park City Council Chambers, 701 Laurel Street, Menlo Park, California, before me, MARK I. BRICKMAN, CSR No. 5527, State of California, there commenced a Planning Commission meeting under the provisions of the City of Menlo Park.

---o0o---

MEETING AGENDA

OCTOBER 7, 2019 7:05 PM

P R O C E E D I N G S

---o0o---

COMMISSIONER BARNES: We have a public hearing and there are two -- we've got a public hearing. This is F1 and FG, and these are associated items within a single staff report.

What I will to do is I'll read one of these in both F1 and FG and I'll have the same lead in.

F1, Environmental Impact Report, EIR Scoping Session/Peninsula Innovation Partners/1350 to 1390 Willow Road, 925 to 1098 Hamilton and 1005-1275 Hamilton Court.

This is a request for an Environmental Review, Conditional Development Permit, Development Agreement, Below Market Rate (BMR) Housing Agreement, Zoning Map Amendment, General Plan Amendment, Heritage Tree Removal, Vesting Tentative Map, Fiscal Impact Analysis and an appraisal to identify the Community Amenity Value for a Master Plan to comprehensively redevelop an approximately 9 -- 59-acre site located at 1350-1390 Willow Road, 925-1098 Hamilton Avenue and 1005-1275 Hamilton Court.

The proposed project would demolish approximately one million square feet of existing office, industrial research and development (R&D) and warehousing campus. The project site will be redeveloped with

approximately 1,735 housing units (with a minimum fifteen percent affordable), up to 200,000 square feet of non-office/commercial retail uses (including a grocery store and pharmacy), approximately 1,750,000 square feet of offices, a hotel with approximately 200-250 rooms, an approximately 10,000 square foot community center, and approximately 9.8 acres of publicly accessible open space (including an approximately four acre public park).

The proposal includes the request for an increase in height, floor area ratio (FAR) and density under the bonus level development allowance in exchange for community amenities, as outlined in the General Plan and Zoning Ordinance.

The project site encompasses multiple parcels zones O-B (Office) and R-MU-B (Residential Mixed Use). The project site contains a toxic release -- contains a toxic release site, per Section 6596.2 of the California Government Code that would be remediated as part of the proposed project, in accordance and in compliance with the applicable requirements of the California Department of Toxic Substance Control, the State Water Resources Control Board and/or other responsible agencies.

So there you have it.

Commissioner -- excuse me. Mr. Perata.

MR. PERATA: Thank you. So I will give the

staff introduction to the project tonight and we'll follow up with a presentation of the applicant and then a presentation from the Environmental Impact Report consultant developing the EIR for the project.

So I just want to start from a staff perspective by giving an overview of the meeting purpose for tonight.

As mentioned, we have two items on the agenda for the Willow Village project. These are two public hearings. The first is an Environmental Impact Report Scoping Session, so this provides an opportunity for members of the public and members of the Planning Commission to provide input on the scope and content of topics on items that can be studied in the EIR.

Then following that, we'll have a Study Session tonight which will allow an opportunity for members of the public and the Commission as well as provide feedback on the project plans more generally, so not EIR focused for that, but rather more general design, uses, layout, more conceptual guidance or comments on the plans for the applicant team and the staff.

And then just by way of kind of background, the latest Study Session by the City Council for this project May 7th. And so no actions will be taken at tonight's hearing.

So I just want to start with a little bit of background which is highlighted in blue on the side slide.

It is generally located on the east side of Willow Road north of the San Francisco Public Utilities Commission right-of-way and Ivy Drive, then just south of the Dumbarton corridor, the Dumbarton corridor further north of that is Highway 84/Bayfront Expressway.

So the existing site, it's approximately 59 acres in size. It's commonly referred to as a Prologic Menlo Science and Technology Park. The site includes twenty buildings, approximately one million square feet of square footage within those buildings, and existing land uses at the project site include office, research and development and warehouse uses.

Facebook occupies a number of buildings on the project site and uses those buildings for a multitude of uses, including offices, employee amenities, research and development and a employee health center.

There's approximately 3,500 employees at the site currently and the site has two zoning districts, Office Bonus as well as Mixed Use Residential Bonus.

So I'll give a brief overview of the proposed project here and the applicant team can go into further detail.

As part of the project, the existing buildings onsite will be demolished. The proposed project is a Mixed Use Development. It would utilize the City's ordinance allowance for a Master Plan Development which will include a Conditional Development Permit and a Development Agreement as a part of the entitlements for the project.

Some of the main components to talk about briefly. The project includes housing, retail as well as a hotel and office.

As far as housing, there's approximately 1,735 units currently proposed. Retail, you have 200,000 square feet, and that does includes uses such as a grocery store and pharmacy as well as some other non-office commercial uses, restaurants, cafes, commercial services could be within that square footage.

The hotel right now is proposed for up to 250 rooms and the office campus is 1.75 million square feet, and that is a net increase of approximately 750,000 square feet above the existing commercial square footage at the site currently.

The site also includes public space throughout, the majority of which is an approximately four acre publicly accessible park at the southwestern corner of the site.

Adjacent to that site would be a community serving space within the adjacent building.

And so the recommended meeting format for tonight. As mentioned, we have two items, the EIR Scoping Session and Study Session.

For the EIR Scoping Session, staff recommends that the Commission, after staff's review and overview of the proposed project, listen to a presentation by the applicant, and then following that a presentation by the City's EIR consultant of the project.

It's recommended that the Commission hold general questions on the project for the EIR process more generally without -- not comment particularly, but more general clarifying questions.

So after all three presentations, but certainly if you have a question for the applicant or the EIR consultant or myself, we can take that after each presentation if necessary.

Following any clarifying questions, we want to open public comment, and then close that, Commissioner comments on the EIR scope and content, and then after closing the Scoping Session and Public Hearing, move on to the Study Session, item G1.

For that, there will be no presentations. Staff recommends moving all three presentations to this

time rather than having the applicant present it during the Study Session.

But it would be an opportunity for clarifying questions and we would take Public Comment and Commissioner comments on the project.

So that concludes my presentation. As I stated previously, I'd be happy to answer any general questions, and then I'll turn it over to the applicant team to make their presentation.

CHAIRPERSON BARNES: Any clarifying questions from the Commissioners?

Seeing none, and, too, for the purpose of clarity, just to give an overview one more time, we're going to have the consultant for the EIR give a presentation, and then -- then we'll bring it back to Public Comment and then bring it up here.

We'll do it again as it relates to the session on the project itself as we move to the EIR. In the middle of that will be Public Comment opportunity and then we'll bring it back up here.

So with that, let's call for the applicant. Good evening.

MR. GHIELMETTI: Hi. My name is Mike Ghielmetti. I'm the founder of Signature Development Group and we're partnering with Facebook on the project

before you. So thanks for having us tonight. We've been to a few of these before, so some of these may be repeats for members of the audience and some of you Commissioners have been to our study sessions, as well.

So again, I'm Mike Ghielmetti with Signature Development Group. We're a Bay Area-based private family-owned development organization; been building around the Bay Area for twenty years, and we take pride in building the right project for the community we're building in.

So a picture of the project we did in Oakland called The Hive with kind of a derelict district that was defunct and we brought it alive with a mixture of residential and retail, building hotels and office space around there and -- and we build from Novato to -- to San Jose, San Francisco to Oakland.

And the consistent theme there is not that it's a specific type of project, but it's hopefully the right product for the community in terms of scale and scope, architecture and the theme being connectivity.

Because we want residents to be connected to these neighborhoods that we're building, be they brown field or green field or something in between.

So we're excited to be here. We've been partnering with Facebook for about eighteen months now.

We're trying to envision what this project could be.

As you know, Facebook's been in the community for about seven or eight years now. I don't need to go into too much detail. They've been very generous with their time and public dollars and a number of topics here, economic opportunity, housing, mobility, community, sustainability and hopefully this project can carry forward some of those goals.

A little bit of background. This concept has been before you a couple of times. Initially Facebook brought forth the concept in 2017 to help try and envision what -- what could -- what could happen in this area, and there were a number of community workshops.

We met with hundreds of people during that timeframe and trying to get ideas from folks.

This wasn't a talking tour. It was really a listening tour to -- to Belle Haven and to the neighborhood surrounding it and broader Menlo Park.

What would you like to see here? What's important to you? What are some of the good things? What are some of the bad things? And how can we make this better?

From that process, a number of issues came forth that were things that the community had said hey, can you help solve some of these problems and/or can you

provide opportunities or amenities? Things like retail amenities, grocery store, pharmacy, things like parks and open space, bike trails, traffic solutions and general connectivity were very important.

Educational opportunities, housing and housing affordability came about. Mobility in a variety of ways, like I said, bike and pedestrian, public transportation, vehicular access.

And so we took all of those ideas and meshed them with some of the conditions at the site to help create something that we could build forth from there.

As staff indicated, the site is about plus/minus sixty acres. It's filled with a number of old buildings, about -- about a million square feet with capacity for about 3,500 folks working there.

The existing site conditions are ones that were built from yesteryear. Not what I would call resilient, not what I would call sustainable and it's not what I would call connected.

So there's a whole lot of folks working there that aren't going to be able to provide the broader benefit we think a future project can deliver to the -- to the neighborhood.

So from all of the workshops that we had with the community and stakeholder organizations, we started

to come up with some really broad brush Stokes, just kind of a back-of-the-napkin kind of first blush, and basically what it shows is that the project wanted to have ample public parks.

We thought moving them together we'd be able to create some parks and open space with better visibility and better use and wanted to have a lot of connectivity, both to the other Facebook campuses, but also to the community as large.

And it didn't want to be sequestered. It wanted to be an open community.

So the dotted lines in there kind of represent places where a campus and a community could kind of come together.

And so we've got office to, you know -- as I'm looking at it to the right in and residential to the left, but also ways for those to kind of blend together.

So this is the start of it and I'm going to introduce Eron Ashley from our land planner and Howard Layton to help explain how involved and I'll come back.

MR. ASHLEY: Thanks, Mike.

Good evening. My name is Eron Ashley. I'm a partner in Hart Howerton. We're planners, architects, interior designers based in San Francisco and New York and we tend to get involved in either exceedingly large

or exceedingly complex projects where the real focus is --

CHAIRPERSON BARNES: I'm sorry. Can you move the mic?

MR. ASHLEY: Sure. We tend to work in situations where the experience of living there working there, visiting there is, you know, of the utmost importance.

And so it's been really kind of fun for us to get to know Facebook, get to know the community, especially Belle Haven community, but Menlo Park as a whole and to understand how a project of this sort can really make more of a site.

Today it's really a cul-de-sac full of outdated offices.

The program forward Willow Village is very much what it was a year ago or two years ago when you first saw it. It's a mix of office, residential, retail and a hotel.

I think what's different here is we -- we've spent a lot of time listening onsite, and if you've ever sat at a light at Hamilton waiting for it to turn, all the Facebook bikes and all the people walking across Willow, you can really understand what connectivity means in this part of Menlo Park.

And so a lot of what we've been doing is how do you create a place that better interfaces with the community.

And so my pointer doesn't really work here, but one big change is to take the grocery store and some of the other communities, the retail, the hotel, and make them more a part of Willow Road in a way that makes it more accessible for Belle Haven, more accessible to the larger community.

Same for our open space. I think in a previous version, you might have seen open space winding itself through the community, and in this place -- in this case, we really thought about -- well, we're not sure what this open space wants to be yet, but let's consolidate it in a way that's very accessible to the community.

A big theme of Facebook as a place to work, it's connectivity. It's amazing to me that someone has a business that people will be inclined to get on a bike, to walk to meet one face-to-face as opposed to calling them on the phone or e-mail them, and yet that's such a significant part of the culture there.

And so we wanted to really embrace that in a way that made it easier to be a Facebook employee, but not in such a way that it would bother the community.

I think there's a blatant desire in this part

of Menlo Park to connect to things that certainly were from the bay, by the highway. So how do we connect better to the Bay Trail. How do we connect better to each other?

And so some of the key themes are what is this big red line that flashes through the plan? So this is a theme or -- or a -- it's principally a road, but a road dedicated more to people and bikes than it is to cars.

Thus creating a seam between the office campus, which tends to be on the right side, and mixed use of the plan which tends to be on the left side, and that theme connects to -- it's shown with that yellow circle which would be a grade separated crossing over the rail corridor that will start to link people from belle Haven and this Willow Village site to the bay.

We think that's just a huge opportunity that is seamless connectivity.

We're at a site today that's got one way in, one way out. Well, two if you're a UPS driver, I guess.

This needs to have as many ways in and ways out as it can. So we've created five meaningful connections for people, for bikes, for vehicles that capitalizes on the redundancy.

You know, mixed use place to work because people are coming and going at different times, and

connectivity means different things to different people.

So principally this is a place to walk. In green, there are all -- all the green lines are the pedestrian paths, and if you think about how few pedestrian paths exist on the site today, what a significant increase this is.

Dashed red lines are streets designed so that bikes have the right-of-way. Solid red lines are where bikes have a dedicated space to go from point A to point B.

The idea you could ride safely free of cars through that site and connect to the bay.

Obviously bikes are a big part of working at Facebook, and so in kind of solid areas are these bike parking lots and at the front door to every building.

The really -- the entire project team at Facebook loved the idea that this office campus functions like it's in a real town.

You walk out the front door, you use the real street to get places, and it's not all behind gates and walls.

On the two, on the east side of the property, there's two large parking structures for 3,000 cars total, but on the bottom portion is for the buses.

Obviously you're familiar with the Facebook

buses. The idea is that those buses are coming in and leaving in an efficient way, and we're designing for them, and this continues to allow Facebook to rely heavily on transit and not every -- every employee has a car.

At the heart of the project, we're calling it a town square, and it really is. It's a - it's a hub of activity and this gathering place where a grocery store, a pharmacy, restaurant, shopping all come together with the hotel and the front door of the office complex.

So if I'm a visitor to Facebook, I come to this very civic place. If I'm a neighbor who lives across the street and I want to come to this civic place, and it really is a -- you know, great public space at the heart of the project.

So here is the plan. On the left-hand side is Willow. You can see Hamilton Avenue labeled just below that. Above that would be the Chevron just above that, the Jack-in-the-Box.

And so this square which has a hotel on the top side of it, which is numbers 4 and 6, the office campus to the right, numbers 9, a grocery store number 2 and a pharmacy number 3 really is, you know, in a specific place.

You know, we don't much have as many of the

squares in the West Coast, but certainly if you spend any time on the East Coast, these squares are a great place to come together.

The yellow is meant to be kind of a plaza street. So the idea is that this whole place could be taken over for farmer's markets and festivals and really feel like the pedestrians have the right-of-way.

So if you were coming in from Willow Road, here's the grocery store on the right, here's the pharmacy in the distance as you come into the town square.

It's important for us as you arrive to this place, it felt like a real place. It didn't feel like an office campus masquerading as a place.

So the office campus is set back and really kind of community life is at the forefront.

I mentioned this bright red line which we call Main Street. It's between the office campus, which is on the right, and the residential mixed use area on the left. In the distance is the hotel or town square.

The idea is that the office campus would have retail and other active uses kind of laminated on the front of it.

So it behaves like it's a real active participant in the streetscape, in the public realm even

though it does have certain security requirements that it's going to maintain.

And so you've got this kind of great street-scape with this dedicated bike lane, all the stormwater treatment, the street and -- and very few cars.

I think one of the things we're trying to do is put cars that come here to work and shop into garages. And so the public realm becomes a place for people and bikes.

Inside the office campus, kind of borrowing on a lot of the things that have worked really well in the classic old Sun Microsystems campus on the other side of the highway, a place that within that kind of secure office environment that people can come together and socialize, a place that feels very California.

You know, buildings that are four and five stories, but also have lots of outdoor space. You know, the kind of place that can only be here in Menlo Park.

A big piece of what we're excited about is a big public park. I'm showing it here with no lines. And so it's four acres. That's the school on the right there. There's soccer fields behind. That's Willow Road in the foreground.

There's a modest parking lot, and I think we see a lot of value in that open space. We're really

looking to the community to help us figure out what that means.

We don't have the monopoly on good ideas on what should be built here, and a big point of public engagement over the coming months is to understand this.

So here we -- we just drew the lines. This was a college soccer field. So you can put two youth soccer fields across here or two baseball fields, how big it is.

So, you know, here's the campus that we're looking for the community to really share with us. We'd love to hear from you tonight, and then here's the detail of what we're attempting to do.

So with that, I'll turn it back to Mike.

MR. GHIELMETTI: So you heard from staff tonight. This is a Scoping Session. It is a Study Session. We're not here to answer. We're hear to share our initial thoughts about the project, talk to you about some of our goals and listen.

And then along with our -- the City's EIR consultants, study a number of alternatives and variants that meet with community desires.

We do start off with a number of -- of really important goals here, especially in this day and age around sustainability. The LEED goals, all electric, recycled water, no new emissions for gases, et cetera.

And so we've -- we set the bar pretty high compared to -- to the community development standards in the Bay Area, which are quite high, and we'll be studying these throughout the process.

Some other things I just wanted to touch on have to do with phasing. So what we're trying to do here -- and again, we'd love to take input from the community and you and continue to get input on the entire process, but we had to start somewhere. We had to put pen to paper.

We've got a three-phase project as shown here and what we've tried to do is combine elements of different aspects of this.

So, for instance, major community benefits and amenities up-front along with a certain amount of housing, both affordable and market rate and a certain amount of office.

Now, we recognize that these lines are going to move through the process again as we get input from everybody.

The blue area was shown as -- as our initial thoughts on phase one. What we've got are the parks as they may manifest themselves over time.

We have four building -- residential buildings here and a certain amount of office space with a certain

amount of parking and the transit hub.

We -- we do intend to exceed the minimum requirements for affordable housing. How that comes out again depends on community input. Your input to the Council, et cetera, all the various stakeholders, but we do intend to receive those standards. They elected you to go through to go through the environmental and feasibility standards.

The green phase here shown in phase two, again more of the housing and pharmacy, the town square, which is kind of scaled like the Sonoma town square, some office and the balance of the transit hub and parking.

The yellow area that's shown here is phase three which includes the bounds of the office space, the grocery store, the hotel, the visitor center and more residential.

We've already heard from folks in the community about wanting to accelerate the grocery store. So we've already started to look at that. Ways to do that either to accelerate the grocery store or put in some other grocery type use.

We certainly want the grocery store to be successful, as well, and so we're -- we're looking at that.

Part of this plan, too, is looking at, you

know, incorporating senior housing, you know, messing around with the phasing over time.

So this is not something that is, you know, a finished product. This is very early in the process and that's why we're here to get all of your input.

A little bit about the schedule. So in February of this year, we basically re-engaged -- as I said, Facebook had started with the concept plan in 2017 and through parts of '18 and they brought us on board in early '18 to help take that concept forward.

We -- we submitted a revised plan to the City in February and have continued to have open houses, you know, and a number of, as it said, one-on-one or large or small-sized group presentations around the City.

We tried to emphasize Belle Haven because it's the neighborhood most proximate.

In May, we had our Council Study Session. The EIR contract was approved in August, and the NOP, Notice of Preparation was posted in September and we're here before you now.

But we have, you know, a while ahead of us. We're -- we are -- we know there are issues out there. We've heard a lot about the traffic and congestion.

We think we have some solutions that can help that, but we know there are issues and we know we have to

be a part of those solutions.

So with that, we're available for any questions you may have and thank you for your time.

CHAIRPERSON BARNES: Thank you very much.

And at this time clarifying questions only if we have some. Your light's on, Commissioner Riggs.

COMMISSIONER RIGGS: So you're taking questions that would be for the study just or just EIR at this point?

CHAIRPERSON BARNES: You know, the fact is that it might be better to hold the project in general because we're going to do the project last, the EIR before that.

We're going to hear from the consultant prior to that. So if it's clarifying, feel free to ask it.

COMMISSIONER RIGGS: I'm happy to hold it.

CHAIRPERSON BARNES: Great. Thank you.

Commissioner Doran.

COMMISSIONER DORAN: Yeah. I'd just like to know on the residential units whether the intention is for those to be earmarked for Facebook employees or are they going to be available for rent, selling condos? What's the use of this?

MR. GHIELMETTI: Thank you for the question.

At this point, again, I think we're open to

listening. I think there are referred folks in the community talking about, you know, pros and cons either way, but they probably at this point are looking to be public.

Again, some folks have talked about a certain amount that maybe cuts down on traffic if some of are more geared towards Facebook employees, but I think they're -- they're up for grabs in terms of input from you and the community.

COMMISSIONER DORAN: Thank you.

CHAIRPERSON BARNES: Great. Seeing no other questions, we will progress to the EIR consultant.

MS. CHAPMAN: Good evening, Commissioners and members of the public. Thank you for coming to the Scoping Session for the Willow Village Master Plan Project EIR.

My name is Kirsten Chapman and I work for the environmental consulting firm ICF. We will be pre -- preparing the environmental review component for the project.

I'm a project manager. I -- with us tonight we have Erin Efner who's the project director from ICF and then we also Gary Black from Hexagon and they will be preparing the transportation component of the EIR.

So should you have any questions after the

presentation regarding the environmental review process, we can respond to them accordingly.

Let me move to what is shown here. So we'll cover the building process and the environmental review process. We won't get into a project overview because that is the job of the project applicant.

Just a quick introduction to our CEQA project team or California Environmental Quality Act project team.

We have the City of Menlo Park as the lead agency, meaning that they have the principal responsibility for carrying out the project.

ICF will be the lead EIR consultant and we will prepare all sections of the EIR with assistance from Hexagon for the transportation analysis.

We will also have Keyser Marston & Associates on our team and they will be preparing the housing needs assessment which we will then incorporate into the population and housing section of the EIR.

And then also Bay Area Economics will prepare the fiscal impact analysis which part of that will be incorporated into the public services section, but it will also be an interim document separate from the EIR.

So since the project involves discretionary actions by the City, it is subject to the California

Environmental Quality Act or CEQA, and according to CEQA, because this project may have significant effects on the environment, an EIR is being prepared.

The EIR is a tool for identifying physical impacts to the environment by analyzing the community conducted by our EIR team.

The EIR is also used to inform the public and decision-makers about a project and its potential variance prior to project approval, recommend ways to reduce impacts and also consider feasible alternatives to lessen the item by physical.

So what's shown here, the EIR will cover most of the environmental top -- topics required by CEQA. The EIR analysis will cover topics such as asthetics, air quality, transportation, noise.

Since the project site is going to be developed in an urbanized area of the City, we will not be doing a full analysis of agricultural or rural resources. They do not exist on the project site.

But each of these projects have several sub-issues associated with them. There's one purpose of this meeting tonight is to understand what the Planning Commission and the public think about specific issues under topics such as hydrology, for example.

So this slide shows the general step involved

in the CEQA process for the project. As most of you know, the NOP was released on October 18th and the NOP comment period will end on October 18th.

Following close of the scoping period, we will begin preparing the EIR. When the Draft EIR is released for public review, a Public Hearing will be held to solicit comments on the adequacy of the Draft EIR.

A Final EIR will then be prepared and will address all the comments received during the Draft EIR review period and make any required changes that are necessary to the Draft EIR.

And then the third hearing for the Final EIR will be held before the Planning Commission and City Council.

After the EIR is certified, the project can then be approved, and following approval of the project, Notice of Determination will be issued.

So the purpose of tonight's scoping phase is to guarantee public input, early investigation of possible mitigation measures to reduce the impact and also to consider possible project alternative.

I want you to know that the attempt of the scoping period is not focused on the project itself or its merits, but instead the comments should be focused on the environmental impact of the project.

The next step includes collecting data on existing conditions from which we will evaluate the impacts of the project. We will also begin a preliminary review of the project for potential effects, and as we prepare the EIR, we will consider all public comments received during the scoping period either tonight, received orally or via comment letter.

You can submit comments on the scope of the EIR to Kyle Perata, Principal Planner with the City. You can also speak tonight and we will note your comments and consider them during the preparation of the Draft EIR. As shown here, the comments must be received by October 18th.

So thank you again for coming tonight and we look forward to receiving your comments.

CHAIRPERSON BARNES: Thank you.

Commissioner questions as it relates to the EIR?

Seeing no Commissioner questions as it relates to the EIR, I will move to open Public Comment on --

MR. PERATA: Through the chair, can I just chime in before you open public comment?

CHAIRPERSON BARNES: Yes.

MR. PERATA: I just want to make one additional staff clarification or update for the project.

In my opening remarks, I didn't mention that we received four items of correspondence since the staff report. Those were provided via e-mail to the Planning Commission throughout the last few days, and hard copies were available, also in the back of the room.

Members of the public who are interested in hearing additional comments that are not in the staff report due to time permitting after publication of it. I just wanted to get that update prior to opening Public Comment.

CHAIRPERSON BARNES: Great. Thank you.

And I will proceed to open Public Comment, and then after that, will be another opportunity for Commissioners to provide comments at that time, as well.

And I have a number of cards. Some of them double up on the EIR portion of this meeting and on the project portion of tonight's meeting.

I'm going to start with a Ms. Patti Fry going first followed by Pamela Jones.

Good evening. Good evening. Please state your name, jurisdiction.

MS. FRY: Patti Fry, Menlo Park. I wanted to make -- make some suggestions regarding the EIR evaluation. One is that since this is the largest project Menlo Park has had it is planned to occur in

phases, that the EIR evaluate each phase separately so that the mitigations for impacts for each phase could be implemented since the implementation of the entire project may take time.

We would not like to see these mitigation measures end up being at the very end of the project, but rather as they occur.

So that's one suggestion.

Another is as an alternate that the reduced intensity alternate be focused on less office as opposed to less retail or housing.

Those two uses are uses that are very important to the community, and office I know is very important to Facebook, but if there were a less intense project, it should be solely less office, in my opinion.

In terms of metrics, we often see EIRs based on ABAG projections. Since Menlo Park just went through a ConnectMenlo General Plan update process, I suggest that that be used for the growth assumptions that comparisons are made regarding population, jobs and housing, et cetera rather than ABAG.

And in terms of transportation and traffic, I know that CEQA likes to look at VMT, vehicle miles traveled solely, but our town, especially in that part of it, is congested incredibly, gridlocked a lot of the

time.

I would suggest that some of our traditional tools also be used also to help inform decisions, and that will be things like local level of service at intersections and roadway segments.

The jobs/housing imbalance in Menlo Park and our region is very, very acute and causing a lot of the problems with traffic and displacement of very important people to our community, so I urge the -- that be looked at in terms of its impact and ways to help our overall community do better at that.

So I thank you.

CHAIRPERSON BARNES: Thank you very much.

Followed by Patti Fry who is in turn -- excuse me. That was Patti Fry. Excuse me. Pamela Jones followed by Ms. Crystal Leach.

MS. JONES: Good evening.

A couple things for this aspect that I would like to see included in the NOP. One is notification. I'd like to see us use the TIERS public engagement process.

The local newspaper, there is none, so for people to find out about the sequencing here is going to be virtually possible. My letter includes some detail.

High level Dumbarton corridor project,

including the train stop, must be a part of this Environmental Impact Report along with a list of any projects that are somewhere in the pipeline, one almost to be completed with the -- with comment on specific discussion items, mixed of land use and Master Plan development.

I think it's critical that all of the team review the CCI meeting -- the City Council meeting, CCI and community role and input to better understand the sentiments of the residents at this time when it comes to development.

I know it can't be a part of the EIR, but it helps to have everything framed.

I also -- under the land use, I would like to see the bar significantly reduced for office and an increase in housing, significance in housing.

The reality is we have an additional 6,000 employees over in that area which means there will be 9,000.

Currently there's about 18,000 -- somewhere between 16 and 18,000 Facebook employees and we've only built 738 units.

So we would further exacerbate the jobs/housing imbalance if we move forward with this configuration. So I would like for the NOP to consider those two areas.

I do want to see increase in BMR, for sale housing and for sale condos. We know that communities are stronger when people buy their property.

All residential and commercial areas should be completed prior to any office regardless of what the configuration is.

On the proposed circulation, the traffic studies must include cross traffic between University Avenue, O'Brien avenue and Willow Road in addition to the usual cut-through traffic, and I would also like for them to look at having a direct access from where the office buildings would be to Bayfront so there would be no need for any of the office people during Monday through Friday to have to access Willow Road or University Avenue for that matter.

In the rest of the impact from Pacific from Bohannon building, hotel, shuttles, private vehicles.

CHAIRPERSON BARNES: Thirty seconds.

MS. JONES: Uber, Lyft and limousine. Air quality, we must do local air quality monitoring. The closest monitor in Redwood City. That definitely doesn't address the area where this impact is.

Thank you.

CHAIRPERSON BARNES: Thank you.

Crystal Leach followed by Mr. Matthew Zito.

MS. LEACH: Good evening. My name is Crystal Leach and I am the superintendent at Sequoia Union High School District.

The district does not oppose development within the district boundaries and appreciates the importance of housing.

Rather, the district is solely concerned with ensuring the safety of district families and staff and the viability of the district's educational program.

The district is concerned that the project as presented will have a vast number of significant impacts on the district, including impacts related to transportation, traffic, circulation, safety, noise, population and student housing.

Are we counting the underclass? Often our middle class, especially in the Bay Area, is now our underclass, and realistically we have families living in studios and in one bedroom housing.

So I ask: Why are we excited to build communities without children? Thank you.

CHAIRPERSON BARNES: Thank you.

Matthew Zito followed but Luis Guzman.

MR. ZITO: Good evening, Commissioners. Thanks for the opportunity to speak. I'm Matthew Zito. I'm the chief facility officer for the Sequoia Union High

School District and the Pueblo Village sits squarely within and near this project.

Menlo-Atherton currently has 2,500 students and is the largest high school in the county, and the scope and content of the EIR as it's being scoped out.

So this project has potential to have profound and lasting impacts on the district, its facilities, our students and staff, and Menlo-Atherton in particular is the high school, the public high school for the entire City of Menlo Park. There are 1,200 students from Menlo at M-A currently.

And it has this impact particularly on this entire project as proposed. You have recently been proposed or approved in the Bayfront area of Menlo Park as well as some of the condominium development, Stanford development on El Camino Real.

So the district hopes to work with the City and the developer to ensure that these impacts are fully and adequately mitigated.

As I mentioned, the district operates two schools within the attendance area, Menlo-Atherton, which is a traditional public high school, plus the two miles from the project site, and we also have a new small high school that's essentially, Bohannon Industrial Park, but it's in the former M-2 area at Jefferson near Chrysler.

So just opened this year. Has a capacity for 400 students, and it costs 56 million dollars.

Imagine the cost of development in the Bay Area, it's astronomical and the cost of school development is particularly challenging for us.

So we bought two acres for 9.6 million dollars. Two acres which are probably now worth eighteen million dollars. To secure land and build facilities is staggering.

We are also a mile and a half from the proposed project and we have many, many students that are in East Palo Alto, and in that area, I know it's not really east, but the El Camino kind of north and south that is behind this development, and the bus that actually takes many students from East Palo Alto to Menlo-Atherton is Q96 currently has an average speed of 5 miles an hour.

And so the traffic impacts in this area are particularly troubling to us. It does look like a very substantial transit center's being developed is what looks like hundreds of buses in and out, I think an additional 3,000 parking spaces and other ancillary traffic, so we're concerned about our students actually being able to move from their location, particularly in East Palo Alto and actually being able to get safely in time and safely to Menlo-Atherton.

So while the miles might seem quickly, might seem a small distance, it's quite a bit of time to travel..

So we have challenges to what the statutory fees are for all intents a pittance. They cover almost none of the construction costs, maybe five to eight percent of the building facilities.

We're concerned about the traffic caused by the project. This will discourage alternative means of traffic and we really would ask that the EIR analyze the existing and anticipated student movement pattern, bus routes to all these two schools, looking at vehicular movement and potential conflict, and this is a key part.

Potential conflicts with school pedestrian movement with all the additional cars and buses and our most precious commodity are teenagers that are moving to the two schools.

So the safety issue is first and foremost --

CHAIRPERSON BARNES: Time is expired.

MR. ZITO: -- our concern.

We have other issues that we will outline, noise and air quality concerns, but again, mitigation is just key and the ability to have our students actually be able to.

CHAIRPERSON BARNES: I'm sorry. Your time is

expired.

MR. ZITO: Thank you. Appreciate it.

CHAIRPERSON BARNES: Thank you.

With that, I have no other additional cards for the EIR. If anyone -- I do have some more. So for clarification, this is the EIR public comment period. We will be doubling back for another. That relates to the project itself, and -- so I have -- I have two here. They're both for -- these look like EIR.

Is that your understanding for the EIR?

MR. PERATA: Correct. The one should be an EIR comment card. I also another here. So I'm trying to bring them up.

CHAIRPERSON BARNES: Is it your understanding Mr. Bookman is EIR, as well?

MR. PERATA: That one appears to not be EIR. What I might recommend that the chair does is there's a number of comments that are for the project which might be on the Study Session, but it may be possible that people may want to speak now instead of wading through the Commission deliberation.

So I would recommend giving the public opportunity if they have submitted a card more for a Study Session topic, commenting now in respect.

It might be a good idea to give an opportunity

to speak on this item prior to the Study Session. The preference would be continue, separately from the EIR comments for the purposes of the record.

CHAIRPERSON BARNES: I have no problem with that.

So for clarification, what I will be doing is we just finished the EIR Public Comment and we'll move right into Public Comment as it relates to the project itself, and I see Ms. Levin coming forward.

It sounds as though she -- so with that in mind, I'm happy to call Ms. Levin.

MS. LEVIN: I'm --

CHAIRPERSON BARNES: Thank you. I had called prior to that for Mr. Guzman. The gentleman who's waiting in front.

Thank you very much. Sorry for the delay.

MR. GUZMAN: Good evening. Luis Guzman, a East Palo Alto resident. Dear Commissioners, we will benefit from the new village Facebook campus and we are excited about the opportunity to have the access to new retail services and recreational amenities on the east side of 101.

However, East Palo Alto residents will also be highly impacted to the increase of Facebook traffic and parking issues.

Therefore, the revised East Palo Alto city trip must be included in the evaluation as part of the EIR and some of the impact projects, the City of East Palo Alto for safety and traffic mitigation measures.

Residents would like to have as much local amenities as many community parks, because we -- we do not have access to public open space at the present in the East Palo Alto area.

Therefore, we would like to have the O'Brien Park much bigger than the current plan site.

The park shall include the complete re-development of Hetch Hetchy right-of-way to connect to the parks with additional park lands.

We would like the current developer of this project to work with relevant parties such as the City in that SF-PUC to increase park, playgrounds, actual on the Hetch Hetchy sight to secure children, toddlers areas and, football, soccer courts to serve future employees and local residents.

Additional pedestrian parks to connect O'Brien and Willow Village shall also be with other nearby landlords.

For example, utilizing the current drainage channel between 1075 and 1105 O'Brien Drive and the previous connection between the Hamilton Court and 960

and 1350 Hamilton.

In connection with the project and in order to limit traffic, the Willow-O'Brien area should be redeveloped with pedestrian/bicycle traffic in mind.

Such a time was which at the present are mostly non-existent should be constructed, from Capital Way in Menlo Park.

Better lighting shall should be installed and bicycle lanes should be also developed on the O'Brien drive.

Although we are very excited about this new mixed use project with public access needed, nearby residents are looking forward for their developers to improve their areas.

We are also looking forward for the City of Menlo Park and the Planning Commission to encouraging more of such live/work play development in the near future that we will transform the O'Brien Business Park into a more lively community district integrating in the surrounding city neighborhoods.

Thank you.

CHAIRPERSON BARNES: Thank you. Thank you for your patience. Appreciate it.

Next up is Ms. Adina Levin followed by Mr. Colin Bookman.

Good evening.

MS. LEVIN: Good evening. Planning Commissioners. I'm Adina Levin. I serve on Complete Street Commission and was on the Menlo Park General Plan Advisory Committee. I'm speaking for myself. So having served on General Plan Committee, it's exciting to see mixed use proposed moving forward including much needed housing, multiple income levels and needed services.

On the project alternatives for the EIR, because there's a window for opportunity to be studied, the EIR studies a lower office alternative that would rebuild the current office and then use the remaining space for a higher housing alternative with up to 3,000 units for us, for BMR and at the same time office.

The areas seeing tremendous job growth, Facebook is driving displacement of Belle Haven and nearby communities.

These alternatives in the EIR should consider reporting on vehicle miles traveled and the consequences on less office and more housing.

Also the transportation, since there is ongoing study of Dumbarton rail that Facebook is working on, please do include a report of impacts of the vehicle miles traveled when Dumbarton rail is coming forward using that study that is currently in progress.

I know that's a little bit unusual because it's usually only something that is done, but that analysis could be highly relevant.

Let me see. With regard to phasing, phasing has accelerated housing, which is very welcome. I'm glad to hear that the grocery may be accelerated.

In terms of energy, please remove the offset and credit options. That is no longer eligible under the PUC code policy, and this is a big enough development. It should be able to accommodate that without those workarounds.

In terms of the safety of this EIR, pedestrian overcrossing. It seems counterintuitive. A pedestrian overcrossing of arterials.

The latest best practices suggest that that could reduce safety because people will still cross, drivers will expect them less and it might be even less safe, so please do look at the latest and best practices for the safety.

In terms of the housing needs assessment, I'm glad to see that that is being done and we want to see this project and the City as a whole to get total impacts of the housing needs thing invoked by the additional office, and on the housing, please do use the Density Bonus Development Agreement for a higher share of below

market rate housing of twenty-five percent would be a good level, including in a mix of subsidy levels with very low and, you know, a mix of income levels with senior housing also sounds like it would be welcome.

And I think those are the comments that I had had. So thank you very much for your consideration on this important project.

CHAIRPERSON BARNES: Thank you.

Mr. Colin Bookman followed by Mr. John Kadvany.

MR. BOOKMAN: So I'm Colin Bookman.

CHAIRPERSON BARNES: Good evening.

MR. BOOKMAN: Thank you. First off, thank you for your time today.

CHAIRPERSON BARNES: Could you please state your political jurisdiction?

MR. BOOKMAN: I live in East Palo Alto.

CHAIRPERSON BARNES: Thank you.

MR. BOOKMAN: One mile away from this new development.

CHAIRPERSON BARNES: Thank you.

MR. BOOKMAN: My only comment why not build more? Why not build higher? Why not more below market unit rental units?

Doubling or tripling the height of these buildings would afford the greater density, to justify

more public transit, more investment.

As that area builds up, so builds the surrounding areas, and I think by extending the height limits, it would benefit the surrounding communities and would enable a lot of the concerns to be addressed.

You get more BMR, you triple the housing density, all that could be used for housing. You triple that, right, hey, we need more public transit, all of those people are paying tax revenue.

Not all of them are commuting very far. Many of them will be working at Facebook and will benefit the surrounding areas.

That's all.

CHAIRPERSON BARNES: Thank you.

Mr. Kadvany followed by Pat Sausedo.

MR. KADVANY: Good evening, Commissioners. I'm John Kadvany, several decades resident of Menlo -- Menlo Park.

I think this project as it comes forward and assuming it gets past some considerable hurdles, it's going to involve significant negotiation for additional public benefit going well beyond the boundaries of Willow Village that has been presented to us today.

Within the village, the housing looks great. Its environment looks great. We need to say 1,700 units,

but in terms of the environmental numbers, the housing and the office, office increase is probably going to offset each other, especially with transportation changes.

But I think -- I think within the boundaries of the project, Facebook can probably come in with a pretty good -- a pretty good case, but I don't think that's going to be enough.

We're -- it's not like this is an isolated project. Menlo Park is at a significant crossroads like the rest of Silicon Valley in terms of our infras -- infrastructure and our quality of life.

Facebook is proceeding in advance with good ideas to mitigate that with -- such as their Dumbarton Rail and Bridge Study, and if that's successful, that can be a part of our future negotiations, but that's not going to be nearly enough.

We need a whole lot more as indicated by Mr. -- Mr. Zito and by Adina Levin, that we have to think in terms of what's really going to be involved here in terms of public benefit. Then it's going to go well beyond the borders of this project.

So in terms of the EIR, I suggest -- the EIR can't be everything, but it can start looking at what goes beyond.

For example, the discussed transit corridor down the rail line from East Palo Alto to Redwood -- to Redwood City, that would be a big jump.

Facebook may be working with Google and other South -- South Bay tech firms can talk about keeping that going down into the South Bay.

As Mr. Zito said, we're going to have significant impacts on the educational system. Maybe we need to look inside the circle of the campus for an ed -- for an educational facility because land is so expensive.

So to the extent -- and as Adina said, also, let's look at how the housing can be expanded different from the parameters that are given here and maybe even looking at changing the zone -- the zoning in the office area, which doesn't allow any -- any housing at all.

So do that somehow so that the public is ready with the knowledge base to intelligently discuss these issues when they come up in the areas of transit, housing, including affordability and education.

Thank you.

CHAIRPERSON BARNES: Thank you. Good evening.

MS. SAUSEDO: Good evening, Commissioners. I'm Pat Sausedo with BIA Bay Area. BIA Bay Area is very encouraged by the Willow Village project before you this evening.

Willow Village embraces today's urban village concept enabling City residents to work, reside, shop, socialize and generally live a full rewarding life within their local community with minimal dependence on the automobile to fulfill their daily needs.

The village project will enable the City to maintain -- maintain stable economic growth while significantly increasing its housing supply utilizing smart land use and building design standards to minimize environmental impacts.

In response to prior feedback, the applicants have rev -- revised their proposed project to develop at this point over 1,700 residential units and are analyzing single occupancy to family size three-bedroom residential units.

The project's increase for multi-family housing will help balance the proposed office and retail development while reducing vehicle miles traveled by giving employees the opportunity to walk and bike between their homes, their jobs and shopping.

Recognizing the significant issues of housing affordability, over twenty -- over 260 residential units at this point will be committed to affordability standards as determined by the City.

Additionally through the project's town square,

public parks, designated community buildings, it will allow neighbor-to-neighbor socializing and community engagement opportunity that will be fully supported by the project's community benefits infrastructure.

Willow Village's core components embrace smart development. Housing, jobs, retail services all in one location.

BIA believes that this project as it continues through the process has great core components and the applicants want to work with you, work with the community to make it all that it can be.

BIA thanks you for this opportunity to share our thoughts at this point in time and we look forward to continuing the dialogue as this project moves through the processes in the City of Menlo Park.

Thank you again. Good evening.

CHAIRPERSON BARNES: Thank you.

COMMISSIONER RIGGS: Ma'am, could I just ask for those present if you would tell us. BIA stands for what?

MS. SAUSEDO: Building Industry Association for the Bay Area.

COMMISSIONER RIGGS: Thank you.

MS. SAUSEDO: You're welcome.

CHAIRPERSON BARNES: Thank you.

MR. PERATA: Through the chair?

CHAIRPERSON BARNES: Yes, sir.

MR. PERATA: May I just jump in and clarify the process? At the point that we're at, I just had an additional item labeled F1 for this topic area to dias.

It sounds like we're starting to get into comments that were probably identified as G1 Study Session, and so I think it would probably be appropriate for the Planning Commission through the chair to check and see if there's any other items with F1 if the rest are study items, actually close Public Comment, but prior to closing Public Comment on the EIR scoping session, call for any other items or anyone who has submitted a card so far and would like to make their comments or have comments on the EIR content and scope, make those comments now rather than waiting for the Study Session.

CHAIRPERSON BARNES: So I've got maybe five F1 cards.

MR. PERATA: Okay.

CHAIRPERSON BARNES: And the intent is to work through the F1. That's my intent.

So with that, Sergio Ramirez-Herrera followed by Lushorn Lee.

And good evening. Please state your -- you have three minutes. Please state your name, organization

and political jurisdiction.

MR. RAMIREZ-HERRERA: Good evening, Chair and Commissioners. Thank you for allowing me to speak. My name is Sergio Ramirez-Herrera and I am a member of Carpenters Local 217 and a long resident of Menlo Park.

I'm here to speak in favor of the Willow Village project for the benefit it brings to the surrounding community through housing and job creation.

This development will allow my carpenters like me to continue living in Menlo Park, and will provide me with the nec -- necessary benefits and income to provide for myself and my family.

And I am in full support of the Willow Village project. I encourage you to consider the positive benefits of this community center. Responsible development brings to Menlo Park by making certain it is appealing.

All right. Thank you so much.

CHAIRPERSON BARNES: Thank you.

Next is Lushorn Lee followed by Elizabeth Jackson.

Good evening, you have three minutes, please state your name and your organizes.

MS. JACKSON: Good evening. My name is Elizabeth Jackson and I am currently live in East Palo

Alto, but for many years, I lived in eastern Menlo Park, and I feel that these two areas, they're the same community.

So whatever you do, it's going to affect both of them because people who live in both areas share in the community.

So I thank you for having the meeting tonight and I wanted to attend to express my support for your Willow Village and for the affordable housing project, and also the traffic improvements that you plan on working on, and that will certainly benefit both areas.

This Willow Village, I think it will deliver good benefits and it will allow Facebook to continue to remain in Menlo Park and to provide jobs for the surrounding areas.

And I'm a carpenter and we look forward to working with Facebook and the development because we know that they understand skilled labor and quality work and that's what we intend to offer.

And as a carpenter, I -- on this project, I feel that I could help build and improve this project because we're well trained. So I urge you to support Willow Village.

Thank you very much for letting me -- allowing me to make comments.

CHAIRPERSON BARNES: Thank you.

So the last two cards I have for G1 is Jose Contreras followed lastly by James Kendle.

Good evening. You have three minutes.

MR. CONTRERAS: Good evening.

CHAIRPERSON BARNES: Excuse me. Your organization represented, if any?

MR. CONTRERAS: Good evening, Commissioner. My name is Jose Contreras. I'm a resident of Menlo Park, Belle Haven for the past forty years.

CHAIRPERSON BARNES: Would you pull the mic up a little bit?

MR. CONTRERAS: I'm a resident of Menlo Park and Belle Haven for the past forty years. I'm here tonight to support the Willow Village.

Willow Village will bring new retail and housing to the Belle Haven community, but will also create jobs and pay fair wages.

As a carpenter, I look forward to working in the community where I live and close to home and to support my family.

I've lived in Menlo Park for the past forty years. I would encourage you to move the project as far as possible and approve it.

Thank you.

CHAIRPERSON BARNES: Thank you.

And lastly Mr. James Kendall.

MR. KENDALL: Good evening, Chair and Commissioners and staff. My name is James Kendall. I'm a representative from Carpenter's Local 217 for San Mateo County. I'm speaking on behalf of approximately 39,000 carpenter men and women across Northern California, including Menlo Park residents, and some of them are with me here tonight.

We are here in full support of the Willow Village project signature development, and responsible contractors will work on this project. This company has a growing history that respects the workers.

Carpenters will earn a fair wage with medical and retirement benefits that will allow workers a chance to live in the community they work in.

It also means those wages will be invested back into the community as they spend their earnings and tax dollars into the local school and government.

This comes with commitment to apprenticeship programs which guarantee that you will continue to have trained, skilled and experienced workforce and be able to complete high quality projects in a safe and timely manner.

Opportunities not just for jobs on this

project, but a career path for many men and women apprentices, hard hat program for returning veterans.

Community members look forward to more than their income. They're excited to have a chance to revitalize their own community at the same time as increasing the housing stock so badly needed by this region.

The carpenters are in full support of this project to expedite Willow Village the benefits bring to the community as well as housing and union job creation.

Thank you for your time.

CHAIRPERSON BARNES: Thank you.

So with that, having no other cards specific to F1 and G1, seeing no one coming forward, I will close Public Comment.

There's another public for public after this which we will get to later.

And I'm going to bring it back up to the dais, my fellow Commissioners for comments related to the EIR Scoping Session.

Comments at this time. Commissioner Doran.

COMMISSIONER DORAN: Through the Chair, I'd like to ask the people on the EIR about this mention of a toxic site, toxic release site on the building site.

Could you just give us a little bit more

information about what that toxic site is, what the toxins are? If you have any preliminary things to say.

MS. CHAPMAN: No. We actually do not have any information on that at this time. A Phase I environmental site has been prepared by the project applicant, and as part of our environmental review, we will be reviewing that and incorporating that into the EIR.

But at this time it has not been reviewed yet. But it will definitely be.

CHAIRPERSON BARNES: Good. Commissioner Riggs.

COMMISSIONER RIGGS: Yes. Thank you, Chair Barnes.

I have -- I have a few comments to make. First I did want to acknowledge more than half a dozen comments tonight that addressed the EIR.

For the most part, they seem to deal with the potential alternate projects. So our first speaker suggested that there be a project that holds the existing million square feet of office and that the new construction or new square footage consisting of housing and non-commercial retail spaces.

There was also the comment that in review of transportation and traffic, VMT alone ignores local

conditions.

That can be local gridlock. That can be neighborhood lockdowns. That can be diversion of traffic through Wayz to go through neighborhoods.

We'll note the suggestion to add back levels of service for related intersections, and per my comments from several months ago, I would also add that neighborhoods that are adjacent to these arterials that are so impacted but are not listed as -- were not normally listed as candidates for study under LOS, that these should be included also because in fact if traffic does divert.

And then there was the overall comment about the jobs to housing balance. I believe that that refers to in the case of this immediate area, the Facebook campuses, that the last two projects of half a million square feet each actually did not include any housing.

They were entirely negative to the jobs/housing balance, and I would note that it's self-evident what the transportation situation is and we haven't even occupied the buildings that are currently under construction.

The next speaker made a similar suggestion regarding the balance to note they have an alternative noticeably reducing office and boosting housing. With the emphasis on the fact that this proposal will make the

situation worse.

There was a comment from the school district that the EIR should include a study of student traffic, and I realize that VMT would include likely vehicles, but the new school does not have a history and would not have been measured to date, and I don't know that it would come up with full numbers if it were measured here in October or in the next few months compared with 2020 or 2021.

We might want to look ahead to that, including Mr. Zito's comments about pedestrian access.

But I will note in response to an earlier comment that we don't -- Facebook or I should say Signature Development is not proposing pedestrian overcrossing at Willow, but an undercrossing as I understand it, which is much more inviting to people in a hurry than having to climb -- rather than having to climb fifteen feet when there is only ten to cross.

Another comment to reduce office square footage to the existing one million square feet and put the increased development and housing.

There was a comment that to the degree that this conforms to the ConnectMenlo guidelines -- and I'll note since this is looking to a development agreement that doesn't actually necessarily attempt to do so, that

particular effort perhaps outside of the zoning, which would indeed be a public benefit discussion, that a lead item would be activating the rail which already exists and is in occasional use for Caltrain when it opens between Facebook and Redwood City junction.

In other words, the infrastructure is sitting there, and that essential transportation link could indeed be an impact on overall traffic.

And I would have more comment on that later.

And also the suggestion that I assume is for the City Council that potentially ConnectMenlo should be reconsidered in that the OB, office and bonus area does not currently allow housing.

I think that reflects the fact that the RM, the mixed use residential on the other hand does allow office which perhaps was not what everyone anticipated.

And then there was an interesting comment from one of our neighbors outside of Menlo Park that this person looks forward to this project and its potential traffic improvements, resulting improvement in current traffic conditions, and for that, I have a couple of questions for the transportation consultant through the chair.

CHAIRPERSON BARNES: Yes, please.

COMMISSIONER RIGGS: So is that Mr. Black?

MR. BLACK: Yes. Gary Black with Hexagon Transportation Consultants. Good evening.

COMMISSIONER RIGGS: Good evening.

I guess the key question is through the team, you would have an idea at perhaps the proposed additional 750,000 square feet about how many new employees that would indicate or as we have in recent meetings, assuming fifty percent diversion from a single car occupancy, how many additional drivers were likely to be associated with another 750,000 square feet of office?

MR. BLACK: Yes. Unfortunately I'm not prepared to answer that question tonight because that's part of the study that will be done, and it's anticipated that that office would be occupied by Face -- Facebook.

And so we are scoped to engage with a study of Facebook of their existing campus and their existing number of employees and their mode of getting to work versus bus versus drivable car, et cetera and to apply those same numbers to the projected occupancy of the office on this site.

But we haven't done that study yet, so we're not prepared to provide that information tonight.

COMMISSIONER RIGGS: All right. Thank you.

And Kyle, I'll turn to you. For building 21 we knew roughly how many employees resulted from 500,000

square feet, 490 or whatever it was, and again the latest information that I recall is somewhere around fifty percent diversion from single occupancy cars, and I guess perhaps that doesn't exactly count the additional buses and Lyft drivers and so forth.

But just looking at the single car, do we have a rough idea -- well, for example, for the 500,000 square feet, do we know? Was that an additional 4,000 employees, for example?

MR. PERATA: Sure. So I don't have off the top of my head the breakdown for building 21 and 22, but I can tell you the total.

It was approximately 962,000 square feet and the employment was 6,400 to be anticipated employment based on Facebook's utilization of square footage within the offices.

COMMISSIONER RIGGS: All right. So doing a very rough shot at this, we could anticipate, assuming some similarities, another 5,000 vehicles using seventy-five percent of 100,000 square feet for 750 versus 940 or whatever the number was. That can be improved.

MR. PERATA: I'm not prepared to answer how many vehicles here and the building would equate in terms of number of employees per vehicle at the time.

COMMISSIONER RIGGS: That's all right. I'm willing to do that because I have a history of three building approvals.

So if we're talking about -- for the moment, until we get Mr. Black's actual analysis, we're talking an additional 5,000 vehicles for an office portion alone for this project, not counting vehicles associated with close to 2,000 residents, residences.

So maybe 3,000 additional humans of which a percentage will either work in another location or will come as tech workers do to in the future work in a another location or have a spouse that works in another location.

So just for perspective, I wanted to note that this project will not on the surface of it reduce traffic.

So I'll jump ahead and -- and make a couple of suggestions for the EIR alternatives. I think we're reflecting the comments tonight and e-mails to the Planning Commission and I'll confess that I have not in the last six or eight days looked at CCIN for e-mails to the City Council, that an alternative -- one alternative might be to indeed hold the existing office space at the existing one million square feet.

Of course that existing is actually R&D space

and is a lower intensity than full-on office space. But it's a handy target.

And then again I would support adding LOS measurements to the VMT -- I'm sorry. For those who don't speak the lingo, vehicle miles traveled is the latest and most hip way of measuring traffic flow because in theory, it measures how much time -- it's actually mileage, automobile engines are running and therefore how much pollution they're causing.

But it does not serve well to measure how much time a resident is stuck in traffic, including a bus or a fire truck.

Whereas LOS, which is levels of service says at this intersection, that we're going to be stuck there for three traffic lights or from this block to the next block, it will take you seventeen minutes to go one block, and we do that in some situations in Menlo Park.

And then I think the alternative reflects the note that I had made which was that there should be a real residential component.

I think in terms of traffic there should be an alternative project which has no increase in traffic associated with it, at the peak hour and through the day, because many people know, our morning commutes ends at around 11:30 am and our evening commute begins somewhere

around 2:45 or 3:00. I think earlier in that area.

And then maybe just a -- an overall comment that this project which -- I should stop for a moment and say I am impressed with this project.

I like a lot about it. I do have some experience in the last thirty years with town planning, and I think this is something very much to look forward to, including a certain level of curiosity on my part just how well it will work trying to be a center of residential and social activity.

But this is not what is referred to I believe in the project description as an urban area served by transit. It simply is not.

The fact that there are shuttle buses and Lyft drivers available two to three miles away from the train station does not make the area served by transit.

So in and of itself, it lacks transportation, but I believe there are significant transportation opportunities, and as one speaker noted, perhaps one of those should be linked to this project when we move from environmental into scoping.

So those are my comments this evening.

CHAIRPERSON BARNES: Thank you.

A couple questions for our consultants. Before I start, thank you to everyone that made public comment

this evening. I have taken copious notes and there's just a trove of good thoughts here to bring down.

I'll focus on a couple of things. I'd like to ask the consultants for the record as it relates to the ability or inability to spec out future transportation projects, for instance, a regional project like the Dumbarton corridor cross by Transbay Partners.

For the record, does that at all fit into or will become part of your analysis as it relates to traffic flows?

MR. BLACK: It's in our scope of work to study the effects of rail service on the Dumbarton rail -- in the Dumbarton rail corridor.

CHAIRPERSON BARNES: Say more about that. From where to where?

MR. BLACK: From the East Bay to this area and then continuing where the tracks meet up with the existing Caltrain tracks. It -- the exact scope of that has not been identified yet --

CHAIRPERSON BARNES: Mm-hmm.

MR. BLACK: -- but it is going to be part of the study.

CHAIRPERSON BARNES: So there's enough information available to create a scenario where -- so educate me. How does that show up in your scenarios?

Say a little more about that.

MR. BLACK: Well, we need to -- we are still to study a scenario that has that and a scenario that does not have that.

So we need to identify what the scenario with the rail is going to look like. We're not prepared to say right now tonight what that area is going to look like, but we do believe there's enough studies that looked at that corridor that we could identify a likely possibility of a transportation improvement there.

CHAIRPERSON BARNES: And is that only for rail or does it include some of the bus expressway lines, dedicated lines that are contemplated, any improvements in that service transportation?

MR. BLACK: We are scoped to look at only improvements that are reasonably expected to be in place by the year 2040.

I don't know if that answers your question, but if it's just somebody's idea that's not in the Regional Transportation Plan, then that would not be part of this study.

But of course the reason for this hearing is the -- you could add things to the study that aren't already part of the scope.

CHAIRPERSON BARNES: And so to clarify, that's

an in-service date of 2040 which is some time between now and 2040, twentyish years from now.

MR. BLACK: Yes. If the project is in the Regional Transportation Plan.

CHAIRPERSON BARNES: And I would assume that service is in there, and if it's not, certainly to be talked about through samTrans through -- as a component of the Dumbarton corridor, that shows up in there somehow.

MR. BLACK: I'll make a note that the Commission is interested in seeing that studied.

CHAIRPERSON BARNES: It's in the context of a hypothetical, of course. That's what scenarios are for, and being able to in this EIR to understand the interplay between the potentiality for regional solutions for transportation and how it fits into what's being contemplated here in Menlo Park and what it alleviates, what it doesn't, how it impacts. That's what the scenario is for.

So yes, to the extent that it's out there, and whatever vetting process you have for its plausibility, it should be in there.

Do me a favor, because we talk about acronyms a lot. Educate me, if you would, about VMT and LOS and why one is included, why VMT is used and how it relates to

this particular project and what would be the role of for instance in level of service, as well, what your methodology is.

MR. BLACK: Well yes. Right now we're scoped to do both VMT and level of service. VMT is vehicle miles traveled.

As I'm sure you're aware, the California legislature passed a bill a number of years ago that requires that EIRs look at vehicle miles traveled instead of intersection level of service when assessing projects from a transportation standpoint for EIRs.

And that new rule goes into effect in July of 2020, which is before we anticipate that this EIR would be available.

And so we are required to include a discussion of vehicle miles traveled in the EIR and to come to the conclusion whether it -- the project would or would not have significant impact on vehicle miles traveled.

But we do recognize as -- as some people have commented, including the Commission, that that doesn't answer the question about how long is it going to take me to drive down Willow Road, for example, and that gets into level of service and traffic flow and delays on the streets, and it's in our scope to analyze that, as well.

Even though starting in July 2020 that would

not be a -- what we call CEQA impact, but it would be studied in the traffic study.

CHAIRPERSON BARNES: And when you do an EIR study, whether it's this project or something in our Life Sciences District, how are you able to ferret out what is a specific project for what the EIR is done on, what that contribution is to overall traffic flows in terms of the general public being able to understand and contextualize?

You've got -- in any given arterial, you've got X traffic generated by Y locations. Y locations could be disparate throughout the area, could be local.

To what level of granularity are you able to pull out the -- the origination destinations for traffic and be able to get to net new trips, where they're coming from, where we're going, what they impact?

And this gets to the bigger issue of data driven discussions about what's contributing to what, where the circulation is getting held up and by whom and how it is to address that.

So if you could educate a little bit on how that works in terms of what you what work that you do in the EIR.

MR. BLACK: Yes. Well, we look at scenarios that are with and without the project, and so that would

clearly show how the transportation system would change as a result of the project.

In terms of sort of background of the transportation system and who's going where, the tool that we use to do the analysis is the regional travel demand model that accounts for where trips originate and where they're destined for, and we can look at patterns in there and pretty much answer whatever question might come up in the EIR process about -- if you want to know, for example, let's look at the traffic on Bayfront Expressway, where is it coming from and where is it going to? Is it originating in Menlo Park? Is it originating somewhere else and where is it going to?

Those types of questions can be answered with the tools that we intend to implement.

Though this EIR's on a specific project, so it will be focused on what will happen to the system with this project.

CHAIRPERSON BARNES: So the -- the before-mentioned data which is on the Bayfront, we have X amount of cars and where is it coming from, where is it going to? I'm sorry. That data exists, but it's outside the scope of this? Is that what you said?

MR. BLACK: It does exist. That would not normally be a product of this EIR process to report

something like that, but if it's the interest of the community to really dig down and know more about what's happening on Bayfront Expressway, for example, the tools exist to be able to do that.

And perhaps a question that might be related to the project is well, what will happen to Bayfront Expressway?

I can posit a scenario where the traffic would not increase on Bayfront Expressway with this project because the capacity is limited.

And so what would happen is -- is that there would be more traffic from this project or from Menlo Park that would use Bayfront Expressway, thereby displacing perhaps longer distance trips today using Bayfront Expressway.

Maybe this is getting a little too wonky, but we would expect questions like that, could very well come up.

CHAIRPERSON BARNES: Well, it's -- it's not too wonky. We have sat in this chamber over and over again with Planning Commission meetings as a ConnectMenlo process and as projects come through the cycle now is the data that relates to what's happening on our streets, who's going where.

And on the smaller projects, it's very

difficult to get detailed data -- to use a particular project as a conduit to extract more detailed data.

On a project this big, there is no more worthy endeavor for this whole process than to move the discussion from, you know, I was on this street this many years ago and this was my experience with traffic and now I'm on this street now and this is my experience of traffic. Therefore do something.

Move it from the visceral reaction of what we think congestion is to really understand what congestion is. Who's on the roads -- to the extent we can get the data, DODs, all of it. Who's on the roads, what's coming through our town.

For this particular development, and we've heard tonight a number of times this is the largest single development in -- to be proposed in Menlo Park's history.

So there is no better time, opportunity to get some real data on this, and we -- we have been through and are still in the last leg of our Transportation Master Plan which we did without data, as well.

So I personally have been waiting for the right moment where we can get in and dig in and understand to where, from where, when, whose sit, what are the trips, who's adding to the trips, what's the complexion of those

night trips, what's mass transit, what can we do to get there, and certainly to use this project as a lever to better understand and have more data discussions so we're all working off the same information when we extrapolate impacts.

I think it's the most critical piece that we can have information about what's going on.

So with that said, how close can you get us to that?

MR. BLACK: Well, I'm making notes that the Commission is quite interested in that, and I guess the good news is we're getting better tools every day to be able to answer that question about where traffic is coming from and going to, and it is in our scope to study that as part of putting together the tool that we're going to use.

And so we could report out some of the facts from that exercise that I think would be of interest to the Commission.

CHAIRPERSON BARNES: And to the community.

MR. BLACK: Yeah.

CHAIRPERSON BARNES: A community discussion.

And so to that extent, you have, for instance on this project the tentative Facebook, and Facebook runs extensive Transportation Demand Management programs and

shuttles and has data available to it based on its own workforce, where they're going, how they're getting there, what they're doing.

To what extent do you have the ability to tap into them or other sources to get real data from existing patterns?

And is there a firewall between what you do and what for instance data they might have and how is it that what they have in terms of knowledge can -- can be validated and come to use so we can use it, as well?

MR. BLACK: Well, it is our expectation that we're going to get that type of data from Facebook, exactly the questions that you just asked.

There is a concern about -- from -- about privacy for Facebook workers, so we're not going to identify, you know, specific people, but we will identify aggregated data about mode split and place, you know, where people live, basically, working at Facebook, not individual addresses, of course, but perhaps zip code data would be available or at least by City. That will definitely be available, and mode split will be available, I'm told.

CHAIRPERSON BARNES: Incredibly important, the ability to understand what's happening in our town as it relates to traffic patterns.

MR. BLACK: I'll also say that that would be information that we would know for Facebook, but you probably also would like to know what about traffic that's not Facebook that's out there, and --

CHAIRPERSON BARNES: Well, as part of it, that's contextualizing the whole flow. You have it in X, Y and Z. However granular that gets, obviously better.

MR. BLACK: That's the type of data that I said we're fortunate that more data's becoming available every day that we can tap in to where there are companies that are keeping track of where people are coming from and going to.

CHAIRPERSON BARNES: Thank you.

I wanted to bring up two other points. One of them is the ability to -- the ability to look at the project over multiple phases, and you're going to do an EIR and it's going to assume a completed project and we're looking at Phase I, Phase II, Phase III.

What's your flexibility to do that and how would that look and is it something you've done before?

MR. BLACK: Yes. We can certainly look at the project in whatever phases it's presented. I believe we heard tonight that there would be three phases, and so we can do the analysis on three phases.

One of the comments was that we wanted -- we

don't want to wait until the very end to get our improvements that -- that would go along with the project.

And so that part of that phasing would be to identify which improvements, transportation and otherwise, would occur with each phase.

CHAIRPERSON BARNES: I think it's helpful because it helps to add clarity to impacts, and so I -- I would propose that, as well.

And then the question of using -- as it relates to statistics, using Menlo Park statistics versus ABAG statistics and the Menlo Park statistics is done with the ConnectMenlo process, and I remember -- I can see in my head the staff line of jobs, population, employment, all of that.

Tell me a little bit about what's used for what and respond to that question.

MR. BLACK: Well, it's in our scope of work to use the ConnectMenlo dataset for Menlo Park that we would obtain from the City.

For the context outside of Menlo Park, we would use the ABAG 2040 forecasts, but ConnectMenlo inside Menlo Park.

CHAIRPERSON BARNES: Okay. And then if there were to be -- this is a half applicant question about to

get back over to you.

If there was the ability to look at access directly from Bayfront to the project -- and I don't know how it gets scoped out, but would that change materially scenarios that you're running?

MR. BLACK: It could, and the first I've heard of that was just suggested tonight and I wrote it down on my list of things to look at, that -- that direct connection.

That could be looked at in the context of -- of mitigation, in which case it wouldn't really be an additional scenario, but I haven't really thought that through about how that would be -- how that would be analyzed.

CHAIRPERSON BARNES: And of course I don't know what, so let me elevate that as something to be considered and looked at.

So thank you.

Additional Commissioner questions? And I forget who was next. So Commissioner Kennedy.

COMMISSIONER KENNEDY: So I did scribble a lot of notes that I've now confused myself. So, you know, I want to add something that maybe hasn't been said before, and I generally -- you know, I -- I agree with Commissioner Riggs it's a -- that the project is a very

attractive project. It's -- it's very unique in both its size and complexity, its phasing.

I think for me from a visual perspective, it's very important to see an overlay of all the -- all the different campuses, the phases that the tenants can occupy within the communities because it is -- the Belle Haven -- the classic Belle Haven community is bounded on three sides by significant development that is phasing driven, and I don't think that's either a good thing or a bad thing. It's just what it is. It's the amount of zoning of the development.

But I think what's -- what's hard is that there's -- I'm trying to figure out a good -- a visual, but it really is a tsunami coming from this development that just overtakes that community, and whether we phase in community amenities that, you know, have been vetted by the community and the people have asked for it, phasing is eally important.

And so I think frontloading all of the community development in Phase I is -- is incredibly important, but beyond that, any -- any privately owned public space is just that, it is a privately owned public space, and so it comes with a tremendous number of restrictions, and potentially it sends not belonging.

And so if residents say, "Well, a significant

portion of the residents who will be living in Willow Village are Facebook workers," but they're residents who live there, as well, those community amenities are designed in part for them, but it is also designed in part to benefit the classic commuter, which to me seems to be the most important driver in how -- how these phases are programmed.

That being said, the -- the hope of creating more jobs in the Belle Haven community for existing Belle Haven residents, and some of people have lived there, and I think that's really important to have skilled craftsman jobs that are local so you don't have to drive from Modesto, because that's where you can afford to live, as a union carpenter or electrician.

But just thinking more holistically on this project, not just from -- not just from an EIR perspective, but from the planning perspective on how -- what does that overlay look like and who does it impact and how do we make it such that, as my colleagues up here and talked about all the traffic, and that is -- if you're able to count it, if you're able to collect all that data and then analyze it.

But beyond that, people have to live there. They want to live there. They've lived there for decades and there seems to be this ongoing -- this ongoing

situation where we -- things get built and then in hindsight, we'll say, "We'll correct that next time."

That won't happen again, but I have yet to see that as part of the Commission or as parts of the residents of Menlo Park that being corrected, right?

So I think this is an opportunity to watch Belle Haven and for Menlo Park to actually correct the things that have gone wrong and create tools and paths forward that will work beyond the next twenty or thirty or forty years.

I also believe that and feel that regional solutions have to be tied to all of this and how to make that a possibility.

I don't have the answers to that, but my general sense is that this is a -- the project itself is a very -- this is a good project and the question is how -- how is that project implemented in reality as opposed to being really lovely.

I do support this kind of development, but it is it needs to be looked at.

CHAIRPERSON BARNES: Commissioner Riggs.

COMMISSIONER RIGGS: Yeah. Thank you.

This isn't really anything new. I think if anything, I just wanted to take the opportunity to add to what Chair Barnes said regarding -- let me put it this

way: What happens to the traffic after it is only measured as what we used to call LOSF or it wasn't moving and it won't be moving after the new project?

So in context, it was maybe six years ago we had a project on El Camino Real where we were considering reducing -- holding the number of traffic lanes through downtown at two lanes and reducing it north and south of downtown to two lanes, as well, in order to provide better bicycle lanes.

And I asked the question given that that is the main highway connecting the twenty-three cities, if the traffic right now needs the three lanes and it's quite evident when we get to the two lane portion for the four lanes through Menlo Park that that is a bottleneck, where does the traffic go if we enlarge the bottleneck?

And by the way, where is the traffic going right now as a result of the existing bottleneck?

We were told by our transportation consultants -- not Hexagon at the time -- that people would find other routes and everything works out, and so I said well, what other routes would those be that associate with El Camino Real? Well, Alameda de las Pulgas and Middlefield.

Well, but during commute hours, they come to a full stop. Well, then people change their behavior, but

if they were going to 101, they go to 280. Well, but 280 is no longer a clear shot south of Palo Alto or up near San Mateo.

Well, we don't study the freeways, and actually Alameda and Middlefield are outside of our study, so the answer is that everything looks fine on El Camino.

So I have not forgotten that exchange or the fact that this went down just fine with City Council at the time, and they concluded that there would be no impact as a result of fewer lanes, and we had similar discussions when projects of 10,000 square feet or larger on El Camino were built.

So when traffic is diverted to routes outside of our study area, we don't -- have not in the past necessarily responded.

Recent traffic studies I have seen absolutely that Middlefield and Alameda de Las Pulgas are included, but the traffic when it is diverted through, say -- in the last six years roughly through the Willows, no one could say in a traffic impact analysis that traffic is significantly increased on McKendry Drive because there were no previous estimates of traffic on McKendry Drive, and McKendry Drive is a residential street and wasn't meant to take commuter traffic. Therefore, no impacts were identified.

Can we just assure that we won't similarly miss an impact? And -- and I'll note that's why I -- and I don't word things anywhere near as well as Chair Barnes, but that's why I have noted a few months ago and tonight that we need to look at impacts in neighborhoods and the -- within the neighborhood and an increase in access.

Is that all doable and is that in the current scope or can be in the scope?

MR. BLACK: Yes. I -- I already took a note from one of the comments that we don't want to just study intersections.

Typically when we do intersection levels of service, we're looking at intersections, but what you're talking about is traffic that would use -- what I -- I use the term cut-through. It would cut through of residential streets to avoid certain congested intersections for congested arterials.

We have a very extensive area that we're scoped to look at for this project, and it does include many residential streets, but we'll definitely take your comment in -- to heart and be on the lookout for that type of potential impact.

CHAIRPERSON BARNES: Commissioner Tate.

COMMISSIONER TATE: So I'd like to move us just a bit and that is to that housing needs portion, and

I was wondering if it is possible to make sure the study looks at twenty-five percent BMR as well as having some condo units and just really what would be the difference -- the impact I should say in the community with having twenty-five percent BMR or higher and some units that are for sale?

CHAIRPERSON BARNES: And that's to the consultant?

COMMISSIONER TATE: That is to the consultant.

MS. EFNER: Erin Efner for ICF. We can take that to the consultant and talk about adding that analysis to their scope of work.

COMMISSIONER TATE: Thanks.

CHAIRPERSON BARNES: Process question as it relates to the scope of work. And you're bidding it out and understanding how much money it takes to get it done.

How is it that we don't end up with a situation where you don't have enough money -- specific on traffic, that we don't run into a situation where you don't say you have a scope of work and funds allocated to cover some of the -- explicitly what we talked about tonight as it relates to traffic and we don't end up with a situation which -- again, I'll call out the Transportation Master Plan where we said we didn't have the money to go through and go through the type of data

that we think we have the opportunity to do now.

Do you think that the things that we're telling you about now just all included in the scope, how we make sure that there's a budget for this and what you need to ask Council for this and what would it look like?

MR. BLACK: Oh, well, I can answer with the transportation scope that there's -- everything that you mentioned tonight could be reasonably construed by me to be included in our scope.

So I'll stay tuned if -- if something else comes up that seems like it's out of scope and then we would need to communicate with our client that that's out of scope and what do you want to do about it.

CHAIRPERSON BARNES: Great.

MR. BLACK: Yeah.

CHAIRPERSON BARNES: Thank you.

So looking for any more EIR specific questions, comments from my fellow Commissioners, and if I don't have any, then we will move to the Project Proposal Study Session.

Mr. Perata.

MR. PERATA: Sure. So -- so you're looking to closing the EIR Public Hearing?

CHAIRPERSON BARNES: Yeah. I'm looking to you to see if you have any thoughts, and if not, if you're

blank on thoughts, I'll just close it.

MR. PERATA: Yeah. I --

CHAIRPERSON BARNES: If you want to think what you're having for lunch tomorrow, that's fine.

MR. PERATA: I don't know. You may close the public hearing portion now.

CHAIRPERSON BARNES: Right. Thank you.

(This record was concluded at 9:14 PM).

---o0o---

STATE OF CALIFORNIA)
COUNTY OF SAN FRANCISCO)

I, the undersigned, hereby certify that the discussion in the foregoing meeting was taken at the time and place therein stated; that the foregoing is a full, true and complete record of said matter.

I further certify that I am not of counsel or attorney for either or any of the parties in the foregoing meeting and caption named, or in any way interested in the outcome of the cause named in said action.

IN WITNESS WHEREOF I have hereunto set my hand this 12 day of November

MARK I. BRICKMAN CSR 5527

STAFF REPORT

City Council
Meeting Date: **12/16/2019**
Staff Report Number: **19-274-CC**

Regular Business: **Receive an overview of public comments on the notice of preparation and confirm the scope and content of the environmental impact report to be prepared for the proposed Willow Village mixed-use master plan development**

Recommendation

Staff recommends that the City Council review the following related to the environmental impact report (EIR) for the proposed Willow Village mixed-use master plan development (proposed project):

1. Comment letters received by the City during the notice of preparation (NOP) comment period on the scope and content of the EIR (Attachment A;)
2. Transcript from the Planning Commission scoping session (Attachment B) on the proposed project; and
3. The matrix summarizing the comment letters and transcript and providing a brief discussion (Attachment C.)

Staff recommends that the City Council provide any additional input on the scope and content of the EIR, and proceed with the preparation of the draft EIR for the proposed project in compliance with State law.

Policy Issues

Signature Development Group (the applicant) has submitted an application for the proposed project. The Planning Commission and the City Council will be required to consider the merits of the proposed project, including its consistency with the city's general plan and zoning ordinance, along with the municipal code, and other adopted policies and programs of the city such as the below market rate housing program. The proposed project requires an EIR pursuant to the California Environmental Quality Act (CEQA.) The City Council will be the final decision-making body on the certification of the EIR and on the proposed project, including a development agreement.

On August 20, the City Council authorized the contract with ICF International, Inc. (ICF) and its subconsultants to prepare an EIR for the proposed project and to conduct a housing needs assessment (HNA) and a fiscal impact analysis (FIA.) Authorization of the contract did not imply an endorsement of the proposed project by the City Council, rather it allowed the city to move forward with the legally required processing of the application, which includes conducting the environmental review required by CEQA.

When the City Council authorized the contract, it requested that staff bring a summary of the comments received on the scope and content of the EIR to City Council for review and input following the close of the NOP comment period as an additional step given the large scale of this particular project. This agenda item satisfies that request and provides the City Council the opportunity to provide additional feedback and confirm the scope and content of the EIR, and to consider policy issues that may be addressed through the EIR, the HNA, and the FIA or outside of these documents, either in or concurrently with the entitlement process.

Background

Site location

The approximately 59-acre project site is generally located along Willow Road between Hamilton Avenue and Ivy Drive, previously referred to as the ProLogis Menlo Science and Technology Park. The site contains 20 existing buildings, encompassing the following addresses 1350-1390 Willow Road, 925-1098 Hamilton Avenue and 1005-1275 Hamilton Court. Facebook Building 20 is located to the northwest and multifamily and neighborhood commercial uses are to the west, across Willow Road. The property is generally bordered by the San Francisco Public Utilities Commission (SFPUC) Hetch Hetchy right of way and Mid-Peninsula High School to the south, the Dumbarton Corridor to the north, and properties within the Menlo Business Park to the east.

Proposed project

The applicant on behalf of Peninsula Innovation Partners, Inc. is proposing to redevelop the project site through the master plan process, as provided for in the zoning ordinance, by utilizing a conditional development permit and entering into a development agreement with the city. The proposed project would demolish existing on-site buildings and landscaping and construct new buildings within a town square district, a residential/shopping district, and a campus district. Excerpted plan sheets identifying the proposed site plan and layout of the project components are included in Attachment D. The proposed project would result in a net increase of approximately 1 million square feet (sf) of nonresidential uses (office space and non-office commercial/retail,) for a total of approximately 2 million sf of nonresidential uses at the project site. In addition, the proposed project would include multifamily housing units, a hotel, indoor space dedicated for community facilities/uses, park building/improvements and open space.

The EIR would analyze the proposed project along with up to five potential variants on the proposed project. Variants that are currently anticipated to be analyzed include: realignment of Hamilton Avenue and relocation of the existing gas station; a grade-separated crossing over or under the currently inactive Dumbarton Rail Corridor/Willow Road for bicycles, pedestrians and Facebook trams; an on-site emergency municipal water storage tank; and a recycled water system for either public use or on-site use only. In addition, the EIR would analyze two housing variants: an increase in housing units up to a maximum of 2,000 housing units and a decrease in housing units to a minimum of 1,500 housing units. An additional variant could look at additional programming for the proposed publicly accessible park or modifications to the project phasing.

The approximately 22-acre residential/shopping district would be located in the southwestern portion of the project site. The approximately 5-acre town square district would be located in the northwestern portion of the project site. Together, these two districts would include: approximately 1,735 residential units, which would include a minimum of 15 percent affordable/below market-rate units (approximately 261 units;) a maximum of up to approximately 200,000 sf of retail, including a grocery store, pharmacy and restaurants (of which approximately 25,000 sf would be located on the ground floor along the east side of Main Street in the campus district and would be open to the public;) an approximately 175,000-sf hotel with up to approximately 200-250 rooms and food services; an approximately 500-space parking structure intended to accommodate visitors/vendors to the office campus and hotel guests during normal business hours and provide retail overflow parking during evening and weekend time periods; and an approximately 10,000 sf indoor space dedicated to community facilities/uses adjacent to a 4-acre public park. In addition, an approximately 0.7-acre town square and 0.3-acre dog park would be accessible to the public.

The approximately 32-acre campus district, located in the eastern portion of the project site, would include

approximately 1.75 million sf of office uses and employee-serving amenity space, along with two aboveground parking structures with approximately 3,100 parking spaces. Both parking structures would include a ground-level transit hub to support private campus commuter shuttles and trams. Open spaces would include a chain of publicly accessible spaces and gardens along Main Street, a landscaped area off O'Brien Drive, and various secure, interior open spaces for the campus district users.

The proposed project is anticipated to be developed in three phases, outlined in the table below.

Table 1: Proposed phasing schedule

Phase	Office (s.f.)	Retail/non-office commercial (s.f.)	Hotel (s.f.) (200-250 rooms)	Residential dwelling units
Phase 1	600,000 s.f.	10,000 s.f.	-	767 du
Phase 2	630,000 s.f.	40,000 s.f.	-	633 du
Phase 3	520,300 s.f.	150,000 s.f.	140,000 s.f - 175,000 s.f	335 du
Total	1,750,000 s.f.	200,000 s.f.	140,000 s.f - 175,000 s.f.	1,735 du

The project site would generally be developed beginning along the southern portion of the site and moving north with the northwest portion being completed last. The project site would be bisected by the proposed north-south Main Street, which would provide access to all three districts. The project site would include a circulation network for vehicles, bicycles, and pedestrians inclusive of both public rights-of-way and private streets, generally aligned in an east-to-west and a north-to-south grid. The exact amount of dedicated public rights-of-way will be determined through the city review process. Modifications to the total area of dedicated rights-of-way could affect the overall development potential at the project site and the proposed project would be adjusted accordingly.

For a more detailed analysis of the proposed project, including an overview of the project history and analysis of the site plan, land use and zoning compliance, site circulation and project phasing, please see the October 7 Planning Commission staff report in the link in Attachment E. A link to the most recent project plans is included in Attachment F.

Environmental review process

One of the basic purposes of CEQA is to inform decision makers and the public about the potential significant environmental effects of a proposed project. For purposes of CEQA, the environment is the physical conditions within the area which will be affected by a proposed project, including land, air, water, plants and animals, noise and objects of historic or aesthetic significance. An EIR must be prepared whenever it is established that a proposed project may have a significant effect on the environment.

An EIR is an informational document that the City Council must consider and certify as compliant with CEQA before it approves or disapproves the proposed project. The purpose of an EIR is to provide decision makers and the public with detailed information about the effect that the proposed project is likely to have on the environment, list ways in which the significant effects of the proposed project might be minimized and identify alternatives to the proposed project. The main substantive components of an EIR are as follows:

- The project description, which discloses the activity that is proposed for approval;
- Discussion and analysis of significant environmental effects of the proposed project, including cumulative impacts and growth-inducing impacts;

- Discussion of ways to mitigate or avoid the proposed project's significant environmental impacts; and
- Discussion of alternatives to the project as proposed, in order to reduce potentially significant environmental impacts while still meeting the overall project objectives.

The EIR process begins with the city's decision to prepare an EIR. The city determined that an EIR was required for the proposed project and issued a NOP September 18. A link to the NOP is included in Attachment G for reference. A NOP signifies the city's intention to prepare an EIR for the proposed project. The notice is designed to seek guidance from potentially interested parties and members of the public on the scope and content of the EIR.

As part of the city's outreach for the proposed project, the city sent a mailed notice of the release of the NOP and the Planning Commission scoping session public hearing and study session to all addresses within a quarter mile radius of the project site. A public notice was also published in the Daily News prior to the release of the NOP identifying the date of the release of the NOP and the start of the NOP comment period along with the date and time of the Planning Commission meeting for the proposed project. In addition, the city mailed copies of the NOP to a comprehensive list of local agencies (including adjacent cities, special districts and school districts), state agencies and federal agencies, Planning Commissioners and City Council members, and members of the public who requested CEQA notices. A City Council digest item publicizing the release of the NOP and the start of the scoping comment period was also published. The NOP was available for review at City Hall as well as the Main Library and Belle Haven Branch Library.

The release of the NOP began the process for agency and early public consultation, which is referred to as the "scoping" process. The scoping process is designed to enable the city to determine the scope and content of the EIR at an early stage, including identifying possible issues to be studied, topic areas that do not warrant additional study based on specifics of the proposed project (e.g., mineral resources,) and possible alternatives and mitigation measures to be analyzed and considered in the EIR. As part of the scoping process, the Planning Commission held a scoping session for the EIR for the proposed project October 7, 2019. The scoping period was set at 30 days following the release of the NOP, ending October 18, 2019. For a more detailed discussion of the proposed project, the CEQA analysis, the CEQA topics included and those excluded from the EIR, the project variants, and the framework for the alternative analysis, please review the October 7 Planning Commission staff report available through the link in Attachment E.

The scoping session was an opportunity for the Planning Commission and public to provide comments on the scope and content in the EIR. Oral comments received during the scoping session and written comments received during the NOP comment period on the scope and content of the environmental review will be considered while preparing the draft EIR. NOP comments will not be responded to individually in the draft EIR; however, all written comments on the NOP will be included in an appendix of the draft EIR, and a summary of all comments received (both written and oral) on the NOP will be included in the body of the draft EIR.

Staff has prepared a matrix summarizing all of the comments received and providing a brief discussion regarding each comment. This matrix provides a more detailed discussion regarding the comments than the summary of comments typically included in a draft EIR. The matrix helps identify and explain those areas which will be considered in the EIR pursuant to CEQA compared to those areas that are outside the scope of CEQA review (understanding that CEQA is focused on changes to the physical environment and therefore does not cover all issues about which a community member may be concerned) but that may be addressed through other mechanisms (e.g., HNA, FIA, the entitlement process, etc.) The matrix is included in Attachment C and discussed in more detailed in the Analysis section of this report. The comment letters and transcript of the EIR scoping session are included in the links in Attachment A and B.

At the December 16 meeting, the City Council will have an opportunity to review the scoping comments and provide any additional comments on the scope and content of the EIR for the proposed project (e.g., alternatives the City Council would like considered in the CEQA process, or the level of detail at which VMT should be analyzed for an alternative.) Unless directed otherwise, following the meeting the city's environmental consultants will continue the work needed to thoughtfully and thoroughly prepare the draft EIR based on the scope of work in Attachment H. The draft EIR will be prepared and processed in accordance with CEQA statues and guidelines in effect at the time of the release of the NOP. Senate Bill (SB) 743 will modify state guidelines for transportation impact analyses and effects all draft EIRs released after July 1, 2020. Since the draft EIR is anticipated to be released in the fall of 2020, after the effective date of SB 743, the transportation impact analysis will be structured to comply with the requirements of SB 743. A detailed discussion of the transportation impact analysis and SB 743 is included in the Analysis section of the staff report. Where appropriate, the EIR for the proposed project will incorporate by reference analyses, discussions and mitigation measures from the program EIR certified November 29, 2016 by the City Council for the general plan and zoning ordinance update.

Upon release of the draft EIR there will be another opportunity to comment on the analysis before the final EIR is prepared. The final EIR will include responses to the comments provided on the draft EIR during the comment period. The final EIR will also be reviewed by the City Council, which is the final decision-making body regarding the certification of the EIR as compliant with CEQA.

In addition to the EIR process, concurrently, the city's consultants will be working to prepare an HNA and a FIA, The proposed project will also go through an appraisal process regarding community amenities because the project is seeking bonus level development. The City Council will review all of these analyses along with the full record of proceedings prior to taking final action on the proposed project, which requires a development agreement.

Analysis

During the EIR scoping period, the City received 23 total comment letters, 14 from members of the public, three from community organizations/nonprofits (Committee for Green Foothills, Menlo Together, Mid-Peninsula High School,) and six from public agencies (City of East Palo Alto, Governor's Office of Planning and Research, Native American Heritage Commission, San Francisco Public Utilities Commission, Sequoia Unified High School District, West Bay Sanitary District.) In addition to the comment letters, 13 members of the public spoke at the EIR scoping session, some of who also provided written comment letters. Individual Planning Commissioners also provided comments and input on the scope and content of the EIR for consideration in the preparation of the draft EIR.

City staff has reviewed the written comments received and oral comments made by members of the public and the Planning Commission at the EIR scoping session. A comment matrix is included in Attachment C summarizing the comments and providing a brief discussion regarding each comment. The comment matrix is set up to provide the following information:

- Identify the commenter and summarize individual comments from each individual, organization or agency;
- Identify the general topic area;
- Identify the context through which the comment would be considered, for example the EIR, the HNA, the FIA or outside of these documents, either through or concurrently with the entitlement process; and
- Provide a discussion related to the comment and how the comment, if applicable, fits within the EIR, HNA, FIA or other element of the entitlement process. These discussions are intended to be informational to help aid the City Council in understanding why the comments would or would not be

considered in the CEQA process and what other opportunities the City may have to consider these comments during the entitlement process.

The majority of the comments provided during the NOP comment period relate to topics within the EIR, HNA, FIA, and requested land use entitlements (conditional development permit, development agreement, below market rate housing agreement, etc.) Comments focused on transportation impacts (e.g., vehicle miles traveled, Dumbarton rail, traffic congestion, cut-through traffic impacts, cumulative impacts), population and housing (e.g., jobs/housing balance, indirect population growth and displacement), air quality, project design components (e.g., number of below market rate units, reduced office square footage, increase in total number of housing units, on-site and off-site circulation, project phasing,) and potential project alternatives.

Transportation comments

With respect to transportation, some comments identify the desire to limit traffic from the site to current levels. The city's current transportation impact analysis (TIA) guidelines include adopted impact thresholds for level of service (LOS,) which measures motor vehicle delay during peak commute hours. In accordance with state law SB 743, the City will need to update its guidelines to identify an impact threshold for vehicle miles traveled (VMT,) which will be the CEQA metric for transportation impacts for draft EIRs released after July 1, 2020. That threshold represents a policy decision for the City Council and will be applied to all draft EIRs released after July 1, 2020. A City Council study session on the TIA guidelines update is currently planned for January 14, 2020. As stated previously, it is anticipated that the draft EIR for the proposed project would be released after July 1, 2020; as such, the EIR for this project would analyze the impact of transportation in relation to the identified VMT threshold of significance. Discussion on LOS will be provided for informational purposes only (and will be considered in the land use section relative to compliance with general plan goals, policies and programs.) Currently, the thresholds of significance for transportation do not require that mitigation measures reduce transportation impacts to current levels. Thus, comments relative to maintaining existing conditions are a policy consideration for the City Council when considering the proposed project (as well as during the process to adopt a VMT threshold of significance.)

A number of comments on transportation impacts requested that the EIR analyze the potential impacts of the proposed project with and without Dumbarton Rail, including a potential transit station at Willow Road. The EIR scope that the City Council authorized includes an analysis of quantitative cumulative impacts with and without the Dumbarton Rail. Therefore, the cumulative analysis for the transportation section of the EIR will include the potential impacts of the proposed project with and without Dumbarton Rail. The analysis of Dumbarton Rail will be done in the cumulative analysis as it is a reasonably foreseeable project; however, the timeline for delivery of Dumbarton Rail is beyond the timeline for the near term project level analysis. The city also intends to coordinate, as appropriate, with SamTrans as the Lead Agency for the Dumbarton Rail project to ensure consistency between the cumulative analysis for the proposed project and the Dumbarton Rail project. It should be noted, however that the City's transportation consultant Hexagon is currently scoped to conduct a qualitative, not a quantitative, analysis for alternatives with and without Dumbarton Rail as the analysis of alternatives is generally completed at a lesser degree of specificity.

Air quality comments

With regard to air quality, a commenter requested that the analysis include local monitoring stations, specifically in the Belle Haven neighborhood, in addition to the Bay Area Air Quality Management District (BAAQMD) monitoring station in Redwood City. The BAAQMD monitoring station is the best and most reliable source of data and should be utilized in the analysis. However, ICF will evaluate what additional information is available regarding air quality from the County or the applicant (who is in the process of obtaining a quote for additional air quality monitoring in Belle Haven) and include it as appropriate in the

draft EIR.

Project alternatives comments

With regard to project alternatives, City staff will consider the suggested alternatives in the comments when developing the EIR for the proposed project, but cannot identify the specific alternatives at this time. Some suggested alternatives received during the scoping period were an increase in housing units and/or reduction in office square footage, limiting traffic congestion to current conditions, and limiting office to the existing square footage at the site. The CEQA guidelines require the evaluation of a no project alternative plus a range of reasonable alternatives to the proposed project, or to the location of the proposed project, which would feasibly attain most of the basic objectives of the proposed project, but would avoid or substantially lessen any of the significant effects of the proposed project. The EIR will analyze a no project alternative, a reduced intensity alternative and two other feasible alternatives, including potentially an alternative that is proposed during the scoping process. To develop project alternatives, potential impacts must first be identified through the initial analysis within the draft EIR. Once potential impacts are identified through the environmental analysis, City staff will work with ICF to develop alternatives compliant with the requirements of CEQA and will take into consideration alternatives identified through the scoping process. Alternatives will be included in the draft EIR.

Project alternatives are different from project variants. Alternatives are analyzed qualitatively, where the project variants are proposed to be analyzed quantitatively. As stated previously, the project variants that would be studied in the EIR include increased housing, decreased housing, Hamilton Avenue realignment, Willow Road/Dumbarton Corridor grade separated crossing, municipal emergency water storage tank, recycled water, and potentially an additional variant identified through the scoping process (e.g., public park programming, project phasing.) The scope assumes that variants would be quantitatively analyzed in a separate chapter in the EIR at a level of detail that would allow for the variants to be adequately analyzed under CEQA, allowing the project entitlements to potentially include the variants.

Policy level and non-CEQA comments

Some comments identify broader policy issues that are outside the purview of the entitlement review and environmental analysis for the proposed project, such as the jobs/housing balance within Menlo Park. The jobs/housing balance is an economic and social issue, but not a physical environmental issue subject to analysis in the EIR. The jobs/housing balance may impact commute times, the effects of which would be considered in the transportation, air quality and GHG sections of the draft EIR. The HNA will not specifically consider the jobs/housing balance, but will consider the housing need generated by the proposed project and compare that to the available supply of housing. City staff consulted with the city's housing consultant and a study of the jobs/housing balance would be more appropriate on a larger citywide or regional scale. Such an analysis could be completed concurrently during the entitlement process. If the City Council is interested in a broader study of the jobs/housing balance, it may wish to prioritize the study during the development of the City Council's 2020 work plan, which would be outside of the project's environmental and entitlement review. However, the preparation of a jobs/housing balance study could be conducted concurrent with the project's timeline. The jobs housing/balance and any study thereof could be applicable to the City Council's consideration of this proposed project and other proposed development projects in the city. For this project specifically, the applicant is proposing bonus level development, which requires the provision of community amenities, the value and identification of which will be determined through the community amenities appraisal process, which will involve City Council review and approval. As part of the master plan development, the applicant is required to enter into a development agreement with the City, which could include additional applicant commitments in exchange for vested rights. The jobs/housing balance and any study thereof could be used to inform the development agreement negotiations as part of the entitlement review.

Other comments that are not directly related to the CEQA analysis include comments on the project description or design of the proposed project. For instance, a number of comments suggest modifying the phasing to increase housing units in earlier phases and delivering key commercial components such as the grocery store earlier in the project development timeline than currently proposed. These comments can be considered through the entitlement process and changes incorporated into the proposed project at any time during the entitlement review process. Staff would ensure that the environmental review appropriately consider any changes to the project components. In addition, there were a number of comments on the percentage of BMR units provided. The number of BMR units would not affect the environmental analysis in the draft EIR, which is concerned mainly with the number and type of unit, but consideration of the number of affordable units would be evaluated in the HNA and can be considered as part of the entitlement process. Finally, comments either in support or opposition to the proposed project would be considered as part of the overall entitlement review by the Planning Commission and any other responsible city commissions, and the City Council. All comments received can be considered throughout the entitlement process.

Next steps

At its December 10 meeting the City Council is scheduled to create a Willow Village development agreement subcommittee. The draft EIR, HNA, FIA and other information would be used to inform the subcommittee's work on the development agreement for the proposed project. Following the City Council's review and confirmation of the scope of the draft EIR, the consultant team will continue the environmental analysis for the proposed project, including the TIA. As stated previously, the draft EIR is anticipated to be released in the fall of 2020 and staff plans to develop a public engagement and development agreement process schedule to bring to the City Council for review before the release of the draft EIR. Staff believes that a draft schedule can be developed by summer 2020. The draft schedule would outline the public engagement process, the meeting schedule for the entitlement and environmental review, and the milestones for the development agreement negotiation process.

Conclusion

The NOP scoping period closed October 18 and the majority of the comments will be evaluated in either the EIR, HNA, FIA or the project entitlement review. As mentioned above, policy issues about which the community is concerned that do not fall directly within the scope of the environmental review, such as the jobs/housing balance could be considered in the entitlement process and analyzed in more detail through a broader citywide study undertaken by staff outside of the focused review of the proposed project. Staff recommends that the City Council provide any additional input on the scope and content of the EIR, and proceed with the timely preparation of the draft EIR for the proposed project in compliance with State law. Unless directed otherwise by the City Council, the development of the draft EIR is the next step in the review process and will be prepared concurrently with the HNA and FIA and staff's review of the requested land use entitlements.

Impact on City Resources

The applicant is required to pay all planning, building, public works and city attorney fees, based on the city's master fee schedule, to fully cover the cost of staff time spent on the review of the proposed project. The applicant is also required to bear the cost of the environmental review and any associated analysis. For the environmental review and associated analysis, the applicant deposits money with the city and the city pays the consultants.

Environmental Review

A full project level EIR is being prepared for the proposed project. The project-level EIR will, to the extent applicable, utilize the program-level EIR prepared for the general plan and zoning ordinance update.

Public Notice

Public notification was achieved by posting the agenda, with the agenda items being listed, at least 72 hours prior to the meeting. In addition, a Community Development Update email notification about this agenda item was sent December 2 to interested parties that signed up for the city notifications.

Notice of Preparation Comment Letters Summary

Notice of Preparation Comment Letters Summary
Willow Village Master Plan EIR

#	Date	Commenter Name	Commenting Entity	Topics	EIR	HNA	FIA	Other	Summary of NOP Comment	Discussion
1	9/18/2019	Scott Morgan	State of California Governor's Office of Planning and Research State Clearinghouse and Planning Unit	Other	Yes				The State Clearinghouse provided the City with a copy of the letter that was sent to responsible agencies to comment on the Notice of Preparation (NOP) and the distribution list, showing the responsible agencies to which the NOP was sent.	The California Environmental Quality Act (CEQA) requires that the NOP be sent to the State Clearinghouse. The letter confirms that the City has complied with the CEQA requirement. There is no comment in this letter that requires analysis in the Environmental Impact Report (EIR) for the proposed project.
2	9/24/2019	Andrew Green	Native American Heritage Commission (NAHC)	Tribal/Cultural Resources	Yes				NAHC recommends consultation with California Native American Tribes in order to avoid inadvertent discoveries of Native American human remains and to best protect tribal cultural resources.	The City will consult with California Native American tribal organizations prior to the release of the draft EIR. A form describing the proposed project will be sent to the NAHC requesting a list of eligible tribes. The City will send a letter to eligible tribes providing an opportunity for consultation.
				Tribal/Cultural Resources	Yes				The comment letter identifies the requirements to adhere to AB 52, including the procedures that would be followed for AB 52, including notification, consultation, requirements for the environmental document, and the types of mitigation that could be implemented.	The City will follow the requirements of AB 52 relative to notification and consultation with tribal organizations during the CEQA process.
				Tribal/Cultural Resources	Yes				The comment letter identifies the requirements to adhere to SB 18.	In accordance with SB 18, the City will establish meaningful consultation with California Native American tribal governments at the earliest possible point in the EIR process so that places of archaeological, cultural, spiritual, and ceremonial importance can be identified and considered.
				Tribal/Cultural Resources	Yes				The NAHC includes recommendations for cultural resource assessments, including (1) conducting an archeological records search at the appropriate California Historical Information System Center, (2) preparation of a report detailing findings and recommendations of the record search and field survey, (3) contacting the NAHC for a sacred land files search and Native American tribal consultation list, and (4) recommendations for mitigation measures, per existing State Regulations.	The City's environmental consultant (ICF) will contact the NAHC and request a search of its sacred land files. The applicant is having a professional consultant prepare an archeology report that will be peer reviewed by ICF. All of this information will be considered and analyzed in the tribal/cultural resources section of the draft EIR and mitigation measures will be recommended if necessary.
				Utilities and Service Systems	Yes				The SFPUC owns an 80-foot wide parcel in-fee as part of the Hetch Hetchy Regional Water System right-of-way (ROW) along the southern boundary of the project area. SFPUC has provided a map showing the SFPUC ROW and infrastructure. The SFPUC pipelines and property ownership must be described as part of the existing setting in the draft EIR. The EIR should also describe the project's impact on this infrastructure.	The SFPUC pipelines and property ownership will be described in the draft EIR. Any potential impact of the proposed project on existing conditions will be analyzed in the utilities and service systems section of the draft EIR.

Notice of Preparation Comment Letters Summary
Willow Village Master Plan EIR

#	Date	Commenter Name	Commenting Entity	Topics	EIR	HNA	FIA	Other	Summary of NOP Comment	Discussion
3	10/11/2019	Jonathan S. Mendoza	San Francisco Public Utilities Commission (SFPUC)	Utilities and Service Systems	Yes				The project includes a new public roadway ROW (Main Street), which would connect to O'Brien Drive. SFPUC has identified that this new ROW appears to go over the SFPUC ROW property. This new ROW could impact SFPUC facilities. SFPUC has not yet permitted this use and must be reviewed in the SFPUC project review process.	Any potential impact of the proposed project on SFPUC facilities will be analyzed in the utilities and service systems section of the draft EIR. The draft EIR will identify the SFPUC as a responsible agency for permitting.
				Utilities and Service Systems	Yes				The applicant should determine the feasibility of constructing Main Street over the SFPUC pipelines, and adjacent to the SFPUC appurtenances. Describe the disruptions that could occur to the SFPUC Hetch Hetchy Regional Water System during construction and whether critical infrastructure would be impacted or reconfigured. Mitigation should include mitigation to address any impact.	Any potential impact of the proposed project on the SFPUC pipelines will be analyzed in the utilities and service systems section of the draft EIR. Mitigation measures will be recommended if necessary.
				Project Description	Yes				During which phase will Main Street (over the SFPUC ROW) be constructed? If during the first phase, SFPUC recommends starting the project review process immediately.	The draft EIR will identify the phase during which Main Street will be constructed. The draft EIR will identify the SFPUC as a responsible agency for permitting.
				Project Description	Yes				Will temporary access or staging occur on the SFPUC ROW? The EIR should disclose any temporary use of SFPUC property, include mitigation if there is an impact, and any proposed use must be reviewed and authorized by the SFPUC.	The draft EIR will identify the location of temporary access or staging. Mitigation measures will be recommended if necessary.
				Project Description	Yes				The EIR should clarify that the SFPUC must review and approve any proposed improvements, including the proposed street connection, on SFPUC property.	The draft EIR will identify the SFPUC as a responsible agency for permitting.
				Alternatives	Yes				Include an alternative where the street connection (Main Street) over the SFPUC property is not built.	One purpose of the NOP is to identify potential alternatives to the proposed project. Alternatives that would reduce significant impacts of the proposed project are identified during the CEQA process prior to the release of the draft EIR.
				Transportation	Yes				The transportation impact analysis (TIA) should detail the safety of the proposed street connection, over the SFPUC property, including designing the street to ensure visibility of pedestrians and drivers crossing the intersection. The TIA must also include that SFPUC staff will need sufficient space to park vehicles and access SFPUC infrastructure and appurtenances from all sides of the SFPUC ROW near the proposed street connection.	Safety will be considered in the TIA and transportation section of the draft EIR; however, safety is not a threshold of significance. To the extent that the proposed project modifies SFPUC access and parking, it will be considered.
				Project Description	Yes				The Project must be reviewed by the SFPUC 's Project Review Committee.	The draft EIR will identify the SFPUC as a responsible agency for permitting.
				Land Use	Yes				The EIR should include an analysis of the project's consistency with SFPUC adopted plans and policies.	The draft EIR will consider the consistency of the street connection proposed by the project with the SFPUC adopted plans and policies in the land use section.
				Hydrology and Water Quality	Yes				The project must comply with current West Bay Regulations and Standards.	The draft EIR will identify West Bay as a responsible agency for permitting. West Bay's current regulations and standards will be considered in the hydrology and water quality section of the draft EIR.

Notice of Preparation Comment Letters Summary
Willow Village Master Plan EIR

#	Date	Commenter Name	Commenting Entity	Topics	EIR	HNA	FIA	Other	Summary of NOP Comment	Discussion
4	10/14/2019	Jonathan Werness	West Bay Sanitary District (West Bay)	Utilities and Service S	Yes				Project may require improvements to downstream West Bay facilities.	Down stream improvements to West Bay facilities are not identified as part of the proposed project. The draft EIR will analyze and determine if such improvements are necessary.
				Utilities and Service S	Yes				EIR shall address all sewer improvements, including gravity mains, force mains, and pump stations.	The utilities and service systems section of the draft EIR will analyze such improvements.
				Utilities and Service S	Yes				On-site recycled water may not be needed, since the West Bay is in the preliminary stages of a Recycled Water Treatment Facility and distribution system near the project.	Pursuant to the applicant's project description, the office parcel(s) will include looped recycled water systems. Because on-site recycled water is identified in the application materials, it will be analyzed in the utilities and service systems section of the draft EIR. The draft EIR would analyze public recycled water as a variant and the City will coordinate with West Bay during the CEQA process.
				Utilities and Service S	Yes				New sewer mains should be in the ROW if possible, and not in easements.	Pursuant to the project description, public domestic water, storm drain, sewer, recycled water, communications, and PG&E electrical and gas mains will be routed in public roadways and within public utility easements within private streets. The draft EIR will analyze the project as proposed. Any potential impacts related to sewer mains will be considered in the utilities and service systems section of the draft EIR.
				Public Services	Yes				The new residential units will generate hundreds of new students, creating significant impacts on the District, including impacts on the District's already overburdened and overcrowded educational facilities.	The potential for the proposed housing to generate students will be analyzed in the public services section of the draft EIR.
				Transportation	Yes				The District is concerned about traffic impacts from the significant number of vehicles that will be brought to the area.	Potential traffic impacts from the proposed project will be analyzed in the transportation section of the draft EIR.
				Air Quality	Yes				The District is concerned about air quality impacts from the significant number of vehicles that will be brought to the area.	Potential air quality impacts from the proposed project will be analyzed in the air quality section of the draft EIR.
				Transportation	Yes				Describe the existing and the anticipated vehicular traffic and student pedestrian movement patterns to and from school sites, including movement patterns to and from TIDE Academy and Menlo-Atherton High School, and including consideration of bus routes.	The transportation section of the draft EIR will discuss the potential impacts of the proposed project on several intersections adjacent to the TIDE Academy and Menlo-Atherton High School. The City's transportation consultant (Hexagon) will provide a qualitative discussion of project-generated student pedestrian, bicycle, and transit patterns to these schools. However, additional specific consideration of school movement patterns is beyond the scope of analysis relative to the proposed project.
				Transportation	Yes				Assess the impact(s) of increased vehicular movement and volumes caused by the project, including but not limited to potential conflicts with school pedestrian movement, school transportation, and busing activities to and from TIDE Academy and Menlo-Atherton High School.	The transportation section of the draft EIR will discuss the potential impacts of the proposed project on several intersections adjacent to the TIDE Academy and Menlo-Atherton High School.

Notice of Preparation Comment Letters Summary
Willow Village Master Plan EIR

#	Date	Commenter Name	Commenting Entity	Topics	EIR	HNA	FIA	Other	Summary of NOP Comment	Discussion
5	10/18/2019	Mary Streshly	Sequoia Union High School District (District)	Transportation	Yes				Estimate travel demand and trip generation, trip distribution, and trip assignment by including consideration of school sites and home-to-school travel.	The transportation section of the draft EIR will include consideration of home-to-school trip patterns in development of the trip generation, distribution and assignment for project-generated trips.
				Transportation	Yes				Assess cumulative impacts on schools and the community in general resulting from increased vehicular movement and volumes expected from additional development already approved or pending in the City and Bayfront neighborhood. (Cumulative Projects: 777 Hamilton Drive; Facebook Campus Project; Menlo Gateway Project; Facebook Campus Expansion; Menlo Uptown Project; 111 Independence Drive; Sobrato Group acquisition of 5 parcels).	The transportation section of the draft EIR will include a discussion of potential cumulative impacts. Those listed projects that were occupied at the time of the spring 2019 counts will be in the baseline and those that were not occupied will be considered in the cumulative analysis.
				Transportation	Yes				Discuss the direct, indirect, and cumulative impacts on the circulation and traffic patterns in the community as a result of traffic generated by the transportation needs of students to and from the Project and schools throughout the District during and after the Project build-out.	The transportation section of the draft EIR will analyze project-generated school traffic and will include a discussion of potential cumulative impacts. An indirect environmental impact is a change that is not immediately related to the proposed project, but occurs later in time or farther removed in distance. An indirect impact will be considered if it is a reasonably foreseeable physical change to the environment caused by the proposed project and it will be evaluated at a more general level of detail.
				Transportation	Yes				Assess the impacts on the routes and safety of students traveling to school by vehicle, bus, walking, and bicycle/skateboard.	The transportation section of the draft EIR will provide a qualitative discussion of the multimodal facilities between the project site and the nearby schools.
				Transportation	Yes				Assess increased potential for accidents due to gridlock during school drop-off and pick-up hours.	The transportation section of the draft EIR will answer the question of whether there is a substantial increase in hazards due to a design feature or incompatible uses. There is no defined methodology for analyzing the potential for accidents due to gridlock; this is not included in Hexagon's scope. Afternoon school pick-up is outside of the PM peak.
				Public Services	Yes				Assess potentially reduced response time for emergency services and first responder (traveling to school).	The potential for reduced response times will be considered in the public services section of the draft EIR.
				Noise	Yes				Identify any noise sources and volumes, which may affect school facilities, classroom, and outdoor school areas. Include TIDE Academy and Menlo-Atherton High School in the analysis.	The noise analysis in the draft EIR will consider adjacent sensitive users.
				Public Services	Yes				Identify historical, current, and future population projectio	The draft EIR will identify the current student population and analyze the potential increase as a result of the proposed project, including cumulative conditions, in the public services section of the draft EIR.
				Public Services	Yes				Assess the impacts of population growth within the District, on the District's ability to provide its educational program. The commenter identifies that TIDE Academy is expected to exceed its capacity for the 2023-2024 school year and Menlo-Atherton High School struggles with its population size.	The potential increase in student population as a result of the proposed project will be considered in the public services section of the draft EIR. An assessment of the potential impacts of population growth within the District generally is beyond the scope of the EIR for the proposed project.

Notice of Preparation Comment Letters Summary
Willow Village Master Plan EIR

#	Date	Commenter Name	Commenting Entity	Topics	EIR	HNA	FIA	Other	Summary of NOP Comment	Discussion
				Public Services	Yes				Potential overcrowding impacts include: unsafe conditions, decreased quality of education, need for new bus routes.	The potential increase in student population as a result of the proposed project will be considered in the public services section of the draft EIR. Consideration generally of potential impacts of school overcrowding is beyond the scope of the EIR for the proposed project.
				Public Services	Yes				Potential overcrowding impacts include: need for new school construction. Consider AB 48.	The potential increase in student population as a result of the proposed project will be considered in the public services section of the draft EIR. If the proposed project necessitates construction of additional school facilities that will be considered in the draft EIR. However, consideration more broadly of the District's potential need for school construction is beyond the scope of the EIR for the proposed project. AB 48 is relative to school bond funding and does not appear to raise an issue for study in the draft EIR.
				Population and Housing	Yes	Yes			Describe the type and number of anticipated dwelling units resulting directly or indirectly from the project.	The draft EIR and HNA will describe the number and type of dwelling units proposed by the project. The population and housing section of the draft EIR will consider the potential for the proposed project to induce substantial population growth directly or indirectly and the potential for adverse impacts on the physical environment.
				Population and Housing	Yes	Yes			Describe the average square footage for anticipated dwelling units, broken down by type of unit, directly or indirectly resulting from the project.	The draft EIR will describe the number and type of dwelling units proposed by the project. The Housing Needs Assessment (HNA) will consider direct and indirect housing market effects. Consideration of average square footage for anticipated dwelling units, broken down by type of unit for potential indirect growth is too speculative for the HNA and beyond the scope of the environmental analysis in the draft EIR.
				Population and Housing			Yes		Estimate the amount of development fees to be generated by development in accordance with implementation of the project.	This information is outside the scope of the EIR which is focused on the potential physical environmental effects of the proposed project. However, this information will be included in the Fiscal Impact Analysis (FIA) that is prepared for the proposed project.
				Transportation	Yes				The East Palo Alto has identified 23 intersections that they are requesting be included in the TIA. Many of these intersections have been identified to be included in the TIA; however, intersections 8 and 16-23 are not currently in the scope of work.	Hexagon will analyze all of East Palo Alto's requested intersections, with the exception of #8 which is not an intersection that exists (two streets that do not intersect are identified).
				Transportation	Yes				Prior to release of the draft EIR, the City of Menlo Park should identify specific City intersections, grade separations, specify the trip reduction measures, and specify transit capacity enhancements that will be implemented to determine whether the project is effectively addressing its contribution to cumulative traffic volumes and congestion in East Palo Alto.	To the extent that infrastructure improvements or trip reduction measures are necessary to mitigate potentially significant effects of the proposed project, whether in Menlo Park or in East Palo Alto, they will be identified in the draft EIR. Menlo Park will coordinate with East Palo alto if any of the identified mitigations are located in East Palo Alto.

Notice of Preparation Comment Letters Summary
Willow Village Master Plan EIR

#	Date	Commenter Name	Commenting Entity	Topics	EIR	HNA	FIA	Other	Summary of NOP Comment	Discussion
6	10/17/2019	Patrick Heisinger	City of East Palo Alto (East Palo Alto)	Population and Housing	Yes	Yes			Per the Settlement Agreement, a HNA is required. East Palo Alto identifies that the EIR should be consistent with all relevant terms of the Settlement Agreement. East Palo also identifies that the scope of the HNA, to the extent possible, shall include an analysis of the multiplier effect for indirect and induced employment by the development project and its relationship to the regional housing needs market and displacement.	An HNA compliant with the settlement agreement will be prepared for the proposed project. An HNA is not a CEQA requirement. Potential Impacts on population and housing as required by CEQA will be considered in the draft EIR.
				Population and Housing		Yes		Yes	East Palo Alto is concerned about exacerbating the housing crisis from displacement of current residents and/or creating a demand for residential units without sufficient resources to address the need. Include an analysis of how the project will affect the jobs/housing ratio in Menlo Park and include the following analysis: (1) net number of new market rate and affordable units permitted and constructed in the last 10 years in Menlo Park and (2) an analysis of where it is anticipated that the new employees will live, based on zip code level data.	To the extent possible, the HNA will consider displacement as a result of the proposed project. Based on zip code data, the HNA will consider where new employees generated by the proposed project are anticipated to live. The HNA will not specifically consider the jobs housing balance, but will consider the housing need generated by the proposed project and compare that to the available supply of housing (with reference to the number of units generated in Menlo Park per year over the past 10 years). A study of the jobs housing balance would be more appropriate on a larger city-wide or regional scale and could be completed concurrently during the entitlement process.
				Population and Housing	Yes				Identify total population growth from indirect household growth and compare to projected population growth.	The population and housing section of the draft EIR will consider potential for the proposed project to induce substantial population growth indirectly through job growth and the potential for the projected growth to result in impacts on the physical environment.
7	10/8/2019	Phil Gutierrez	Mid-Peninsula High School	Transportation	Yes				Concern about increased traffic on Willow Road.	The transportation section of the draft EIR will consider potential impacts to Willow Road through a microsimulation analysis.
				Transportation	Yes				Identification of potential mitigation: reworking of the intersection of Ivy Drive and Willow Road so that Ivy Drive leads straight into Mid-Peninsula High School's parking lot, with a signal. This would allow drivers to go left, straight, or right as they leave campus, as opposed to the current set-up, where everyone exiting the site has to make a right onto Willow Drive.	Hexagon is not currently scoped to study this proposed configuration as it is not currently identified as part of the proposed project or a project variant. Mitigation measures will be identified after the analysis of potential impacts is completed. If modifications to Ivy Drive and Willow Road are needed, they will be considered.
8	10/18/2019	Helen Wolter	Committee for Green Foothills	Hydrology and Water Quality	Yes				EIR should consider sea level rise sustainability and flood resilience.	Sea level rise will be considered in the hydrology and water quality section of the draft EIR.
				Alternatives	Yes	Yes			EIR should include an alternative that has less office space (1 million sf) and more housing (up to 3,000 units using the density bonus for below market rate units). The comment identifies that this would result in a better balance between jobs and housing, which could help reduce displacement. An analysis of the VMT would be needed for this, since the alternative would include more housing and less office.	One purpose of the NOP is to identify potential alternatives to the proposed project. Alternatives that would reduce significant impacts of the proposed project are identified during the CEQA process prior to the release of the draft EIR. Hexagon is not currently scoped to complete a quantitative VMT analysis for alternatives. The potential for displacement will be considered to the extent possible in the HNA.

Notice of Preparation Comment Letters Summary
Willow Village Master Plan EIR

#	Date	Commenter Name	Commenting Entity	Topics	EIR	HNA	FIA	Other	Summary of NOP Comment	Discussion
9	10/18/2019	Adina Levin	Menlo Together	Project Description	Yes	Yes		Yes	Commenter requests that the EIR include the consequence on housing needs and VMT from providing 20 percent below market rate housing.	The proposed project includes approximately 1,735 residential units of which 15% would be for below market rate (BMR) housing in compliance with the City's BMR ordinance. The draft EIR will describe and consider the potential environmental effect of the project as proposed. Additional BMR housing could be considered by the applicant. For purposes of the draft EIR, analysis of the number and type of dwelling units is critical; the income level of the residents does not change the impact on the environment. The HNA will take into consideration the number of BMR units relative to housing need generated by the proposed project. The percentage of BMR units within the proposed project could be considered through the entitlement process.
				Population and Housing	Yes	Yes			The HNA should include cumulative impacts of the relative amounts of housing and job growth since Facebook initially moved in, including the "fit" between the affordability of housing and the additional jobs.	The draft EIR and the HNA are focused on the potential effects of the proposed project. Existing development will be included in the baseline conditions to which the proposed project will be added to determine its potential environmental effects. The draft EIR will also consider potential cumulative impacts.
				Transportation	Yes				Include in the EIR, the impacts on VMT if/when Dumbarton Rail is in place.	Dumbarton Rail will be considered quantitatively in the cumulative analysis of the transportation section of the draft EIR. The City is currently discussing with Hexagon the appropriate level of detail for analysis with and without Dumbarton Rail.
				Transportation	Yes				Include in the EIR, the nature and impacts of transportation to and from the Willow station which will be adjacent or co-located with the development.	Dumbarton Rail will be considered quantitatively in the cumulative analysis of the transportation section of the draft EIR. The City is currently discussing with Hexagon the appropriate level of detail for analysis with and without Dumbarton Rail.
				Project Description	Yes				Move the grocery store from Phase 3 to Phase 1, since it would be valuable to the community. Include VMT for the following scenario: Having the grocery store/pharmacy available in different phases of the project.	The grocery store is currently identified as a component of the proposed project in the third phase. The draft EIR will analyze the project as proposed. Should the phasing be changed through the entitlement process, the draft EIR will analyze accordingly.
				Transportation	Yes				Include VMT for the following scenario: Project with Dumbarton Rail.	Dumbarton Rail will be considered quantitatively in the cumulative analysis of the transportation section of the draft EIR. The City is currently discussing with Hexagon the appropriate level of detail for analysis with and without Dumbarton Rail.
				Transportation	Yes				Include VMT for the following scenario: Project without Dumbarton Rail.	Dumbarton Rail will be considered quantitatively in the cumulative analysis of the transportation section of the draft EIR. The City is currently discussing with Hexagon the appropriate level of detail for analysis with and without Dumbarton Rail.

Notice of Preparation Comment Letters Summary
Willow Village Master Plan EIR

#	Date	Commenter Name	Commenting Entity	Topics	EIR	HNA	FIA	Other	Summary of NOP Comment	Discussion
				Alternatives	Yes				Include VMT for the following scenario: 1 million sf office, 3000 homes, with Dumbarton rail.	One purpose of the NOP is to identify potential alternatives to the proposed project. Alternatives that would reduce significant impacts of the proposed project are identified during the CEQA process prior to the release of the draft EIR. Hexagon is not currently scoped to complete a quantitative VMT analysis for alternatives.
				Alternatives	Yes				Include VMT for the following scenario: 1 million sf office, 3000 homes, without Dumbarton rail.	One purpose of the NOP is to identify potential alternatives to the proposed project. Alternatives that would reduce significant impacts of the proposed project are identified during the CEQA process prior to the release of the draft EIR. Hexagon is not currently scoped to complete a quantitative VMT analysis for alternatives.
				Energy	Yes				The most recent "Reach Code" policy adopted by the City eliminates credits/offsets. Please do not include credits/offsets as options for this project in order to meet 100 percent renewable energy use.	The applicant will be required to comply with and the draft EIR will consider all applicable codes adopted by the City.
10	9/26/2019	Dave Gildea	Public	Transportation	Yes				EIR should review the unwanted traffic side effects of Facebook's employee growth.	The transportation section of the draft EIR will analyze the effect of the proposed project.
				Transportation	Yes				The project should not be allowed to increase traffic beyond existing levels.	The impacts from the proposed project on transportation will be analyzed in the draft EIR. If there are potentially significant impacts, mitigation would be identified to minimize the impacts. The desire not to increase traffic beyond existing levels is a policy consideration.
11	10/7/2019	Gabrielle Johnck	Public	Population and Housing	Yes	Yes			EIR should consider whether the 1,500 residential units proposed is not sufficient to offset added employees.	The draft EIR will consider the potential environmental impact of the proposed project (approx. 1,735 units) and variants with fewer (approx. 1,500) and more (approx. 2,000) units. The HNA will consider the housing need generated by the proposed project and compare that to the available supply of housing.
				Project Description	Yes				Housing should be built before the offices.	The draft EIR will analyze the project as proposed, including the timing for the office and housing components of the proposed project. Should this change be implemented through the entitlement process, the draft EIR will analyze accordingly.
				Project Description	Yes				Pursuit of AB 900 could result in bypassing the City's effort to plan for the future, per the ConnectMenlo General Plan.	If the applicant seeks AB 900 certification, the City is not limited in its ability to conduct its own environmental review of the proposed project and reach its own conclusions regarding potential environmental impacts and appropriate mitigations, even those necessary to meet the requirements for certification as an AB 900 project.
12	9/25/2019	Jeffrey A. Rodgers	Public	Transportation	Yes				Identify timeline for offsetting new traffic caused by the project; commit to executing plan of offsetting traffic before construction begins.	Appropriate timing for mitigation measures will be determined through the transportation analysis and included in the fully enforceable mitigation monitoring and reporting program (MMRP) for the proposed project.

Notice of Preparation Comment Letters Summary
Willow Village Master Plan EIR

#	Date	Commenter Name	Commenting Entity	Topics	EIR	HNA	FIA	Other	Summary of NOP Comment	Discussion
				Transportation	Yes				Incorporate the concept of "offsetting the environmental traffic impacts of the project" into the EIR.	Appropriate mitigation measures will be determined through the transportation analysis and included in the fully enforceable MMRP for the proposed project.
13	9/26/2019	Lloyd Leanse	Public	Population and Housing		Yes		Yes	Concern that the project would make the jobs-housing imbalance worse. The Project should accommodate all or most of the employees generated by the project.	The HNA will not specifically consider the jobs housing balance, but will consider the housing need generated by the proposed project and compare that to the available supply of housing. A study of the jobs housing balance would be more appropriate on a larger city-wide or regional scale and could be completed concurrently during the entitlement process.
				Other	Yes				Consider environmental justice when considering topics to consider in the EIR.	The City does not currently have an environmental justice element. Nevertheless, there are certain topics that will be considered in the draft EIR that are relevant to environmental justice; for example, preparation of a health risk assessment and analysis of compliance with the general plan's goals policies and programs designed to promote citywide equity and healthy communities.
				Other	Yes				What is the status of mitigation in Resolution 6356?	Resolution 6356 adopted the MMRP for the general plan update. These mitigations will be applied, as appropriate, to the proposed project and discussed in the draft EIR. A broader discussion regarding the status of the general plan update mitigations is beyond the scope of the EIR for the proposed project.
				Other				Yes	The assumptions in the program-level EIR (Plan Bay Area 2040) are not correct. What now needs revising in the ConnectMenlo Program-level EIR?	At any time the City Council could modify the general plan and/or zoning, and if changes are made, an appropriate level of environmental review (addendum, supplemental, or subsequent EIR) would be conducted for the proposed changes. A full EIR utilizing appropriate assumptions will be prepared to analyze the proposed project.
				Other				Yes	What is the status of benefits in Resolution No. 6356? What are the City's plans to achieve the benefit and by when?	Resolution 6356 adopted the statement of overriding considerations for the general plan update. Any discussion of this Resolution is beyond the scope of the EIR for the proposed project.
				Other				Yes	What are the City's plans to revise the ConnectMenlo ordinances in light of Council's recent discussion of a development moratorium?	Any potential revisions to either the general plan or zoning are beyond the scope of the EIR for the proposed project. Should the City modify either prior to final action on the proposed project, those modifications will be applied to the project and considered in the EIR.
				Transportation	Yes				What measures will the City institute so that development requires tangible transportation improvements before approving more development?	Appropriate mitigation measures for the proposed project and their timing will be determined through the transportation analysis and included in the fully enforceable MMRP for the proposed project.

Notice of Preparation Comment Letters Summary
Willow Village Master Plan EIR

#	Date	Commenter Name	Commenting Entity	Topics	EIR	HNA	FIA	Other	Summary of NOP Comment	Discussion
				Transportation	Yes				What's the cost from the infrastructure improvements needed due to increased traffic from the Project (what has Facebook funded, what will taxpayers pay)?	Appropriate mitigation measures for the proposed project and their timing will be determined through the transportation analysis and included in the fully enforceable MMRP for the proposed project. Any cost of mitigation will be borne by the applicant. In addition, the City is currently updating its Transportation Impact Fee (TIF) to fund infrastructure improvements and the proposed project will be subject to the new TIF, once adopted.
				Other				Yes	How will the potential breakup of Facebook by the U.S. Justice Department affect the Project and Menlo Park?	This comment is beyond the scope of the draft EIR which is focused on the physical environmental impact of the project as proposed.
				Public Services	Yes				What is the City's plan for emergency services in District 1, especially during commute hours?	Emergency services will be considered in the public services section of the draft EIR.
				Geology/ Hazards/ Hydrology	Yes				What is the City's plan for disaster preparation for a major disaster, such as a major earthquake that also causes fire and flooding in District 1?	The potential for the project to directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault, will be considered in the geology and soils section of the draft EIR.
				Other				Yes	What is the status of Facebook's required mitigations (total, how it's tracked, measures, reported, how Facebook is held to account)?	This is not project-specific and will not be considered in the EIR for the proposed project. Through the MMRP and annual reviews, the City keeps track of the status of mitigations applicable to previously approved projects.
				Other			Yes	Yes	What is the sum total of Facebook's annual financial contributions to the City's annual revenue?	To the extent this comment relates to previous projects, it is not project-specific. Furthermore, financial contributions are not a physical environmental impact that will be considered in the draft EIR. A FIA will be prepared for the proposed project that will look at the impact of the proposed project on City revenue.
				Transportation	Yes				Stringent requirements for measuring traffic impacts (reverse commutes and average daily traffic).	The transportation analysis in the draft EIR will analyze impacts using VMT, LOS, and will include average daily traffic.
				Biological Resources	Yes				How will the Project affect birdlife?	Any potential impacts on birds will be analyzed in the biological resources section of the draft EIR.
				Biological Resources	Yes				How will the Project affect nature (insects, flower pollinat	Any potential impacts on nature will be analyzed in the biological resources section of the draft EIR.
				Population and Housing	Yes				Impacts on current occupants of the Projects site due to displacement.	CEQA identifies displacement of existing housing, necessitating the construction of replacement housing for study in the EIR. There are no housing units on the project site. The project site is currently occupied by office and warehouse uses; relocation of these businesses is beyond the scope of the draft EIR for the proposed project.
14	9/22/2019	Lynne Bramlett	Public	Population and Housing				Yes	Where will the businesses that would be demolished relocate? What is the impact on clientele? Where will non-profit and local government services go?	The EIR focuses on the potential environmental impact of the proposed project and does not speculate relative to the relocation of existing businesses. These are questions outside the scope of environmental review, but that could be answered through the entitlement process.

Notice of Preparation Comment Letters Summary
Willow Village Master Plan EIR

#	Date	Commenter Name	Commenting Entity	Topics	EIR	HNA	FIA	Other	Summary of NOP Comment	Discussion
				Greenhouse Gases	Yes				Impact on climate change, per Council Resolution No. 64	Resolution 6493 was an aspirational statement relative to reducing greenhouse gas (GHG) emissions. The resolution does not adopt specific thresholds or requirements. The draft EIR will analyze compliance with the City's Climate Action Plan in the GHG section of the draft EIR.
				Project Description	Yes			Yes	How will public amenities be chosen? How is it consistent with ConnectMenlo Program-level EIR (environmental justice)?	The draft EIR will consider the potential environmental impact of the proposed project, including any community amenities. The process for selection of community amenities is outside the scope of the EIR for the proposed project. The determination of community amenities is subject to City Council review through the entitlement process. If the City Council makes any changes to the community amenities list prior to action on the proposed project, the updated community amenities list will be applicable to the proposed project.
				Project Description				Yes	What retail, grocery store, and restaurant is planned? How will this impact other existing grocery stores and restaurants? How will Facebook help to ensure retail is successful?	These are questions outside the scope of environmental review, but could be answered through the entitlement process.
				Project Description				Yes	Provide additional information about community space (dollar amount, what is being discussed, what is ruled out).	These are questions outside the scope of environmental review, but that could be answered through the entitlement process. The proposed project will be required to go through an appraisal process to identify the community amenity value.
				Project Description				Yes	Can more housing be added instead of community space? Instead of community space, and a dollar amount set aside for District 1 residents to decide how and where it will be spent?	These are questions outside the scope of environmental review, but that could be answered through the entitlement process. The proposed project will be required to go through an appraisal process to identify the community amenity value and the amenity itself. If there are changes to the proposed project as a result, those will be analyzed in the EIR.
				Project Description	Yes				Identify trees to be planted to mitigate impacts of development.	The removal and replacement of trees will be discussed in the project description and biological resources sections of the draft EIR. If mitigation measures are necessary they will be identified in the draft EIR.
				Utilities and Service S	Yes				What landfills will be used for demolition debris and what is the impact? How will debris be reused.	Use of landfills will be analyzed in the utilities section of the draft EIR.
				Hydrology and Water Quality	Yes				Impacts from building the Project in a flood zone, and what are the plans to protect life and property? Including impact on underground water reservoir from flooding.	These issues will be analyzed in the hydrology and water quality section of the draft EIR.
				Other				Yes	Will adjacent property owners also be allowed to develop their properties into office complexes due to changes in zoning?	This is not project specific and is outside the scope of the environmental review for the proposed project.

Notice of Preparation Comment Letters Summary
Willow Village Master Plan EIR

#	Date	Commenter Name	Commenting Entity	Topics	EIR	HNA	FIA	Other	Summary of NOP Comment	Discussion
				Population and Housing	Yes			Yes	Identify overall jobs/housing imbalance in Menlo Park, Santa Clara County, San Mateo County. Identify impacts on jobs/housings imbalance, including cumulative impacts.	The jobs housing balance is an economic and social issue, but not a physical environmental issue subject to analysis in the EIR. The jobs housing balance may impact commute times, the effects of which would be considered in the transportation, air quality and GHG sections of the draft EIR. A study of the jobs housing balance would be more appropriate on a larger city-wide or regional scale and could be completed concurrently during the entitlement process.
				Other				Yes	Is there any regional effort to halt office development projects?	This is not project-specific and not required for CEQA review. City staff is unaware of regional efforts to halt development projects.
				Cumulative	Yes			Yes	Identify cumulative impact from jobs/housing imbalance (noise; pollution; species decline, including birds).	The jobs housing balance is an economic and social issue, but not a physical environmental issue subject to analysis in the EIR. The jobs housing balance may impact commute times, the effects of which would be considered in the transportation, air quality and GHG sections of the draft EIR.
				Cumulative	Yes				Consider cumulative impacts from (Stanford and Los Angeles Developer, Lowe Enterprise), including from jobs/housing imbalance.	The draft EIR will consider cumulative impacts resulting from reasonably foreseeable future projects. The jobs housing balance is an economic and social issue, but not a physical environmental issue subject to analysis in the EIR. The jobs housing balance may impact commute times, the effects of which would be considered in the transportation, air quality and GHG sections of the draft EIR.
				Other				Yes	The use of the term "Village" is misleading, consider using "Office Park."	The title of the proposed project has no impact on the environmental analysis.
				Other				Yes	The commenter identifies a “misleading Facebook sponsored poll designed to get answers that would help Facebook to demonstrate public support for Willow Village.” Would the Planning Commission consider adopting a general development code of ethics that would prohibit misleading or deceptive business practices such as described below?	This comment does not raise any environmental issues that require analysis in the EIR for the proposed project.
				Transportation	Yes				Traffic impacts from construction of new offices and structures in the perimeter of their neighborhood (Belle Haven). Future growth should reduce traffic (not just maintain parity).	Impacts from construction will be considered in the transportation section of the draft EIR. Mitigations measures identified as appropriate.
				Noise	Yes				Noise impacts from construction equipment and labor in the perimeter of their neighborhood (Belle Haven).	Construction noise impacts will be analyzed in the draft EIR.
				Air Quality/Noise	Yes				Dust and air pollution from construction of new offices and structures in the perimeter of their neighborhood (Belle Haven). Concern for impacts on asthma and respiratory illnesses for their children. Would like to see rigorous mitigation during construction and after construction (addition of more trees, plans, sound walls, traps for air particulates).	Construction impacts on air quality will be analyzed in the draft EIR. In addition, a health risk assessment will be prepared. Mitigation measures will be identified as appropriate.

Notice of Preparation Comment Letters Summary
Willow Village Master Plan EIR

#	Date	Commenter Name	Commenting Entity	Topics	EIR	HNA	FIA	Other	Summary of NOP Comment	Discussion
15	9/22/2019	Mike Murillo	Public	Project Description	Yes	Yes			Increase affordable housing from a minimum of 15 percent to 30 percent.	The proposed project includes approximately 1,735 residential units of which 15% would be for BMR housing in compliance with the City's BMR ordinance. The draft EIR will describe and consider the potential environmental effect of the project as proposed. Additional BMR housing could be considered by the applicant. For purposes of the draft EIR, analysis of the number and type of dwelling units is critical; the income level of the residents does not change the impact on the environment. The HNA will take into consideration the number of BMR units relative to housing need generated by the proposed project. The percentage of BMR units provided in the project could be considered through the entitlement process.
				Project Description	Yes				Increase open space by 50 percent more than proposed. Connect open space to Baylands.	The draft EIR will analyze the project with the amount of open space proposed. Should the applicant choose to implement the comment and increase open space, the draft EIR will analyze accordingly. A potential increase in open space provided by the project could be considered through the entitlement process.
16	9/25/2019	Nancy Barnby	Public	Transportation	Yes				Submit a viable plan that identifies mitigation to traffic impacts, prior to any construction beginning. The commenter identifies increasing traffic problems in Belle Haven in the past 15 years.	Appropriate mitigation measures for the proposed project and their timing will be determined through the transportation analysis and included in the fully enforceable MMRP for the proposed project.
				Other				Yes	Concern over public noticing. Suggestion that the process should follow the TIERS public engagement process.	CEQA required noticing procedures will be followed; noticing in excess of legal requirements is a policy decision. This comment does not raise any environmental issues that require analysis in the EIR for the proposed project.
				Population and Housing	Yes				Identify number of Facebook employees and contracted employees in multiple buildings throughout District 1.	The draft EIR will identify existing baseline conditions, including existing employment.
				Transportation	Yes				Include Bus Stop Occupancy Plan in analysis.	The applicant will be asked to provide an updated plan showing shuttle and tram routes for consideration as part of the transit analysis in the transportation section of the draft EIR.
				Cumulative	Yes				Include these projects in the cumulative analysis: Dumbarton Corridor project including train stop; Bohannon Gateway (almost completed); Gateway Family Housing; Sobrato Office development; SP Menlo LLC multi-family; Menlo Uptown; Menlo Portal; and Hotels citizen and Moxy.	Projects will be included as appropriate either in the background conditions or the cumulative conditions.
				Other				Yes	Review council meetings (including moratorium), CCIN, and community input to understand resident's concerns.	This comment does not raise any environmental issues that require analysis in the EIR for the proposed project. Comments provided on the NOP or the draft EIR will be included in the EIR.

Willow Village Master Plan EIR

#	Date	Commenter Name	Commenting Entity	Topics	EIR	HNA	FIA	Other	Summary of NOP Comment	Discussion
				Project Description	Yes				Reduce FAR and decrease office size (30-50%) to allow for more housing.	The draft EIR will analyze the project as proposed. One purpose of the NOP is to identify potential alternatives to the proposed project. Alternatives that would reduce significant impacts of the proposed project are identified during the CEQA process prior to the release of the draft EIR.
				Cumulative	Yes				The hotel is next to the proposed Dumbarton Corridor train stop.	The Dumbarton Corridor train stop is not an existing condition, but will be included in the cumulative analysis in the transportation section of the draft EIR.
				Population and Housing		Yes		Yes	Include a housing needs and displacement study. Ensure mitigation for jobs/housing imbalance.	The jobs housing balance is an economic and social issue, but not a physical environmental issue subject to analysis in the EIR. The jobs housing balance may impact commute times, the effects of which would be considered in the transportation, air quality and GHG sections of the draft EIR. The HNA will not specifically consider the jobs housing balance, but will consider the housing need generated by the proposed project and compare that to the available supply of housing. A study of the jobs housing balance would be more appropriate on a larger city-wide or regional scale and could be completed concurrently during the entitlement process. To the extent possible, the HNA will consider displacement as a result of the proposed project.
				Project Description		Yes			The housing needs and displacement study should include change of property ownership, including LLCs for the past 10 years. In addition, the number of apartments and homes unoccupied, reserved for Airbnb, reserved for corporations, or otherwise unavailable to the public must be included.	Such information could be incorporated into the HNA if available.
17	10/7/2019	Pamela D. Jones	Public	Project Description	Yes				Residential and commercial areas should be completed prior to office development.	The draft EIR will analyze the project as proposed. Should the phasing be modified through the entitlement process, the draft EIR will analyze accordingly.
				Land Use				Yes	The potential loss of the local businesses on Willow Road and Hamilton Avenue will create an additional hardship on the residential area.	Potential loss of local business is an economic effect and will be considered to the extent that the proposed project has the potential to cause urban decay.
				Other	Yes			Yes	Review community amenities, grocery store, so that they are compatible with needs of residents.	The draft EIR will consider the potential environmental impact of the proposed project, including any community amenities. The process for selection of community amenities is outside the scope of the EIR for the proposed project. Community amenities provided by the project would be reviewed through the entitlement process.
				Project Description	Yes				Decrease office development to allow for more open space.	The draft EIR will analyze the project as proposed. One purpose of the NOP is to identify potential alternatives to the proposed project. Alternatives that would reduce significant impacts of the proposed project are identified during the CEQA process prior to the release of the draft EIR.

Notice of Preparation Comment Letters Summary
Willow Village Master Plan EIR

#	Date	Commenter Name	Commenting Entity	Topics	EIR	HNA	FIA	Other	Summary of NOP Comment	Discussion
				Project Description	Yes				Include access to Bayfront Expressway from the Southern boundary.	The draft EIR will analyze the project as proposed. Should this be implemented through the entitlement process, the draft EIR will analyze accordingly.
				Transportation	Yes				Include “cross-traffic” between University Avenue, O’Brien Avenue, and Willow Road.	Traffic on O'Brien Drive, University Avenue and Willow Road will be analyzed in the transportation section of the draft EIR.
				Transportation	Yes				Study “cut-through traffic" along Hamilton Avenue, Chilco Avenue, and Ivy Drive.	Cut-though traffic on the suggested streets will be analyzed in the transportation section of the draft EIR.
				Project Description	Yes				Provide public access.	Public access as proposed by the project will be identified and considered in the draft EIR.
				Cumulative	Yes				Include Dumbarton Rail in analysis.	Dumbarton Rail will be considered quantitatively in the cumulative analysis of the transportation section of the draft EIR. The City is currently discussing with Hexagon the appropriate level of detail for analysis with and without Dumbarton Rail.
				Project Description	Yes				Acquire Willow Road from Caltrans.	This is not currently a component of the proposed project. The project will be analyzed as proposed. Should this be implemented through the entitlement process, the draft EIR will analyze accordingly.
				Transportation	Yes				Enforcement of no bus, shuttle, or private vehicles on local streets, fine schedule, trip cap.	Appropriate timing for mitigation measures will be determined through the transportation analysis and included in the fully enforceable mitigation monitoring and reporting program (MMRP) for the proposed project.
				Transportation	Yes				Study pedestrian overcrossings for safety.	Pedestrian overcrossings will be analyzed in the transportation section of the draft EIR.
				Cumulative	Yes				Cumulative impacts on traffic [Bohannon buildings, Sobrato proposed development, and Hotels shuttles, buses, and private vehicles (including Uber, Lyft and limousines)].	The cumulative impacts on traffic will be considered in the transportation section of the draft EIR.
				Air Quality	Yes				The Redwood City air monitoring location is inadequate; use location in Belle Haven Neighborhood, which will be installed by San Mateo County Labs.	The Bay Area Air Quality Management District (BAAQMD) monitoring station is the best and most reliable source of data and will be utilized. ICF will evaluate what additional information is available regarding air quality from the County or the applicant and include it as appropriate in the draft EIR.
	10/7/2019			Population and Housing	Yes				Use ConnectMenlo General Plan Projections instead of the ABAG Projections.	Both ConnectMenlo growth projections and ABAG projections will be considered.
				Project Description	Yes				Commenter notes the requirements from the Facebook Development Agreement (DA).	The Facebook Campus Expansion Development Agreement required Facebook to design a minimum of 1,500 on the project site. This requirement was not a mitigation measure, but a negotiated public benefit. The City could not pre-authorize development of these housing units through the Development Agreement. By submitting the proposed project application with 1,735 units Facebook has complied with the Development Agreement.

Willow Village Master Plan EIR

#	Date	Commenter Name	Commenting Entity	Topics	EIR	HNA	FIA	Other	Summary of NOP Comment	Discussion
18	10/6/2019	Patti Fry	Public	Project Description	Yes				In the EIR, analyze each proposed phase (Phase 1; Phase 1 and 2; all Phases). Mitigation should be included for each phase.	The phasing plan, as proposed by the applicant, will be analyzed throughout the EIR and mitigation will be phased as appropriate (although it is currently anticipated that the majority of the mitigation will be front-loaded).
				Population and Housing		Yes		Yes	Discuss jobs/housing imbalance (ConnectMenlo is reaching its projections for office but not residential).	The jobs housing balance is an economic and social issue, but not a physical environmental issue subject to analysis in the EIR. The jobs housing balance may impact commute times, the effects of which would be considered in the transportation, air quality and GHG sections of the draft EIR. The HNA will not specifically consider the jobs housing balance, but will consider the housing need generated by the proposed project and compare that to the available supply of housing. A study of the jobs housing balance would be more appropriate on a larger city-wide or regional scale and could be completed concurrently during the entitlement process.
				Population and Housing	Yes				Per the DA, the 1,500 units would be for previous housing demand. So, the project can only claim the 235 units from the demand for Willow Village. Consider this in analysis.	The Facebook Campus Expansion Development Agreement required Facebook to design a minimum of 1,500 on the project site. This requirement was not a mitigation measure, but a negotiated public benefit. The City could not pre-authorize development of these housing units through the Development Agreement. By submitting the proposed project application Facebook has complied with the Development Agreement. The project will be analyzed as proposed, with approximately 1,735 units.
				Alternatives	Yes				Consider Alternative: Alternative should only comprise a reduction of Office square footage while keeping proposed housing, retail, community services.	One purpose of the NOP is to identify potential alternatives to the proposed project. Alternatives that would reduce significant impacts of the proposed project are identified during the CEQA process prior to the release of the draft EIR.
				Population and Housing	Yes	Yes		Yes	Use standard metric for jobs/housing imbalance. Consider impacts within the context of Facebook footprints in Menlo Park. Consider the overall jobs/housing imbalance. Consider: trips, greenhouse gas emissions, demand for water and housing, air quality, noise, etc.	The jobs housing balance is an economic and social issue, but not a physical environmental issue subject to analysis in the EIR. The jobs housing balance may impact commute times, the effects of which would be considered in the transportation, air quality and GHG sections of the draft EIR. The HNA will not specifically consider the jobs housing balance, but will consider the housing need generated by the proposed project and compare that to the available supply of housing. A study of the jobs housing balance would be more appropriate on a larger city-wide or regional scale and could be completed concurrently during the entitlement process.

Willow Village Master Plan EIR

#	Date	Commenter Name	Commenting Entity	Topics	EIR	HNA	FIA	Other	Summary of NOP Comment	Discussion
				Transportation	Yes				EIR should analyze VMT and LOS.	The draft EIR will analyze VMT in the transportation section (and also the GHG section). LOS will be included in the draft EIR transportation section for informational purposes. LOS will also be considered in the land use section of the draft EIR relative to the proposed project's compliance with the general plan goals, policies and programs.
				Population and Housing				Yes	Consider displacement of the Menlo Park Fire Protection district and Urban Search and Rescue training and storage facility, a dialysis clinic, Community Legal Services of East Palo Alto, and other community-serving tenants.	The EIR focuses on the potential environmental impact of the proposed project and does not speculate relative to the relocation of existing businesses. These are questions outside the scope of environmental review, but that could be answered through the entitlement process.
19	9/25/2019	Peter Altman	Public	Air Quality	Yes				Work to reduce the spread of air pollution caused by traffic.	The impact of traffic on air quality will be analyzed in the air quality section of the draft EIR.
				Noise	Yes				Work to reduce the spread of noise caused by traffic.	The impact of traffic on noise will be analyzed in the noise section of the draft EIR.
				Transportation	Yes				Prepare a traffic assessment and work to reduce traffic.	A Transportation Impact Analysis (TIA) will be prepared for the proposed project. Transportation impacts will be analyzed in the transportation section of the draft EIR and appropriate mitigations measures will be identified.
	9/27/2019			Air Quality	Yes				Increase in soot from cutting down the trees at Willow and 101. Impact on health of children.	The draft EIR will consider all elements of the proposed project in analyzing the impact on air quality. A health risk assessment will be conducted and the results reported in the air quality section of the draft EIR.
				Noise	Yes				Increase in noise from cutting down the trees at Willow and 101.	The draft EIR will consider all elements of the proposed project in analyzing the impact on noise.
				Transportation	Yes				Increase in time to get off US-101 (South) onto Willow West and Willow East.	The transportation section of the draft EIR will consider both VMT and LOS, which is a measure of delay. However, the threshold of significance will be based upon VMT, and LOS will be provided for informational purposes only (and to determine compliance with the general plan).
				Transportation	Yes				Evaluate Project's impacts on traffic/parking on East Palo City Streets.	The draft EIR will consider whether there is adequate parking proposed for the project and whether there is a physical environmental impact that could result from a shortage. The draft EIR transportation section will assess transportation impacts on East Palo Alto facilities.
				Transportation	Yes				Use impact fees for East Palo Alto (2 new stop signs; radar speed limit signs; reconstruction of roadways; larger sidewalks; burying utility lines; lamp posts; traffic calming study; bike lanes; lighting; all-red traffic light interval; enforcement of speed and parking regulations).	The draft EIR transportation section will consider whether there are any impacts to identified intersections in East Palo Alto and any appropriate mitigation. Impact fees are earmarked for specific projects (some of which may be in East Palo Alto) and cannot be re-allocated through the environmental review process.

20	10/7/2019	Romain Taniere	Public	Project Description	Yes				Redevelop Willow/O'Brien/University with pedestrian/bicycle traffic in mind. Construct sidewalks with ADA compliant crosswalks/curbs/ramps, on both sides all along O'Brien Drive. Better lighting should be installed and bicycle lanes should be also developed on O'Brien Drive.	This is not currently a component of the proposed project. The project will be analyzed as proposed. Should this be implemented through the entitlement process, the draft EIR will analyze accordingly.
				Project Description	Yes				Work with nearby landowners (10 Kelly Court, 1 Casey Court, 1215 O'Brien Drive) and specifically CSBio (Kelly Court, 1075 O'Brien) and 1105-1165 O'Brien Drive to better connect to O'Brien Drive.	This is not currently a component of the proposed project. The project will be analyzed as proposed. Should this be implemented through the entitlement process, the draft EIR will analyze accordingly.
				Project Description	Yes				Consider more direct bus/street connections from Willow/University to Willow Village to limit residential traffic.	This is not currently a component of the proposed project. The project will be analyzed as proposed. Should this be implemented through the entitlement process, the draft EIR will analyze accordingly.
				Project Description	Yes				Add the redevelopment of Hetch Hetchy right of way as an open space.	This is not currently a component of the proposed project. The project will be analyzed as proposed. Should this be implemented through the entitlement process, the draft EIR will analyze accordingly.
				Project Description	Yes				Make the O'Brien Park (presumably the Dog Park) much bigger than the current planned size.	This is not currently a component of the proposed project. The project will be analyzed as proposed. Should this be implemented through the entitlement process, the draft EIR will analyze accordingly.
				Project Description	Yes				Move public park away from Willow Road towards O-Brien Drive. The public park should be full amenity community park and not limited as a sport's/multi use field.	This is not currently a component of the proposed project. The project will be analyzed as proposed. Should this be implemented through the entitlement process, the draft EIR will analyze accordingly.
				Project Description	Yes				Include and allow rooftop accessible mixed use business/retail spaces such as bars/restaurants.	This is not currently a component of the proposed project. The project will be analyzed as proposed. Should this be implemented through the entitlement process, the draft EIR will analyze accordingly.
				Project Description	Yes				Allow options to include and connect a future Dumbarton transit/commuting center to the Willow Village Campus.	This is not currently a component of the proposed project. The project will be analyzed as proposed. Should this be implemented through the entitlement process, the draft EIR will analyze accordingly.
	10/8/2019			Transportation	Yes			Yes	Consider no net increase in VMT.	The VMT impacts from the proposed project will be analyzed in the transportation section of the draft EIR. If potentially significant impacts are identified, mitigation would be implemented to minimize the impact (which may not result in no net increase in VMT). The threshold of significance for VMT impacts is a policy consideration to be considered as part of an update to the City's TIA guidelines.
				Transportation	Yes				Consider analyzing VMT from having grocery store/pharmacy at different phases.	This is not currently a component of the proposed project. The project will be analyzed as proposed. Should this be implemented through the entitlement process, the draft EIR will analyze accordingly.
				Alternatives	Yes				Study a Lower Office Alternative: 1 million sf of office and more housing (3,000 units using density bonus for BMR).	One purpose of the NOP is to identify potential alternatives to the proposed project. Alternatives that would reduce significant impacts of the proposed project are identified during the CEQA process prior to the release of the draft EIR.

21	10/7/2019	Adina Levin	Public	Transportation	Yes				Identify VMT with Dumbarton Rail in place.	Dumbarton Rail will be considered quantitatively in the cumulative analysis of the transportation section of the draft EIR. The City is currently discussing with Hexagon the appropriate level of detail for analysis with and without Dumbarton Rail.
				Project Description	Yes				Use Density Bonus for higher share of BMR housing (25%).	The proposed project includes approximately 1,735 residential units of which 15% would be for below market rate (BMR) housing in compliance with the City's BMR ordinance. The draft EIR will describe and consider the potential environmental effect of the project as proposed. Additional BMR housing could be considered by the applicant. For purposes of the draft EIR, analysis of the number and type of dwelling units is critical; the income level of the residents does not change the impact on the environment. The HNA will take into consideration the number of BMR units relative to housing need generated by the proposed project.
				Population and Housing	Yes	Yes			Provide housing to balance jobs and reduce displacement.	The jobs housing balance is an economic and social issue, but not a physical environmental issue subject to analysis in the EIR. The jobs housing balance may impact commute times, the effects of which would be considered in the transportation, air quality and GHG sections of the draft EIR. The HNA will not specifically consider the jobs housing balance, but will consider the housing need generated by the proposed project and compare that to the available supply of housing. A study of the jobs housing balance would be more appropriate on a larger city-wide or regional scale and could be completed concurrently during the entitlement process.
				Project Description	Yes				Move grocery store to an earlier phase.	The grocery store is currently identified as a component of the proposed project in the third phase. The draft EIR will analyze the project as proposed. Should the timing of the grocery store be modified through the entitlement process, the draft EIR will analyze accordingly.
				Energy	Yes				Do not include credits/offsets for the project, per “Reach Code.”	The applicant will be required to comply with and the draft EIR will consider all applicable codes adopted by the City.
				Project Description				Yes	Consider needs of community when choosing a grocery store.	The choice of the grocery store will not be included in the EIR because this information is not necessary for the environmental impact analysis. This can, however, be considered through the entitlement process.
				Transportation	Yes				Consider safety from having pedestrian overcrossing, per safety concerns. https://www.itdp.org/2019/10/01/pedestrian-bridges-make-cities-less-walkable-why-do-cities-keep-building-them/	A pedestrian overcrossing will be considered transportation section of the draft EIR.

Willow Village Master Plan EIR

#	Date	Commenter Name	Commenting Entity	Topics	EIR	HNA	FIA	Other	Summary of NOP Comment	Discussion
				Alternatives	Yes				Consider this in the Analysis: Current proposal, with Dumbarton rail.	Dumbarton Rail will be considered quantitatively in the cumulative analysis of the transportation section of the draft EIR. The City is currently discussing with Hexagon the appropriate level of detail for analysis with and without Dumbarton Rail.
	10/14/2019			Alternatives	Yes				Consider this in the Analysis: Current proposal, without Dumbarton rail.	Dumbarton Rail will be considered quantitatively in the cumulative analysis of the transportation section of the draft EIR. The City is currently discussing with Hexagon the appropriate level of detail for analysis with and without Dumbarton Rail.
				Alternatives	Yes				Consider this in the Analysis: 1 million sf, with Dumbarton rail.	Dumbarton Rail will be considered quantitatively in the cumulative analysis of the transportation section of the draft EIR. The City is currently discussing with Hexagon the appropriate level of detail for analysis with and without Dumbarton Rail.
				Alternatives	Yes				Consider this in the Analysis: 1 million sf, without Dumbarton rail.	Dumbarton Rail will be considered quantitatively in the cumulative analysis of the transportation section of the draft EIR. The City is currently discussing with Hexagon the appropriate level of detail for analysis with and without Dumbarton Rail.
				Alternatives	Yes				Consider this in the Analysis: Less office space with Dumbarton (low impact scenario).	Dumbarton Rail will be considered quantitatively in the cumulative analysis of the transportation section of the draft EIR. The City is currently discussing with Hexagon the appropriate level of detail for analysis with and without Dumbarton Rail.
				Alternatives	Yes				Consider this in the Analysis: Current proposal without Dumbarton (high impact scenario).	Dumbarton Rail will be considered quantitatively in the cumulative analysis of the transportation section of the draft EIR. The City is currently discussing with Hexagon the appropriate level of detail for analysis with and without Dumbarton Rail.
				Project Description/ Biological Resources	Yes				Plant 10 percent of trees (50) with older, mature trees (e.g., 20 year native oak).	This is not currently a component of the proposed project. The project will be analyzed as proposed. Should this be implemented through the entitlement process, the draft EIR will analyze accordingly.
				Project Description	Yes				Any plans for connecting the Project with future rail or bus rapid transit station (Dumbarton)?	Dumbarton Rail will be considered quantitatively in the cumulative analysis of the transportation section of the draft EIR. The City is currently discussing with Hexagon the appropriate level of detail for analysis with and without Dumbarton Rail.
				Land Use	Yes				How will the project integrate with other office developments south of the Project site? Recommendation: bike/ped friendly neighborhood integration plan.	Consistency with existing land uses will be analyzed in the land use section of the draft EIR.
				Transportation	Yes				Analysis of impacts from traffic due to access to the Office Campus from residential areas (new Park Street).	Access issues will be analyzed in the transportation section of the draft EIR.
				Other	Yes				Because of changes, the Project cannot rely on the program EIR, especially for GHG, transportation, and AQ.	The EIR will be a project-level EIR and will not tier from the certified program-level EIR that was prepared for ConnectMenlo. However, ConnectMenlo will be summarized and referenced, where applicable.

Notice of Preparation Comment Letters Summary
Willow Village Master Plan EIR

#	Date	Commenter Name	Commenting Entity	Topics	EIR	HNA	FIA	Other	Summary of NOP Comment	Discussion
22	10/12/2019	Chris DeCardy	Public	Project Description/Air Quality	Yes				Consider net zero emissions from all buildings, without the use of offset or credits. Consider no net increase in indoor and outdoor air pollution.	The impacts from the proposed project on air quality will be analyzed in the draft EIR, with thresholds established by the regional air quality board. These thresholds do not include “no net increase” in air pollutants. Nonetheless, the draft EIR will consider air quality impacts during construction and operation.
				Transportation	Yes			Yes	Consider no net increase in VMT (TDM plan that zeroes out net new trips).	The VMT impacts from the proposed project will be analyzed in the transportation section of the draft EIR. If potentially significant impacts are identified, mitigation would be implemented to minimize the impact (which may not result in no net increase in VMT). The threshold of significance for VMT impacts is a policy consideration to be considered as part of an update to the City's TIA guidelines.
				Alternatives	Yes				Consider keeping office space at or close to its current size (area, no. of employees, vehicle trips).	One purpose of the NOP is to identify potential alternatives to the proposed project. Alternatives that would reduce significant impacts of the proposed project are identified during the CEQA process prior to the release of the draft EIR.
23	10/22/2019	John Kadvany	Public	Alternatives	Yes				Consider keeping traffic at or close to existing baseline.	The VMT impacts from the proposed project will be analyzed in the transportation section of the draft EIR. If potentially significant impacts are identified, mitigation would be implemented to minimize the impact (which may not result in keeping traffic at or close to existing baseline).
				Transportation	Yes				Include travel time estimates, from project entrances to 101 entrance/exits, nearby intersections, Dumbarton Bridge (University Ave).	The transportation section of the draft EIR will consider both VMT and LOS, which is a measure of delay. However, the threshold of significance will be based upon VMT, and LOS will be provided for informational purposes only (and to determine compliance with the general plan).
				Transportation	Yes				Identify a study option or transit scenario for Willow Village becoming a destination.	One purpose of the NOP is to identify potential alternatives to the proposed project. Alternatives that would reduce significant impacts of the proposed project are identified during the CEQA process prior to the release of the draft EIR.
				Other				Yes	Identify office needs based on Connect Menlo and compare to other cities.	Office needs for Menlo Park and other cities is not project-specific and not a CEQA topic subject to analysis in the EIR for the proposed project.

Notice of Preparation Scoping Session Public Comments Summary
Willow Village Master Plan EIR

#	Date	Commenter Name	Commenting Entity	Topics	EIR	HNA	FIA	Other	Summary of NOP Comment	Discussion
P_1	10/7/2019	Patti Fry	Member of the Public	Project Description	Yes				EIR to evaluate each phase separately since mitigation measures should be implemented by phase, as they occur.	The phasing plan, as proposed by the applicant, will be analyzed throughout the EIR and mitigation will be phased as appropriate (although it is currently anticipated that the majority of the mitigation will be front-loaded).
				Alternatives	Yes				Alternative: should focus on less office and not less retail or housing.	One purpose of the NOP is to identify potential alternatives to the proposed project. Alternatives that would reduce significant impacts of the proposed project are identified during the CEQA process prior to the release of the draft EIR.
				Population and Housing	Yes				ABAG Projections vs. ConnectMenlo growth projections. Use ConnectMenlo instead of ABAG.	Both ConnectMenlo growth projections and ABAG projections will be considered in the draft EIR.
				Transportation	Yes				Consider LOS and VMT.	The draft EIR will analyze VMT in the transportation section (and also the GHG section). LOS will be included in the draft EIR transportation section for informational purposes. LOS will also be considered in the land use section of the draft EIR relative to the proposed project's compliance with the general plan goals, policies and programs.
				Population and Housing	Yes	Yes		Yes	Jobs/housing imbalance – traffic and displacement of people. Ways to help the overall community.	The jobs housing balance is an economic and social issue, but not a physical environmental issue subject to analysis in the EIR. The jobs housing balance may impact commute times, the effects of which would be considered in the transportation, air quality and GHG sections of the draft EIR. The HNA will not specifically consider the jobs housing balance, but will consider the housing need generated by the proposed project and compare that to the available supply of housing. A study of the jobs housing balance would be more appropriate on a larger city-wide or regional scale and could be completed concurrently during the entitlement process.

P_2	10/7/2019	Pamela Jones	Member of the Public	Other				Yes	Provide notifications and use tier notification process.	CEQA required noticing procedures will be followed; noticing in excess of legal requirements is a policy decision. This comment does not raise any environmental issues that require analysis in the EIR for the proposed project.
				Cumulative	Yes				Dumbarton must be part of the analysis and other pipeline projects.	Dumbarton Rail along with other projects will be considered quantitatively in the cumulative analysis of the transportation section of the draft EIR. The City is currently discussing with Hexagon the appropriate level of detail for analysis with and without Dumbarton Rail.
				Other				Yes	Review of the CCIN meeting and community rol	This comment does not raise any environmental issues that require analysis in the EIR for the proposed project. Comments provided on the NOP or the draft EIR will be included in the EIR.
				Alternatives	Yes				FAR should be reduced for office, increase housing. Further exacerbate the jobs/housing imbalance. Increase BMR, condos.	One purpose of the NOP is to identify potential alternatives to the proposed project. Alternatives that would reduce significant impacts of the proposed project are identified during the CEQA process prior to the release of the draft EIR.
				Project Description	Yes				All residential and commercial areas should be completed prior to any office development.	The draft EIR will analyze the project as proposed. Should the be implemented through the entitlement process, the draft EIR will analyze accordingly.
				Transportation	Yes				Traffic: consider nearby intersections.	Nearby intersections will be considered in the transportation section of the draft EIR.
				Project Description	Yes				Direct access to Bayfront Expressway.	The draft EIR will analyze the project as proposed. Should this be implemented through the entitlement process, the draft EIR will analyze accordingly.
				Air Quality	Yes				Air quality: do local monitoring closer than Redwood City.	The Bay Area Air Quality Management District (BAAQMD) monitoring station is the best and most reliable source of data and will be utilized. ICF will evaluate what additional information is available regarding air quality from the County or the applicant and include it as appropriate in the draft EIR.

P_6	10/7/2019	Adina Levin	Complete Streets, General Plan Committee	Alternatives	Yes				Project Alternatives: Lower office and more housing.	One purpose of the NOP is to identify potential alternatives to the proposed project. Alternatives that would reduce significant impacts of the proposed project are identified during the CEQA process prior to the release of the draft EIR.
				Alternatives	Yes				Include VMT to show less office/more housing.	One purpose of the NOP is to identify potential alternatives to the proposed project. Alternatives that would reduce significant impacts of the proposed project are identified during the CEQA process prior to the release of the draft EIR.
				Cumulative	Yes				Consider VMT with and without Dumbarton.	Dumbarton Rail along with other projects will be considered quantitatively in the cumulative analysis of the transportation section of the draft EIR. The City is currently discussing with Hexagon the appropriate level of detail for analysis with and without Dumbarton Rail.
				Project Description	Yes				Accelerate housing and grocery in phasing plan.	The draft EIR will analyze the project as proposed. Should this be implemented through the entitlement process, the draft EIR will analyze accordingly.
				Energy	Yes				Remove offsets and credit options.	The applicant will be required to comply with and the draft EIR will consider all applicable codes adopted by the City.
				Transportation	Yes				Pedestrian overcrossing could lead to less safety for pedestrians. Consider revising.	Pedestrian overcrossings will be analyzed in the transportation section of the draft EIR.
				Population and Housing		Yes			In support of HNA being conducted. Analyze the impact of additional office and housing.	The HNA will consider the housing need generated by the proposed project and compare that to the available supply of housing.
				Project Description	Yes	Yes			Consider housing needs – use density bonus for more BMR/senior housing. Mix of income levels should be provided.	The proposed project includes approximately 1,735 residential units of which 15% would be for below market rate (BMR) housing in compliance with the City's BMR ordinance. The draft EIR will describe and consider the potential environmental effect of the project as proposed. Additional BMR housing could be considered by the applicant. For purposes of the draft EIR, analysis of the number and type of dwelling units is critical; the income level of the residents does not change the impact on the environment. The HNA will take into consideration the number of BMR units relative to housing need generated by the proposed project.

Willow Village Master Plan EIR

#	Date	Commenter Name	Commenting Entity	Topics	EIR	HNA	FIA	Other	Summary of NOP Comment	Discussion
P_16	10/7/2019	Commissioner Riggs	Planning Commissioner	Alternatives	Yes				Alternatives: more housing/less office, only develop office to replace existing onsite office, a “real” residential component with no increase in traffic.	One purpose of the NOP is to identify potential alternatives to the proposed project. Alternatives that would reduce significant impacts of the proposed project are identified during the CEQA process prior to the release of the draft EIR.
				Transportation	Yes				Transportation: include VMT and LOS, neighborhoods adjacent to arterials should be considered, activate Dumbarton rail corridor, state the number of net new trips in document.	The draft EIR will analyze VMT in the transportation section (and also the GHG section). LOS will be included in the draft EIR transportation section for informational purposes. LOS will also be considered in the land use section of the draft EIR relative to the proposed project's compliance with the general plan goals, policies and programs. Dumbarton Rail along with other projects will be considered in the cumulative analysis of the transportation section of the draft EIR. The City is currently discussing with Hexagon the appropriate level of detail for analysis with and without Dumbarton Rail.
				Population and Housing	Yes	Yes		Yes	Jobs/Housing imbalance should be considered.	The jobs housing balance is an economic and social issue, but not a physical environmental issue subject to analysis in the EIR. The jobs housing balance may impact commute times, the effects of which would be considered in the transportation, air quality and GHG sections of the draft EIR. The HNA will not specifically consider the jobs housing balance, but will consider the housing need generated by the proposed project and compare that to the available supply of housing. A study of the jobs housing balance would be more appropriate on a larger city-wide or regional scale and could be completed concurrently during the entitlement process.
				Baseline	Yes				Baseline: consider TIDE Academy at full development, rather than current conditions.	The baseline normally consists of the physical conditions that exist at the time the NOP is published. Under certain circumstances, it is appropriate to deviate from the traditional definition of baseline where supported by substantial evidence. Those projects that are not occupied at the time of the NOP will be included in the cumulative analysis.
				Project Description	Yes				Prefers the pedestrian undercrossing instead of an overcrossing.	Both scenarios will be analyzed in the draft EIR; the comment is expressing a preference.

Notice of Preparation Scoping Session Public Comments Summary
Willow Village Master Plan EIR

#	Date	Commenter Name	Commenting Entity	Topics	EIR	HNA	FIA	Other	Summary of NOP Comment	Discussion
				Land Use				Yes	Land Use: Zoning for O-B in ConnectMenlo does not allow for housing, but it should.	Any potential revisions to the zoning are beyond the scope of the EIR for the proposed project. Should the City modify the zoning prior to final action on the proposed project, those modifications will be applied to the project and considered in the EIR.
				Other				Yes	Terminology: don't use the term "urban area served by transit."	There is a comment relative to terminology and does not specifically require analysis in the EIR for the proposed project. The transportation section of the draft EIR will identify what transit serves the project site.
P_17	10/7/2019	Commissioner Barnes	Planning Commissioner	Transportation/Cumulative	Yes				Transportation: Study the effect of rail service and the Project (Dumbarton); need to identify what that scenario would look like. Need to consider regional multimodal solutions for transportation.	Dumbarton Rail will be considered quantitatively in the cumulative analysis of the transportation section of the draft EIR. The City is currently discussing with Hexagon the appropriate level of detail for analysis with and without Dumbarton Rail.
				Transportation	Yes				Transportation: LOS vs. VMT, study who is adding the net trips, mass transit, single occupancy vehicles, night trips, where traffic is coming/going, provide real Facebook data from existing patterns.	The draft EIR will analyze VMT in the transportation section; LOS will also be included in the transportation section for informational purposes. The transportation analysis will utilize a travel demand model to develop trip distribution patterns for the proposed land uses. However, individual project components (such as office or residential uses) will not be evaluated separately in the draft EIR; the impacts of the project are evaluated in aggregate as proposed.
				Project Description	Yes				Phasing: study the Project in multiple phases; helpful to add clarity to impacts.	The phasing plan, as proposed by the applicant, will be analyzed throughout the EIR and mitigation will be phased as appropriate (although it is currently anticipated that the majority of the mitigation will be front-loaded).
				Population and Housing	Yes				Data: Menlo Park statistics vs. ABAG Projects; how will this be approached?	Both ConnectMenlo growth projections and ABAG projections will be considered.
				Project Design	Yes				Design: Potentially add access directly from Bayfront to the Project site – something needs to be considered.	This is not currently a component of the proposed project. The project will be analyzed as proposed. Should this be implemented through the entitlement process, the draft EIR will analyze accordingly.

SUBJECT: Proposal to Prepare an Environmental Impact Report for the Willow Village Master Plan Project – Phase II/Budget Amendment 2

Dear Mr. Perata:

ICF Jones & Stokes, Inc. ("ICF") is pleased to present this scope and budget to prepare Phase II of an Environmental Impact Report (EIR) for the proposed Willow Village Master Plan Project (hereafter referred to as the Project). ICF submitted a Scope of Work (scope) for Phase I of the Project EIR in December 2017. With Budget Amendment 1 (approved May 2019), the current approved budget for the EIR is $67,565.

This scope and budget ($1,113,858) focuses on Phase II of the EIR, which includes the completion of the Notice of Preparation, Draft EIR, and Final EIR. In addition, this Phase II scope and budget includes tasks for the transportation subconsultants Hexagon (Attachment A), the Housing Needs Assessment subconsultant KMA (Attachment B), and the Fiscal Impact Analysis subconsultant BAE (Attachment C). Including Budget Amendment 1 and 2, the total budget for the EIR would be $1,181,423 ICF proposes to invoice costs monthly, on a time and materials basis.

This proposal is valid for a period of 90 days, at which time ICF reserves the right to revise the contents or extend the validity date, if needed. ICF shall provide services, as outlined in the attachment, under the terms and conditions of its existing agreement number 2251 with the City dated January 26, 2018. If you have any questions regarding this proposal, please feel free to contact Kirsten Chapman at 415.537.1702 or kirsten.chapman@icf.com. We look forward to working with you on this project.

Sincerely,

Jodi Young
Manager, Contracts

A. Project Understanding and General Approach

ICF has reviewed the information provided by the City and Peninsula Innovation Partners, LLC and Signature Development Group, on behalf of Facebook, Inc. (Project Sponsor). Based on our review of project materials and experience with similar projects, we understand that an EIR is needed.

Project Understanding

The Project involves the redevelopment of the existing Menlo Park Science and Technology Park. The Project would demolish existing onsite buildings and landscaping and construct new buildings within a Town Square District, a Residential/Shopping District, and a Campus District. The Project would result in a net increase of approximately 1 million square feet (sf) of nonresidential uses (office space and non-office commercial/retail), for a total of approximately 2 million sf of nonresidential uses at the Project site. In addition, the Project would include housing units, a limited-service hotel, a community center, and open space. (The square footage of the hotel, community center, and park buildings are in addition to the increase of 1 million square feet of nonresidential square footage.) The Project site would be bisected by the north-south Main Street, which would provide access to all three districts. The Project site would also include a circulation network for vehicles, bicycles, and pedestrians with approximately 4.6 acres of public rights-of-way and 1.4 acres of private streets, generally aligned in an east-to-west and a north-to-south grid.

The Residential/Shopping District would be located in the southwestern portion of the Project Site, while the Town Square District would be located in the northwestern portion of the Project Site. Together, these two districts would include: approximately 1,735 residential units; a maximum of 200,000 sf of nonresidential/retail uses (including a grocery store, pharmacy, and restaurant); a hotel with 200-250 rooms and food services; and an approximately 10,000 sf indoor community center adjacent to a 4-acre public park. In addition, a 0.5-acre Town Square and 0.3-acre dog park would be accessible to the public.

The 37-acre Campus District, located in the eastern portion of the Project site, would include approximately 1.75 million sf of office uses and employee-serving amenity space, along with two above-ground parking structures with approximately 3,000 parking spaces. Both parking structures would include a ground-level Transit Center for commuter shuttles and campus trams. Open spaces would include a chain of publicly-accessible urban spaces and gardens along Main Street, a landscaped area off of O'Brien Street, and various secure, interior open spaces for the Campus District users.

The Willow Village Master Plan was designed to implement the guiding principles and policies adopted as part of ConnectMenlo such as including new affordable and market-rate housing units for local workers, opportunities for future transit connections, and construction of a grocery store. The Project is meant to align with ConnectMenlo's development and zoning standards and is consistent with ConnectMenlo's density and height limits for bonus development. The Project would develop an area that is transit-ready, with new infrastructure, housing, sustainability features, circulation, open spaces, office and mixed-uses, and pedestrian boulevards. New housing and community-serving retail would include a collection of

varied-scale public spaces, restaurants, and public gathering spaces. The Project would seek to develop using the bonus level allowance of the Zoning Ordinance and as such, would incorporate community amenities selected from the adopted Community Amenities List, consistent with the Zoning Ordinance requirements. As appropriate, this analysis would assess the possible environmental effects of the physical community amenities, provided as part of the Project.

General Approach

ConnectMenlo, which updated the City's General Plan Land Use and Circulation Elements and the Zoning in the M-2 (Bayfront) Area, was approved on November 29, 2016. This serves as the City's comprehensive and long-range guide to land use and infrastructure development. Because of the long-term planning horizon of ConnectMenlo, the ConnectMenlo EIR was prepared as a program EIR, pursuant to Section 15168 of the CEQA Guidelines. Once a program EIR has been certified, subsequent activities within the program must be evaluated to determine whether additional CEQA review needs to be prepared. However, if the program EIR addresses the program's effects as specifically and comprehensively as possible, subsequent activities could be found to be within the program EIR scope, and additional environmental review would not be required (CEQA Guidelines Section 15168[c]). When a program EIR is relied on for a subsequent activity, the lead agency must incorporate feasible mitigation measures and alternatives developed in the program EIR into the subsequent activities (CEQA Guidelines Section 15168[c][3]). If a subsequent activity would have potentially significant environmental effects that are not within the scope of a program EIR, the lead agency must prepare an Initial Study leading to a Negative Declaration, a Mitigated Negative Declaration, or an EIR. The ConnectMenlo Program EIR will serve as the first-tier environmental analysis for the CEQA evaluation of the Project.

ConnectMenlo analyzed an increase in net new development in the Bayfront Area of up to 2.3 million square feet of non-residential uses, up to 4,500 residential units, and up to 400 hotel rooms, and up to 5,500 new employees. As mentioned above, the Project includes a net of approximately 750,000 sf of office uses, 200,000 sf of retail, a 10,000 sf indoor community center, approximately 1,735 residential units, and up to 250 hotel rooms, and approximately 9,500 employees. In total, the Project would include a net increase of approximately 1.04 million sf of non-residential uses (not including the hotel gross square footage), which is within the buildout projections of ConnectMenlo and within the parameters of what was analyzed in the ConnectMenlo EIR. However, it is anticipated that the Project would result in more employees than what was analyzed in the ConnectMenlo EIR. In addition, the Project will be implemented through a Master Plan, the specifics of which were unknown during the preparation of ConnectMenlo.

Due to the General Plan Amendments required to implement the Project, the Settlement Agreement with East Palo Alto (discussed further below), the Master Plan across zoning districts, and the potential increase in on-site employees over what was assumed in the ConnectMenlo EIR, a full EIR is proposed to analyze the Project. The EIR will tier from and utilize the ConnectMenlo program EIR where appropriate.

On December 5, 2017, the City Council approved the proposed Settlement Agreement between the City of Menlo Park and the City of East Palo Alto to fully and finally resolve the litigation initiated by East Palo Alto regarding the environmental review for ConnectMenlo. The Settlement Agreement will serve to inform the scope of the analysis for several topics in the EIR and provide guidance on the requirements for the Project's Housing Needs Assessment (HNA) (Attachment B).

B. Scope of Work – Phase II

The Phase I scope of work was approved in January 2018 and included the following tasks: Project Initiation (Task 1), EIR Project Description (Task 2), EIR Scope Definition (Task 3), and Project Management and Meetings (Task 4). The following tasks were conducted by ICF from January to April 2018, prior to the Project going on hold: attendance at team kick-off meeting; review of all project materials; preparation of several iterations of the data needs lists; preparation of the first draft of the Project Description; review of City/applicant comments on the Project Description and preliminary edits; preparation of the first draft of the Notice of Preparation; ongoing conversations about the transportation scope; and scoping, contracting, and coordination with the transportation subconsultants. Some of the work that was generated during this time period can be applied; however, due to the change in site plans and the year-long hold on the Project, many of the tasks need to be revisited and revised.

Therefore, below scope of work for the EIR includes Tasks 1 through 4 (as amendments to the tasks in the Phase I scope of work), and additional tasks through the certification of the EIR.

Task 1. Project Initiation

Project Initiation will continue by discussing key issues, reviewing completed environmental documents, reviewing revised Project materials, attending a site visit, and continuing to refine the schedule for completion of individual tasks. In addition, ICF will work with the City and Project Sponsor on the data needs list by obtaining the necessary information to conduct the EIR analysis. This task assumes that an in-person "re-kick-off meeting" will occur with City of Menlo Park staff, the Project Sponsor team, and the traffic subconsultant. All other Project Initiation tasks were covered and/or will be covered by the existing Phase I scope of work and budget.

Task 2. EIR Project Description

ICF prepared a draft Project Description and submitted it to the City in February 2018. Comments were received in April 2018. This was included in the Phase I scope of work. However, substantial revisions need to be applied to the Project Description due to the changes in the site plan, pending data needs responses, and changes in existing conditions. Based on discussions with City staff and on the Project Sponsor's application and plans, ICF will update the Project Description. This task assumes that one additional draft of the Project Description will be submitted to the City. Revisions to the Project Description based on City/Project Sponsor comments, and additional data needs responses from the Project Sponsor, will be included in the submittal of the Administrative Draft EIR (Task 5).

Task 3. EIR Scope Definition

ICF prepared the first draft of the Notice of Preparation (NOP) in April 2018 under the Phase I scope and budget. However, this draft was not submitted to the City before the Project went on hold. ICF will prepare the revised NOP for City staff review and revise per City/Project Sponsor edits. Our budget assumes that ICF will distribute to the State Clearinghouse and that the City will oversee mailing to other interested parties and public agencies. ICF will attend and be present at one scoping meeting (held as part of a regular Planning Commission meeting) and record comments received during the meeting. The principle objective of this scoping meeting will be to confirm or revise the list of environmental issues and the range of alternatives to be examined in the EIR. At the close of the comment period, ICF will review all comments and consider and address them while preparing the EIR. The hours for the scoping meeting are included in Task 5 of our budget.

Deliverables

- Electronic copies of draft and revised NOP in MS Word and Adobe PDF format
- Electronic copies of the final NOP in MS Word and Adobe PDF format
- Fifteen hard copies of the final NOP to the State Clearinghouse
- One PowerPoint presentation for scoping meeting.

Task 4. Project Management and Meetings

The purpose of this task is to continue to effectively manage the below tasks and maintain communication with City staff. ICF project management will be responsible for coordination activities, will maintain QA/QC requirements for document preparation, and will monitor schedule and performance for all EIR work tasks. Project management subtasks also include maintaining internal communications among ICF staff and subconsultants and with City staff and other team members through emails and frequent phone contact, as well as the preparation of all correspondence. The Project Manager will coordinate internal staff, project guidance, and analysis criteria.

The purpose of this task is to attend meetings to accomplish the below tasks. Team members will attend and participate in meetings on an as-needed basis. For purposes of the cost estimates, ICF has assumed ten City staff and/or Project Sponsor face-to-face meetings and 30 phone conference calls. Additional meetings may be appropriate during the course of this effort and will be invoiced on a time-and-materials basis. The estimated cost for additional meetings is included in the discussion of the project budget, below.

Task 5. Administrative Draft EIR

The purpose of this task is to prepare the Administrative Draft EIR. This task will synthesize background information for use in the existing setting, evaluate changes to those baseline conditions resulting from implementation of the Project, identify significant impacts, and identify mitigation measures to reduce potentially significant impacts to a less-than-significant level.

For this task, there will be four principal activities:

- Determine, by individual resource topic, the significance criteria to be used in the analysis.
- Present the analysis at full buildout of the Project.
- Compare the Project against analysis and conclusions in the ConnectMenlo EIR.
- Perform the analysis and make determinations of impact significance.
- Recommend mitigation measures to reduce impacts, if needed.

The ICF team will collect the information necessary to define baseline conditions in the Project area. Based on our understanding of the Project and discussions with City staff, baseline conditions will reflect the conditions at the time of the NOP release, unless as the analysis progresses an adjusted baseline is determined to be appropriate. ICF will also refer to the ConnectMenlo EIR (2016) and the Facebook Expansion Project EIR (2016)/EIR Addendum (2017) for applicable background data and impact areas. In particular, ICF will use the mitigation measures from the ConnectMenlo EIR, as applicable.

For each environmental topic, significance thresholds or criteria will be defined in consultation with the City so that it is clear how the EIR classifies an impact. These criteria will be based on CEQA Guidelines, Appendix G, standards used by the City, and our experience in developing performance standards and planning guidelines to minimize impacts.

The analysis will be based on standard methodologies and techniques and will focus on the net changes anticipated at the Project site. The text will clearly link measures to impacts and indicate their effectiveness (i.e., ability to reduce an impact to a less-than-significant level), identify the responsible agency or party, and distinguish whether measures are proposed as part of the Project, are already being implemented (such as existing regulations), or are to be considered. This approach facilitates preparation of the Mitigation Monitoring and Reporting Program (MMRP) that follows certification of an EIR.

The Administrative Draft EIR will also incorporate the alternatives and other CEQA considerations described in Task 7 (below). It is envisioned that the City's initial review of the document will consider content, accuracy, validity of assumptions, classification of impacts, feasibility of mitigation measures, and alternatives analyses. Because the impacts and mitigations are subject to revision based on staff review of the Administrative Draft EIR, the Executive Summary will be prepared only for the Screencheck Draft. The following task descriptions summarize the data to be collected, impact assessment methodologies to be used, and types of mitigation measures to be considered, by environmental issue.

Project Description

The revised draft of the Project Description was submitted to the City and Project Sponsor as part of Task 2, above. The second draft of the Project Description will be included in the Administrative Draft EIR. This will include revisions to the Project Description based on comments from the City and Project Sponsor on the first draft. ICF will also incorporate the data needs responses from the City and Project Sponsor into this draft of the Project Description.

Issues Anticipated to be Less Than Significant

To streamline the EIR process, ICF will "scope out" some environmental topics that do not require detailed discussion in the EIR. These topics will not be evaluated at the level of detail specified for the issues below, but at a level adequate to fully assess the potential effects. This discussion will be presented in the Impacts Found to be Less Than Significant chapter of the EIR.

Based on our preliminary review, the following environmental topics may be scoped out from detailed analysis in the EIR.

- **Agricultural and Forestry Resources.** ICF will describe existing conditions at the Project site, identify General Plan designation and zoning districts, and indicate lack of agricultural and forestry uses at the Project site.
- **Mineral Resources.** ICF will describe existing conditions at the Project site and identify the mineral resources zone classification for soils at the site. It is anticipated that the site does not contain significant mineral resources.
- **Wildfire.** The Project site is not located in or near state responsibility areas, or in an area classified as very high fire hazard severity zones.

Aesthetics

The ConnectMenlo EIR considers views to the Santa Cruz Mountain Range, views to the Bay, and views of the foothills as scenic vistas. The ConnectMenlo EIR determined that no publically accessible views of scenic resources would be blocked by the increasing height limits. The ConnectMenlo EIR determined that buildout in the area would not impact scenic vistas/resources, would not degrade the existing visual character of the area, and would not introduce a significant source of light and glare. The ConnectMenlo EIR conclusions relate to a wide geographic area; the conclusions in the EIR for the Project are anticipated to be consistent with the ConnectMenlo EIR.

The analysis will consider Project site-specific impacts and impacts as viewed from Willow Road, Bayfront Expressway, and the Bay Trail. Data needs to complete the section include massing studies/visual simulations, landscape plans, lighting plans, and building architectural styles. It is assumed that this information will be provided by the Project Sponsor. ICF will prepare the Aesthetics section of the EIR based on the information provided and will conduct the following tasks:

- Visit the Project site and surroundings to identify and photo-document existing visual character and quality conditions, views to and from the Project site, and other urban design features.
- Peer review the massing studies/visual simulations, landscape plans, lighting plans, and shadow diagrams provided by the Project Sponsor.
- Based on scenic resources and scenic vistas identified in ConnectMenlo and the Project Sponsor's massing studies, analyze potential adverse aesthetic effects resulting from the Project:
    - The surrounding scenic vista locations that could be affected by the proposed development include the Bay Trail, and the BCDC Public Shoreline Trail.

  - Scenic vistas in the immediate vicinity that could be affected include the tidal mudflats and marshes of the San Francisco Bay and the Santa Cruz Mountain Range.
  - Analyze potential adverse effects on scenic vistas from adjacent uses and other sensitive viewer locations.
- Review existing and proposed General Plan goals, policies, and programs related to visual quality to determine conflicts with any relevant plans and policies.
- Using the visual simulations and field observations, analyze whether the Project would conflict with applicable zoning and other regulations governing scenic quality due to grading, height, bulk, massing, architectural style, building materials, and other site alterations.
- Analyze lighting and glare impacts created by the proposed buildings, focusing on motorists on Bayfront Expressway and residents of the Belle Haven neighborhood.

Air Quality

ICF will compose the Air Quality section of the EIR using the quantitative and qualitative analyses to be provided by Ramboll (the Project Sponsor's consultant). ICF assumes that the CEQA Technical Analysis Documentation (Task A.14 [Tech Report] in Ramboll's scope of work) will contain sufficient information to complete the EIR section. ICF will conduct a peer review of the Technical Report to ensure that the data, analyses, and conclusions are valid.

In the setting section of the EIR, ICF will summarize meteorological and climatological data for the Project study area, as well as ambient air quality near the Project. Existing state and federal regulations, as well as the locations of sensitive receptors, will also be described. For the discussion of impacts, the analysis will be comprised of the following components:

- Consistency with the BAAQMD's 2017 Clean Air Plan
- Construction emissions inventory of criteria air pollutants
- Operational emissions inventory of criteria air pollutants
- Discussion of the health outcomes associated with the project's construction and operational criteria pollutant emissions.
- Construction health risk assessment based on the project's toxic air contaminants
- Operational health risk assessment based on the project's toxic air contaminants
- Localized carbon monoxide impact analysis
- Odor impact analysis
- Cumulative analysis of toxic air contaminants, carbon monoxide, and odor

As described in Ramboll's scope of work, ICF is assuming that each of the components above will be fully analyzed quantitatively or qualitatively, as applicable, with the results presented in the Tech Report. We are also assuming that the results in the Tech Report will include an analysis of the existing uses at the Project site and that the net effect of the Project will be clearly discernable (i.e., Project emissions – existing site emissions = net emissions). Based on the analysis results of the Tech Report, ICF will use the Bay Area Air Quality Management District's (BAAQMD) most recent CEQA Air Quality Guidelines to

evaluate project impacts. The ultimate determination of impact significance will be evaluated with respect to the BAAQMD CEQA Guidelines or other relevant agency guidance. In the EIR, we will describe the air quality thresholds used to identify significant impacts based on the BAAQMD's CEQA Guidelines and guidance provided by BAAQMD staff. The methodology write-up used to analyze Project impacts will be a high-level overview in the EIR section, and readers of the EIR will be referred to the detailed discussion of methods in the Tech Report, which will be included as an Appendix to the EIR.

In the event that the impact results of any of the components listed above would lead to significant impacts, ICF will review the mitigation recommended by Ramboll in the Tech Report. As discussed in the Ramboll scope of work, ICF will participate in discussions with Ramboll, the City, and the Project Sponsor as needed to determine appropriate, feasible mitigation. ICF also assumes that any revised analyses and/or results that would be needed for a mitigated analysis will be provided by Ramboll. If Project impacts cannot be mitigated by the recommended mitigation measures, ICF would report this conclusion in the EIR.

In addition to the tasks described above, ICF will also review the work products described in Ramboll's scope of work. We are assuming that Ramboll will submit relevant modeling files to ICF for Quality Assurance (QA) purposes, and that the relevant files will be suitable for an air quality expert to determine the overall modeling procedures. ICF will review the Methodology Documentation and Tech Report prepared by Ramboll and will provide input on these documents as applicable.

Biological Resources

The ConnectMenlo EIR determined that development could have an impact on special status species, sensitive habitats, migratory wildlife, and wetlands. ConnectMenlo Mitigation Measure BIO-1 requires that prior to individual project approval, project applicants shall prepare and submit project-specific baseline biological resources assessments on sites with features such as mature trees or unused structures that could support special-status species. The existing site is developed with buildings and surface parking lots. As such, natural biological resources are likely to be minimal. Nonetheless, the Project site is in close proximity to the Bay and the Don Edwards San Francisco Bay National Wildlife Refuge and could have an indirect impact on special-status species inhabiting these areas. In addition, buildings and trees currently exist on the campus, which could provide habitat for nesting birds and/or roosting bats. Consistent with the requirements in Mitigation Measure BIO-1, ICF's qualified biologists will conduct the following tasks:

- The Project Sponsor has conducted a baseline Biological Assessment. ICF will peer review the Biological Assessment and provide one round of comments in a memorandum. In addition to technical accuracy, ICF will verify whether the Biological Assessment is adequate for CEQA purposes. If necessary, an ICF biologist will visit the site to verify existing conditions. Once final, ICF will incorporate the Biological Assessment in the Setting section of the Biological Resources EIR chapter. It is assumed that the assessment will determine if any sensitive biological resources are present on the Project site and will include review of Menlo Park's heritage tree

ordinance, the California Department of Fish and Wildlife's Natural Diversity Database (CNDDB), the U.S. Fish and Wildlife Service's Special-Status Species Online Database, and the California Native Plant Society's online inventory. ICF will also conduct a site visit to aid in the peer review.

- Based on the Biological Assessment and site visit, ICF will evaluate the Project's effects on the identified biological resources, and recommend mitigation as warranted. Based on prior experience in the region, and the urban nature of the site, ICF anticipates that the prominent issues for the Project will be limited to nesting migratory birds, roosting bats, and protected trees, per the City of Menlo Park heritage tree ordinance. However, with the proximity of Ravenswood Slough, the Don Edwards San Francisco Bay National Wildlife Refuge, and the associated salt marsh habitat, ICF also will address the possibility that special-status species associated with this habitat could be affected by the Project.
- Per Mitigation Measure BIO-1, if sensitive biological resources are determined to be present, appropriate measures should be included in the Biological Assessment, such as preconstruction surveys, establishing no-disturbance zones during construction, and applying bird-safe building design practices and materials. ICF will incorporate the mitigation measures, as applicable.

Greenhouse Gas Emissions

As discussed above for Air Quality, ICF will compose the Greenhouse Gas Emissions section of the EIR using the quantitative and qualitative analyses to be provided by Ramboll. ICF assumes that the CEQA Technical Analysis Documentation (Task A.14 [Tech Report] of Ramboll's scope of work) will contain sufficient information to complete the EIR section.

In the setting section of the EIR, ICF will summarize the GHGs of greatest concern, including carbon dioxide (CO_2), methane (CH_4) and nitrous oxide (N_2O) that directly and indirectly result from the proposed project. The project setting will describe these pollutants and their relationship to global climate change. ICF will include information on applicable federal, state, and local goals, policies, and regulations adopted to reduce GHG emissions. ICF will use the BAAQMD's most recent CEQA Air Quality Guidelines to evaluate Project impacts. For the discussion of impacts, the analysis will be comprised of the following components:

- Construction emissions inventory
- Operational emissions inventory
- Greenhouse gas consistency analysis with applicable plans and regulations

As described in Ramboll's scope of work, ICF is assuming that each of the components above will be fully analyzed quantitatively or qualitatively, as applicable, with the results presented in the Tech Report. We are also assuming that the results in the Tech Report will include an analysis of the existing uses at the Project site and that the net effect of the Project will be clearly discernable (i.e. project emissions – existing site emissions = net emissions). As discussed in Ramboll's scope of work, Ramboll will prepare a memorandum that summarizes the available BAAQMD thresholds and presents alternative GHG

thresholds that respond to recent court cases and are based on local conditions. ICF will review the memorandum prepared by Ramboll and will evaluate the findings of their memo.

ICF notes that the BAAQMD's current CEQA Guidelines that include operational GHG thresholds for land use development and stationary source projects are tailored to the state's 2020 GHG reduction goal, and therefore may not be appropriate to evaluate project-level emissions generated after 2020. BAAQMD is currently working on an update to their CEQA Guidelines, which is expected to include GHG thresholds to project-level GHG emissions relative to the state's post-2020 GHG reduction targets. Because the regulatory environment for GHG emissions is evolving, the significant threshold(s) for evaluating the operational GHG impacts for the Project will be finalized at the time of analysis preparation. The ultimate threshold(s) will be selected in coordination with BAAQMD, the City, and Ramboll, and consider all applicable case law and air district and expert agency guidance. ICF will use the GHG threshold(s) to evaluate the Project's significance based on the considerations above, which may or may not be consistent with the findings of Ramboll's memorandum.

ICF expects that because the decision on the appropriate GHG threshold to be used will be developed in concert with the Project Sponsor, City, and Ramboll, all parties will ultimately be in agreement on the appropriate approach. ICF will also review the consistency table to be provided by Ramboll that outlines the Project's consistency with applicable regulations, plans, policies, etc. ICF will provide feedback on this consistency on this analysis as applicable.

The methodology write-up used to analyze Project impacts will be a high-level overview in the EIR section, and readers of the EIR will be referred to the detailed discussion of methods in the Tech Report, which will be included as an Appendix to the EIR.

In the event that the impact results of any of the components listed above would lead to significant impacts, ICF will review the mitigation recommended by Ramboll in the Tech Report. As discussed in the Ramboll scope of work, ICF will participate in discussions with Ramboll, the City, and the Project Sponsor as needed to determine appropriate mitigation. ICF also assumes that any revised analyses and/or results that would be needed for a mitigated analysis will be provided by Ramboll. If Project impacts cannot be mitigated by the recommended mitigation measures, ICF would report this conclusion in the EIR.

In addition to the tasks described above, ICF will also review the work products described in Ramboll's scope of work. We are assuming that Ramboll will submit relevant modeling files to ICF for Quality Assurance (QA) purposes, and that the relevant files will be suitable for an air quality expert to determine the overall modeling procedures. ICF will review the Methodology Documentation and Tech Report prepared by Ramboll and will provide input on these documents as applicable.

Cultural and Tribal Resources

ICF will prepare the Cultural Resources section of the EIR and will conduct the following tasks:

- Where applicable, ICF will use information presented in the ConnectMenlo EIR in the Cultural Resources analysis.
- It is ICF's understanding that an Archeology Report is being prepared by the Project Sponsor. Therefore, ICF's senior archaeologist will peer review the archaeological technical report prepared for the Project to assess whether there are any substantive data gaps or items that require additional clarification as well as assess the report for CEQA adequacy. ICF will provide comments in the form of a memorandum, and participate in up to two one-hour teleconference calls to discuss the technical report with the client and/or their archaeological consultant. ICF will also conduct a site visit to aid in the peer review. Once the Archeology Report is considered final, ICF will incorporate it into the EIR and include mitigation measures, as applicable.
- This scope of work assumes that the Archeology Report conducted by the Project Sponsor will include an updated records search at the Northwest Information Center (NWIC). As needed, ICF can conduct records searches and archival research, if not included in the Archeology Report, to identify any previously documented cultural resources and cultural resources studies that have previously occurred within the vicinity of the Project site. ICF will review historic maps, ethnographic literature, and any related documents on-file with the City.
- The Project would demolish all 21 buildings at the Project site, which includes a mix of office, research and development (R&D), and warehousing uses. Of these, five buildings are 45 years or older. Per ConnectMenlo Mitigation Measure CULT-1 and best practices for built environment resource evaluation, ICF will prepare State of California, Department of Parks and Recreation (DPR) 523 Form A and B forms for the five properties that are 45 years or older. The DPR forms will document the eligibility of the properties under California Register of Historical Resources (CRHR) and the National Register of Historic Places (NRHP) criteria. Each DPR form set will include a detailed description of the respective property, construction history, sketch map, historic context, and an evaluation of the property for listing under CRHR/NRHP criteria. Archival research and pedestrian survey will inform the documentation of current conditions of the properties and the significance evaluations in the DPR forms. This scope assumes that the buildings will be found to not be historic resources. If it is determined that these buildings are historic resources, then a revised scope of work and budget amendment will be needed to complete the work.
- ICF will contact the California Native American Heritage Commission and interested Native American Representatives to help identify any locations of concern to the local Native American community. The results of this review will be integrated into the EIR. If requested by the City, ICF will assist with the City's outreach to Native Americans in accordance with the project's AB-52 and SB-18 obligations. Assistance will include writing correspondence on behalf of the city, tracking and compiling correspondence, and identifying critical path items that arise as a result of the correspondence, including consultation. The results of this correspondence will be integrated into the project's EIR and ICF will analyze whether the Project would cause a substantial adverse change in the significance of a tribal resource

- Pursuant to ConnectMenlo Mitigation Measure CULT-1, the Cultural Resources section of the EIR will summarize the historic context of the Project site, methods employed in the documentation and evaluation of built environment resources, and CRHR evaluations documented in the DPR form sets. If it is determined that any building within the Project site is a historical resource, ICF will prepare a scope amendment to incorporate appropriate mitigation measures in the EIR.

Energy Resources

ICF will use the quantitative energy values for building energy (electricity and natural gas) and transportation fuel (construction and operational equipment/vehicles) provided by Ramboll, as part of their air quality and greenhouse gas analyses. ICF will make a determination as to whether the Project would result in the inefficient, wasteful, or unnecessary consumption of energy pursuant to Appendix G of the CEQA Guidelines. ICF will also evaluate whether the Project would conflict with or obstruct a state or local plan for renewable energy or energy efficiency. The review of Ramboll's energy resources calculations is included in the Air Quality and Greenhouse Gas scopes, above.

Geology/Soils

The ConnectMenlo EIR found impacts related to geology and soils to be less than significant. ICF will use the discussion and findings in the ConnectMenlo EIR, but supplement the analysis with site-specific information. Based on the ConnectMenlo EIR technical information received for the Project site, ICF will prepare the Geology/Soils section of the EIR and will conduct the following tasks:

- Obtain the Geotechnical Report from the Project Sponsor and review.
- Evaluate the geohazard risks from development at the Project site, using the Geotechnical Report, available geologic and/or soils maps, published literature, and other information, reports, and/or plans. The main issue that will be analyzed is the seismic and geotechnical safety of the proposed buildings.
- Assess potential geohazard impacts of the Project in light of existing regulations and policies that would serve to minimize potential impacts. Pertinent regulatory requirements, as outlined in ConnectMenlo, will be identified so that the nexus between regulations and minimized impacts is apparent. In general, construction of development similar to the Project has little or no effect on the geology of an area, but is still subject to seismic ground shaking and local soil conditions, including ground oscillation and long-term and differential settlement.
- ICF will also consider impacts on paleontological resources and human remains. Standard mitigation measures, as outlined in the ConnectMenlo EIR, will be identified.

Hazards and Hazardous Materials

This scope assumes that a Phase I Environmental Site Assessment (ESA) will be provided to ICF. Based on the information in the Phase I ESA, ICF will conduct the following tasks:

- Describe applicable federal, state, and local regulations and how these regulations apply to the Project and reduce the potential for impact. Information in the ConnectMenlo EIR will be used, as appropriate.
- Identify potential exposure to hazardous materials or waste during construction activities and during long-term operation at the Project site. Demolition of the existing structures could potentially result in the release of hazardous materials (asbestos or lead-based paint). ICF will consider this in the analysis.
- Evaluate potential public health risks at the site from groundwater and soil contamination from prior land uses. In addition, the analysis will focus on any potentially poor hazardous materials "housekeeping" practices at the site or from nearby uses. This information will be augmented by the Phase I ESA. The Project site is not listed as a hazardous materials site. However, according to the ConnectMenlo EIR, an open hazardous materials site listed on EnviroStor is located at 990 O'Brien Drive, to the south of the Project site. In addition, in 2017, a site at 1010 O'Brien Drive, also to the south of the Project site, was listed as an open cleanup program site on GeoTracker. ICF will consider this in the analysis.
- Include a discussion of the potential hazardous materials that could be used during the operation of the Project and any potential releases of these materials.
- Include a discussion of the potential public health risk from exposure to hazardous building components in the structures to be demolished at the Project site (e.g., asbestos, PCBs, etc.). Our scope does not assume the preparation of a quantitative health risk from hazards and hazardous materials.
- As needed, the Project will be required to comply with ConnectMenlo Mitigation Measure HAZ-4a and HAZ-4b which require a project-specific Environmental Site Management Plan and a vapor intrusion assessment, respectively. As necessary, compliance with these mitigation measures will be described in the EIR.
- Consider how the Project could interfere with an adopted emergency response plan and/or the airport land use plan for the Palo Alto Airport.

Hydrology/Water Quality

Based on technical information received from the Project Sponsor (such as a hydrology/drainage report), ICF will prepare the Hydrology/Water Quality section of the EIR and will conduct the following tasks:

- Describe the existing regulatory environment at the local, state, and federal levels, including, but not limited to, the Construction General Permit, Municipal Regional Permit for stormwater discharges (including how the project relates to C.3 requirements), the City of Menlo Park Municipal Code, and the California Building Code. ICF will incorporate information from ConnectMenlo, as applicable. These regulations require specific measures for reducing potential impacts on hydrology and water quality as well as from flooding.

- Assess potential Project hydrology and water quality impacts in light of existing regulations and policies that would serve to minimize potential impacts. Pertinent regulatory requirements will be explicitly identified so that the nexus between regulations and minimized impacts is apparent.
- Per ConnectMenlo EIR, each new development project is required, as part of the CEQA process, to demonstrate that stormwater runoff from the site would not result in an increase from pre-development flows. ICF will discuss compliance with these requirements.
- Discuss sea level rise and evaluate future flooding scenarios.

Land Use

Land use and planning analysis generally considers division of an established community and consistency of a proposed project with relevant local land use policies that have been adopted with the intent to mitigate or avoid an environmental effect. With respect to land use conflicts, the magnitude of these impacts depends on how a proposed project affects the existing development pattern, development intensity, traffic circulation, noise, and visual setting in the immediately surrounding area, which are generally discussed in the respective sections. However, per the ConnnectMenlo EIR (Mitigation Measure LU-2), all proposed development is required to demonstrate consistency with the applicable goals, policies, and programs in the General Plan and supporting zoning standards. Therefore, ICF will conduct the following tasks:

- The ConnectMenlo EIR considered the compatibility of the proposed land uses and zoning with current onsite and offsite development. The EIR will reiterate the findings of the ConnectMenlo EIR; it is not anticipated that further land use compatibility discussion will be needed.
- Tiering from the discussion in the Impact LU-1 in the ConnectMenlo EIR, describe the Project's potential to divide an established community highlighting any site-specific features that were not already considered in the ConnectMenlo analysis.
- For applicable plans other than the General Plan and zoning standards, a policy consistency analysis (only for policy conflicts that could result in environmental impacts) will be conducted and will focus only on those Project features that differ from what was considered in the ConnectMenlo EIR since that analysis did a comprehensive policy consistency analysis. The EIR will, however, evaluate the Project against relevant General Plan (including ConnectMenlo) policies and supporting zoning standards, in accordance with Mitigation Measure LU-2.

Noise

ICF will prepare a noise and vibration impact analysis that employs standard noise and vibration modeling techniques consistent with the requirements of the City of Menlo Park General Plan Noise Element and noise section of the City's municipal code. As appropriate, data and analyses from the General Plan Update effort as well as the ConnectMenlo EIR can be used to complete this chapter of the EIR.

Primary noise sources in the Project vicinity include local and regional roadway traffic on nearby roads, including Bayfront Expressway and Willow Road. Noise-sensitive receptors in the Project vicinity include residential uses located directly across Willow Road to the west of the Project site. Other sensitive

receptors could be identified during the screening process. Due to the development intensity at the Project site, the Project would be expected to result in greater noise levels compared to existing conditions.

The discussion of construction noise and vibration impacts will rely on the analysis in the ConnectMenlo EIR, and will include applicable mitigation measures from that EIR that would be required for the Project. Therefore, construction noise (ConnectMenlo Mitigation Measure NOISE-1c), construction vibration (ConnectMenlo Mitigation Measure NOISE-2a), and potential noise impacts to future on-site land uses (ConnectMenlo Mitigation Measures NOISE-1a and NOISE-1b) will be mitigated through the application of relevant mitigation measures. If desired by the City, ICF can prepare the specific vibration analysis required by Mitigation Measures NOISE-2a and NOISE-2b and/or the acoustical study for future on-site uses required by Mitigation Measure NOISE-1a during the CEQA process for integration into the EIR. If desired, our scope and budget will be modified accordingly.

ICF will address the following key noise issues:

- Exposure of existing noise sensitive land uses to Project-related changes in traffic noise. Although the Project was considered in the ConnectMenlo EIR, the access points for vehicles have changed. In addition, the Project was not analyzed in the ConnectMenlo EIR at the Project level (only cumulative traffic noise impacts of all expected future projects were discussed). As a result, traffic noise for roadway segments in the Project vicinity will need to be analyzed based on new Project-specific traffic numbers.
- Exposure of existing noise sensitive land uses to operational noise from the Project site (mechanical equipment, parking lots, loading docks, etc.).

Although one noise measurement for the ConnectMenlo EIR is located adjacent to the Project site, additional noise measurements would help to characterize the existing noise environment in the Project area for a proposed development of this size. Existing noise levels in the Project area will be characterized based on noise monitoring to be conducted at selected locations and traffic noise modeling, as follows:

- It is anticipated that short-term (15 minutes or less) noise monitoring will be conducted at up to two locations in the Project area. Continuous long-term monitoring (24 hours or more) will be conducted at up to two locations in the Project area.
- Existing traffic noise conditions in the Project area will be modeled using the FHWA Traffic Noise Model (TNM) version 2.5 and traffic data to be provided by the Project traffic engineer.

Traffic noise will be evaluated under the conditions analyzed in the Transportation section, which should include: Existing, Near Term Conditions, Near Term + Project Conditions, and Cumulative with and without the Project. Traffic noise along as many as 10 roadway segments will be modeled. The significance of traffic noise impacts will be evaluated using significance thresholds established based on

applicable City noise standards. Where significant impacts are identified, mitigation measures to reduce impacts will be identified.

Impacts on adjacent uses from noise generated by facility operation including a possible on-site co-generation plant, loading docks, parking lots, and mechanical equipment will be evaluated using standard acoustical modeling methods and operational data provided by the Project Sponsor. The significance of noise impacts will be evaluated using the significance thresholds. Where significant impacts are identified, mitigation measures to reduce impacts, as feasible, will be identified.

Population/Housing

Due to the Settlement Agreement with East Palo Alto, the increase in the number of employees anticipated at the site from the ConnectMenlo EIR, and the public interest in this topic, ICF proposes to do a full analysis of potential impacts to population and housing. The Project would include office, retail, and hotel uses, which would generate new employees at the Project site. In addition, the Project would include approximately 1,735 housing units, directly increasing the population in the City consistent with growth planned in Connect Menlo. ICF will analyze the impact of the increase in employees and residents. The Population and Housing chapter of the EIR will examine the Project's effect on population and housing in the City, and to a lesser extent, the region. This analysis will focus on the increase in population and the secondary effects associated with housing needed to accommodate the increased employment that would result from the Project. ICF, with assistance from Keyser Marston Associates (KMA), will undertake the following tasks:

- ICF will obtain additional information from the Project Sponsor, including the number of existing employees at the Project site and the assumptions for how many employees could also live at the proposed housing, if available.
- A Housing Needs Assessment (HNA) will be prepared by Keyser Marston Associates (Attachment B). ICF will work closely with the KMA throughout the process and will peer review the HNA and incorporate the findings into the analysis.
- Discuss the housing effect resulting from the Project in the context with the Association of Bay Area Governments (ABAG) regional household forecasts and fair share housing allocations.
- ICF will evaluate the direct population impacts from the proposed housing at the Project site.
- Similar to other job intensive projects, the EIR will examine the secondary housing demands based on future residential patterns for Project employees.
- One of the key terms of the Settlement Agreement between the City of Menlo Park and the City of East Palo Alto is that an HNA will be prepared when the preparation of an EIR is required. As required by the Settlement Agreement, the HNA prepared for the Project will include an analysis of the multiplier effect for indirect and induced employment to the extent possible.

Public Services and Recreation

It is ICF's understanding that the population increases associated with the Project site as assumed in the ConnectMenlo EIR may be less than what is now anticipated. Thus, ICF proposes to not tier from the

ConnectMenlo EIR and conduct a full analysis for the impacts to public services and utilities since the magnitude of impacts could be greater than what was previously disclosed. Based on information received from various service providers, ICF will prepare the Public Services section of the EIR. BAE will conduct an FIA (Attachment C) and ICF will coordinate the FIA findings with the Public Services section to ensure that we are efficient in our requests for information from the public service providers. As appropriate, ICF will utilize existing data gathered as part of the ConnectMenlo EIR. ICF will conduct the following tasks:

- As necessary, send public service questionnaires to the City's police department, community services department, library, fire district, and the school district to determine current service levels and capacity to serve increased demand. For efficiency, ICF will coordinate these questionnaires with BAE.
- Estimate Project-generated demand for public services based on existing operational standards obtained from the service providers. Other measures of demand will also be considered, such as the projected increase in the calls for service and the projected demand of recreational facilities and library services. ICF will consider the direct impacts from the residents living at the Project site and the secondary effects of adding to the residential population due to employment growth.
- In accordance with CEQA, evaluate the extent to which Project demands would trigger the need for new public facilities whose construction might result in physical environmental effects.

Transportation

The scope of work for the Transportation analysis is included as Attachment A (Hexagon). Note that the appropriate standards for the transportation analysis will be identified at a later time, based on the legal requirements.

Utilities/Service Systems

As appropriate, the ConnectMenlo EIR will be summarized. However, the EIR will evaluate the site-specific nature of certain utilities such as storm drain and wastewater infrastructure. The Utilities/Services Systems section of the EIR will examine the Project's effect on water supply, wastewater treatment, storm drainage, solid waste disposal, telecommunications facilities, and energy generation and transmission. Information for these analyses is expected to come from the Project Sponsor and the City. Per discussions with the Project Sponsor, ICF will assume a Code-compliant project for a conservative analysis. Based on technical information for the Project site, and information received from the utility providers, ICF will prepare the Utilities/Service Systems section of the EIR and will conduct the following tasks:

- Discuss applicable regulations at the local, state, and federal level, using the ConnectMenlo EIR where applicable.
- Peer review utilities data prepared by the Project Sponsor for adequacy and use in the EIR.
- ICF assumes the City will require a Water Supply Assessment for the Project. ICF will peer review the WSA which will be provided by the City and incorporate the WSA into the analysis.

- Describe existing utility providers, system capacity, and improvement plans, using the ConnectMenlo EIR where applicable.
- Evaluate the net change in the demand for water, wastewater, storm drainage, solid waste, telecommunications, and energy, relative to existing and planned capacity for the utilities and using the ConnectMenlo EIR where applicable.
- Discuss whether Project impacts would require the expansion or construction of new infrastructure or facilities.
- Include a discussion of fuel and energy consumption pursuant to Appendix F of the CEQA Guidelines.

Deliverables

- Five hard copies of Administrative Draft EIR
- One electronic copy of Administrative Draft EIR in MS Word
- One electronic copy of Administrative Draft EIR in Adobe PDF format

Task 6. Project Variants

The Project could include additional and/or alternative access to/from the Project site, along with other onsite features than currently proposed. All potential variants to the Project will be analyzed as a separate chapter in the EIR. As needed, the analysis will be quantitative; however, this scope and budget assumes that the variants would not be analyzed at the same level as detail as the Project.

- **Increased Housing Variant.** A maximum of 2,000 dwelling units could be constructed at the Project Site, as permitted with the density bonus. The EIR will analyze the development of up to 1,735 housing units as part of the Project, but to provide development flexibility, a variant will be analyzed to include the construction and operation of up to 2,000 units.
- **Decreased Housing Variant**. A minimum of 1,500 units, as required by the development agreement for the Facebook Expansion Project, would be analyzed in order to provide development flexibility.
- **Hamilton Realignment.** Hamilton Avenue could be realigned at the intersection with Willow Road. ICF would consider the environmental impacts associated with the construction of the realignment. In addition, as a result of the realignment, an existing gas station would need to be relocated across the street. ICF would analyze the environmental impacts associated with demolition and construction of a gas station. For purposes of this analysis, it is assumed that the replacement gas station would be the same size as existing; therefore, operational impacts would not be considered since there would be no change compared to existing conditions.
- **Willow Road/Dumbarton Rail Corridor Crossing.** A grade-separate crossing is proposed for bicycles, pedestrians, and campus trams. It is currently unknown whether this proposed crossing would be above or below grade. The EIR will analyze one of the options as part of the Project, while the other option will be analyzed in the Variants chapter.

- **Recycled Water.** It is currently unknown whether the recycled water system would be used at the Project site only, or if it should be a public utility. The onsite system will be analyzed as part of the Project, while the system as a public utility would be analyzed in the Variants chapter.
- **Others.** Other potential variants could include different programming for the proposed park and community amenities.

Task 7. Project Alternatives and Other CEQA Considerations

The purpose of this task is to complete drafts of the remaining sections (Alternatives and Other CEQA Considerations) of the EIR for City staff review. This task involves preparation of other required sections examining particular aspects of the Project's effects and the identification and comparison of Project alternatives.

Other CEQA Considerations

This task involves documenting unavoidable adverse impacts, growth-inducing effects, and cumulative effects of the Project:

- The unavoidable effects will be summarized from analyses performed in Task 6.
- Growth-inducing effects will be based on economic multipliers for the proposed uses, as well as comparisons with ABAG projections for the City. Growth inducement will be discussed in the context of population increases, utility and public services demands, infrastructure, and land use. Effects associated with increased housing demand in the City and region will be discussed.
- Cumulative effects where relevant will be addressed in Task 6 and summarized as part of this section of the EIR. The future projects in the vicinity of the Project site will be considered as they relate to potential cumulative impacts. This scope assumes the City will help develop the approach for analyzing cumulative effects, typically a combination of using the General Plan and a list of reasonably foreseeable planned projects.

Alternatives

The alternatives to the Project must serve to substantially reduce impacts identified for the Project while feasibly attaining most of the Project objectives. ICF assumes that one Reduced Project Alternative will be quantitatively analyzed and will be based on a sensitivity analysis to reduce identified impacts, unless the Project Sponsor has a preferred alternative. The No Project Alternative will also be analyzed. Up to two additional alternatives could be developed by ICF, the City, and/or the Project Sponsor and evaluated qualitatively. This scope assumes that the City/Project Sponsor will provide justification for dismissing offsite alternatives and other alternatives considered but rejected.

Deliverables

- Other CEQA Considerations chapter to be submitted with Administrative Draft EIR
- Alternatives chapter to be submitted with Administrative Draft EIR

Task 8. Screencheck Draft

The purpose of this task is to prepare the Screencheck Draft EIR for City staff review. ICF will prepare a Screencheck Draft EIR to respond to the City's and Project Sponsor's comments on the Administrative Draft EIR. This scope assumes that comments from multiple reviewers will be consolidated with any conflicting comments resolved, and that comments do not result in substantial revisions or additional analyses. The Screencheck Draft EIR will include an Executive Summary section, which will summarize the Project Description, impacts and mitigations, and alternatives. Impacts and mitigations will be presented in a table that identifies each impact, its significance, and proposed mitigation as well as the level of significance following adoption for the mitigation measures.

Deliverables

- Five hard copies of Screencheck Draft EIR
- Electronic copies of Screencheck Draft EIR in MS Word and Adobe PDF format

Task 9. Public Draft EIR

The purpose of this task is to prepare and submit the Draft EIR to the City for distribution to the public. ICF will revise the Screencheck Draft to incorporate modifications identified by the City. The revised document will be a Draft EIR, fully in compliance with State CEQA Guidelines and City guidelines, and will be circulated among the public agencies and the general public as well as specific individuals, organizations, and agencies expressing an interest in receiving the document. During this task, ICF will also compile the appendices that will be distributed with the Draft EIR and produce a version of the full document that can be uploaded onto the City's website. ICF will also prepare a Notice of Completion (NOC) to accompany the copies that must be sent to the State Clearinghouse. This scope of work and budget assumes that ICF will send the required documents to the State Clearinghouse and that the City will distribute the Draft EIRs to all other recipients.

Once the City has been notified of the intent to pursue AB 900 certification, ICF will concurrently prepare the Administrative Record. In addition, ICF will show compliance with AB 900 requirements regarding the posting on the City's website.

Deliverables

- Thirty-five hard copies of the Draft EIR with appendices in CDs
- Electronic copies of the Draft EIR in MS Word and in Adobe PDF format
- Notice of Completion
- Fifteen hard copies of the Executive Summary, along with 15 electronic copies of the entire Draft EIR on CD, for the State Clearinghouse
- One electronic copy of the Draft EIR Administrative Record, pursuant to AB 900.

City Involvement

Review the Notice of Completion. Prepare and file the Notice of Availability with the County Clerk. Distribute the NOA and Draft EIRs (other than to the State Clearinghouse), and handle any additional noticing (e.g., newspaper, posting at site).

Task 10. Public Review and Hearing

The City will provide a 45-day review period during which the public will have an opportunity to review and comment on the Draft EIR. During the 45-day review period, the City will hold a public hearing to receive comments on the Draft EIR. ICF key team members will attend and participate as requested. This scope of work assumes the preparation of meeting materials (e.g., PowerPoint presentations and handouts) but does not assume the labor needed to provide meeting transcript/minutes.

Task 11. Draft Responses to Comments and Administrative Final EIR

The purpose of this task is to prepare responses to the comments received on the Draft EIR and incorporate these responses into an Administrative Final EIR for City review. The Administrative Final EIR will include:

- Comments received on the Draft EIR, including a list of all commenters and the full comment letters and public meeting transcripts with individual comments marked and numbered;
- Responses to all comments; and
- Revisions to the Draft EIR in errata format as necessary in response to comments.

All substantive comments for each written and oral comment will be reviewed, bracketed, and coded for a response. Prior to preparing responses, ICF will meet with staff to review the comments and suggest strategies for preparing responses. This step is desirable to ensure that all substantive comments are being addressed and that the appropriate level of response will be prepared. This scope of work and budget assumes ICF will prepare responses for up to 100 substantive discrete, non-repeating comments and will coordinate integrating the responses prepared by other consultants. However, the number and content of public comments is unknown at this time. Therefore, following the close of the Draft EIR public review period and receipt of all public comments, ICF will meet with the City to revisit the budget associated with this effort to determine if additional hours are needed. Very roughly, each additional substantive discrete comment may cost an additional $350.

Frequently raised comments of a substantive nature may be responded to in a Master Response, which allows for a comprehensive response to be presented upfront for all interested commenters. ICF will identify and recommend possible Master Reponses for City consideration during the initial meeting to discuss strategies for preparing responses.

Following the strategy session, ICF will prepare Master Responses (as appropriate) and individual responses to the bracketed and coded comments. Individual responses to each comment letter will be placed immediately after the comment letter. As necessary, responses may indicate text revisions, in addition to clarifications and explanations. All text changes stemming from the responses to the

comments, as well as those suggested by City staff, will be compiled into an errata included as part of the Final EIR.

Following City's review of the Administrative Final EIR, ICF will address all comments received and prepare a Screencheck Final EIR for City review to ensure that all comments on the Draft were adequately addressed.

Deliverables

- Five hard copies of the Administrative Final EIR
- Electronic copies Administrative Final EIR in MS Word and in Adobe PDF format
- Five hard copies of the Screencheck Final EIR
- Electronic copies of the Screencheck Final EIR in MS Word and in Adobe PDF format

Task 12. Screencheck and Final EIR

Based on comments received from City staff, the Screencheck Responses to Comments will be revised and appropriate revisions to the Draft EIR will be noted. This scope assumes that comments from multiple reviewers will be consolidated with any conflicting comments resolved, and that comments do not result in substantial revisions or additional analyses. The Final EIR will then consist of the Draft EIR and the Responses to Comments document. Revisions to the Draft EIR will be presented as a separate chapter in the Final EIR. The revised Responses to Comments document will be submitted to the City for discussion by the Planning Commission and subsequent certification by the City Council.

Deliverables

- Twenty hard copies of the Final EIR with appendices in CDs
- Electronic copies of the Final EIR in MS Word and Adobe PDF format

Task 13. Certification Hearings, MMRP, Statement of Overriding Considerations, and Final Administrative Record

The purpose of this task is to attend meetings to certify the EIR. Team members will attend and participate in up to two meetings to certify the EIR. If requested by City staff, ICF will present the conclusions of the EIR and a summary of the comments and responses.

As part of this task, ICF will also prepare a draft and final MMRP for the Project, as required by Section 15097 of the State CEQA Guidelines. The MMRP will be in a tabular format and include:

- The mitigation measures to be implemented
- The entity responsible for implementing a particular measure
- The entity responsible for verifying that a particular measure has been completed
- A monitoring milestone(s) or action(s) to mark implementation/completion of the mitigation measure

ICF will prepare the Statement of Overriding Considerations pursuant to Section 15093 of the CEQA Guidelines, if required based on the impacts of the Project. CEQA requires the decision-making agency to balance the economic, legal, social, and technological benefits of a proposed project against its unavoidable environmental impacts. The Statement of Overriding Considerations includes the specific reasons to support its action based on the Final EIR and other information in the record.

ICF will also compile the Administrative Record, assembling background documents as well as correspondence or telephone notes that are cited as sources in the EIR.

Deliverables

- Electronic copies of the Draft MMRP in MS Word and Adobe PDF format
- Five hard copies of the Final MMRP
- Electronic copies of the Final MMRP in MS Word and Adobe PDF format
- Electronic copies of the Draft Statement of Overriding Considerations in MS Word and Adobe PDF format
- Electronic copies of the Final Statement of Overriding Considerations
- One electronic copy (on CD or DVD) of the final Administrative Record

C. Cost

The cost estimate to implement Phase II of the EIR is $1,113,858 as detailed in Attachment D.

HEXAGON TRANSPORTATION CONSULTANTS, INC.

June 26, 2019

Ms. Kirsten Chapman
ICF
201 Mission Street, Suite 1500
San Francisco, CA 94105

Re: Proposal to Prepare a Transportation Impact Analysis for the Proposed Willow Village Project in Menlo Park, CA.

Dear Ms. Chapman:

Hexagon Transportation Consultants, Inc. is pleased to submit this proposal to prepare a Transportation Impact Analysis (TIA) for the proposed Willow Village project in Menlo Park, CA. The approximately 59-acre project site is bounded to the north by the Dumbarton rail corridor, to the south by the Hetch Hetchy right-of-way and Mid-Peninsula High School, Willow Road to the west and existing life science complex to the east. The project proposes to demolish the existing approximately one million s.f. of industrial/office/warehouse buildings on site and build a mixed-use development including approximately 1,735 residential units, 125,000 to 200,000 s.f. of retail (non-office commercial) uses, a 200- to 250-room hotel and a 1.75 million s.f. office campus. A variant project description increasing the residential component to up to 2,000 units (as permitted with the density bonus) is being considered. Another variant where the project will include no less than 1,500 residential units (in order to comply with the Development Agreement for the Facebook Expansion Project) is also being considered.

Site access to the project site would be provided by three intersections on Willow Road (at Hamilton Avenue, and two new driveways south of Hamilton Avenue), a new intersection on O'Brien Drive at the southeast corner of the project site, and Adams Court. A variant to re-align the Hamilton Avenue intersection is also being considered.

Scope of Services

The purpose of the traffic study is to satisfy the requirements of the City of Menlo Park and the City/County Associations of Governments (C/CAG) Congestion Management Program (CMP). The traffic analysis will include an analysis of weekday AM and PM peak-hour traffic conditions and will determine the traffic impacts of the proposed project on 49 key intersections, 20 freeway segments and 8 freeway ramps in the vicinity of the site. The study will also analyze 10 roadways segments for Average Annual Daily Traffic (AADT) analysis. All internal intersections and driveways proposed on the project site (approximately 20 intersections/driveways based on the February 8, 2019 site plan) will also be evaluated. The external intersections, freeway segments and freeway ramps that we propose to study are identified below.

Study Intersections

1. Marsh Road & Bayfront Expressway [CMP]
2. Marsh Road & US 101 Northbound Off-Ramp
3. Marsh Road & US 101 Southbound Off-Ramp
4. Marsh Road & Scott Drive
5. Marsh Road & Bohannon Drive/Florence Street

6. Marsh Road & Bay Road
7. Marsh Road & Middlefield Road [Atherton]
8. Chrysler Drive & Bayfront Expressway
9. Chilco Street & Bayfront Expressway
10. MPK 21 Driveway (west) & Bayfront Expressway
11. MPK 20 Driveway (east) & Bayfront Expressway
12. Chrysler Drive & Constitution Drive
13. Chilco Street & Constitution Drive/MPK 22 Driveway (unsignalized)
14. Chilco Street & Hamilton Avenue (unsignalized)
15. Ravenswood Avenue & Middlefield Road
16. Ringwood Avenue & Middlefield Road
17. Willow Road & Bayfront Expressway [CMP]
18. Willow Road & Hamilton Avenue
19. Willow Road & North Street (future intersection)
20. Willow Road & Park Street (future intersection)
21. Willow Road & Ivy Drive
22. Willow Road & O'Brien Drive
23. Willow Road & Newbridge Street [East Palo Alto]
24. Willow Road & US 101 Northbound Ramps [East Palo Alto]
25. Willow Road & US 101 Southbound Ramps
26. Willow Road & Bay Road
27. Willow Road & Hospital Plaza/Durham Street
28. Willow Road & Coleman Avenue
29. Willow Road & Gilbert Avenue
30. Willow Road & Middlefield Road
31. O'Brien Drive/Loop Road & Main Street/O'Brien Drive (future intersection)
32. O'Brien Drive & Kavanaugh Drive (unsignalized)
33. Adams Drive & Adams Court (unsignalized)
34. Adams Drive & O'Brien Drive (unsignalized)
35. University Avenue & Bayfront Expressway [CMP]
36. University Avenue & Purdue Avenue (unsignalized)
37. University Avenue & Adams Drive (unsignalized) [East Palo Alto]
38. University Avenue & O'Brien Drive [East Palo Alto]
39. University Avenue & Kavanaugh Drive/Notre Dame Avenue [East Palo Alto]
40. University Avenue & Bay Road [East Palo Alto]
41. University Avenue & Runnymede Street [East Palo Alto]
42. University Avenue & Bell Street [East Palo Alto]
43. University Avenue & Donohoe Street [East Palo Alto]
44. US 101 Northbound Off-Ramp & Donohoe Street [East Palo Alto]
45. Cooley Avenue & Donohoe Street [East Palo Alto]
46. University Avenue & US 101 Southbound Ramps [East Palo Alto]
47. University Avenue & Woodland Avenue [East Palo Alto]
48. University Avenue & Middlefield Road [Palo Alto]
49. Lytton Avenue & Middlefield Road [Palo Alto]

Note: This proposal includes budget to study a few additional intersections if necessary.

CMP Roadway Segments

San Mateo County:

- SR 84 – 4 CMP segments between Alameda de las Pulgas and Alameda County Line
- US 101 – 2 CMP segments between SR 92 and Santa Clara County Line
- SR 109 – 1 CMP segment between Kavanaugh Drive and SR 84
- SR 114 – 1 CMP segment between US 101 and SR 84

Santa Clara County:

- US 101 – 8 CMP segments between Embarcadero Road and SR 85

Alameda County

- SR 84 – 4 CMP segments between San Mateo County Line and I-880

Freeway Ramps

- US 101/Marsh Road Interchange – 2 ramps
- US 101/Willow Road Interchange – 4 ramps
- US 101/University Avenue Interchange – 2 ramps

Roadway Segments for AADT Analysis

Minor Arterials

1. Willow Road, north of Durham Street [Avenue – Mixed Use]
2. Willow Road, north of Blackburn Avenue [Avenue – Mixed Use]
3. Middlefield Road, west of Willow Road [Avenue – Mixed Use]
4. Middlefield Road, east of Willow Road [Avenue – Mixed Use]

Collectors

5. Marsh Road, north of Bohannon Drive [Mixed Use Collector]
6. Hamilton Avenue, east of Madera Avenue [Neighborhood Collector]
7. O'Brien Drive, east of Willow Road [Mixed Use Collector]
8. O'Brien Drive, west of University Avenue [Mixed Use Collector]
9. Adams Drive, west of University Avenue [Mixed use Collector]
10. Bay Road, west of Willow Road [Neighborhood Collector]

It should be noted that Hexagon has prepared an interim proposal for this project to collect travel time data on Willow Road and conduct field observations for approximately 30 to 35 intersections. The interim proposal has a budget of $16,000. These tasks will not be repeated in the scope below and will not be reflected in this proposal's budget or schedule breakdowns.

The tasks to be included in this proposal are:

1. ***Site Reconnaissance***. The physical characteristics of the site and the surrounding roadway network will be reviewed to identify existing roadway cross-sections, intersection lane configurations, traffic control devices, and surrounding land uses.

2. ***Observation of Existing Traffic Conditions in the Study Area.*** Existing traffic conditions will be observed in the field in order to identify any operational deficiencies and to confirm the accuracy of calculated levels of service. This task includes conducting field observations for the remaining approximately 20 study intersections not covered by the interim proposal.

3. ***Data Collection***. It is assumed that intersection counts at all study intersections and AADT counts at all 10 study roadway segments will be provided by City staff. This task does not include conducting additional counts. Freeway segment traffic counts will be obtained from the latest Congestion Management Program (CMP) monitoring report.

4. ***Evaluation of Existing Conditions***. Existing traffic conditions will be evaluated based on existing traffic volumes at the study intersections. Study intersections within each jurisdiction will be evaluated using the jurisdiction's approved software and analysis methodologies. Due to the close proximity of the intersections at University Avenue and Donohoe Street, at US 101 Northbound Off-Ramp and Donohoe Street and at University Avenue and US 101 Southbound Ramps, these three intersections will be analyzed using the Synchro/SimTraffic software using the latest micro-simulation model built for the University Avenue corridor.

5. ***Willow Road Simulation.*** Hexagon proposes to develop a micro-simulation model of all study intersections along Willow Road north of Durham Street using the City-preferred simulation software (SimTraffic 10). The micro-simulation model will simulate travel of individual vehicles and pedestrians along the corridor and will allow us to generate a visual animation of the existing traffic operations. Separate simulation models will be developed for the AM and PM peak hours. In order to closely simulate existing conditions, it is assumed that City staff and Caltrans staff will provide detailed signal timing plans as inputs into the simulation model. Hexagon will utilize the collected travel time data (outlined in the interim proposal) and field observations to calibrate the model to closely represent existing traffic operations. The progression analysis will be run for existing conditions as well as for each fully studied scenario.

   Hexagon will report LOS results from Vistro for intersections along Willow Road that are being analyzed using simulation models. To ensure consistency, Vistro parameters at each intersection under each scenario will be adjusted so the Vistro results and the simulation results are consistent. Hexagon will prepare an initial technical memorandum summarizing our simulation calibration methodology and results for existing conditions. Upon receiving City approval on the existing simulation model, Hexagon will provide subsequent memorandums documenting all parameter adjustments made to the Vistro file. Separate memorandums will be provided for existing and existing project conditions, background and background project conditions, cumulative and cumulative plus project conditions, and cumulative with Dumbarton conditions (if needed). Impact discussions for each project scenario will begin only after receiving City approval on the respective technical memorandum documenting the Vistro parameter adjustments.

6. ***Model Validation***. Hexagon will start with the ConnectMenlo model to be provided by the City. It is assumed that the land use data for existing conditions is relatively up to date and would not require modifications. It is assumed that the model is set up to run daily, AM and PM 4-hour trip assignments, and that it includes most of the study intersections. The model network will be updated to ensure any study intersections not included in the model are also coded. We will check the model validation for the study area, and we will make adjustments to model parameters to get a good match with traffic counts. Because the model will be running 4-hour trip assignments but traffic counts are only 2-hour counts, additional 24-hour roadway traffic counts within or near Menlo Park will be needed to validate the model and derive conversion factors for the intersection counts. Hexagon will provide a list of up to 25 street segments where daily roadway traffic counts are needed. It is assumed that City will provide Hexagon with the counts. We will expect the City to critically evaluate the land use data in the ConnectMenlo model and advise Hexagon about any necessary changes to reflect current existing conditions. Hexagon will input the land use data into the model files. Hexagon will prepare a memorandum documenting our assumptions, inputs and adjustments to the model as well as the validation results.

7. ***Future Land Use Data.*** Hexagon will rely on the City to provide land use data for the future scenarios, which include Background and Cumulative (2040). The Background scenario will include projects that have been approved and may be under construction but not yet occupied. For zones outside of Menlo Park, Hexagon will use the existing model data for year 2025 for Background conditions. The 2040 scenario will use the current model's 2040 land use data set, except as modified by the City in Menlo Park. This task budget includes some time for Hexagon to assist City staff with allocating development into the model's zones and land use categories.

8. ***Trip Generation***. Hexagon will prepare trip generation estimates for the project using various sources. For the Office District, Hexagon will rely on data to be supplied by the project applicant based on driveway counts and in-house mode-split data. For other uses in the project (residential and retail), Hexagon will use ITE trip generation rates. Hexagon will rely on input from the City/project applicant regarding the different land use categories (for the non-residential and office components) and the amount of development in each land use category for trip generation purposes. For internal and any transit-oriented reductions, Hexagon will run the MXD model and derive appropriate trip reductions. Trips generated by existing uses on site will be credited using ITE trip generation rates.

   Hexagon will run the travel demand forecasting model to determine the trip distribution pattern for the project. It is assumed that a detailed site plan including parking management plan will be provided by the applicant. This information is needed for trip assignment assumptions. Hexagon will prepare a memo with the trip generation estimates and trip assignment pattern for review and approval by City staff prior to completing the following tasks. This task will be completed for only the main project description.

9. ***Background Scenarios.*** Hexagon will run the travel forecasting model to produce link-level and intersection turning movement forecasts for the study intersections and freeway segments. The model will be used to produce 4-hour forecasts. Hexagon will convert the 4-hour link forecasts into forecasts of peak-hour intersection turning movements. Hexagon will produce model forecasts both with and without the project. Hexagon will also produce forecasts of vehicle miles traveled (VMT). Model forecasts for the two residential variants

will be analyzed and documented in the same fashion. This task will be completed for only the main project description.

10. ***Cumulative (2040) Scenarios***. In the same fashion as Task 9, Hexagon will produce year 2040 forecasts with and without the project. Hexagon will work with City staff to identify the transportation network to be used in the Cumulative scenario, and potentially include a scenario that includes rail service in the Dumbarton corridor. Hexagon will work with the City to determine how to analyze a Dumbarton scenario. This task will be completed for only the main project description.

11. ***Intersection Analysis.*** For all background, cumulative and Dumbarton scenarios with and without the project, Hexagon will evaluate intersection levels of service using adjusted model forecast volumes. Intersection impacts will be identified by comparing the project scenarios to the without-project scenarios in accordance with the appropriate jurisdiction's adopted significant impact criteria. For intersections analyzed using the micro-simulation models, this task assumes adjustments to signal timing and corridor coordination under the without-project scenarios. The adjustments will be made based on several key measures of effectiveness (i.e. travel time, stops, queues, etc.) to be determined in coordination with City staff. The with-project scenarios will use the same models as the without-project models. This task will be completed for only the main project description.

12. ***Intersection Variant Analysis.*** It is our understanding that the project applicant is considering a variant scheme at the Willow Road and Hamilton Avenue intersection. This variant scheme would realign Hamilton Avenue south of the current Chevron gas station. As a result, the current signalized intersection at Willow Road and Hamilton Avenue would be moved south by about 200 feet. Under this scheme, the original Hamilton Avenue site access point will become a right-in-right-out only access point. Hexagon will conduct intersection level of service analysis under all project scenarios at these two intersections using the simulation model. The evaluation will include reassigning traffic volumes at these two intersections as necessary. This task will be completed for only the main project description.

13. ***Freeway Analysis.*** For all background and cumulative scenarios with and without the project, freeway levels of service will be evaluated using adjusted model forecast volumes. Freeway impacts will be identified by comparing the project scenarios to the without-project scenarios in accordance with the appropriate jurisdiction's adopted significant impact criteria. This task will be completed for only the main project description.

14. ***Freeway Ramp Analysis***. The freeway ramp analysis will consist of a volume-to-capacity analysis of the study freeway ramps under all study scenarios. Hexagon will conduct field observations at existing on-ramps with ramp meters to determine the existing ramp meter rates and queuing. Queuing at the study on-ramps will be analyzed under background and background plus project scenarios assuming the same ramp meter rates. Freeway ramp analysis will be presented only for information. This task will be completed for only the main project description.

15. ***Roadway AADT Analysis.*** For all background and cumulative scenarios with and without the project, Hexagon will evaluate the project impacts on roadway AADT using adjusted model forecast volumes. Impacts will be identified by comparing the project scenarios to

the without-project scenarios in accordance with the appropriate jurisdiction's adopted significant impact criteria. This task will be completed for only the main project description.

16. ***Signal Warrant Analysis.*** The need for future signalization of the unsignalized study intersections will be evaluated on the basis of the Peak Hour Warrant (Warrant 3 – Part B) in the *California Manual on Uniform Traffic Control Devices*. The warrant will be evaluated using peak-hour volumes for all study scenarios. This task will be completed for only the main project description.

17. ***Alternative Metrics***. This task provides a budget allowance for Hexagon to calculate other potential transportation metrics. These could include travel time and speed, mode split, transit ridership, or others. This task could also be used to test different mitigation strategies such as congestion pricing, trip caps, parking charges, or others. This task will be completed for only the main project description.

18. ***Project Alternatives.*** Hexagon will estimate the trip generation of project alternatives for reporting in the EIR. Estimates will be done using ITE trip rates and the MXD model. This task does not include running the travel forecasting model for the project alternatives. Hexagon will qualitatively discuss whether the potential project impacts would differ as a result of the different land use alternatives. This discussion will be based off only the impact conclusions of the main project description. This task assumes analyzing up to four project alternatives. Two of the project alternatives will be the increased residential variant (up to 2,000 units) and the decreased residential variant (no less than 1,500 units). It is envisioned that the two residential variants will be analyzed in greater detail than the other two project alternatives budgeted in this task, but the level of analysis required for the two residential variants is unknown at this time. Therefore, this task assumes up to 80 hours of Hexagon staff time.

19. ***Sensitivity Analysis.*** Hexagon will conduct a qualitative sensitivity analysis to determine the extent to which the project would need to be modified to eliminate all significant intersection and freeway impacts. This task will be completed for only the main project description.

20. ***Phasing Analysis.*** It is our understanding that the project is anticipated to be completed in three phases. Hexagon will conduct a trip generation analysis to estimate the project trips after completion of each phase. Hexagon will provide a qualitative discussion of the intersection and freeway impacts expected during the two interim phases. This task will be completed for only the main project description.

21. ***Internal Intersection Analysis.*** Hexagon will conduct an operations analysis of the proposed internal roadway network. This task will be completed for only the main project description. This analysis will include intersection levels of service analysis using the Vistro software. Intersection controls will be assumed as proposed. For proposed unsignalized intersections, a signal warrant analysis will be conducted in accordance with Task 16. A queueing analysis will also be conducted to determine the need, and if so length of turn pockets, as well as to identify any potential spillback issues.

    For the variant scheme, it is expected that traffic operations at the four internal intersection on West Street and on Main Street at Hamilton Avenue and at North Street will be affected. The intersection levels of service analysis, queuing analysis and potential signal warrant analysis will be evaluated just for these four intersections under the variant scheme.

22. ***Site Plan Review.*** A review of the project site plan will be performed to determine the overall adequacy of the site access and on-site circulation in accordance with generally accepted traffic engineering standards and to identify and access or circulation issues that should be improved.

    Hexagon will also review any proposed bus/shuttle routes on site for site access and site circulation. Proposed bus/shuttle stops will be reviewed to determine potential circulation issues. This task will be completed for only the main project description.

23. ***Parking and Peer Review of Shared Parking Analysis.*** Parking will be evaluated relative to the City of Menlo Park parking requirements. It is our understanding that a shared parking analysis will be prepared by the project applicant. This task includes two rounds of peer review of the shared parking analysis (one round of review for the draft and one round of review for the final report). This task will be completed for only the main project description.

24. ***Evaluation of Vehicle Queuing.*** For selected locations where the project would add a significant number of left-turning vehicles, the adequacy of existing/planned storage at turn pockets will be assessed by means of comparison with expected maximum vehicle queues. Vehicle queues will be estimated using a Poisson probability distribution. This task will be completed for only the main project description.

25. ***Bicycle, Pedestrian, and Transit Facilities***. A qualitative analysis of the project's effect on transit service in the area and on bicycle and pedestrian circulation in the study area will be included in the traffic report. This includes sidewalks, bicycle lanes, and amenities to promote the safe use of alternate modes of transportation, and connections to the existing bicycle and pedestrian network. The analysis will consider the project's proposed elements with respect to the City's currently adopted Bicycle Plan and Sidewalk Master Plan as well as the Transportation Master Plan currently in development. This task will be completed for only the main project description.

26. ***Peer Review of TDM Plan.*** Hexagon will conduct a comprehensive peer review of the applicant-provided Transportation Demand Management (TDM) Plan. Hexagon will summarize our comments in a draft memorandum and will respond to one round of comments from City of Menlo Park and ICF and prepare a final memorandum. This task also includes a peer review of the Final TDM Plan. This task will be completed for only the main project description.

27. ***Description of Impacts and Recommendations***. Based on the results of the level of service calculations, impacts of the site-generated traffic will be identified and described. Recommendations will be formulated that identify the locations and types of improvements or modifications necessary to mitigate significant near-term or long-range project impacts. Potential secondary impacts associated with any proposed improvements will be discussed as well. Hexagon will also determine whether the requirement of specific TDM measures could mitigate project impacts. This task will be completed for only the main project description.

28. ***C/CAG Checklist.*** For developments generating over 100 net peak hour trips, the San Mateo County CMP require the completion of a C/CAG checklist. Hexagon will prepare the required C/CAG checklist based on the final TDM Plan provided by the project applicant. This task will be completed for only the main project description.

29. ***Meetings***. The fee estimate includes Hexagon staff attendance at ten meeting in connection with the project. It also includes Hexagon staff attendance at four public hearings in connection with the project.

30. ***Reports***. Hexagon will prepare the Transportation chapter of the EIR as well as a stand-alone TIA report. The TIA report will include all analysis included in the Transportation chapter of the EIR and will include other non-CEQA related analysis. The TIA report will serve as the technical appendix to the Transportation chapter of the EIR This task includes preparation of two rounds of the Administrative Draft and one round of the Draft Transportation Chapter and TIA. Hexagon will respond to editorial comments on each round of the reports from both City staff and ICF. It is assumed that ICF will provide the outline of the format to be used for the EIR Transportation Chapter.

31. ***Final EIR.*** Hexagon will respond in writing to comments received on the Draft EIR Transportation Chapter. As it is unknown at this time the level of effort required in responding to these comments, this task assumes up to 80 hours of Hexagon staff time.

Additional Services

Any work not specified in the above Scope of Work Tasks 1-31 – for example analyzing a different project description, reviewing a different site plan, analyzing additional intersections, or conducting progression analysis for other corridors – shall be considered additional services. Additional services will require additional budget and additional time and will be conducted upon receipt of authorization to proceed.

Time of Performance

Barring any unforeseen delays, an administrative Transportation Chapter and the technical appendix will be submitted approximately 30 weeks after: (1) authorization to proceed, (2) receipt of all required data (such as new count data, model's land use input assumptions, and project related information), and (3) field observations. It should be noted that the field observations included in this proposal cannot be conducted until school resumes in September. Upon receiving budget authorization, Hexagon will provide a detailed schedule outlining a list of milestones needed to maintain the 32-week schedule.

Cost of Services

The fee for the scope of services will be based on time and expenses up to a maximum budget of $367,000.

We appreciate your consideration of Hexagon Transportation Consultants for this assignment. If you have any questions, please do not hesitate to call.

Sincerely,
HEXAGON TRANSPORTATION CONSULTANTS, INC.

KEYSER MARSTON ASSOCIATES
ADVISORS IN PUBLIC/PRIVATE REAL ESTATE DEVELOPMENT

August 1, 2019

Erin Efner and Kirsten Chapman
ICF International
201 Mission Street, Suite 1500
San Francisco, CA 94105

Re: Proposed Scope of Services to Prepare a Housing Needs Assessment for the Willow Village Master Plan

Dear Ms. Efner and Ms. Chapman:

Keyser Marston Associates, Inc. ("KMA") is pleased to present the enclosed proposed scope of services to prepare a Housing Needs Assessment ("HNA") for the City of Menlo Park addressing the proposed Willow Village Master Plan Project ("Project"). The Project is a mixed-use development encompassing up to 1,735 units of housing, 1.75 million square feet of office space, 250 hotel rooms, up to 200,000 square feet of retail, as well as parks and open space. The Project replaces the existing Menlo Science and Technology Park encompassing approximately 1 million square feet of existing office, R&D and warehouse space in 21 separate buildings.

KMA is exceptionally well qualified to prepare the HNA for the Project based on our broad expertise preparing housing impact studies and project-specific housing needs analyses. Our HNA experience includes three prior projects in Menlo Park: Menlo Gateway, the Facebook Campus, and the Facebook Campus Expansion Project. KMA is also currently engaged in preparation of HNAs for several additional development projects in Menlo Park.

The enclosed HNA scope of services includes preparation of an HNA addressing, to the extent possible, the following housing-related impacts of the proposed Project:

- Housing need by affordability level for on-site workers;
- Estimated geographic distribution of housing needs by jurisdiction; and
- Evaluation of the potential impacts on the regional housing market, including in connection with potential multiplier effects, and the degree to which the Project may contribute to rising housing costs and displacement of existing residents of lower income communities in the local area.

We understand that the HNA must be prepared consistent with the terms of the recent settlement agreement between the City of East Palo Alto and Menlo Park. The enclosed scope of service is designed to provide the analyses contemplated by the settlement agreement. However, we would be happy to discuss potential refinements to the scope of services and budget to ensure the HNA addresses the City's needs and satisfies the intent of the agreement with East Palo Alto.

The scope of services and proposed budget for the HNA is enclosed as Attachment A. The HNA will provide similar analyses to the other HNAs KMA is currently engaged to prepare but will need to address the added complexity associated with the larger scale, greater range of non-residential uses, inclusion of a significant housing component, and analyses related to removal of the existing Menlo Science and Technology Park.

Please let me know if you have any questions or comments regarding this proposed scope of services.

Sincerely,

KEYSER MARSTON ASSOCIATES, INC.

David Doezema

Attachment A: Scope of Services
Attachment B: KMA Rate Schedule

Attachment A
Scope of Services to Prepare a Housing Needs Assessment (HNA)
for the Willow Village Master Plan Project

The following scope of services is for preparation of a Housing Needs Assessment (HNA) addressing the Willow Village Master Plan Project ("Project"). The HNA will address the following major housing-related topics, to the extent possible:

1) Housing need by affordability level for on-site Project workers;

2) Estimated geographic distribution of housing needs by jurisdiction; and

3) Evaluation of potential impacts of the Project on the regional housing market and the degree to which the Project may contribute to rising housing costs and displacement of existing residents of lower income communities in the local area. The analysis of housing market effects will include, to the extent possible, consideration of the potential "multiplier effect" for indirect and induced employment by the Project.

These housing-related impacts are not required to be analyzed under CEQA but may be of interest to decision-makers and/or the public in evaluating the merits of the Project. These analyses are being provided consistent with the terms of a 2017 settlement agreement with the City of East Palo Alto. The pertinent paragraph from the 2017 settlement agreement states the following:

> *When the preparation of an EIR is required pursuant to this Agreement, concurrent with the preparation of the EIR, Menlo Park or East Palo Alto, whichever is the lead agency for the Development Project, will conduct a Housing Needs Assessment ("HNA"). The scope of the HNA will, to the extent possible, include an analysis of the multiplier effect for indirect and induced employment by that Development Project and its relationship to the regional housing market and displacement. Nothing in this section indicates an agreement that such an analysis is required by CEQA.*

Task 1 – Project Initiation and Data Collection

The purpose of this task is to identify the availability of data necessary to complete the HNA, identify key analysis inputs and assumptions, and refine the approach to the assignment. As part of this task, KMA will:

(1) Provide a list of data needs to complete the HNA and work with ICF International and the City's project team as necessary to gather the necessary data.

(2) Meet with City staff, its consultants, and the project sponsor team to: (a) discuss data and analysis alternatives (b) review technical methodology and approach (c) discuss and agree on schedule.

Task 2 – Housing Needs Assessment for On-Site Workers

KMA will quantify, by affordability level, the net new housing demand associated with on-site workers at the Project. The analysis will quantify total housing demand based on the estimated number of employees added by the Project (which are net new jobs in the region) and household size ratios developed from Census data. Employee compensation levels are estimated by linking generic occupational categories with local data on compensation levels. Employee compensation levels are then translated into housing need by affordability level using published income limits and accounting for the fact that households have more than one worker on average.

The primary data sources we will use for this component of the analysis are:

1. Data on occupations by industry from the Bureau of Labor Statistics. KMA will select the industry categories (or blend multiple categories) to represent each non-residential component of the Project.

2. Current employee compensation data specific to San Mateo County for the relevant occupational categories from the California Employment Development Department will be used in the analysis.

Each project component will need to be analyzed separately to address differences in compensation structure. In addition, existing housing needs associated with the Menlo Science and Technology Park will need to be analyzed to establish the net new housing demand considering removal of this existing use.

KMA has prepared similar analyses for other projects in Menlo Park including the existing Facebook Campus, the Facebook Campus Expansion Project, and the Menlo Gateway Project. We have also performed project-specific housing needs analyses for commercial and institutional development proposals in the cities of San Carlos, Palo Alto, Redwood City, and Napa County. Some of these analyses have been performed using employee occupation and compensation data provided by the applicant and some have been performed using generic data as is assumed in this proposal. KMA has also prepared affordable housing nexus fee studies in many cities and has developed a methodology to perform the nexus analyses using local, state and federal data sources. KMA has refined the nexus analysis methodology over the years and now has considerable experience adapting it to specific development projects.

The result of this task will be the estimated number of net new employee households, by affordability level, who will need housing within daily commute distance.

Task 3 – Net Housing Need Considering 1,735 Added Housing Units

In this task, KMA will take the 1,735 added housing units into consideration through completion of the following analyses:

a. *Housing Supply Addition by Income Level* – The 1,735 units to be added to the housing supply by the Project will be summarized based on the income level applicable to the proposed market rate and below market rate (BMR) affordable units. The income level for market rate units will utilize rent estimates provided by the applicant or will be estimated by KMA based on an analysis of rental market data. The income level for the BMR units will reflect City requirements.

b. *Off-site Jobs Supported by Residential – D*evelopment of new residential units adds to the demand for services such as retail, restaurants, healthcare and education. Some of these services will be met through on-site retail, while others may be met at off-site establishments. KMA will prepare an analysis to estimate housing demand by income for workers associated with off-site services to residential units. The analysis will utilize the most current data available and will follow a series of steps linking the estimated incomes of residents living in the new units, their demand for goods and services estimated to be met off-site, the number of jobs associated with providing these off-site services, and the housing need by income level of the workers who fill those jobs. The analysis will adjust for non-local spending such as at on-line retailers. Multiplier effects will be considered as part of the analysis.

c. *Net Housing Demand / Supply Effect* – The net housing supply / demand effects will be computed by combining the findings of the above analyses with that of Task 2.

Task 4 – Analysis of Commuting and Geographic Distribution of Housing Needs

The prior tasks are to determine the total housing needs irrespective of where workers will live. This task develops information to help understand existing commute relationships and trends, and approaches to identifying how the total housing needs will be accommodated locally. KMA will analyze the commute relationships of existing jobs in Menlo Park and where job holders live (or commute from as a place of residence) using data from the U.S. Census. KMA will then apply the data to estimate Menlo Park's share of increased housing needs and the estimated distribution of housing needs throughout the region. KMA will incorporate any tenant-specific commute data for Facebook and / or the existing tenants of the Menlo Science and Technology Park to be removed, to the extent it can be provided.

Task 5 – Relationship to Regional Housing Market and Potential to Contribute to Displacement

This task is designed to provide an evaluation, to the extent possible, of the potential for the Project to influence housing prices and rents and contribute to displacement pressures in the local area. Lower income communities in the Bay Area have become increasingly vulnerable to displacement of existing residents. Employment growth, constrained housing production, and rising income inequality are among the factors that have contributed to increased displacement pressures, especially within lower income communities in locations accessible to employment centers where many households are housing-cost burdened.

Given the complex array of factors that influence housing markets and neighborhood change, precise estimates or projections of impacts and outcomes are not feasible; rather, the analysis will seek to provide information and context that will be useful to understanding the likely magnitude or range of potential impacts. The estimated local housing demand absorbed by the 1,735 units of additional housing, including required BMR affordable units, will be considered as part of the evaluation.

KMA will complete the following tasks to inform an evaluation of potential impacts:

a) *Historic Residential Real Estate trends* – KMA will assemble data on historic home sales and rental trends for the County, the Belle Haven Neighborhood, the City of East Palo Alto, and up to seven other comparison communities within the Bay Area. Selection of comparison communities will be based on areas that are considered vulnerable to displacement or undergoing displacement as the most relevant context for trends in East Palo Alto and Belle Haven. KMA will utilize data readily available from commercial data providers such as CoStar and CoreLogic.

b) *Comparative Analysis of Residential Real Estate Trends* – Residential real estate market trends in East Palo Alto and Menlo Park's Belle Haven neighborhood since the existing Facebook campus was first occupied will be compared to trends in the selected Bay Area comparison communities to inform an understanding of the extent to which localized market trends in the two communities diverged from other Bay Area locations since Facebook moved into its existing campus in 2011. This information will help inform an understanding of whether Facebook has had a localized impact on the housing market that is distinguishable from broader regional trends.

c) *Review of employment trends* – KMA will assemble data on historic employment trends for the same time frame as the historic review of real estate trends. Employment trends data will be distinguished by compensation level so that growth in higher-income and lower-income jobs can be separately understood. We will look at employment trends

across different geographic scales to enable relationships to be tested at the different geographic scales.

d) *Analysis of historic relationships* – KMA will analyze the extent to which employment growth and residential real estate trends have been correlated with one another. Separate findings specific to the influence of high compensation jobs will be provided as a proxy for consideration of the impacts associated with potential multiplier effects. These relationships will be drawn upon to provide context for understanding the degree of influence the Project may have on local home prices and rents.

e) *Estimated increased housing demand in East Palo Alto and Belle Haven* – KMA will draw on the commute shed data from Task 4 to describe the estimated share of new Project workers likely to seek and find housing in East Palo Alto and Belle Haven. The ability to isolate commute trends specific to Belle Haven will depend on the availability of commute data from the Project Sponsor.

KMA will discuss the likely impacts or range of impacts on displacement that could be experienced as a result of the Project based upon the information assembled in a) through e), above. Findings will be qualitative in nature but will reference the quantitative information assembled in the analysis tasks as part of the narrative.

Task 6 – Evaluation of Project Variants

The report will include a discussion of two Project variants regarding the number of added housing units, a 2,000-unit variant and a 1,500-unit variant. KMA will quantify the net impact on housing demand and supply for the Project variants consistent with Tasks 3 and 4. For the Task 5 analysis of displacement impacts, a limited qualitative discussion of Project variants will be provided.

Task 7 – Report Preparation

The methodology, data sources, results and implications of the HNA will be documented in a written report. This scope assumes one draft version of the report for review and one final report.

Task 8 – Coordination with DEIR Population and Housing Section

This task includes a time and materials budget allowance for review and coordination between the Population and Housing Section of the DEIR to be prepared by ICF and the HNA.

Task 9 – Responses to DEIR Comments

KMA anticipates assisting the City and ICF International in preparing responses to comments on the Draft EIR. KMA's focus will be on comments that are directly related to the HNA. We have included a time and materials budget allowance for KMA to assist with preparation of responses to comments.

Budget

KMA proposes to complete this scope of services for the Willow Village Master Plan Project on a time and materials basis for an amount not to exceed $105,500 per the estimate below. A copy of our current rate schedule is attached.

Task	Budget Estimate
Task 1 - Project Initiation and Data Collection	$4,000
Task 2 – Total Housing Need by Income, on-site workers	$22,000
Task 3 – Off-site jobs supported by residential and net new housing needs	$15,000
Task 4 – Geographic Distribution of Housing Needs	$4,000
Task 5 – Relationship to Regional Housing Market and Displacement	$27,000
Task 6 – Evaluation of Project Variants	$3,000
Task 7 – Report (Draft and Final)	$7,000
Task 8 – Coordination with DEIR Population and Housing Section	$1,500
Task 9 – T&M Allowance for DEIR responses to comments	$12,000
Meetings in Menlo Park (one in addition to kickoff)	$1,000
Public hearings (assume two)*	$4,000
Reimbursable Expenses (market data)	$5,000
Total	**$105,500**

* Includes related coordination and preparation.

Kirsten Chapman
Project Manager
ICF
201 Mission Street, Suite 1500
San Francisco, CA 94105

Dear Ms. Chapman:

We appreciate the opportunity to submit this proposal to prepare a Fiscal Impact Analysis for the Willow Village Master Plan in the Bayfront Area of Menlo Park ("Project"). Our understanding is that the Base Project would consist of a 59-acre mixed-use neighborhood with 1,735 housing units, 125,000 to 200,000 square feet of retail that would include a grocery store and pharmacy (and possibly entertainment uses), a 200- to 250-room hotel and ancillary uses, a 1.75 million square foot office campus with ancillary uses, and public parks and open space. A 10,000 square foot community center is planned adjacent to the public park. The City of Menlo Park ("client") requires a Fiscal Impact Analysis study that will address impacts to the City's General Fund, as well as Special Districts, including the Menlo Park Fire Protection District. In addition to an analysis of the fiscal impacts of the Base Project described above, the City of Menlo Park is requesting an analysis of two potential "Variants" of the Project: Variant 1, which would include up to 2,000 housing units, and Variant 2, which would include no less than 1,500 units.

BAE is an award-winning real estate economics and development advisory firm with a distinguished record of achievement over its 30+-year history. Headquartered in Berkeley, CA, BAE also has branch offices in Los Angeles, Sacramento, New York City, and Washington DC, enabling our 18 staff to contribute to and learn from best practices in urban sustainable development around the U.S. Our practice spans national and state policy studies to local strategic plans and public-private development projects. BAE has extensive experience assessing the fiscal impacts and economic impacts of proposed new development, including our previous work for the City of Menlo Park, as well as assisting local governments to negotiate for community benefits from proposed new development.

The following pages detail our proposed work program, schedule, and budget. This proposal remains effective for 90 days from the date of submittal of this letter. Please feel free to

contact me at stephaniehagar@bae1.com or 510.547.9380 if you have any questions or would like to further discuss this proposal.

Sincerely,

Stephanie Hagar
Vice President

SCOPE OF SERVICES

This section outlines BAE's proposed work program, including deliverables.

Task 1: Meet with City Staff and Review Background Materials

Task 1A: Meet with City Staff and Tour Project Site. BAE will meet with City staff to review the scope of services, proposed schedule, and deliverables. BAE will also tour the site and area.

Task 1B: Review Key Financial, Planning, and Environmental Documents. This task will include a review of relevant documents and plans pertaining to the proposed project including the Willow Village Project Description and Plans, the City's General Plan and Zoning Ordinance, the project Environmental Impact Report (if applicable), and City staff reports. BAE will also review the City budget, the Comprehensive Annual Financial Report, City fee ordinances, and other financial documents from the City and affected special districts including fire and school districts.

Task 2: Analyze Fiscal Impacts

This analysis will consider revenue and cost implications of the Project, up to three Project Alternatives, and two Project Variants for the City, Menlo Park Fire Protection District, and affected special districts and school districts. BAE understands that the Project Variants analyzed under this task will be the Variants that includes up to 2,000 dwelling units and the Variant that includes no less than 1,500 dwelling units. BAE has included a contingency budget in this proposal, which would enable additional analysis of the fiscal impacts of Project Variants if determined necessary. BAE will utilize and update prior FIA models prepared for the City of Menlo Park to conduct this analysis.

BAE will estimate annual General Fund revenue sources, including sales tax, property tax, transient occupancy tax, business license revenue, franchise fees, and any other applicable taxes. BAE will also estimate one-time revenue sources including impact fees and property transfer tax. For key revenues, (e.g., transient occupancy taxes) BAE will estimate revenues within an expected low to high range as appropriate.

BAE will estimate annual General Fund expense items, including police, public works, recreation and library services, and general government services, as well as services provided by special districts. The cost analysis will, whenever feasible, study the marginal cost of providing additional service. As part of this process, BAE will contact local public service providers including the police department and Fire Protection District to assess existing service capacity and the potential impact of the proposed project. For police, BAE will work with the local department to examine the current beat structure and discuss how this may need to be altered to serve the new development. Any new patrol officers and/or equipment

would also be analyzed on a marginal basis. For fire, BAE will study existing capacity at the station that would serve the proposed project and assess any additional labor or equipment costs that the station would incur. Cost impacts for other city departments and school districts will also be analyzed.

Fiscal impacts will be presented in current dollars on a net annual and cumulative basis over a 20-year period presented in constant 2019 dollars. To determine an appropriate absorption rate for the various proposed land uses, BAE will review the project applicant's anticipated absorption schedule.

During the preparation of the FIA, all communication with the project sponsor will be with or through City staff.

Task 3: Prepare Fiscal and Economic Impact Report

Task 3A: Prepare Administrative Draft Fiscal and Economic Impact Analysis Report. BAE will prepare and submit an Administrative Draft Fiscal Impact Analysis report to City staff. The report will include a concise and highly-accessible executive summary, including a summary of the methodology and key findings from Tasks 1 and 2.

Task 3B: Prepare Public Review and Final Draft Report. Staff will provide written a single set of consolidated comments to BAE regarding the Administrative Draft. At the discretion of City Staff, BAE will also review any comments from the Project Applicant. BAE will address all comments with City staff and make modifications as needed. BAE will then submit a draft Public Review Draft for staff to review. Staff will note any minor corrections and BAE will submit a Public Review Draft.

Task 3C: Prepare Presentation, Attend Two Meetings. This task includes preparation of a PowerPoint presentation for use by staff, BAE, and posting to the City's website. BAE will discuss comments with City staff and make changes as necessary. BAE will then submit a Final report. BAE will attend up to two meetings to present its findings, anticipated to be one Planning Commission meeting and one City Council meeting.

Task 4: Project Coordination

BAE will coordinate this assignment and participate in team conference calls with ICF, as necessary.

DATA NEEDS

In order to complete this analysis BAE will require access to various City and special district staff to conduct brief interviews and confirm methodologies and assumptions. In particular, BAE would intend to speak with most department/district heads, or their designees, as well as the City finance director. BAE would work with the finance department to obtain electronic copies of relevant budget files if any of the files needed for this analysis are not publicly available on the City's website.

BAE will acquire market, demographic, and other data from data vendors and publicly-accessible data sources. A budget for all data that BAE will purchase to undertake the above scope of work is included below.

From the project sponsor, BAE will request market studies and marketing plans, including pricing assumptions. If the project sponsor provides these studies and plans, BAE will use this information to supplement data from data vendors and publicly-accessible data sources to inform assumptions related to assessed property values as well as other revenue and cost assumptions, as appropriate. If the project sponsor does not provide market studies or marketing plans, BAE will rely on more general information provided by data vendors and publicly-available sources.

BUDGET AND FEES

BAE will complete the work described above for a fixed-fee budget of $35,800, or $39,050 including the proposed contingency budget, as shown in the budget provided below. BAE believes that it is prudent to include a contingency budget for this project given that there is little information currently available related to the Project Variants, and that it may be determined that analysis of the fiscal impacts of additional Project Variants is necessary as these Variants are defined over time. In no event shall BAE perform work under the contingency budget without prior written approval from City staff.

The budget shown below will include all consultant costs, including personnel, overhead, and miscellaneous reimbursable expenses. Miscellaneous expenses such as data purchase and travel are passed through to the client with no markup. This budget includes two public meetings as part of Task 3. Please note that attendance at additional public meetings/hearings is calculated at the rate of $1,500 for preparation, travel and up to three hours of meeting time, with hourly rates for all meeting time over three hours, as well as additional meetings beyond those set forth in the scope. In no event shall the total project cost exceed the fixed-fee budget, unless the client requests work beyond the agreed-upon scope.

	Hours by Staff			
	Principal Shiver	Vice President Hagar	Associate	
Hourly Rate	*$300*	*$210*	*$140*	**Budget**
Task 1: Start-up Meeting & Review of Background Materials	4	8	6	$3,720
Task 2: Conduct Fiscal Impact Analysis	6	31	66	$17,550
Task 3: Prepare Draft & Final FIA Reports (incl. 2 mtgs)	6	30	25	$11,600
Task 4: Project Coordination	1	3	0	$930
Subtotal Labor	17	72	97	**$33,800**
Expenses (a)				$2,000
Total (Labor + Expenses) before contingency				**$35,800**
Contingency (b)				$3,250
Total with Contingency				**$39,050**
Optional Task: BAE Attendance at Additional Public Meetings/Hearings - Each				**$1,500**

Notes:
(a) Includes purchase of Smith Travel Research data for hotel market trends, other data expenses, and mileage for meetings.
(b) Contingency budget will cover any unanticipated additions to BAE's scope of work, which could include analysis of additional Project Variants. BAE will use the contingency budget only if authorized by City staff for specific additions to BAE's scope of work.

Costs for any additional work authorized by the client will be billed on an hourly time-and-materials basis, in accordance with BAE's standard hourly billing rates:

Principal	$300/hour
Senior Advisor	$300/hour
Director	$235/hour
Vice President	$210/hour
Senior Associate	$185/hour
Associate	$140/hour
Sr. Analyst	$110/hour
Analyst	$95/hour

These rates are subject to revision on or after January 1, 2020.

PROJECT SCHEDULE

Assuming that BAE receives all requested data within the first two weeks following project start up, BAE will complete the Administrative Draft within eight weeks following project start up. BAE will prepare a Public Review Draft within two weeks of receiving a single set of combined written comments on the Administrative Draft. BAE will prepare a Final report within two weeks of receiving a single set of combined written comments on the Public Review Draft.

General Plan

Office. This designation provides for office and R&D uses, business-oriented community education and training facilities, supportive sales and personal services, corporate housing, and hotel uses. The designation also accommodates existing and new light-industrial uses that are not in conflict with existing or planned commercial or residential uses in the vicinity. Hotels are allowed as options in several locations. The maximum base FAR shall be 45 percent and the maximum bonus FAR with community amenities shall be 100 percent. Maximum FAR for corporate housing shall be 60 percent, for retail and service uses shall be 25 percent, and for hotels shall be 175 percent

Mixed Use Residential. This designation provides for higher density housing to meet the needs of all income levels. It also allows mixed use developments with integrated or stand-alone supportive sales and service uses, and uses that are consistent with the Office Designation. Sales uses can range from small-scale businesses that serve nearby employment to a large-format grocery to serve adjacent neighborhoods. This designation is intended to promote live/work/play environments oriented toward pedestrians, transit, and bicycle use, especially for commuting to nearby jobs. The maximum base residential density shall not exceed 30 units per acre, and the maximum bonus FAR is 100 units per acre. Maximum base FAR for residential uses shall be 90 percent, and a maximum of 225 percent for bonus FAR. Non-residential uses shall have a maximum base FAR of 15 percent and bonus FAR of 25 percent.

LEGEND

	BOTANIC NAME (COMMON NAME)	QUANTITY	SIZE	WUCOLS
	Existing Tree to Remain *Pinus canariensis* (Canary Island Pine)	23	-	-
	Alnus rhombifolia (White Alder)	10	48" box	High
	Arbutus 'Marina' (Marina Arbutus)	13	48" box	Low
	Magnolia grandiflora (Southern Magnolia)	21	48" box	Medium
	Pinus canariensis (Canary Island Pine)	33	48" box	Low
	Pistacia chinensis (Chinese Pistache)	2	48" box	Low
	Platanus x *acerifolia* 'Morton Circle' (Exclamation London Plane Tree)	118	48" box	Medium
	Platanus racemosa (California Sycamore)	53	48" box	Medium
	Ulmus parvifolia cv. (Chinese Elm)	38	48" box	Low
	Zelkova serrata cv. (Zelkova)	68	60" box	Medium
	Total Proposed Tree	356		

Note: Structural soil to be used under sidewalk and plaza adjoining street trees.

TREE VALUATION

QUANTITY	UNIT SIZE	UNIT VALUE	VALUE
0	#5	$ 100	$ -
55	#5	$ 200	$ 11,000
369	24" box	$ 400	$ 147,000
103	36" box	$ 1,200	$ 123,000
670	48" box	$ 5,000	$ 3,350,000
110	60" box	$ 7,000	$ 770,000
294	72" box	$ 10,000	$ 2,940,000
12	84" box	$ 12,000	$ 144,000
34	96" box	$ 15,000	$ 510,000
2	108" box	$ 17,000	$ 34,000
2	120" box	$ 20,000	$ 40,000
1,651			$ 8,070,000

Note: Current valuation includes all proposed trees within Willow Village, and excludes the publicly accessible park. Pending park design.

White Alder
Alnus rhombifolia

Marina Arbutus
Arbutus 'Marina'

Southern Magnolia
Magnolia grandiflora

Canary Island Pine
Pinus canariensis

Chinese Pistache
Pistacia chinensis

Exclamation London Plane Tree
Platanus x acerifolia 'Morton Circle'

California Sycamore
Platanus racemosa

Chinese Evergreen Elm
Ulmus parvifolia cv.

Zelkova
Zelkova serrata cv.

THE IRRIGATION VALVE SCHEDULE SHOWN ABOVE IS INTENDED TO BE USED AS A GUIDELINE ONLY AND INDICATES THE APPROXIMATE RUN TIMES IN MINUTES FOR EACH VALVE BASED ON ESTIMATED WEEKLY WATER REQUIREMENTS FOR ESTABLISHED PLANT MATERIAL. THE TIMES SHOWN ARE APPROXIMATE AND HAVE BEEN DEVELOPED FROM LOCAL AND CURRENT AVERAGES FOR EVAPOTRANSPIRATION, AND REFLECTIVE WATER REQUIREMENTS OF THE PLANT MATERIAL BASED ON PLANT TYPE AND THE APPROXIMATE PRECIPITATION OR APPLICATION RATES OF THE IRRIGATION SYSTEM TYPE. ACTUAL RUN TIMES MAY BE DIFFERENT DEPENDING ON A VARIETY OF FACTORS INCLUDING TOPOGRAPHY, SOIL STRUCTURE, SUN AND WIND EXPOSURE, WEATHER, ACTUAL PLANT WATER REQUIREMENTS, OVERALL PRECIPITATION RATE OF ZONE, ETC.

MAWA FORMULA
MAXIMUM APPLIED WATER ALLOWANCE (MAWA) GALLONS PER YEAR
MAWA = (ETo)(0.62)(LA x 0.45) + (0.55 x SLA)]

ETo = REFERENCE EVAPOTRANSPIRATION

0.45= ET ADJUSTMENT FACTOR

LA=LANDSCAPED AREA (SQUARE FEET)
0.62 = CONVERSION FACTOR (GALLONS/SQ.FT/YR)

ETWU FORMULA
ESTIMATED TOTAL WATER USE (ETWU) GALLONS PER YEAR
ETWU= (ETO)(.62)(ETAF x LA))

ETo = REFERENCE EVAPOTRANSPIRATION

PF = PLANT FACTOR FOR HYDROZONES

HA = HYDROZONE AREA (SQ.FT)
0.62 = CONVERSION FACTOR (GALLONS/SQ.FT/YR)

IE = IRRIGATION EFFICIENCY (0.81)-BUBBLER/DRIP

IE = IRRIGATION EFFICIENCY (0.75)-ROTORS/SPRAY

PLAN NOT TO SCALE

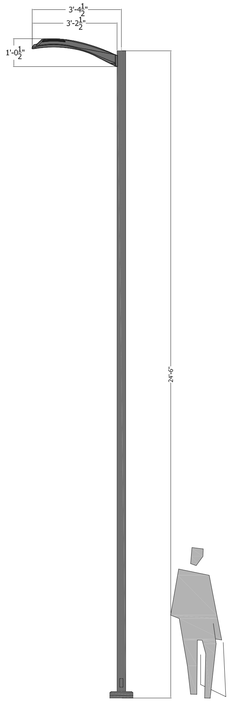
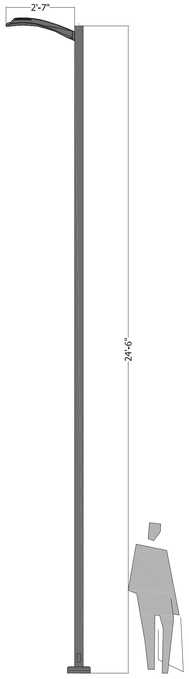
STERNBERG MILLENIA PROPOSED TYPOLOGIES



Type TMB- ML730 - At intersection

STREET COMPONENT

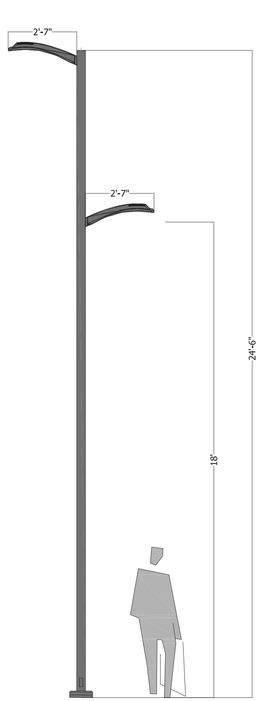
Fixture ordering code : Sternberg Millenia ML730-32L30T4-MDL018-SV1
Pole height : 25'
Fixture head size : 12"Hx20.5"Wx38"L
Wattage : 154w
Lumen package : 16,560 lm
Number of LEDs : 32L
Distribution : T4
Lens : SV1: (Flat Soft Vue Light Difused Acrylic)
Color Temperature : 3,000K
Driver : MDL018
Pole Finish : Black



Type TMA - ML630 - Typical streets

STREET COMPONENT

Fixture ordering code : Sternberg Millenia ML630-12L30T2-MDL018-SV1
Pole height : 18'
Fixture head size : 9"Hx16"Wx30"L
Wattage : 27 W
Lumen package : 2,990 lm
Number of LEDs : 32L
Distribution : T2
Lens : SV1: (Flat Soft Vue Light Difused Acrylic)
Color Temperature : 3,000K
Driver : MDL018
Pole Finish: Black



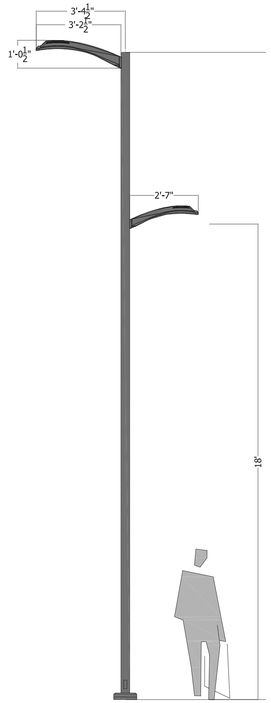
Type TMC - ML630 -Main street
+ ML630 - pedestrian on Main street

STREET COMPONENT (Type TMA)

Fixture ordering code : Sternberg Millenia - ML730-32L30T4-MDL018-SV1
Pole height : 25'
Fixture head size : 12"Hx20.5"Wx38"L
Wattage : 154w
Lumen package : 16,560 lm
Number of LEDs : 32L
Distribution : T4
Lens : SV1: (Flat Soft Vue Light Difused Acrylic)
Color Temperature : 3,000K
Driver : MDL018
Pole Finish: Black

PEDESTRIAN COMPONENT (Type TMA)

Fixture ordering code : Sternberg Millenia: ML630-12L30T2-MDL018-SV1
Pole height : 18'
Fixture head size : 9"Hx16"Wx30"L
Wattage : 27 W
Lumen package : 2,990 lm
Number of LEDs : 12L
Distribution : T2
Lens : SV1: (Flat Soft Vue Light Difused Acrylic)
Color Temperature : 3,000K
Driver : MDL018
Pole Color : Black



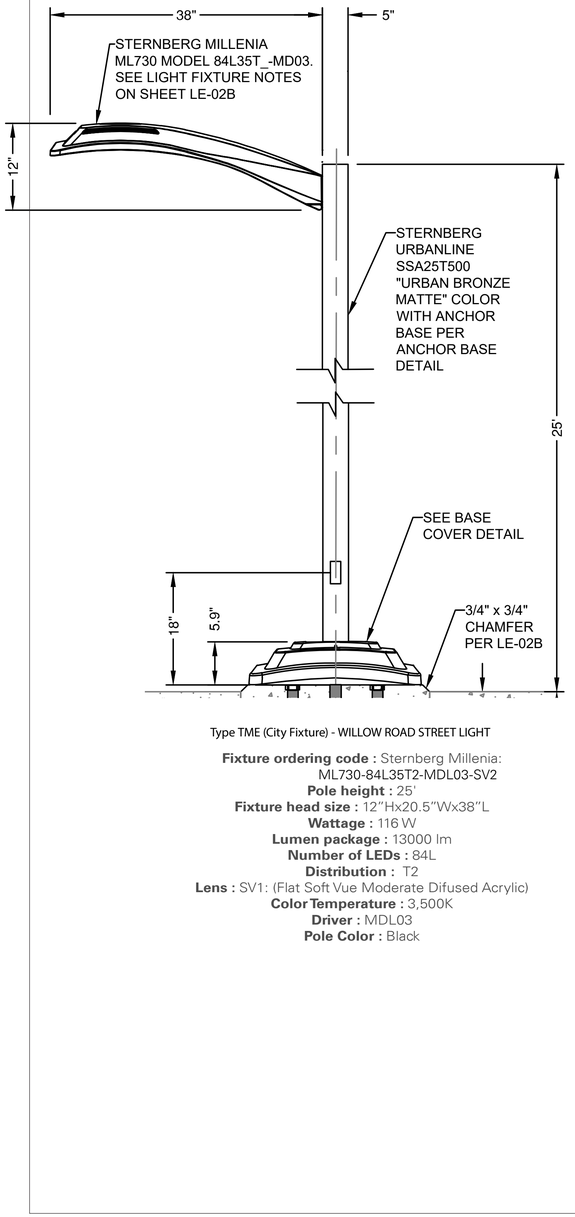
Type TMD - ML730 - At intersection
+ ML630 - pedestrian on Intersection

STREET COMPONENT (Type TMB)

Fixture ordering code : Sternberg Millenia - ML730-32L30T4-MDL018-SV1
Pole height : 25'
Fixture head size : 12"Hx20.5"Wx38"L
Wattage : 154w
Lumen package : 16,560 lm
Number of LEDs : 32L
Distribution : T4
Lens : SV1: (Flat Soft Vue Light Difused Acrylic)
Color Temperature : 3,000K
Driver : MDL018
Pole Finish: Black

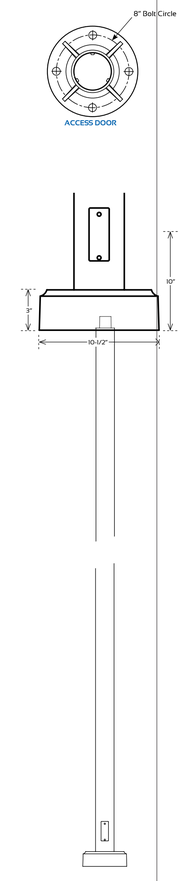
PEDESTRIAN COMPONENT (Type TMA)

Fixture ordering code : Sternberg Millenia: ML630-12L30T2-MDL018-SV1
Pole height : 18'
Fixture head size : 9"Hx16"Wx30"L
Wattage : 27 W
Lumen package : 2,990 lm
Number of LEDs : 12L
Distribution : T2
Lens : SV1: (Flat Soft Vue Light Difused Acrylic)
Color Temperature : 3,000K
Driver : MDL018
Pole Color : Black



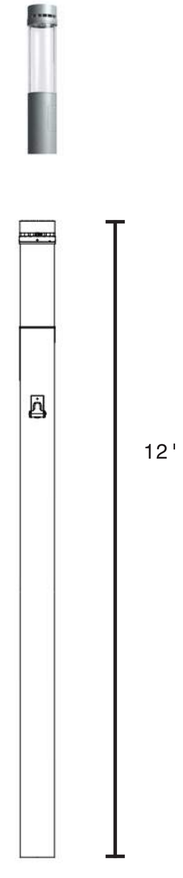
Type TME (City Fixture) - WILLOW ROAD STREET LIGHT

Fixture ordering code : Sternberg Millenia: ML730-84L35T2-MDL03-SV2
Pole height : 25'
Fixture head size : 12"Hx20.5"Wx38"L
Wattage : 116 W
Lumen package : 13000 lm
Number of LEDs : 84L
Distribution : T2
Lens : SV1: (Flat Soft Vue Moderate Difused Acrylic)
Color Temperature : 3,500K
Driver : MDL03
Pole Color : Black



Pole Spec for Type TMA, TMB, TMC & TMD

Pole ordering code : 450 Lexington Series



Type TTSA- NORTH WEST STREET LIGHT

Fixture ordering code : Selux : Exelia Gen5 LED
Pole height : 12'
Wattage : 66 W
Lumen package : 5962 lm
Distribution : Asymmetic
Color Temperature : 3,000K

APPENDIX 2

PARCEL 1-8
ILLUSTRATIVE BUILDING HEIGHT

BUILDING HEIGHT

Menlo Park Municipal Code 16.04.330 Definitions
Except as otherwise provided in this chapter, "height of structure" means the vertical distance from the average level of the highest and lowest points of the natural grade of the portion of the lot covered by the structure to the topmost point of the structure, excluding elevator equipment rooms, ventilating and air conditioning equipment and chimneys. (Ord. 938 § 1 (part), 2005: Ord. 822 § 2 (part), 1991: Prior code § 30.232)

Menlo Park Municipal Code 16.45.050 Development Regulations
Height: 52.5 feet; Maximum Height: 70 feet
A parapet used to screen mechanical equipment is not included in the height or maximum height. The maximum allowed height for rooftop mechanical equipment is 14 feet, except for elevator towers and associated equipment, which may be 20 feet.
Properties within the flood zone or subject to flooding and sea level rise are allowed a 10-foot increase in height and maximum height.

Proposal / Notes: This project is subject to flooding and sea level rise, and therefore qualifies for the 10-foot increase in height and maximum height. See below for calculations.

BUILDING HEIGHT CALCUATIONS

Roofs w/ Different Heights	Average Natural Level (FASL)	New FFE (FASL)	Added Height (Nat. to FFE)	Roof Height (FFE. to roof)	Roof Height (Nat. to roof)	Footprint (SF)	Roof Height x Footprint

BUILDING HEIGHT

HEIGHT REGULATIONS PER CITY OF MENLO PARK MUNICIPAL CODE

PROPOSAL / NOTES: THIS PROJECT IS SUBJECT TO FLOODING AND SEA LEVEL RISE, AND THEREFORE QUALIFIES FOR THE 10-FOOT INCREASE IN HEIGHT AND MAXIMUM HEIGHT. SEE BELOW FOR CALCULATIONS.

HEIGHT OF STRUCTURE - 16.04.330

EXCEPT AS OTHERWISE PROVIDED IN THIS CHAPTER, EIGHT OF STRUCTURE" MEANS THE VERTICAL DISTANCE FROM THE AVERAGE LEVEL OF THE HIGHEST AND LOWEST POINT OF THE NATURAL GRADE OF THE PORTION OF THE LOT COVERED BY THE STRUCTURE TO THE TOPMOST POINT OF THE STRUCTURE, EXCLUDING ELEVATOR EQUIPMENT ROOMS, VENTILATING AND AIR CONDITIONING EQUIPMENT AND CHIMNEYS.

- MAXIMUM HEIGHT
  16.45.050 (70-FT. + 10-FT.=80-FT.)

BONUS LEVEL DEVELOPMENTS SHALL NOT EXCEED 70-FEET IN HEIGHT, EXCEPT THAT PROPERTIES WITHIN THE FLOOD ZONE OR SUBJECT TO FLOODING AND SEA LEVEL RISE ARE ALLOWED A 10-FOOT INCREASE IN HEIGHT AND MAXIMUM HEIGHT.

- MAXIMUM AVERAGE HEIGHT
  16.45.050 (52.5-FT. + 10-FT. = 62.5-FT.)

BONUS LEVEL DEVELOPMENTS SHALL NOT EXCEED 52.5-FEET IN AVERAGE HEIGHT, EXCEPT THAT PROPERTIES WITHIN THE FLOOD ZONE OR SUBJECT TO FLOODING ARE SEA LEVEL RISE ARE ALLOWED A 10-FOOT INCREASE IN HEIGHT AND MAXIMUM HEIGHT.

- 54.76'
- 66.51'
- 77.01'
- 79.43'
- 79.78'

P6 - BUILDING HEIGHT CALCULATION - ROOF (1)
1" = 30'-0"

MENLO PARK ZONING CODE REQUIREMENTS

16.04.330: HEIGHT OF STRUCTURE (DEFINITION)

EXCEPT AS OTHERWISE PROVIDED IN THIS CHAPTER, "HEIGHT OF STRUCTURE" MEANS THE VERTICAL DISTANCE FROM THE AVERAGE LEVEL OF THE HIGHEST AND LOWEST POINTS OF THE NATURAL GRADE OF THE PORTION OF THE LOT COVERED BY THE STRUCTURE TO THE TOPMOST POINT OF THE STRUCTURE, EXCLUDING ELEVATOR EQUIPMENT ROOMS, VENTILATING AND AIR CONDITIONING EQUIPMENT AND CHIMNEYS.

16.45.050: HEIGHT

"HEIGHT" IS DEFINED AS AVERAGE HEIGHT OF ALL BUILDINGS ON ONE SITE, WHERE A MAXIMUM HEIGHT CANNOT BE EXCEEDED. MAXIMUM HEIGHT DOES NOT INCLUDE ROOF-MOUNTED EQUIPMENT AND UTILITIES.

HEIGHT: 52.5 FEET

MAXIMUM HEIGHT: 70 FEET

A PARAPET USED TO SCREEN MECHANICAL EQUIPMENT IS NOT INCLUDED IN THE HEIGHT OR MAXIMUM HEIGHT. THE MAXIMUM ALLOWED HEIGHT FOR ROOFTOP MECHANICAL EQUIPMENT IS 14 FEET, EXCEPT FOR ELEVATOR TOWERS AND ASSOCIATED EQUIPMENT, WHICH MAY BE 20 FEET.

PROPERTIES WITHIN THE FLOOD ZONE OR SUBJECT TO FLOODING AND SEA LEVEL RISE ARE ALLOWED A 10-FOOT INCREASE IN HEIGHT AND MAXIMUM HEIGHT.

PROPOSED DESIGN

MAXIMUM HEIGHT:
ALLOWED PER ZONING CODE: 70' + 10' = 80'
PROPOSED DESIGN: 80' ABOVE NATURAL GRADE

(SEE ELEVATION SHEETS AND PLAN DIAGRAM FOR MAXIMUM BUILDING HEIGHT DIMENSIONS)

AVERAGE HEIGHT:
ALLOWED PER ZONING CODE: 52.5' + 10' = 62.5'
PROPOSED DESIGN: 62.92' ABOVE NATURAL GRADE

(SEE PLAN DIAGRAM FOR ROOF AREAS AND HEIGHTS. SEE TABLE FOR AVERAGE HEIGHT CALCULATIONS.)

NOTES:
THIS PROJECT IS SUBJECT TO FLOODING AND SEA LEVEL RISE, AND THEREFORE QUALIFIES FOR THE 10-FOOT INCREASE IN HEIGHT AND MAXIMUM HEIGHT.

AVERAGE HEIGHT COMPLIANCE IS REGULATED AT A MASTERPLAN-WIDE LEVEL FOR WILLOW VILLAGE.

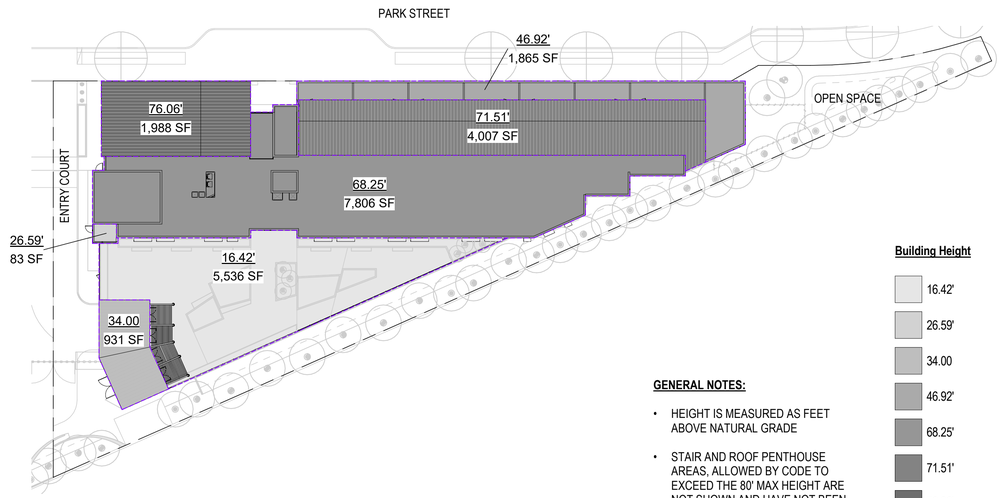
(SEE PLAN DIAGRAM FOR ROOF AREAS AND HEIGHTS. SEE TABLE FOR AVERAGE HEIGHT CALCULATIONS.)

NOTES:
THIS PROJECT IS SUBJECT TO FLOODING AND SEA LEVEL RISE, AND THEREFORE QUALIFIES FOR THE 10-FOOT INCREASE IN HEIGHT AND MAXIMUM HEIGHT.

AVERAGE HEIGHT COMPLIANCE IS REGULATED AT A MASTERPLAN-WIDE LEVEL FOR WILLOW VILLAGE.



GENERAL NOTES:

- HEIGHT IS MEASURED AS FEET ABOVE NATURAL GRADE
- STAIR AND ROOF PENTHOUSE AREAS, ALLOWED BY CODE TO EXCEED THE 80' MAX HEIGHT ARE NOT SHOWN AND HAVE NOT BEEN CALCULATED IN THIS EXHIBIT

16.04.330 Height of structure.	Except as otherwise provided in this chapter, "height of structure" means the vertical distance from the average level of the highest and lowest points of the natural grade of the portion of the lot covered by the structure to the topmost point of the structure, excluding elevator equipment rooms, ventilating and air conditioning equipment and chimneys. (Ord. 938 § 1 (part), 2005: Ord. 822 § 2 (part), 1991: Prior code § 30.232)
16.43.050 Development regula	Height: 67.5 feet; Maximum height: 110 feet
	A parapet used to screen mechanical equipment is not included in the height or maximum height. The maximum allowed height for rooftop mechanical equipment is 14 feet, except for elevator towers and associated
	Properties within the flood zone or subject to flooding and sea level rise are allowed a 10-foot increase in height and maximum height.

RESIDENT COMMON OPEN SPACE

OPEN SPACE

Menlo Park Municipal Code 16.45.120(4) Open Space

(C) Residential developments shall have a minimum of common open space and private open space. These requirements are counted towards the minimum amount of open space equal to twenty-five percent (25%) of the total lot area.

(i) One hundred (100) square feet of open space per unit shall be created as common open space or a minimum of eighty (80) square feet of open space per unit created as private open space, where private open space shall have a minimum dimension of six (6) feet by six (6) feet;

(ii) In the case of a mix of private and common open space, such common open space shall be provided at a ratio equal to one and one-quarter (1.25) square feet for each one (1) square foot of private open space that is not provided.

(iii) Depending on the number of dwelling units, common open space shall be provided to meet the following criteria:

c. One hundred one (101) or more units: minimum of one (1) space, forty (40) feet minimum dimension (one thousand six hundred (1,600) square feet total, minimum).

(D) All open spaces shall:

(i) Interface with adjacent buildings via direct connections through doors, windows, and entryways;

(ii) Be integrated as part of building modulation and articulation to enhance building facade and should be sited and designed to be appropriate for the size of the development and accommodate different activities, groups and both active and passive uses;

(iii) Incorporate landscaping design that includes:

a. Sustainable stormwater features;

b. A minimum landscaping bed no less than three (3) feet in length or width and five (5) feet in depth for infiltration planting;

c. Native species able to grow to their maximum size without shearing.

(E) All exterior landscaping counts towards open space requirements.

Proposal / Notes: See open space calculations provided below.

Open Space Summary

Lot Area: 137,540 SF 100%

Open Space	Area	% of Total Lot Area
Private Open Space:	20,326 SF	15%
Common Open Space:	33,314 SF	24%
Total:	**53,640 SF**	**39%**
Minimum Required:		**25%**

Total provided is greater than minimum required.
Therefore project complies.

Public Open Space: 0 SF 0%

Private and Common Open Space Mix

Min. Private Open...	80 SF
Min. Common Open Space/Unit:	100 SF
Min. area of Common Open Space required to replace (1) square foot of Private Open Space that is not provided:	1.25 SF

Provided Private Open...	Unit Count	Area/Unit	Total Area
Units with 80SF+ of Private Open Space:	91	Varies - Always >80SF	20,326 SF
Total:			20,326 SF

Required Common Open...	Unit Count	Area/Unit	Total Area
Units with no Private Open Space:	236	100 SF	23,600 SF
Total Required:			**23,600 SF**
Common Open Space Provided:			**33,314 SF**

Total provided is greater than minimum required.
Therefore project complies.

MENLO PARK ZONING CODE REQUIREMENTS

16.45.120 (4): OPEN SPACE

(C) RESIDENTIAL DEVELOPMENTS SHALL HAVE A MINIMUM OF COMMON OPEN SPACE AND PRIVATE OPEN SPACE. THESE REQUIREMENTS ARE COUNTED TOWARDS THE MINIMUM AMOUNT OF OPEN SPACE EQUAL TO TWENTY-FIVE PERCENT (25%) OF THE TOTAL LOT AREA.

(I) ONE HUNDRED (100) SQUARE FEET OF OPEN SPACE PER UNIT SHALL BE CREATED AS COMMON OPEN SPACE OR A MINIMUM OF EIGHTY (80) SQUARE FEET OF OPEN SPACE PER UNIT CREATED AS PRIVATE OPEN SPACE, WHERE PRIVATE OPEN SPACE SHALL HAVE A MINIMUM DIMENSION OF SIX (6) FEET BY SIX (6) FEET;

(II) IN THE CASE OF A MIX OF PRIVATE AND COMMON OPEN SPACE, SUCH COMMON OPEN SPACE SHALL BE PROVIDED AT A RATIO EQUAL TO ONE AND ONE-QUARTER (1.25) SQUARE FEET FOR EACH ONE (1) SQUARE FOOT OF PRIVATE OPEN SPACE THAT IS NOT PROVIDED.

(III) DEPENDING ON THE NUMBER OF DWELLING UNITS, COMMON OPEN SPACE SHALL BE PROVIDED TO MEET THE FOLLOWING CRITERIA:
- C. ONE HUNDRED ONE (101) OR MORE UNITS: MINIMUM OF ONE (1) SPACE, FORTY (40) FEET MINIMUM DIMENSION (ONE THOUSAND SIX HUNDRED (1,600) SQUARE FEET TOTAL, MINIMUM).

(D) ALL OPEN SPACES SHALL:

(I) INTERFACE WITH ADJACENT BUILDINGS VIA DIRECT CONNECTIONS THROUGH DOORS, WINDOWS, AND ENTRYWAYS;

(II) BE INTEGRATED AS PART OF BUILDING MODULATION AND ARTICULATION TO ENHANCE BUILDING FACADE AND SHOULD BE SITED AND DESIGNED TO BE APPROPRIATE FOR THE SIZE OF THE DEVELOPMENT AND ACCOMMODATE DIFFERENT ACTIVITIES, GROUPS AND BOTH ACTIVE AND PASSIVE USES;

(III) INCORPORATE LANDSCAPING DESIGN THAT INCLUDES:
- A. SUSTAINABLE STORMWATER FEATURES;
- B. A MINIMUM LANDSCAPING BED NO LESS THAN THREE (3) FEET IN LENGTH OR WIDTH AND FIVE (5) FEET IN DEPTH FOR INFILTRATION PLANTING;
- C. NATIVE SPECIES ABLE TO GROW TO THEIR MAXIMUM SIZE WITHOUT SHEARING.

(E) ALL EXTERIOR LANDSCAPING COUNTS TOWARDS OPEN SPACE REQUIREMENTS.

Executive Summary

This report presents the results of the Transportation Impact Analysis (TIA) conducted for the proposed Willow Village Master Plan Project in Menlo Park, California. The Proposed Project would redevelop an approximately 59-acre industrial site plus two parcels north of Willow Road[1] (collectively, the Project Site) as a mixed-use development. The Proposed Project would demolish all existing onsite buildings and landscaping on the 59-acre portion of the Project Site and construct new buildings, provide open space areas, and install infrastructure within a new Residential/Shopping District, Town Square District, and Campus District. In addition, the Proposed Project would alter two parcels (Hamilton Avenue Parcels North and South[2]) to accommodate realignment of Hamilton Avenue at Willow Road for Project Site access.

The Proposed Project would provide up to 1.6 million sf of space for office and accessory use (consisting of up to 1.25 million sf of office uses and the balance (350,000 square if office use is maximized) of accessory uses[3]) and up to 200,000 sf of commercial/retail space. The Proposed Project would also include up to 1,730 multi-family housing units, an up to 193-room hotel, and open spaces, including publicly accessible parks (e.g. 3.5 acre publicly accessible park, elevated linear park, town square, and dog park).

The Project Site would be bisected by a new north–south street (Main Street) and an east–west street, which would provide access to all three districts. It would include a circulation network for vehicles, bicycles, and pedestrians, inclusive of both public rights-of-way and private streets, that would be generally aligned to an east-to-west and a north-to-south grid. The Proposed Project would also alter parcels north of the industrial site, across Willow Road, on both the east and west sides of Hamilton Avenue (Hamilton Avenue Parcels North and South) to support realignment of the Hamilton Avenue right-of-way and provide access to the new elevated park. This would require demolition and reconstruction of an existing service station (Chevron gas station) and potentially an increase in 1,000 sf on Hamilton Avenue Parcel South and enable the potential addition of up to 6,700 sf of retail uses at the existing neighborhood shopping center on the Hamilton Avenue Parcel North. A total of 7,700 sf could be added to the Hamilton Avenue Parcels.

[1] For transportation analysis, “North/South” is aligned to be parallel to US 101. Hence, Willow Road and University Avenue are considered east-west streets, whereas Hamilton Road and Bayfront Expressway are considered north-south streets.
[2] Hamilton Avenue Parcels North and South consider Hamilton Avenue an east to west street, which differs from the compass directions used for the transportation analysis discussion.
[3] Accessory uses could include the following types of spaces: meeting/collaboration space, orientation space, training space, event space, incubator space, a business partner center, an event building (including pre-function space, collaboration areas, and meeting/event rooms), a visitor center, product demonstration areas, film studio, gathering terraces and private gardens, and space for other Meta accessory uses. Accessory uses could occur in spaces located anywhere throughout the Campus District

CEQA Vehicle-Miles Travelled Analysis

The most readily available long-range forecast year is the year-2040 conditions, which assumes the buildout of the City of Menlo Park General Plan and any pending General Plan Amendments, the buildout of the pending developments in the City of East Palo Alto (as of December 2020), and regional growth projected by the Association of Bay Area Governments (ABAG), modified by VTA/C/CAG for model land use inputs. Therefore, the project's VMT analysis was conducted under year-2040 conditions.

Office VMT

According to the City's VMT guidelines, office land use is evaluated based on a daily VMT per employee metric. Using the model, this metric is calculated only for home-based work trips, per OPR's Technical Advisory on Evaluating Transportation Impacts in CEQA. Based on the latest citywide travel demand model, the regional average office VMT is 15.9 per employee. Therefore, City's office VMT impact threshold, at 15% below regional average, would be 13.6 daily VMT per employee. Office land use was evaluated using the model under the year 2040 plus project scenario. For the Campus District, the applicant proposed a daily trip cap of 18,237 trips, which would be 20% below the standard ITE trip generation estimate. The model was adjusted to account for the proposed trip cap. As shown in Table ES-1 below, the project's Campus District land use would generate VMT at the City's VMT impact threshold and would thus not have a VMT impact.

Residential VMT

According to City VMT guidelines, the evaluation of residential land use is based on a daily VMT per capita metric. Using the model, this metric is calculated only for home-based trips, per OPR's technical advisory. Based on the latest citywide travel demand model, regional average residential VMT is 13.1 per capita. Therefore, the City's residential VMT impact threshold, at 15% below regional average, would be 11.2 daily VMT per capita.

For the residential land use, trip generation was adjusted to account for the Project's expected 2.03 people per unit compared to the ITE average of 2.46 people per unit. The VMT analysis also accounted for the applicant proposed TDM Plan for the mixed-use district. The TDM Plan proposed a 20% trip reduction from gross ITE trip generation through a combination of passive TDM measures and active TDM measures. Passive TDM measures include the project's proximity to complementary land uses, proximity to alternative transportation infrastructure, and the project's mixed-use nature. As discussed in Chapter 3 below, it is estimated that the passive TDM measures would achieve a 17% trip reduction from the gross ITE trip generation. Active TDM measures include TDM programs to be implemented to further promote alternative modes of travel. These TDM measures generally include providing transit, biking, and carpooling information to residents, assisting in ride-matching programs for residents, and could also include transit subsidies and other measures. To represent the applicant proposed 20% trip reduction goal and given that passive TDM measures are assumed to achieve a 17% trip reduction, the balance of 3% (20%-17%) trip reduction due to active TDM measures was assumed for the VMT analysis.

The Project's residential land use would require a 16% reduction in VMT to mitigate the significant VMT impact. The VMT analysis, as discussed above, already assumed 3% trip reduction due to active TDM measures. Therefore, mitigation of the VMT impact would require implementing a TDM Plan for the residential component that achieves at least 19% (3% + 16%) trip reduction via active TDM measures (see Figure 10 in Chapter 3 below) or increases the effectiveness of passive TDM measures. According to the Project's proposed TDM Plan dated July 2021 and attached in Appendix G, the proposed active TDM measures for the residential component could achieve at least a 19% reduction in trips, with an estimated reduction between between 11% and 36% [4]. This range represents the potential low to high range of effectiveness of the proposed TDM measures, as calculated by research data from the California Air Pollution Control Officers Association (CAPCOA). This range depends on how each TDM measure is eventually implemented. Therefore, it is feasible for the Project to mitigate its residential VMT impact by implementing its proposed TDM Plan.

IMPACT (TRA-2 in Transportation Chapter): As shown in Table ES-1 below, the Proposed Project's residential land use VMT is estimated to be 13.3 daily miles per capita, which would exceed the VMT threshold and result in a VMT impact. The mitigation measure TRA-2 identified below would fully mitigate this impact.

MITIGATION MEASURE (TRA 2 in Transportation Chapter): The residential land use of the Project Site will be required to implement a TDM Plan achieving a 36% reduction from gross ITE trip generation rates (for the Project, this reduction equals 6,023 daily trips). Should a different number of residential units be built, the total daily trips will be adjusted accordingly. The required residential TDM Plan will include annual monitoring and reporting requirements on the effectiveness of the TDM program. The Project applicant submitted a draft residential TDM Plan, which contained specific measures that would meet this trip reduction requirement. The draft TDM Plan is subject to City review and approval. If the annual monitoring finds that the TDM reduction is not met , the TDM coordinator will be required to work with City staff to detail next steps to achieve the TDM reduction. With the implementation of the required residential TDM Plan, the residential VMT impact would be **less than significant with mitigation (LTS/M)**.

Table ES- 1
Office and Residential VMT Evaluation

Land Use	Regional Average	VMT Threshold	Project VMT	VMT Impact	Additional TDM Mitigation needed to eliminate VMT impact
Office [1]	15.9	13.6	13.6	No	-
Residential [2]	13.1	11.2	13.3	Yes	16%

Notes:
** All data referenced the latest Menlo Park citywide travel demand forecast model.*
1. VMT for office land use is reported in VMT per employee.
2. VMT for residential land use is reported in VMT per capita.

[4] Willow Village TDM Plan. Prepared for Peninsula Innovation Partners. Fehr & Peers, Inc. July 2021

Hotel VMT

Based on consultation with the City and applicant, the hotel is expected to have a service area of approximately three (3) miles in radius. This means that most of the destinations of hotel patrons are expected to be within three miles of the hotel. While some trips are expected to be longer than three miles, the majority of the change in VMT is expected to occur within this three-mile radius. The evaluated daily VMT includes the entire length of the trip even when it extends beyond the three-mile radius.

The total daily VMT generated by land uses within a three-mile radius was compared under the "no hotel" and "with project" scenarios. As shown in Table ES-2, the proposed hotel component of the project was shown to slightly reduce the total daily VMT generated by land uses within a three-mile radius of the Project Site. Since the proposed hotel would be located within very close proximity to major employment in the Bayfront area, hotel patrons would enjoy shorter travel distances to their business destinations. It's location within a mixed-use project, including complementary retail space, also would allow hotel patrons to shop/dine within walking distance.

Because the proposed hotel component of the Project would not cause an increase in total VMT generated within the analysis area, it is concluded that the proposed hotel component of the Project would have a less than significant impact on vehicle miles travelled.

Table ES- 2
Hotel VMT Evaluation

	3-Mile Radius Area of Project Site		
	No Hotel Conditions [2]	With Project Conditions [2]	% Change
Total Daily VMT [1]	6,656,914	6,629,443	-0.4%

Notes:
1. Total daily VMT includes VMT generated by all trips having at least one trip-end in the analysis area, as estimated by the citywide travel demand model.
2. "No hotel conditions" represent conditions with the Proposed Project except the hotel component. "With project conditions" represent conditions with the Proposed Project including the hotel component.

Retail VMT

The project has two areas of retail development. The main Project Site includes up to 200,000 s.f. of retail space within a mixed use development. North of Willow Road, as a result of the proposed Hamilton Avenue realignment, the two retail parcels adjacent to Hamilton Avenue at the intersection with Willow Road ("Hamilton Avenue Parcels") would be reconfigured. The Project proposes to increase the total retail square footage at the Hamilton Avenue parcels by up to 7,700 s.f. to approximately 23,400 s.f. Because the retail at the Hamilton Avenue Parcels will require a separate use permit and would be operated as a separate retail use from the retail uses at the main Project Site, the Hamilton Avenue Parcels retail is evaluated separately from the retail component of the main Project Site. According to the City's VMT policy, local serving retail (defined as having total square footage less than 50,000 s.f.) would be exempt from a VMT analysis. The Project's proposed net 7,700 s.f. of potential retail development at the Hamilton Avenue Parcels would thus be exempt from VMT analysis. The discussion below is focused on the 200,000 s.f. of retail space at the main Project Site.

Based on the types of retail being proposed as well as nearby comparable retail stores, it is expected that the proposed retail would have a service area of approximately five (5) miles in radius. The 5-mile radius service area was selected based on engineering judgement, as it would cover most of Menlo Park, Palo Alto, as well as downtown Redwood City, and would include a mix of retail shops and restaurants comparable to the three cities. Assuming equal services, it is expected that people would patronize the closer store or restaurant. The five-mile radius service area also means that most of the destinations of the Project's retail patrons are expected to be within five miles of the project. While some trips are expected to be longer than five miles, the majority of the change in VMT is expected to occur within this five-mile radius.

The total daily VMT generated by land uses within a five-mile radius was compared under the "no retail" and "with project" scenarios. As shown in Table ES-3, the proposed retail component of the project was shown to slightly reduce the total daily VMT generated by land uses within a five-mile radius of the Project Site. Since the proposed retail space would be located in close proximity to the Belle Haven neighborhood, a large number of offices and life sciences buildings in the Bayfront area, as well as the project's proposed residential land uses, the proposed retail component would provide retail stores closer to homes for nearby residents and closer to jobs for nearby workers.

Because the proposed retail component of the Project would not cause an increase in total VMT generated by the analysis area, it is concluded that the proposed retail component of the Project would have a less than significant impact on vehicle miles travelled.

Table ES- 3
Retail VMT Evaluation

	5-Mile Radius Area of Project Site		
	No Retail Conditions [2]	With Project Conditions [2]	% Change
Total Daily VMT [1]	14,360,590	14,334,067	-0.2%

Notes:
1. Total daily VMT includes VMT generated by all trips having at least one trip-end in the analysis area, as estimated by the citywide travel demand model.
2. "No retail conditions" represent with the Proposed Project except the retail component. "With project conditions" represent with the Proposed Project including the retail component.

Non-CEQA Levels of Service Transportation Analysis

Until July 1, 2020, the City's TIA Guidelines used roadway congestion, commonly referred to as level of service (LOS), as the primary study metric for evaluating transportation impacts under CEQA. LOS is no longer a CEQA threshold of significance; however, the City's TIA Guidelines require that the TIA also analyze LOS for planning purposes (per General Plan Program Circ-3.A Transportation Impact Metrics):

> Supplement Vehicle Miles Traveled (VMT) and greenhouse gas emissions per service population (or other efficiency metric) metrics with Level of Service (LOS) in the transportation impact review process, and utilize LOS for identification of potential operational improvements, such as traffic signal upgrades and coordination, as part of the Transportation Master Plan.

The LOS analysis would determine whether the project traffic would cause an intersection LOS to exceed the City's LOS thresholds or cause either the average delay or average critical delay to exceed the City's intersection delay thresholds under near term and cumulative conditions. The LOS and delay thresholds vary depending on the street classifications as well as whether the intersection is on a State route or not.

The City's TIA Guidelines further require an analysis of the Proposed Project in relation to relevant policies of the Circulation Element and consideration of specific measures to address noncompliance with local policies which may occur as a result of the addition of project traffic. The TIA identifies measures that could be applied as conditions of approval that would bring operations back to pre-Project levels. Although not included in the TIA for purposes of this EIR, an analysis may be prepared separately to determine if there are potential measures that could bring the Proposed Project into conformance with the LOS goals of Circulation Policy 3.4. Implementation of any such measures would require review and approval by City decision makers.

Intersection level of service non-compliance caused by the proposed project under near-term (2025[5]) with project, cumulative (2040) with project, and cumulative (2040) with Dumbarton rail with project conditions were analyzed. Both near-term (year 2025) with project, and cumulative (year 2040) with project scenario forecasts of intersection turning movements were completed using the latest Menlo Park travel demand forecast model. The base model structure was refined for application within Menlo Park to add more detail to the zone structure and transportation network.

The cumulative with Dumbarton Rail scenario assumed that the Dumbarton Rail would be built and there would be a shift in vehicular trips to transit trips near the Project Site[6] as well as along the Dumbarton Rail corridor. Cumulative plus project conditions with Dumbarton Rail were evaluated relative to cumulative conditions with the Dumbarton Rail. This analysis is speculative since there is no current approved plan or financing to provide any Dumbarton transit service and is provided for informational purposes in the transportation analysis.

[5] 2025 is the earliest year for expected occupancy when this analysis started.
[6] *Dumbarton Rail Corridor Update Public Meeting*, Prepared by Facebook for the San Mateo County Transit District. March 15, 2021

The following intersections were adversely affected under either near term plus project or cumulative plus project scenarios during at least one peak hour (see Table ES-4 and ES-5):

City of Menlo Park:

1. Marsh Road and Bayfront Expressway [CMP]
5. Marsh Road and Bohannon Drive/Florence Street
13. Chilco Street and Hamilton Avenue
16. Willow Road and Bayfront Expressway [CMP]
17. Willow Road and Hamilton Avenue
18. Willow Road and Park Street
19. Willow Road and Ivy Drive
21. Willow Road and Newbridge Street
24. Willow Road and Bay Road
25. Willow Road and Hospital Plaza/Durham Street
30. O'Brien Drive and Kavanaugh Drive
32. Adam's Drive and O'Brien Drive

City of East Palo Alto:

39. University Avenue and Bay Road
42. University Avenue and Donohoe Street
44. Cooley Avenue and Donohoe Street
46. University Avenue and Woodland Avenue
47. E. Bayshore Road and Donohoe Street
49. Saratoga Avenue and Newbridge Street
50. East Bayshore Road and Euclid Avenue

Caltrans:

23. Willow Road and US 101 Southbound Ramps (AM peak hour)
43. US 101 Northbound Off-Ramp and Donohoe Street (AM and PM peak hours)
45. University Avenue and US 101 Southbound Ramps (AM peak hour)

Since the Cumulative with Dumbarton Rail scenario was analyzed for information only, analysis summary is presented only in Chapter 3.

Table ES- 4
Intersection Level of Service Summary (City of Menlo Park)

					Existing Conditions		Near-Term (2025) Conditions								Cumulative (2040) Conditions

Notes:
* Denotes CMP Intersection
AWSC - All Way Stop Control; TWSC - Two Way Stop Control
[1] Average delay is reported for signalized and AWSC intersections. For TWSC intersections, the delay for the worst stop-controlled movement is reported
"OVERSAT" indicates that the SimTraffic microsimulation model indicates that the intersection would experience capacity issues where the demand cannot be served by the intersection. Oversaturated intersections would operate at LOS F.
[1]Intersections were analyzed using Synchro/SimTraffic software due to the close proximity of these intersections. Changes in average delay and critical delay calculated using Vistro.
[2]The intersection is not considered as non-compliant under cumulative plus project conditions because the critical movement of the local approach shifts with the addition of project traffic.
[3]Intersection operates as an AWSC under existing conditions. It would operate as signalized under background conditions.
[4]The intersection is not considered as non-compliant under background plus project and cumulative plus project conditions because the critical movement of the local approach shifts with the addition of project traffic.
Bold indicates substandard level of service
Bold indicates noncompliance. The project exceeds thresholds in the City of Menlo Park's TIA Guidelines.

Note:
* Denotes a CMP interesection
AWSC - All Way Stop Control; TWSC - Two Way Stop Control
[1] Average delay is reported for signalized and AWSC intersections. For TWSC intersections, the delay for the worst stop-controlled movement is reported.
[2] Intersection is signalized under cumulative conditions.
"OVERSAT" indicates that the SimTraffic microsimulation model indicates that the intersection would experience capacity issues where the demand cannot be served by the intersection. Oversaturated intersections would operate at LOS F.
* Intersections were analyzed using Synchro/SimTraffic software due to the close proximity of these intersections. Changes in critical delay and v/c calculated using Traffix.
Bold indicates substandard level of service
Bold indicates adverse effect

Adverse Effects and Recommended Improvements

Improvement options were studied for each intersection that were found to be non-compliant under the near term plus project conditions, and cumulative plus project conditions, were compared to near term no project, and cumulative no project conditions, respectively. Potential improvement strategies are shown in Table ES-6.

Table ES- 6
Recommended Improvements

#	Intersection	Potential Improvement	Notes
1	Marsh Road & Bayfront Expressway	Modify the southbound approach to include a shared left-through lane, shared through-right lane, and a right turn only lane.	This improvement is in Menlo Park's traffic impact fee (TIF) program. With implementation of these intersection modifications, the intersection would be in compliance with the TIA Guidelines and address the Proposed Project's share of the non compliant operation.
5	Marsh Road & Bohannon Drive/Florence Street	Physical improvements at this intersection are considered infeasible due to right-of-way constraints and/or adverse effects on pedestrian and bicycle travel.	The City's TIF program includes multi-modal improvements along the Marsh Road corridor such as Class II buffered bike lanes along Marsh Road from Bay Road to Scott Road, and installing sidewalks along the north-side of Marsh Road between Page Street and Bohannon Drive/Florence Street. Implementing recommended multi-modal facilities along the corridor (from the City's TIF program) could shift some motor vehicle traffic to alternative modes of travel and reduce congestion. With implementation of these multi-modal improvements, the intersection deficiencies could be further reduced and partially address the Proposed Project's share of the non compliant operations at this intersection.
13	Chilco Street & Hamilton Avenue	A traffic signal is not recommended until signal warrants conducted with a future year's actual counts have been met	The recommended improvement includes conducting a signal warrant analyses for a period of five years after full Project completion to determine if a signal would be warranted and if warranted, install a new signal. This improvement is included in the City's TIF program. With implementation of the intersection modifications, the intersection would be in compliance with the TIA Guidelines which would address the Proposed Project's share of the non compliant operation.
16 17 18 23	Willow Road & Bayfront Expressway; Willow Road & Hamilton Avenue; Willow Road & Park Street; Willow Road & US 101 southbound ramps	Physical improvements at thes intersection are considered infeasible due to right-of-way constraints and/or adverse effects on pedestrian and bicycle travel.	The TIF program also proposes multimodal improvements along this section of Willow Road. Implementing recommended multi-modal facilities along the corridor (from the City's TIF program) could shift some motor vehicle traffic to alternative modes of travel and reduce congestion. With implementation of these multi-modal improvements, the intersection deficiencies could be further reduced and partially address the Proposed Project's share of the non compliant operations along Willow Road.
19	Willow Road & Ivy Drive	The Menlo Park TIF proposes to install a right-turn overlap phase on southbound Ivy Drive and restrict eastbound Willow Road U-turns.	This would improve the critical movement delay of the local approach to better than cumulative no project conditions. The Project is required to pay traffic impact fees according to the City's current TIF schedule.

Table ES-6 (Continued)
Recommended Improvements

#	Intersection	Potential Improvement	Notes
21	Willow Road & Newbridge Street	The TIF program proposes to modify the signal timing to a protected left-turn phasing operation on Newbridge Street, provide a leading left-turn phase on the southbound movement and a lagging left-turn phase on the northbound movement, and optimize signal timing.	With implementation of these intersection modifications under project conditions, the critical movement delay would be reduced for the northbound movement to lower than no project conditions. However, the improvement would not address the southbound deficiency. Further improvements to address the southbound deficiency are not feasible.
24	Willow Road & Bay Road	The TIF program proposes to modify the southbound approach at this intersection to two left-turn lanes and one right-turn lane and to modify the westbound approach to add a right-turn lane. With these improvements under project conditions, the critical movement delay at the local approach would be reduced to lower than no project conditions.	This improvement would address the adverse effect on the intersection due to Project traffic. With implementation of these intersection modifications, the Willow Road and Bay Road intersection would be in compliance with the TIA Guidelines which would address the Proposed Project's share of the non compliant operation. With implementation of the recommended improvements from the TIF program for the Willow Road and Bay Road intersection the deficiency attributable to the Proposed Project would be addressed.
25	Willow Road & Hospital Plaza/Durham Street	The recommended improvement measure for this intersection is restriping northbound Durham Street as a shared left-through lane and right-turn lane, and adding a northbound right turn overlap phase.	With this improvement, the critical movement delay of the local approach would improve to better than cumulative no project conditions in the AM peak hour. The PM peak hour would continue to be non-compliant. If this recommended improvement measure is implemented, the Project should contribute its fair share (25%) towards the improvement. Fair share is calculated as the percentage of net project traffic generated of the overall cumulative traffic growth at this intersection.
30	O'Brien Drive & Kavanaugh Drive	The recommended improvement to bring this intersection back to pre-Project conditions is the installation of the new traffic signal and appropriate pedestrian and bicycle accommodation. Alternatively, traffic calming measures could be installed to discourage the use of Kavanaugh Drive, which is a residential street, and encourage vehicles to use O'Brien Drive and Adam's Drive instead. Other measures such as peak period turning movement restrictions could be considered to discourage traffic from using Kavanaugh Drive and improve intersection operations.	Monitoring of traffic operations at this intersection for a period of five years after full Project completion should be conducted to determine if signalization or alternative improvements are needed. If warranted, implementation of the new traffic signal would address the Proposed Project's share of the non compliant operation and bring the intersection into compliance with the TIA Guidelines. If the alternative measures are implemented, the intersection may or may not be brought into compliance with the TIA Guidelines and address the Proposed Project's share of the non compliant operation.
32	Adams Drive & O'Brien Drive	The recommended improvement to bring this intersection back to pre-Project conditions is the installation of the new traffic signal and appropriate pedestrian and bicycle accommodations at this intersection and within the vicinity. The expected intersection operational issues would be due to the increased through traffic on O'Brien Drive between the Project Site and University Avenue. Menlo Park's TIF program identifies an improvement to signalize the nearby intersection at University Avenue and Adams Drive in East Palo Alto. This improvement may provide an alternative route for Project vehicles to access the Project Site via University Avenue.	Monitoring of traffic operations at this intersection for a period of five years after full Project completion should be conducted to determine if signalization or alternative improvements are needed. If warranted, implementation of the new traffic signal would address the Proposed Project's share of the non compliant operation and bring the intersection into compliance with the TIA Guidelines. If the alternative measures are implemented, the intersection may or may not be brought into compliance with the TIA Guidelines and address the Proposed Project's share of the non compliant operation.

Table ES-6 (Continued)
Recommended Improvements

#	Intersection	Potential Improvement	Notes
39	University Avenue & Bay Road	Potential modification to bring the intersection to pre-Project conditions would be to add an exclusive eastbound right-turn lane and a second eastbound left-turn lane on University Avenue, add a second northbound left-turn lane on Bay Road, add a second westbound left-turn lane on University Avenue, and modify signal phasing.	Since this intersection is located within the City of East Palo Alto, the recommended measure to bring the intersection back to pre-Project conditions and address the Project's share of the non compliant operation would be to make a fair share (34%) contribution towards this improvement. Fair share is calculated as the percentage of net project traffic generated divided by the overall cumulative traffic growth at this intersection. The Menlo Park TIF includes improvements at the University Avenue and Bay Road intersection, but not sufficient improvements to bring the intersection back to pre-Project conditions, as described above. However, the Project's fair share contribution towards this intersection would be calculated considering credit from its TIF payment.
42 43 44 45 46 47 50	University Avenue & Donohoe Street; US 101 Northbound Off-ramp & Donohoe Street; Cooley Avenue & Donohoe Street; University Avenue & US 101 Southbound Ramps; University Avenue & Woodland Avenue; E. Bayshore Road & Donohoe Street; Donohoe Street & Euclid Avenue	East Palo Alto plans to widen the northbound approach on Donohoe Street at the US 101 northbound off-ramp to accommodate four through lanes to improve the vehicular throughput at this intersection. This improvement will require median modifications and narrowing the southbound Donohoe Street approach to Cooley Avenue to include two through lanes and a full length left-turn lane. In addition, the traffic signals will be coordinated with adjacent traffic signals on Donohoe Street. East Palo Alto also plans to install a new traffic signal at the US 101 northbound on-ramp and Donohoe Street and Bayshore Road and Euclid Avenue to coordinate with other closely spaced traffic signals along Donohoe Street. Along with new traffic signals, appropriate pedestrian and bicycle accommodation will be provided. This includes pedestrian countdown timers, Americans with Disabilities Act (ADA) compliant curbs, and bicycle detection loops. In order to align with the proposed driveway for the University Plaza Phase II site on the north side of Donohoe Street, the US 101 on-ramp will be shifted approximately 30 feet to the south. In addition, the northbound approach on Donohoe Street will be restriped to accommodate a short exclusive left-turn pocket (approximately 60 feet in length), a shared left-through lane, and a shared through-right lane. These improvements would require widening of the US 101 northbound on-ramp to accommodate two lanes that taper down to a single lane before this ramp connects with the loop on-ramp from eastbound University Avenue. A northbound right turn only will also be added to Bayshore Road and Euclid Avenue.	Because the improvements in this corridor are all interconnected and dependent on each other to work, the recommended improvement measure would be for the Project sponsor to contribute its fair share to improvements at all six intersections in this corridor. Fair share is calculated as the percentage of net project traffic generated of the overall cumulative traffic growth at this intersection. • Donohoe Street & Cooley Avenue: 10% fair share • Donohoe Street & US 101 Northbound Off-Ramp: 24% fair share • Donohoe Street & University Avenue: 31% fair share • Donohoe Street & US 101 Northbound On-Ramp: 8% fair share • Donohoe Street/Bayshore Road & Euclid Avenue: 2% fair share • US 101 Southbound Ramps & University Avenue: 33% fair share The Menlo Park TIF includes improvements at the University Avenue and Donohoe Street and University Avenue and US 101 southbound ramps intersections, which funding would go toward the planned coordinated system of intersections. The Project's fair share contribution towards these two intersections would be calculated considering credit from its TIF payment.
49	Saratoga Avenue & Newbridge Street	Physical improvements at this intersection are considered infeasible due to proximity to Willow Road.	

Intersection Queuing Analysis

The analysis of intersection levels of service was supplemented with a vehicle queuing analysis for intersection left-turning movements where the proposed project would add significant trips per lane in the vicinity of the Project Site and affect intersection operations. Locations where the estimated 95th percentile queues would exceed the available storage capacity for the movement are discussed below. Queuing issues are operational issues resulting from signal timing and queue storage provisions. Queuing issues are not considered a CEQA issue related to hazards.

Eastbound Left-turn at Willow Road and Bayfront Expressway (#16)

Under near-term conditions, the 95th percentile queue would exceed the storage length of the turn pocket by 15 vehicles during the AM peak hour and four vehicles during the PM peak hour. The Proposed Project would add three vehicles to the 95th percentile queue during the AM peak hour and PM peak hour. There is no room to extend the left turn pocket due to the emergency vehicle only lane cut in the median.

Eastbound Left-turn at Willow Road and Ivy Drive (#19)

Under near-term conditions, the 95th percentile queue exceeds the storage length of the turn pocket by three vehicles during the AM peak hour. The Proposed Project would add one vehicle to the 95th percentile queue during the AM peak hour and one vehicle during the PM peak hour. There is no room to further extend this left-turn.

Southbound Left-turn at Willow Road and Bay Road (#24)

Under near-term conditions, the 95th percentile queue exceeds the storage length of the turn pocket by 13 vehicles during the AM peak hour and one vehicle during the PM peak hour. The Proposed Project would add six vehicles to the 95th percentile queue during the AM peak hour and three vehicles during the PM peak hour. Menlo Park's TIF has a project to add a second left-turn lane to this intersection, which would add additional storage for left-turning vehicles. The exact length of the addition will be determined during the design phase for the intersection improvement. Construction of the recommended improvement would reduce the queuing deficiency created by the Proposed Project.

Eastbound Left-turn and Southbound left-turn at University Avenue and O'Brien Drive (#36)

The existing vehicle storage for the eastbound left turn pocket on University Avenue at O'Brien Drive is 125 feet, which provides enough spaces for about 5 vehicles. Under existing conditions, the 95th percentile queue exceeds the storage length of the turn pocket by 3 vehicles during the AM peak hour. The Proposed Project would add 22 vehicles to the 95th percentile queue during the AM peak hour. There is no room to lengthen the eastbound left turn pocket.

The existing vehicle storage for the southbound left turn pocket on O'Brien Drive at University Avenue is 60 feet, which provides enough spaces for 2 vehicles. Under existing conditions, the 95th percentile queue exceeds the storage length of the turn pocket by one vehicle during the AM peak hour and 11 vehicles during the PM peak hour. The Project would add one vehicle to the 95th percentile queue during the AM peak hour. There would be no increase to the 95th percentile queue length during the PM peak hour. There is room to extend the left turn pocket to accommodate the estimated 95th percentile queue of 325 feet.

Menlo Park's Traffic Impact Fee (TIF) program identifies an improvement to signalize the nearby intersection at University Avenue and Adams Drive in East Palo Alto. This improvement may provide an alternative route for Project vehicles to access the Project Site via University Avenue, and alleviate potential queuing issues at this intersection.

Freeway Facilities Analysis

To determine the Proposed Project's potential freeway adverse effects, a select-zone analysis within the Menlo Park model was performed to estimate the increase in project traffic volume between existing conditions and near term with project conditions. Freeway segments that would experience a freeway adverse effect generated by the Proposed Project are identified below.

San Mateo County

The proposed project would add traffic greater than 1% capacity to the following study freeway segments operating below its LOS standard:

- SR 84 – from Willow Road to Alameda County Line – PM Peak Hour
- SR 84 – from Alameda County Line to Willow Road – AM Peak Hour
- US 101 – between Santa Clara County Line and Whipple Avenue – AM & PM Peak Hours
- US 101 – from Whipple Avenue to SR 92 – PM Peak Hour
- US 101 – from SR 92 to Whipple Avenue – AM Peak Hour

Santa Clara County

The proposed project would add traffic greater than 1% capacity to the following mixed-flow freeway segments operating below its LOS standard:

- US 101 – from SR 85 to Embarcadero Road – AM & PM Peak Hours
- US 101 – from Embarcadero Road to SR 85 – PM Peak hour

The proposed project would add traffic greater than 1% capacity to the following HOV freeway segment operating below its LOS standard:

- US 101 – from Oregon Expressway to Embarcadero Road – AM Peak Hour

Freeway Improvements

It should be noted that the near term plus project conditions model run assumed the US 101 express lane project in San Mateo County. Improvements to eliminate the adverse freeway effects on US 101 and on SR 84 within San Mateo County would require additional capacity improvements and/or additional TDM measures that would reduce peak-hour vehicle trip-making by more than 70%. San Mateo County currently has no plans to further improve US 101 beyond the identified express lane projects. There are also no identified plans to improve the Bayfront Expressway (SR 84) corridor. Such an aggressive TDM plan would also not be feasible.

Within Santa Clara County, Valley Transportation Authority's Valley Transportation Plan 2040 identifies freeway express lane projects along US 101 that would convert the existing HOV lanes to express lanes and add a second express lane in each direction. This improvement would increase the capacity of the freeway and would adequately address the freeway impacts.

The potential Dumbarton Rail corridor would slightly reduce the Project contribution to the identified adverse effects but would not eliminate any. Therefore, the Project's adverse effects on US 101 and on SR 84 freeway segments in San Mateo County would remain.

Freeway Ramp Analysis

A freeway ramp analysis is conducted under near term plus project conditions to determine whether freeway ramps would continue to have sufficient capacity to serve the forecasted traffic demand. Under near term plus project conditions, all study freeway ramps would continue to have sufficient capacity to serve the anticipated demand.

Roadway ADT Analysis

The roadway ADT analysis was conducted under cumulative with project conditions. To determine net Project added traffic, a select zone analysis was conducted using the Menlo Park model under cumulative with project conditions and existing conditions. The proposed project would generate non-compliance at the following roadway segments:

- Willow Road, east of Durham Street
- Willow Road, east of Blackburn Avenue
- Middlefield Road, south of Willow Road
- Marsh Road, east of Bohannon Drive
- O'Brien Drive, south of Willow Road
- O'Brien Drive, north of University Avenue
- Bay Road, north of Willow Road

Internal Site Access, Circulation, and Parking

Appendix H includes the analysis of the main Willow Village site as well as the Hamilton parcels. The site plan review evaluated the internal site's intersection operations, potential queuing issues, and general site access and circulation for the proposed seven new internal streets, 14 parking garage driveways, and 20 new intersections. The results of the level of service analysis show that the intersection of Driveway B & East Loop Road would operate at LOS D during the AM peak hour. Vehicles turning left out of Driveway B would be expected to experience an average delay of 31 seconds while waiting for a sufficient opening on East Loop Road. During the AM peak hour, approximately 101 vehicles (16 heading eastbound and 85 heading westbound) would be expected to exit the garage, which would be one to two vehicles per minute. Therefore, although exiting drivers would experience some wait time, operations at Driveway B are expected to be adequate. The results of the queuing analysis show that the intersection of Hamilton Avenue/Main Street & Willow Road is expected to have insufficient turn lane storage to accommodate the anticipated traffic volumes under near-term plus project conditions. However, it is assumed that vehicles would choose to instead enter the project site via Park Street. Hexagon recommends the following regarding the internal project circulation:

Circulation Related Recommendations

- To prevent southbound queues from spilling back onto Willow Road on Park Street and Main Street, Hexagon recommends coordinating the adjacent signals.

Sight Distance Related Recommendations

- As discussed under Mitigation Measure TRA-2 (see Transportation Chapter of the draft EIR), prior to issuance of the building permit for the North Garage, the applicant shall revise the access design to provide adequate sight distance for the eastern driveway or other design solutions to reduce hazards to a less than significant level, to the satisfaction of the Public Works Director. Potential solutions that would reduce hazards to a less than significant level include restricting the eastern driveway to inbound vehicles only or prohibiting exiting left turns, modifying landscaping or relocating the driveway to the west to allow for adequate sight distance for exiting vehicles, or installing an all-way stop or signal. If driveway A were restricted to inbound vehicles only, all outbound vehicles would use Driveway B, which would provide adequate sight distance for vehicles exiting the north office garage. Driveway B might need multiple exiting lanes to limit queuing inside the garage for exiting vehicles. Alternatively, Driveway A could be moved farther west on East Loop Road so that adequate sight distance could be provided.

- Prior to final design, the project applicant should ensure that landscaping and vegetation would not obstruct visibility at the parking garage driveways.
- Hexagon recommends including 30 feet of red curb on both sides of all garage driveways to prevent vehicles from parking and obstructing the vision of exiting drivers.
- If vehicles exiting the garages cannot see oncoming pedestrians on the sidewalk, Hexagon recommends installing warning signs to alert pedestrians when vehicles are exiting the garages.
- If any driveways are moved from their position on the current site plan, sight distance should be reevaluated.

Parking Garage Circulation Related Recommendations

- Prior to final design, it is recommended that all driveway widths meet the City's requirements.
- At garage driveways where gates and garage doors are proposed, Hexagon recommends conducting an operational analysis to ensure that gate opening and closing times would not create queuing issues or cause vehicles to spill onto the roadway network.
- Prior to final design, the residential parking on level P1 of building RS2 should be shown to be gated and separated from the retail parking on levels 1 and 2. In addition, the roll-up gate in building RS3 should be clearly shown to separate the retail parking in level B1 and the residential parking in level B2.
- It is recommended that all drive aisle and parking stall widths meet the City's requirements.
- It is recommended that adequate turnaround space is provided at all dead-end drive aisles.

Parking Related Recommendations

- If individual vehicles are not able to be retrieved in the tandem puzzle parking, the tandem spaces should be assigned to one residential unit.
- Prior to final design, Hexagon recommends that the required number of ADA and EV parking spaces be provided in all parking garages.

Pedestrian Related Recommendations

- Hexagon recommends that a crosswalk is provided at the intersection of Center Street & East Street and that midblock crosswalks are provided on Center Street and Park Street to reduce block size and improve pedestrian convenience.

Hamilton Parcels Recommendations

- The Hamilton Avenue Parcels are located within the C-2-S zoning district, which per Menlo Park Municipal Code Section 16.37(7), will have parking requirements established by the planning commission for each development. The Hamilton Avenue Parcel North proposes total potential development up to 22,402 square feet and 93 spaces. The Hamilton Avenue Parcel South proposes total development of 5,760 s.f. and 13 spaces. It is recommended that the project applicant confirm that sufficient parking is provided for the proposed total development as part of future architectural control and use permit applications with the City.

1. Introduction

This report presents the results of the Transportation Impact Analysis (TIA) conducted for the proposed Willow Village Master Plan Project in Menlo Park, California. Proposed Project would redevelop an approximately 59-acre industrial site plus two parcels north of Willow Road[7] (collectively, the Project Site) as a mixed-use development (Figure 1). The Proposed Project would demolish all existing onsite buildings and landscaping on the 59-acre portion of the Project Site and construct new buildings, provide open space areas, and install infrastructure within a new Residential/Shopping District, Town Square District, and Campus District. In addition, the Proposed Project would alter two parcels (Hamilton Avenue Parcels North and South[8]) to accommodate realignment of Hamilton Avenue at Willow Road for Project Site access.

The Proposed Project would provide up to 1.6 million sf of space for office and accessory use (consisting of up to 1.25 million sf of office uses and the balance (350,000 square if office use is maximized) of accessory uses[9]) and up to 200,000 sf of commercial/retail space. The Proposed Project would also include up to 1,730 multi-family housing units, an up to 193-room hotel, and open spaces, including publicly accessible parks (e.g. 3.5 acre publicly accessible park, elevated linear park, town square, and dog park).

The Project Site would be bisected by a new north–south street (Main Street) and an east–west street, which would provide access to all three districts. It would include a circulation network for vehicles, bicycles, and pedestrians, inclusive of both public rights-of-way and private streets, that would be generally aligned to an east-to-west and a north-to-south grid (Figure 2). The Proposed Project would also alter parcels north of the industrial site, across Willow Road, on both the east and west sides of Hamilton Avenue (Hamilton Avenue Parcels North and South) to support realignment of the Hamilton Avenue right-of-way and provide access to the new elevated park. This would require demolition and reconstruction of an existing service station (Chevron gas station) and potentially an increase in 1,000 sf on Hamilton Avenue Parcel South and enable the potential addition of up to 6,700 sf of retail uses at the existing neighborhood shopping center on the Hamilton Avenue Parcel North. A total of 7,700 sf could be added to the Hamilton Avenue Parcels (Figure 3).

[7] For transportation analysis, “North/South” is aligned to be parallel to US 101. Hence, Willow Road and University Avenue are considered east-west streets, whereas Hamilton Avenue and Bayfront Expressway are considered north-south streets.
[8] Hamilton Avenue Parcels North and South consider Hamilton Avenue an east to west street, which differs from the compass directions used for the transportation analysis discussion.
[9] Accessory uses could include the following types of spaces: meeting/collaboration space, orientation space, training space, event space, incubator space, a business partner center, an event building (including pre-function space, collaboration areas, and meeting/event rooms), a visitor center, product demonstration areas, film studio, gathering terraces and private gardens, and space for other Meta accessory uses. Accessory uses could occur in spaces located anywhere throughout the Campus District

Scope of Study

The purpose of the transportation study is to identify any transportation operational issues in accordance with City of Menlo Park standards and procedures. This report includes a CEQA VMT analysis, non-CEQA level of service (LOS) analysis (or roadway congestion analysis) and on-site access and circulation review to inform local planning efforts per the City's TIA Guidelines.

CEQA VMT Analysis

Per the City of Menlo Park VMT guidelines adopted in July 2020 and updated in January 2022, mixed-use projects will have each component analyzed independently against the appropriate thresholds. The Project proposes office, residential, hotel and retail land uses. OPR's *Technical Advisory on Evaluating Transportation Impacts in CEQA* recommends that VMT analysis for a mixed-use project should account for internal capture. Internal capture is defined as walking, bicycling, and tram trips between the various types of land use within the Project. By reducing external vehicle trips, internal capture reduces VMT for a mixed-use project in comparison to single-use developments. The project proposes office, residential, hotel and retail land uses. Each of the Project's land uses' VMT threshold of significance is listed below:

- An office project is considered to have a significant impact on VMT if the project's VMT exceeds a threshold of 15 percent below the regional average VMT per employee.
- A residential project is considered to have a significant impact on VMT if the project's VMT exceeds a threshold of 15 percent below the regional average VMT per capita.
- Hotel and retail projects are considered to have a significant impact on VMT if the project results in a net increase in total City VMT.

It should be noted that the City's VMT guidelines exempt local serving retail projects (defined as 50,000 square feet or less) from carrying out a VMT analysis. However, this project exceeds that size.[10]

Non-CEQA Level of Service (Roadway Congestion Analysis)

An LOS analysis was conducted to identify whether the proposed project would comply with local policies.

The traffic analysis is based on the AM and PM peak-hour level of service for 42 signalized intersections and 10 unsignalized intersections in the vicinity of the Project Site as illustrated in Figure 1. Traffic conditions at the study intersections were analyzed for the weekday AM and PM peak hours of adjacent street traffic. The AM peak hour is expected to occur between 7:00 AM and 10:00 AM, and the PM peak hour between 4:00 PM and 7:00 PM on a typical weekday. These are the hours during which most traffic congestion occurs on the roadways. Intersections within the City of East Palo Alto are also studied due to Menlo Park's settlement agreement with the City of East Palo Alto.

The proposed project would generate greater than 100 peak-hour trips. The San Mateo County City/County Association of Governments (C/CAG) administers the CMP. Therefore, an analysis in accordance with the C/CAG CMP guidelines is included.

[10] The VMT for the main Project Site was evaluated. The reconstruction of the service station would not increase VMT, and the modest increase in retail square footage at Hamilton Avenue Parcel North would be operated as a separate project and would be substantially below the City's threshold. Therefore, VMT was not studied for the reconstruction of the service station and the potential increase in square footage at Hamilton Parcel North.

Study Intersections

1. Marsh Road and Bayfront Expressway [Menlo Park]*
2. Marsh Road and US 101 Northbound Off-Ramp [Caltrans]
3. Marsh Road and US 101 Southbound Off-Ramp [Caltrans]
4. Marsh Road and Scott Drive [Menlo Park]
5. Marsh Road and Bohannon Drive/Florence Street [Menlo Park]
6. Marsh Road and Bay Road [Menlo Park]
7. Chrysler Drive and Bayfront Expressway [Menlo Park]
8. Chilco Street and Bayfront Expressway [Menlo Park]
9. MPK 21 Driveway and Bayfront Expressway [Menlo Park]
10. MPK 20 Driveway and Bayfront Expressway [Menlo Park]
11. Chrysler Drive and Constitution Drive [Menlo Park]
12. Chilco Street and Constitution Drive/MPK 22 Driveway (unsignalized) [Menlo Park]
13. Chilco Street and Hamilton Avenue (unsignalized) [Menlo Park]
14. Ravenswood Avenue and Middlefield Road [Menlo Park]
15. Ringwood Avenue and Middlefield Road [Menlo Park]
16. Willow Road and Bayfront Expressway [Menlo Park]*

Freeway Segments

San Mateo County

- SR 84 – between US 101 and Alameda County Line
- US 101 – between Santa Clara County Line and SR 92
- SR 109 (University Avenue) – between Kavanaugh Drive and SR 84
- SR 114 (Willow Road) – between US 101 and SR 84

Santa Clara County

- US 101 – between SR 85 and Embarcadero Road

Alameda County

- SR 84 – between San Mateo County Line and I-880

Freeway Ramps

US 101 & Marsh Road Interchange

- Southbound off-ramp to Marsh Road
- Northbound on-ramp from westbound Marsh Road

US 101 & Willow Road Interchange

- Northbound off-ramp to Willow Road
- Northbound on-ramp from westbound Willow Road
- Southbound on-ramp from westbound Willow Road
- Southbound off-ramp to Willow Road

US 101 & University Avenue Interchange

- Northbound off-ramp to Donohoe Street
- Southbound on-ramp from University Avenue

Traffic conditions were evaluated for the following scenarios:

Scenario 1: *Existing Conditions.* Existing traffic volumes at the study intersections are based on traffic counts obtained from the City of Menlo Park and/or previous studies for other nearby developments.

Scenario 2: *Near-term (2025) Conditions.* The near-term scenario assumed a year 2025 horizon[11] and was analyzed using the model. Traffic volumes were obtained from the Menlo Park Travel Demand Model and adjusted based on existing counts and model results. In addition, traffic and roadway improvements associated with the approved developments were assumed as directed by City Staff.

[11] 2025 is the earliest year for expected occupancy when this analysis started.

Scenario 3: *Near-term (2025) plus Project Conditions.* The near term plus project scenario was analyzed using the model. Traffic volumes were obtained from the Menlo Park Travel Demand Model and adjusted based on existing counts and model results. The near-term plus project scenario was evaluated relative to the near-term scenario.

Scenario 4: *Cumulative (2040) Conditions.* The cumulative scenario assumed a year 2040 horizon and represented the buildout of the adopted General Plan for the City of Menlo Park, including a pending General Plan Amendment for 123 Independence Drive. This scenario was analyzed using the model. Traffic volumes were obtained from the Menlo Park Travel Demand Model and adjusted based on existing counts and model results. In addition, traffic and roadway improvements associated with the approved developments were assumed as directed by City Staff.

Scenario 5: *Cumulative (2040) Plus Project Conditions.* The cumulative plus project scenario was analyzed using the model. Traffic volumes were obtained from the Menlo Park Travel Demand Model and adjusted based on existing counts and model results. The cumulative plus project scenario was evaluated relative to the cumulative scenario.

Scenario 6: *Cumulative (2040) with Dumbarton Rail.* The cumulative with Dumbarton Rail scenario assumed that the Dumbarton Rail would be built and there would be a shift in vehicular trips to transit trips near the Project Site[12] as well as along the Dumbarton Rail corridor. Cumulative plus project conditions with Dumbarton Rail were evaluated relative to cumulative conditions with the Dumbarton Rail. This analysis is speculative since there is no current approved plan or financing to provide any Dumbarton transit service and is provided for informational purposes in the transportation analysis.

Methodology

This section presents the methods used to determine the traffic conditions at study intersections for each scenario described above. It includes descriptions of the data requirements, the analysis methodologies, and the applicable level of service standards and criteria used to determine if a project is compliant with local policies.

Data Requirements

The data required for the analysis were obtained from the City of Menlo Park, field observations, and previous studies. The following data were obtained from these sources:

- existing peak-hour intersection turning-movement volumes,
- existing lane configurations,
- signal timing and phasing, and
- list of approved projects.

Existing counts and field observations were conducted prior to the COVID19 pandemic. No adjustments to the data were made based on pandemic conditions.

[12] *Dumbarton Rail Corridor Update Public Meeting*, Prepared by Facebook for the San Mateo County Transit District. March 15, 2021

Intersection Level of Service Methodologies

Traffic conditions were evaluated using level of service (LOS). Level of service is a qualitative description of operating conditions ranging from LOS A, or free-flow conditions with little or no delay, to LOS F, or forced-flow conditions with extreme delays.

As stated above, LOS is no longer a CEQA threshold. However, the General Plan and City's TIA Guidelines require that the TIA also analyze LOS for local planning purposes (per General Plan Program Circ-3.A Transportation Impact Metrics):

> Supplement Vehicle Miles Traveled (VMT) and greenhouse gas emissions per service population (or other efficiency metric) metrics with Level of Service (LOS) in the transportation impact review process, and utilize LOS for identification of potential operational improvements, such as traffic signal upgrades and coordination, as part of the Transportation Master Plan.

The LOS analysis would determine whether the project traffic would cause an intersection LOS to exceed the City's LOS thresholds or cause either the average delay or average critical delay to exceed the City's intersection delay thresholds under near term and cumulative conditions. The LOS and delay thresholds vary depending on the street classifications as well as whether the intersection is on a State route or not.

The City's TIA Guidelines further require an analysis of the Proposed Project in relation to relevant policies of the Circulation Element and consideration of specific measures to address noncompliance with local policies which may occur as a result of the addition of project traffic. The TIA identifies measures that could be applied as conditions of approval that would bring operations back to pre-Project levels. Although not included in the TIA for purposes of this EIR, an analysis may be prepared separately to determine if there are potential measures that could bring the Proposed Project into conformance with the LOS goals of Circulation Policy 3.4. Implementation of any such measures would require review and approval by City decision makers.

The level of service standard for the City of East Palo Alto at the study intersections is LOS D or better.

Microscopic Simulation of Study Intersections

Due to the close proximity of selected study intersections, six study intersections in the vicinity of the US 101/University Avenue interchange, and ten intersections along Willow Road, were analyzed using the Synchro/SimTraffic 9 software. Unlike macroscopic models of isolated intersection operations such as the Highway Capacity Manual methodology, SimTraffic is a microscopic model that measures the full impact of queuing and blocking of intersections. This software also provides a visual animation of the traffic operations. Simulated delay values were correlated to the level of service definitions set forth in the 2000 Highway Capacity Manual (HCM) methodology.

Macroscopic Analysis of Signalized Intersections

Traffic operations at the signalized study intersections in the City of Menlo Park were evaluated using the VISTRO software based on the level of service method described in the Highway Capacity Manual (HCM) 6th Edition. The study intersections in the City of East Palo Alto and the City of Palo Alto were evaluated using the TRAFFIX software based on the 2000 HCM methodology. The study intersections in Atherton were evaluated using the SYNCHRO software based on the HCM 6th Edition methodology. The 2000 HCM and HCM 6th Edition evaluate signalized intersection operations on the basis of average control delay time for all vehicles at the intersection. Table 1 shows the level of service definitions for signalized intersections.

Unsignalized Intersections

Peak-hour levels of motor vehicle delay at the unsignalized study intersections in the City of Menlo Park were evaluated using the VISTRO software based on the HCM 6th Edition. The study intersections in the City of East Palo Alto were evaluated using the TRAFFIX software based on the 2000 HCM methodology. With these methods, operations are defined by the average control delay per vehicle (measured in seconds) for each movement that must yield the right-of-way. At side-street controlled intersections (two-way or one-way stop control), the control delay (and LOS) is reported for the approach with the highest delay. For all-way stop-controlled intersections, the average delay (and LOS) for all movements is reported. Table 2 summarizes the relationship between average control delay per vehicle and LOS for unsignalized intersections.

Table 1
Signalized Intersection Level of Service Definitions Based on Control Delay

Level of Service	Description	Average Control Delay Per Vehicle (sec.)
A	Signal progression is extremely favorable. Most vehicles arrive during the green phase and do not stop at all. Short cycle lengths may also contribute to the very low vehicle delay.	10.0 or less
B	Operations characterized by good signal progression and/or short cycle lengths. More vehicles stop than with LOS A, causing higher levels of average vehicle delay.	10.1 to 20.0
C	Higher delays may result from fair signal progression and/or longer cycle lengths. Individual cycle failures may begin to appear at this level. The number of vehicles stopping is significant, though some vehicles may still pass through the intersection without stopping.	20.1 to 35.0
D	The influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable signal progression, long cycle lengths, or high volume-to-capacity (V/C) ratios. Many vehicles stop and individual cycle failures are noticeable.	35.1 to 55.0
E	This is considered to be the limit of acceptable delay. These high delay values generally indicate poor signal progression, long cycle lengths, and high volume-to-capacity (V/C) ratios. Individual cycle failures occur frequently.	55.1 to 80.0
F	This level of delay is considered unacceptable by most drivers. This condition often occurs with oversaturation, that is, when arrival flow rates exceed the capacity of the intersection. Poor progression and long cycle lengths may also be major contributing causes of such delay levels.	greater than 80.0

Source: Transportation Research Board, *Highway Capacity Manual 6th Edition* (Washington, D.C., 2016), p.16-19.

Table 2
Unsignalized Intersection Level of Service Definition Based on Average Delay

Level of Service	Description	Average Delay Per Vehicle (Sec.)
A	Little or no traffic delay	10.0 or less
B	Short traffic delays	10.1 to 15.0
C	Average traffic delays	15.1 to 25.0
D	Long traffic delays	25.1 to 35.0
E	Very long traffic delays	35.1 to 50.0
F	Extreme traffic delays	greater than 50.0

Source: Transportation Research Board, *Highway Capacity Manual 6th Edition* (Washington D.C., 2016).

Freeway Segments

Freeway segments within the County of San Mateo are evaluated by using the volume-to-capacity (V/C) ratio method according to the City/County Association of Governments (C/CAG) CMP guidelines. The CMP specifies varying capacities be used based on the number of lanes and the free-flow travel speed. The County of San Mateo freeway segment V/C ratio is correlated to level of service as shown in Table 3.

Within Santa Clara County, freeway segments are analyzed as prescribed in the Santa Clara County CMP technical guidelines. The level of service for freeway segments is estimated based on vehicle density. Vehicle density on a segment is correlated to level of service as shown in Table 3. The CMP requires that mixed-flow lanes and auxiliary lanes be analyzed separately from high-occupancy vehicle (HOV) lanes. The CMP specifies that a capacity of 2,300 vehicles per hour per lane (vphpl) be used for segments three lanes or wider in one direction, and a capacity of 2,200 vphpl be used for segments two lanes wide in one direction. HOV lanes are specified as having a capacity of 1,650 vphpl.

Freeway segments within Alameda County are evaluated by using V/C ratios according to the Alameda County Transportation Commission (ACTC) guidelines. The CMP specifies that a capacity of 2,000 vehicles per hour per lane (vphpl) be used for all freeway segments. The Alameda County freeway segment V/C ratio is correlated to level of service as shown in Table 3.

Freeway Ramps

A freeway ramp analysis was performed in order to verify that the freeway ramps would have sufficient capacity to serve the expected traffic volumes with and without the project. This analysis consisted of a volume-to-capacity ratio evaluation of the freeway ramps at the study interchanges. The ramp capacities were obtained from the *Highway Capacity Manual 2000,* and considered the free-flow speed, number of lanes on the ramp, and ramp metering.

Table 3
Freeway Segment Level of Service Definition

Level of Service	Description	San Mateo County [1] Maximum V/C Ratio	Santa Clara County [2] Density (vehicles/mile/ lane)	Alameda County [3] Maximum V/C Ratio
A	Average operating speeds at the free-flow speed generally prevail. Vehicles are almost completely unimpeded in their ability to maneuver within the traffic stream.	0.28	11.0 or less	0.35
B	Speeds at the free-flow speed are generally maintained. The ability to maneuver within the traffic stream is only slightly restricted, and the general level of physical and psychological comfort provided to drivers is still high.	0.46	11.0 to 18.0	0.58
C	Speeds at or near the free-flow speed of the freeway prevail. Freedom to maneuver within the traffic stream is noticeably restricted, and lane changes require more vigilance on the part of the driver.	0.67	18.0 to 26.0	0.75
D	Speeds begin to decline slightly with increased flows at this level. Freedom to maneuver within the traffic stream is more noticeably limited, and the driver experiences reduced physical and psychological comfort levels.	0.85	26.0 to 46.0	0.90
E	At this level, the freeway operates at or near capacity. Operations in this level are volatile, because there are virtually no usable gaps in the traffic stream, leaving little room to maneuver within the traffic stream.	1	46.0 to 58.0	1
F	Vehicular flow breakdowns occurs. Large queues form behind breakdown points.	greater than 1	greater than 58.0	greater than 1

Level of Service Standards and Adverse Effect Criteria

City of Menlo Park Definition of Adverse Effect

The following thresholds are from the City of Menlo Park's TIA Guidelines and the proposed project's compliance with local policies was evaluated based on these thresholds.

- A project is considered potentially noncompliant with local policies if the addition of project traffic causes an intersection on a collector street operating at LOS "A" through "C" to operate at an unacceptable level (LOS "D," "E" or "F") or have an increase of 23 seconds or greater in average vehicle delay, whichever comes first. Potential noncompliance shall also include a project that causes an intersection on arterial streets or local approaches to State controlled signalized intersections operating at LOS "A" through "D" to operate at an unacceptable level (LOS "E" or "F") or have an increase of 23 seconds or greater in average vehicle delay, whichever comes first.
- A project is also considered potentially noncompliant if the addition of project traffic causes an increase of more than 0.8 seconds of average delay to vehicles on all critical movements for intersections operating at a near-term LOS "D" through "F" for collector streets and at a near-term LOS "E" or "F" for arterial streets. For local approaches to State controlled signalized intersections, a project is considered to be potentially noncompliant if the addition of project traffic causes an increase of more than 0.8 seconds of delay to vehicles on the most critical movements for intersections operating at a near-term LOS "E" or "F."

State (Caltrans) Controlled Intersections Definition of Adverse Effect

For signalized intersections involving two state routes, the proposed project is considered potentially non-compliant with local policies if for any peak hour:

- The level of service degrades from an acceptable LOS D or better under existing conditions to an unacceptable LOS E or F under existing plus project conditions, and the average delay per vehicle increases by four seconds or more, or
- The level of service is an unacceptable LOS E or F under existing conditions and the addition of project trips causes an increase in the average control delay at the intersection by four seconds or more.

City of East Palo Alto Definition of Adverse Effect

The following thresholds are used in East Palo Alto, and the proposed project's compliance with local policies was evaluated based on these thresholds:

At a signalized intersection, the project is considered to have an adverse effect if it:

- Causes operations to degrade from LOS D (or better) to LOS E or F; or
- Exacerbates LOS E or F conditions by both increasing critical movement delay by four or more seconds and increasing volume-to-capacity ratio (V/C ratio) by 0.01 at an intersection evaluated using the TRAFFIX software; or
- Increases the V/C ratio by > 0.01 at an intersection that exhibits unacceptable operations, even if the calculated LOS is acceptable; or
- Causes planned future intersections to operate at LOS E or F.

At an unsignalized intersection, the proposed project is considered to have an adverse effect if it:

- Causes operations to degrade from LOS D or better to LOS E or F; or
- Exacerbates LOS E or F conditions by increasing control delay by five or more seconds; and
- Causes volumes under project conditions to exceed the Caltrans Peak-Hour Volume Warrant Criteria.

Intersection Vehicle Queuing Analysis

For selected high-demand movements at the study intersections, the estimated maximum vehicle queues were compared to the existing or planned storage capacity. The queuing analysis is used to determine the appropriate storage lengths for the high-demand turn lanes where the proposed project would add a substantial number of trips to these movements. Vehicle queues were estimated using Vistro or Synchro for intersections analyzed with this software and a Poisson probability distribution for intersections analyzed in Traffix. Poisson probability distribution estimates the probability of "n" vehicles for a vehicle movement using the following formula:

$$\text{Probability } (X=n) = \frac{\lambda^n e^{-(\lambda)}}{n!}$$

Where:

Probability (X=n) = probability of "n" vehicles in queue per lane

n = number of vehicles in the queue per lane

λ = Average number of vehicles in queue per lane (vehicles per hour per lane/signal cycles per hour)

The basis of the analysis is as follows: (1) the Poisson probability distribution, Vistro, or Synchro is used to estimate the 95th percentile maximum number of queued vehicles per signal cycle for a particular movement; (2) the estimated maximum number of vehicles in the queue is translated into a queue length, assuming 25 feet per vehicle; and (3) the estimated maximum queue length is compared to the existing or planned available storage capacity for the movement.

For signalized intersections, the 95th percentile queue length value indicates that during the peak hour, a queue of this length or less would occur on 95 percent of the signal cycles. In other words, a queue length larger than the 95th percentile queue would only occur on five percent of the signal cycles (about three cycles during the peak hour for a signal with a 60-second cycle length). Therefore, left-turn storage pocket designs based on the 95th percentile queue length would ensure that storage space would be exceeded only five percent of the time. The 95th percentile queue length is also known as the "design queue length."

2. CEQA VMT Analysis

Project VMT is defined as the total distance traveled by vehicles traveling to and from the Proposed Project over a typical day. In order to estimate VMT for the various land use components, the citywide travel demand forecast model was used. The citywide model is the best available model to represent travel within the City of Menlo Park, and serves as the primary forecasting tool for the City. The model is a mathematical representation of travel within the nine Bay Area counties, as well as the Santa Cruz, San Benito, Monterey and San Joaquin counties. The base model structure was developed by the Metropolitan Transportation Commission (MTC) and further refined by the City/County Association of Governments and Santa Clara Valley Transportation Authority for use within San Mateo County and Santa Clara County. The City further refined this model for application with Menlo Park to add more detail to the zone structure and transportation network. The model has a base year of year 2019 (see Appendix E, Transportation/Traffic, of this EIR for the model's calibration and validation memo).

There are four main components of the model: 1) trip generation, 2) trip distribution, 3) mode choice, and 4) trip assignment. The model uses socioeconomic inputs (i.e., population, income, employment) aggregated into geographic areas, called transportation analysis zones (TAZ) to estimate travel within the model area. There are 80 TAZs within the model to represent the City of Menlo Park. The model was used to estimate the Proposed Project's effect on VMT in accordance with the City's VMT guidelines.

VMT Evaluation

The most readily available long-range forecast year is the year-2040 conditions, which assumes the buildout of the City of Menlo Park General Plan and any pending General Plan Amendments, the buildout of the pending developments in the City of East Palo Alto (as of December 2020), and regional growth projected by the Association of Bay Area Governments (ABAG), modified by VTA/C/CAG for model land use inputs. Therefore, the project's VMT analysis was conducted under year-2040 conditions.

Office and Residential Land Uses

According to the City's VMT guidelines, office land use is evaluated based on a daily VMT per employee metric. Using the model, this metric is calculated only for home-based work trips, per OPR's Technical Advisory on Evaluating Transportation Impacts in CEQA. Based on the latest citywide travel demand model, the regional average office VMT is 15.9 per employee. Therefore, City's office VMT impact threshold, at 15% below regional average, would be 13.6 daily VMT per employee.

According to City VMT guidelines, the evaluation of residential land use is based on a daily VMT per capita metric. Using the model, this metric is calculated only for home-based trips, per OPR's technical advisory. Based on the latest citywide travel demand model, regional average residential VMT is 13.1

per capita. Therefore, the City's residential VMT impact threshold, at 15% below regional average, would be 11.2 daily VMT per capita.

Office and residential land uses were evaluated using the model under the year-2040 plus project scenario. For the Campus District, the applicant proposed a daily trip cap of 18,237 trips, which would be 20% below the standard ITE trip generation estimate. The model was adjusted to account for the proposed trip cap. As shown in Table 4 below, the project's Campus District land use would generate VMT at the City's VMT impact threshold and would thus not have a VMT impact.

For the residential land use, trip generation was adjusted to account for the Project's expected 2.03 people per unit compared to the ITE average of 2.46 people per unit. The VMT analysis also accounted for the applicant proposed TDM Plan for the mixed-use district. The TDM Plan proposed a 20% trip reduction from gross ITE trip generation through a combination of passive TDM measures and active TDM measures. Passive TDM measures include the project's proximity to complementary land uses, proximity to alternative transportation infrastructure, and the project's mixed-use nature. As discussed in Chapter 3 below, it is estimated that the passive TDM measures would achieve a 17% trip reduction from the gross ITE trip generation. Active TDM measures include TDM programs to be implemented to further promote alternative modes of travel. These TDM measures generally include providing transit, biking, and carpooling information to residents, assisting in ride-matching programs for residents, and could also include transit subsidies and other measures. To represent the applicant proposed 20% trip reduction goal and given that passive TDM measures are assumed to achieve a 17% trip reduction, the balance of 3% (20%-17%) trip reduction due to active TDM measures was assumed for the VMT analysis.

The Project's residential land use would require a 16% reduction in VMT to mitigate the significant VMT impact. The VMT analysis, as discussed above, already assumed 3% trip reduction due to active TDM measures. Therefore, mitigation of the VMT impact would require implementing a TDM Plan for the residential component that achieves at least 19% (3% + 16%) trip reduction via active TDM measures (see Figure 10 below in Chapter 3) or increases the effectiveness of passive TDM measures. According to the Project's proposed TDM Plan dated July 2021 and attached in Appendix G, the proposed active TDM measures for the residential component could achieve at least a 19% reduction in trips, with an estimated reduction between between 11% and 36% [13]. This range represents the potential low to high range of effectiveness of the proposed TDM measures, as calculated by research data from the California Air Pollution Control Officers Association (CAPCOA). This range depends on how each TDM measure is eventually implemented. Therefore, it is feasible for the Project to mitigate its residential VMT impact by implementing its proposed TDM Plan.

Table 4
Office and Residential VMT Evaluation

Land Use	Regional Average	VMT Threshold	Project VMT	VMT Impact	Additional TDM Mitigation needed to eliminate VMT impact
Office [1]	15.9	13.6	13.6	No	-
Residential [2]	13.1	11.2	13.3	Yes	16%

Notes:
** All data referenced the latest Menlo Park citywide travel demand forecast model.*
1. VMT for office land use is reported in VMT per employee.
2. VMT for residential land use is reported in VMT per capita.

[13] Willow Village TDM Plan. Prepared for Peninsula Innovation Partners. Fehr & Peers, Inc. July 2021

IMPACT (TRA-2 in Transportation Chapter): As shown in Table 4 above, the Proposed Project's residential land use VMT is estimated to be 13.3 daily miles per capita, which would exceed the VMT threshold and result in a VMT impact. The mitigation measure TRA-2 identified below would fully mitigate this impact.

MITIGATION MEASURE (TRA 2 in Transportation Chapter): The residential land use of the Project Site will be required to implement a TDM Plan achieving a 36% reduction from gross ITE trip generation rates (for the Proposed Project, this reduction equals 6,023 daily trips). Should a different number of residential units be built, the total daily trips will be adjusted accordingly. The required residential TDM Plan will include annual monitoring and reporting requirements on the effectiveness of the TDM program. The Project applicant submitted a draft residential TDM Plan, which contained specific measures that would meet this trip reduction requirement. The draft TDM Plan is subject to City review and approval . If the annual monitoring finds that the TDM reduction is not met, the TDM coordinator will be required to work with City staff to detail next steps to achieve the TDM reduction. With the implementation of the required residential TDM Plan, the residential VMT impact would be **less than significant with mitigation (LTS/M)**.

Hotel

Hotel land uses are not explicitly represented in the model. Therefore, the hotel rooms and jobs expected for the Proposed Project are accounted for separately. Hotel employees are represented in the model by service employees. To reflect trips by hotel patrons, residential land use was used as a proxy, as it most closely resembles the behavior pattern of a hotel guest. Trip making characteristics for these proxy residential land uses were restricted to offices and restaurants/shops to mimic patron activities at a typical business hotel (home-based work and home-based shopping trips). Other types of trip-making typical to an actual home such as school trips generally are not applicable to hotel guests. Given the model would only explicitly represent hotel employee VMT without this adjustment, this proxy evaluation provides a conservative analysis as it attributes more VMT (hotel guest VMT) to the Proposed Project. This methodology is undertaken only for VMT purposes.

Project Study Area

Based on consultation with the City and applicant, the hotel is expected to have a service area of approximately three (3) miles in radius. This means that most of the destinations of hotel patrons are expected to be within three miles of the hotel. While some trips are expected to be longer than three miles, the majority of the change in VMT is expected to occur within this three-mile radius. The evaluated daily VMT includes the entire length of the trip even when it extends beyond the three-mile radius.

Scenario Evaluation

The hotel VMT analysis was conducted using the City's transportation model. To evaluate the effect of the hotel component on total daily VMT, the analysis compared two scenarios: 1) with project, and 2) with project without the hotel component (or the "no hotel" scenario).

It was assumed that new hotels would not increase trips overall but would reorient existing trips. Therefore, when hotel trips were added in one zone, they must be subtracted from other zones. This process was represented in the model by redistribution of the hotel attractions from nearby existing hotels. Eleven comparable hotels were found within the area for this redistribution effort (see Figure 4). The proposed hotel would be located within very close proximity to major employment in the Bayfront area, such that hotel patrons may enjoy shorter travel distances to their business destinations. Its location within a mixed-use project, including complementary retail space, also would allow hotel patrons to shop/dine within walking distance.

Service employees were coded in the model under “no hotel” conditions for the zones representing the eleven existing hotels. Under the “with-project” model run, service employees at these zones were shifted to the project zone. According to the project applicant, the hotel would have 210 employees. Thus, approximately 19 service employees were shifted from each of the existing zones to the project zone under the “with-project” model run.

The zones representing the eleven existing hotels do not include any residential land use as a proxy for hotel patrons under the “no hotel” scenario. Thus, residential dwelling units were first added to these zones under the “no hotel” model run, so that under the “with-project” model run, shifting these residential land uses to the project zone would still maintain the same model-wide total land uses. Approximately 270 households were needed at the project zone in addition to the 210 service employees under the “with-project” model run for the model to compute trip generation roughly equivalent to the daily trip generation estimated for the hotel component based on ITE rates. Therefore, under the “no hotel” model run, 270 households were evenly distributed to the eleven zones with existing hotels. It should be noted that the project’s proposed TDM plan is accounted for in the daily trip generation estimates.

VMT Evaluation

The total daily VMT generated by land uses within a three-mile radius was compared under the “no hotel” and “with project” scenarios. As shown in Table 5, the proposed hotel component of the project was shown to slightly reduce the total daily VMT generated by land uses within a three-mile radius of the Project Site. Since the proposed hotel would be located within very close proximity to major employment in the Bayfront area, hotel patrons would enjoy shorter travel distances to their business destinations. It’s location within a mixed-use project, including complementary retail space, also would allow hotel patrons to shop/dine within walking distance.

Because the proposed hotel component of the Project would not cause an increase in total VMT generated within the analysis area, it is concluded that the proposed hotel component of the Project would have a less than significant impact on vehicle miles travelled.

Table 5
Hotel VMT Evaluation

	3-Mile Radius Area of Project Site		
	No Hotel Conditions [2]	With Project Conditions [2]	% Change
Total Daily VMT [1]	6,656,914	6,629,443	-0.4%

Notes:
1. Total daily VMT includes VMT generated by all trips having at least one trip-end in the analysis area, as estimated by the citywide travel demand model.
2. "No hotel conditions" represent conditions with the Proposed Project except the hotel component. "With project conditions" represent conditions with the Proposed Project including the hotel component.

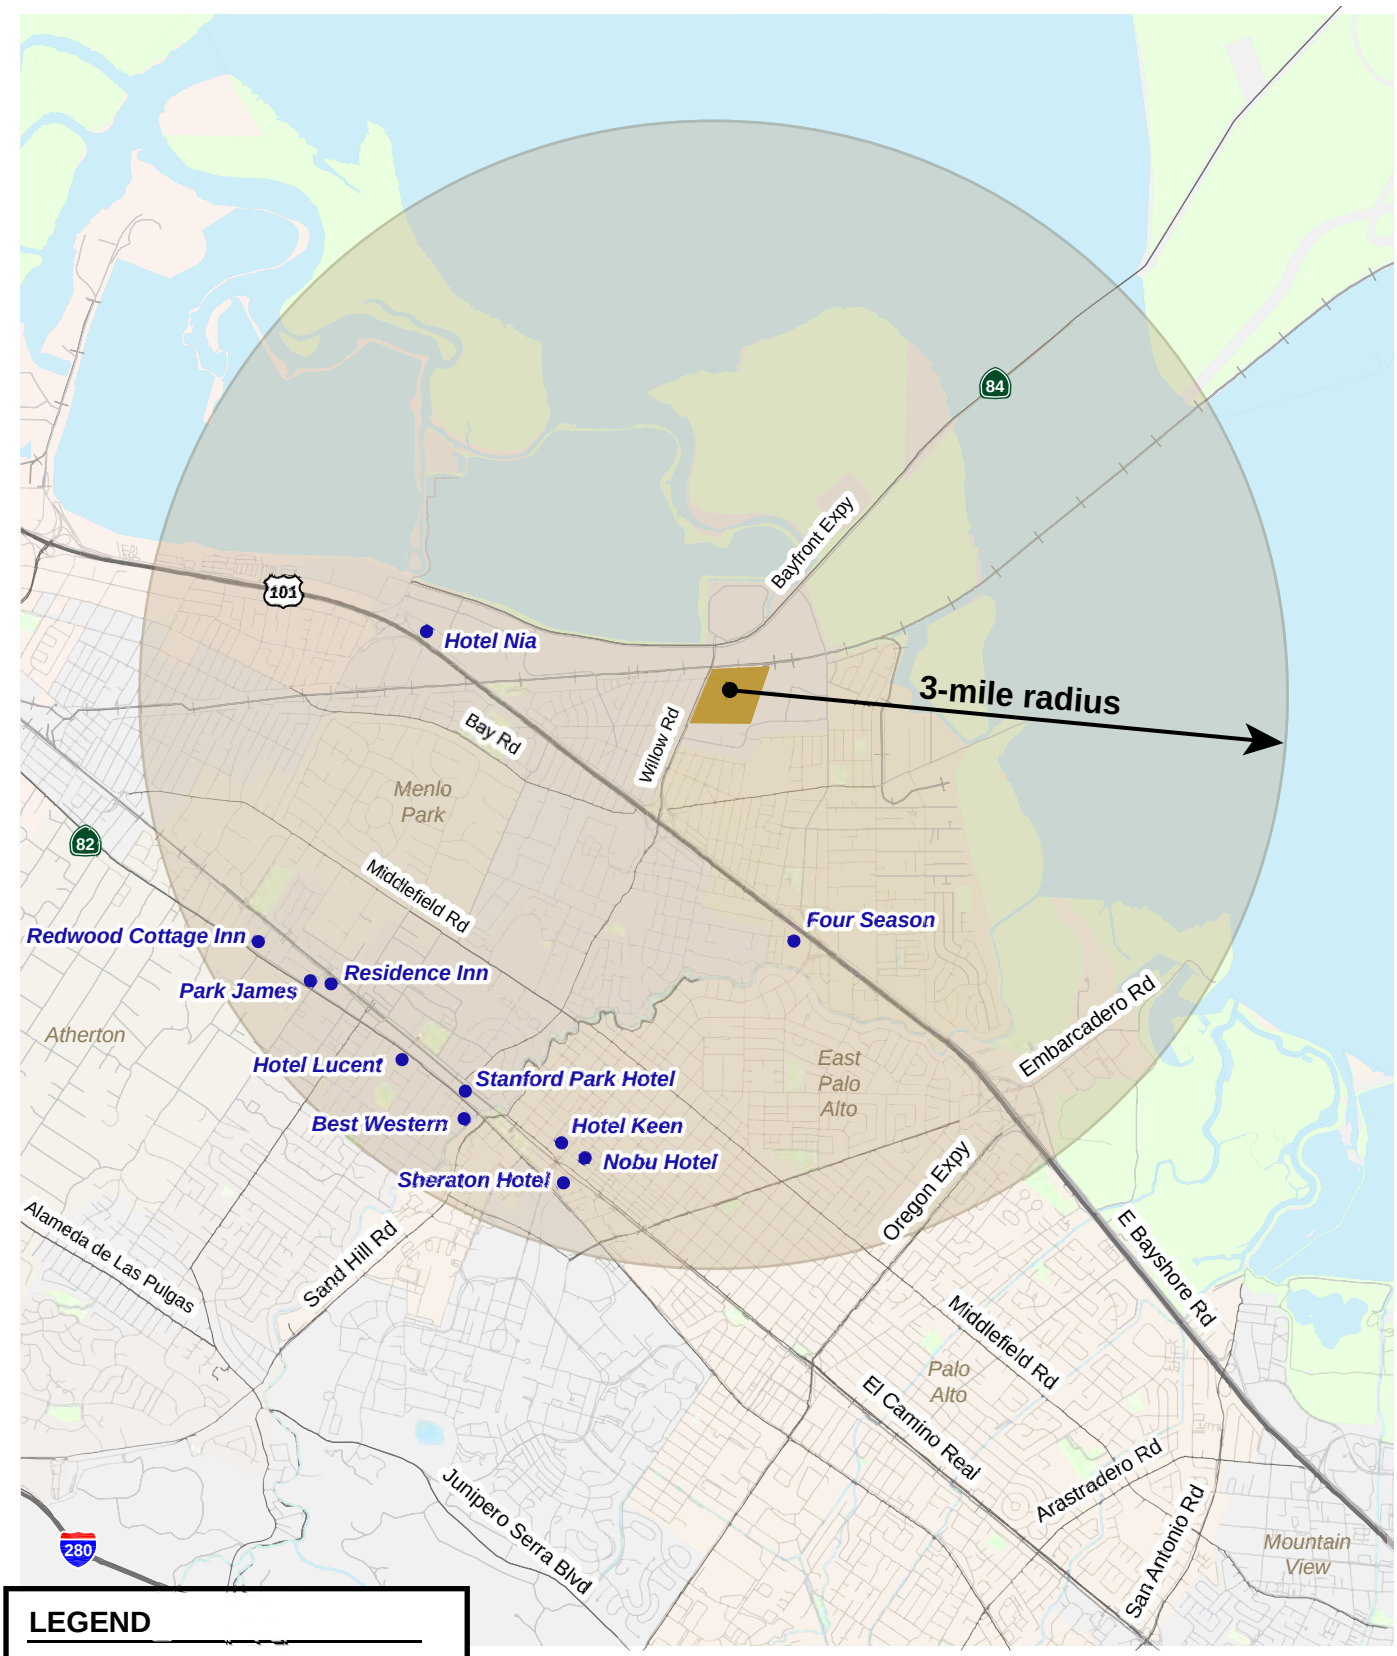

Figure 4
Locations of Comparable Hotel Land Use

Retail

The project has two areas of retail development. The main Project Site includes up to 200,000 s.f. of retail space within a mixed use development. North of Willow Road, as a result of the proposed Hamilton Avenue realignment, the two retail parcels adjacent to Hamilton Avenue at the intersection with Willow Road ("Hamilton Avenue Parcels") would be reconfigured. The Project proposes to increase the total retail square footage at the Hamilton Avenue parcels by up to 7,700 s.f. to approximately 23,400 s.f. Because the retail at the Hamilton Avenue Parcels will require a separate use permit and would be operated as a separate retail use from the retail uses at the main Project Site, the Hamilton Avenue Parcels retail is evaluated separately from the retail component of the main Project Site. According to the City's VMT policy, local serving retail (defined as having total square footage less than 50,000 s.f.) would be exempt from a VMT analysis. The Project's proposed net 7,700 s.f. of potential retail development at the Hamilton Avenue Parcels would thus be exempt from VMT analysis. The discussion below is focused on the 200,000 s.f. of retail space at the main Project Site.

Project Study Area

Based on the types of retail being proposed as well as nearby comparable retail stores, it is expected that the proposed retail would have a service area of approximately five (5) miles in radius. The 5-mile radius service area was selected based on engineering judgement, as it would cover most of Menlo Park, Palo Alto, as well as downtown Redwood City, and would include a mix of retail shops and restaurants comparable to the three cities. Assuming equal services, it is expected that people would patronize the closer store or restaurant. The five-mile radius service area also means that most of the destinations of the Project's retail patrons are expected to be within five miles of the project. While some trips are expected to be longer than five miles, the majority of the change in VMT is expected to occur within this five-mile radius.

Scenario Evaluation

The retail VMT analysis was conducted using the City's transportation model. To evaluate the effect of the retail component on total daily VMT, the analysis compared two scenarios: 1) with project, and 2) with project without the retail component (or the "no retail" scenario).

Similar to the hotel evaluation methodology discussed above, retail employees were redistributed from existing retail locations for the purpose of the VMT analysis. Six (6) comparable retail sites were found within the area for this redistribution effort (see Figure 5).

Retail employees were coded in the model under "no retail" conditions for the zones representing the six existing retail sites. Under the "with-project" model run, retail employees at these zones were shifted to the project zone. The retail land use is expected to generate 571 employees based on the City's default retail employees-per-square-foot conversion rate (1 employee per 350 square feet). Retail employees were shifted from each of the existing zones to the project zone under the "with-project" model run. The number of retail employees shifted from each existing zone was proportionally based on each zone's existing retail employment size (see Figure 6).

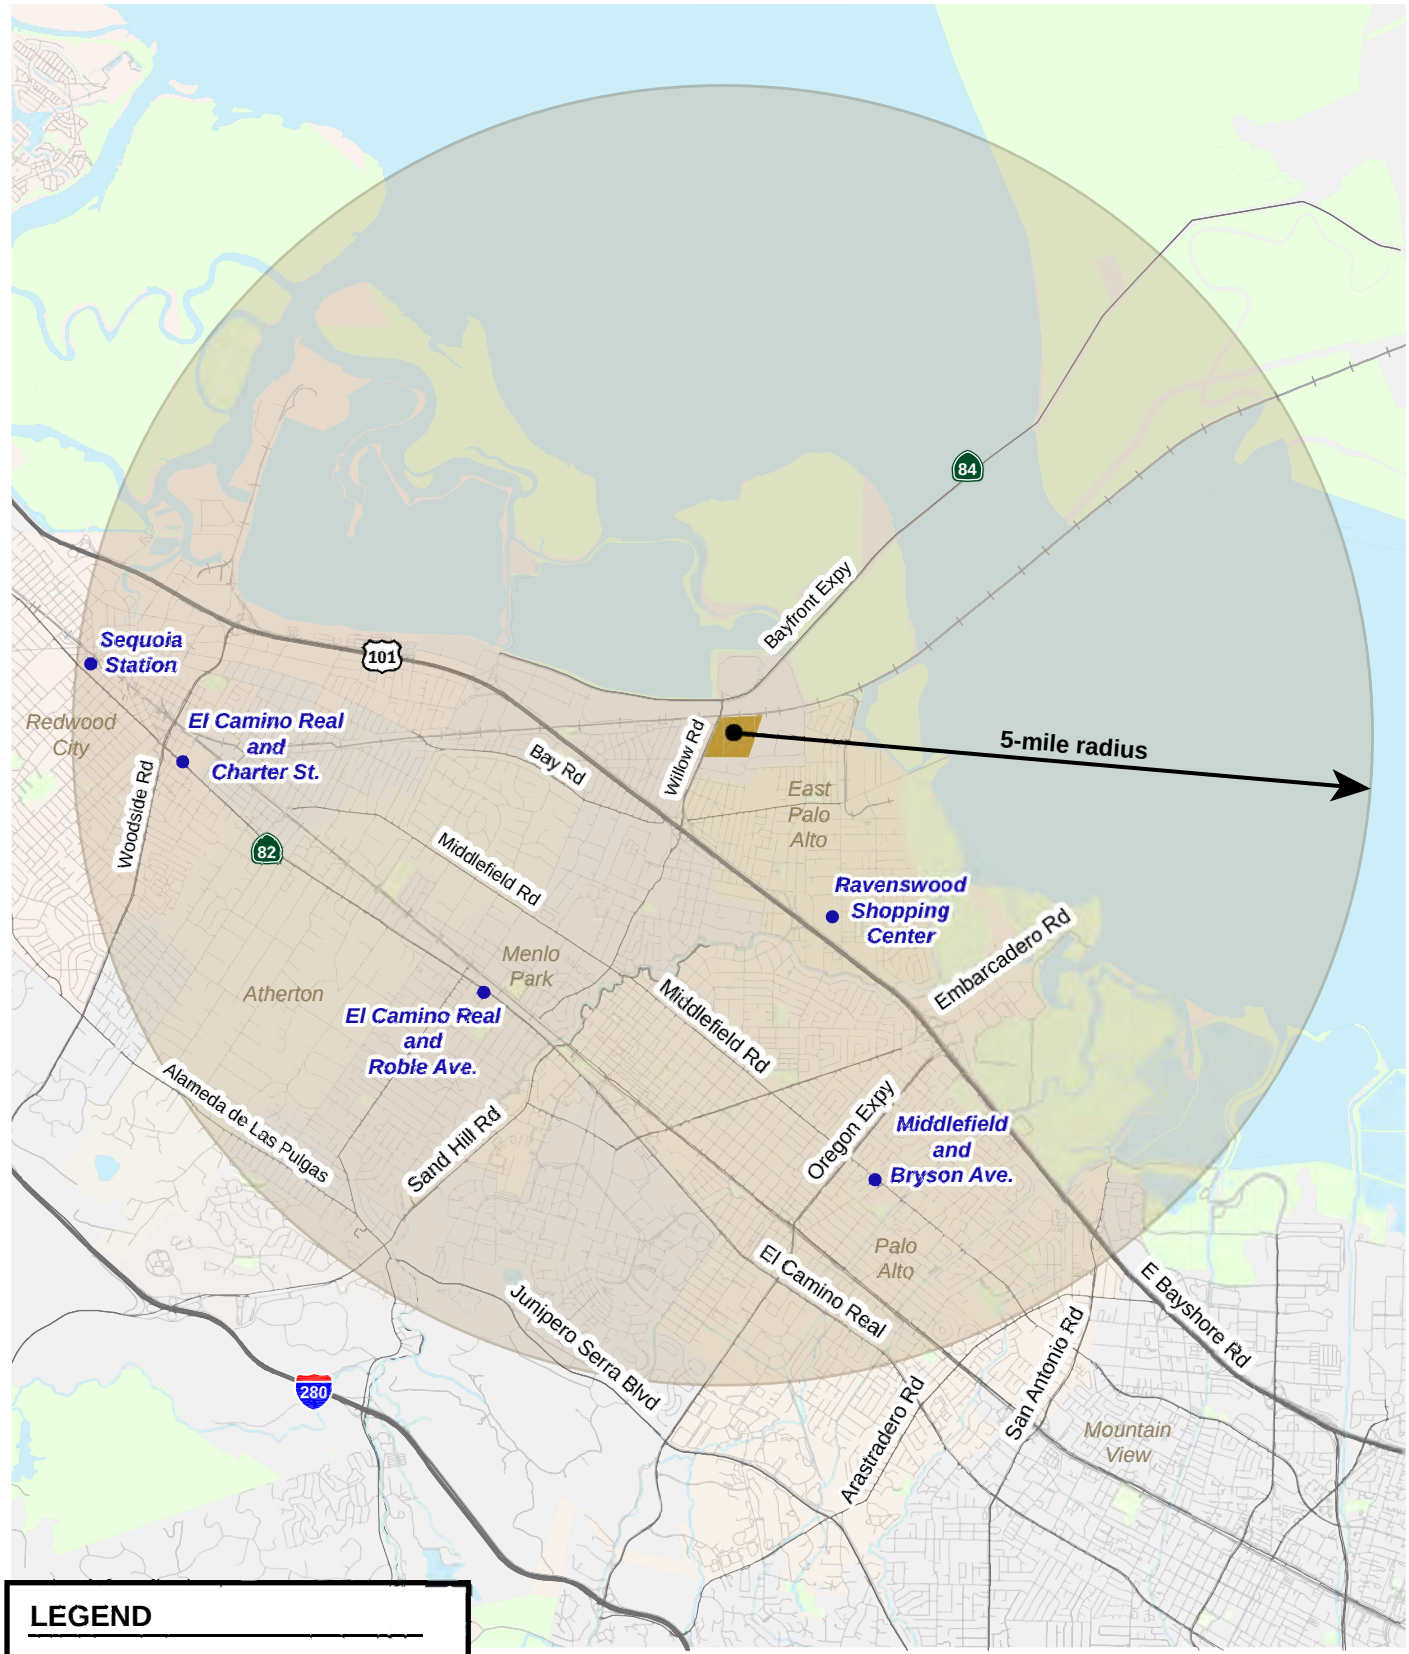

Figure 5
Locations of Comparable Retail Land Use

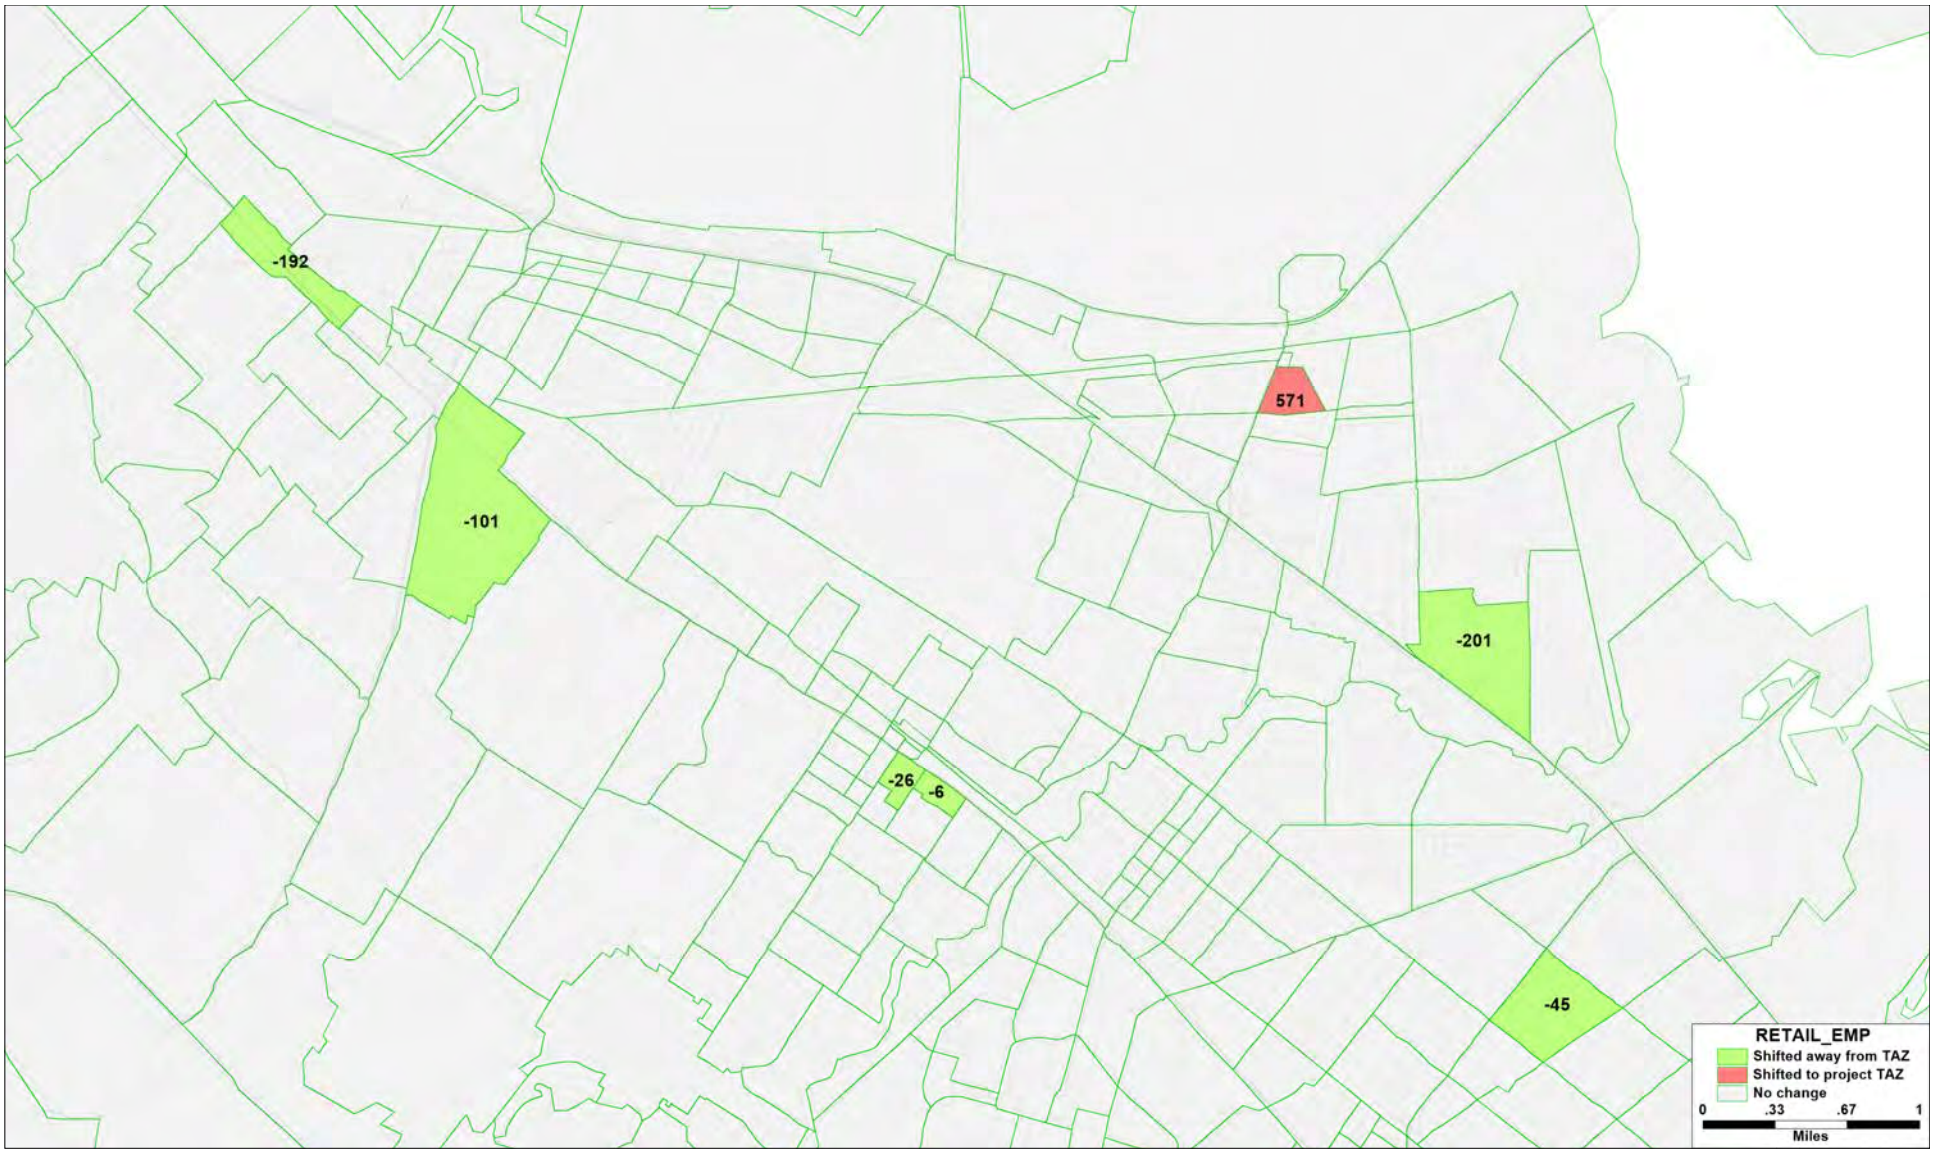

Figure 6
Retail Employment Shifts for VMT Analysis

VMT Evaluation

The total daily VMT generated by land uses within a five-mile radius was compared under the "no retail" and "with project" scenarios. As shown in Table 6, the proposed retail component of the project was shown to slightly reduce the total daily VMT generated by land uses within a five-mile radius of the Project Site. Since the proposed retail space would be located in close proximity to the Belle Haven neighborhood, a large number of offices and life sciences buildings in the Bayfront area, as well as the project's proposed residential land uses, the proposed retail component would provide retail stores closer to homes for nearby residents and closer to jobs for nearby workers.

Because the proposed retail component of the Project would not cause an increase in total VMT generated by the analysis area, it is concluded that the proposed retail component of the Project would have a less than significant impact on vehicle miles travelled.

Table 6
Retail VMT Evaluation

	5-Mile Radius Area of Project Site		
	No Retail Conditions [2]	With Project Conditions [2]	% Change
Total Daily VMT [1]	14,360,590	14,334,067	-0.2%

Notes:
1. Total daily VMT includes VMT generated by all trips having at least one trip-end in the analysis area, as estimated by the citywide travel demand model.
2. "No retail conditions" represent with the Proposed Project except the retail component. "With project conditions" represent with the Proposed Project including the retail component.

Event VMT

The Campus District would consist of up to 1.6 million square feet of space for office and accessory uses, consisting of up to 1.25 million sf of office uses and the balance (350,000 sf if office uses were maximized) of accessory uses[14]. In addition to serving as a gathering space for the surrounding campuses, the applicant proposes to host approximately 55 events per year, that would attract majority non-Menlo Park Meta workers and/or guests. Ten of these events are envisioned as large-sized events with attendance varying between 2,500 and 5,000 people. 15 of these events are envisioned as medium-sized events with attendance varying between 1,000 and 2,500 people. The remaining 30 events would be small-sized events with attendance lower than 1,000 people. It is anticipated that the small-sized events would generate a minimal number of trips that would not exceed the proposed Campus District trip cap. The Project is proposing an allowance of up to 25 exceptions to the trip cap for days when there are medium-size or large-size events. Due to the limited number of events that would exceed the proposed trip cap, it is deemed that such events are not typical conditions and do not require a VMT analysis for CEQA purposes. This impact would be ***less than significant***.

While some of these events could potentially generate substantial traffic that could affect intersection operations in the Project area, specific event details are not known. While congestion is not a CEQA impact, the Project would be required, as a condition of Project approval, to submit event traffic plans

[14] Accessory uses could include the following types of spaces: meeting/collaboration space, orientation space, training space, event space, incubator space, a business partner center, an event building (including pre-function space, collaboration areas, and meeting/event rooms), a visitor center, product demonstration areas, film studio, gathering terraces and private gardens, and space for other Meta accessory uses. Accessory uses could occur in spaces located anywhere throughout the Campus District.

for large events for City approval to demonstrate measures that would be taken to minimize the events' effect on roadway traffic conditions.

Impacts on Pedestrian, Bicycle and Transit Facilities

The project is consistent with all applicable pedestrian, bicycle and transit related plans, ordinances and policies, as listed below:

- City of Menlo Park Circulation Element of the General Plan
- City of Menlo Park Municipal Code, Sections 16.43.100 and 16.45.090
- City of Menlo Park Transportation Master Plan
- City of Menlo Park Transportation Impact Fee

Pedestrian and Bicycle Facilities

The Proposed Project would include multiple pedestrian and bicycle connections between the Project Site and the surrounding roadway network and within the Project Site. The planned bicycle and pedestrian facilities within the Project Site are discussed in Appendix H.

The proposed pedestrian connections to the surrounding roadway network include crosswalks at the proposed signalized intersections on Willow Road at Main Street and Park Street that would connect the Project Site to the Belle Haven neighborhood. The proposed bicycle connections include connections to the existing class II bike lane along Willow Road via Park Street and Main Street. In addition, the Proposed Project includes an elevated park that would provide grade separated pedestrian and bicycle access between the Project site and the Belle Haven neighborhood.

Menlo Park's TIF program also proposes the following bicycle and pedestrian facilities in the immediate vicinity of the Project Site which would improve connections between the Project Site and the surrounding neighborhoods:

- Bicycle signals, cross-bike markings, high visibility crosswalks, and pedestrian improvements at the eastbound right-turn channelizing island at Willow Road and Bayfront Expressway
- Class III bike routes, wider sidewalks, and narrower median on Ivy Drive
- Wider median on the west leg of Willow Road and Ivy Drive, increased pedestrian crossing time, and high visibility crosswalks at the intersection
- Curb ramps, high visibility crosswalks, increased pedestrian crossing times, and bulbouts on the southeast and southwest corners at Willow Road and O'Brien Drive
- Sidewalks and class II bike lanes on both sides of Adams Drive between O'Brien Drive and University Avenue
- Sidewalks and class II bike lanes on both sides of O'Brien Drive between Willow Road and University Avenue
- Install class IV protected bike lanes along Willow Road

The Proposed Project also includes a subgrade pedestrian, bicycle, and tram connection between the main Project Site and the Meta West Campus. This connection would be known as the Willow Road Tunnel. The Willow Road Tunnel would extend between Facebook Way in the Meta West Campus and North Loop Road in the Willow Village Campus underneath Willow Road. The proposed design of the tunnel includes a sidewalk along the eastern edge, a two-way class I bike path which would connect the Bay Trail to the Project Site, and a two-way tram connection between the West Campus and the Project Site. The tunnel would not allow vehicular traffic other than the trams and the bicycle and pedestrian access would be open to the public similar to the existing tunnel between the East and West Campuses.

Pedestrian and Bicycle Access to Schools

Schools in the immediate vicinity of the Project Site include Mid-Peninsula High School, Open Mind School, Cesar Chavez Ravenswood Middle School, San Francisco 49ers Academy, Creative Montessori learning, Belle Haven School, TIDE Academy, and Costano Elementary School. Bicycle and pedestrian access to each school is described below:

- **Mid-Peninsula High School.** This school is located immediately west of the Project Site. Pedestrian and bicycle access from the Project Site to the school would be via Willow Road, which has continuous sidewalks along the south side, and existing Class II bicycle facilities on both sides of the road.
- **Open Mind School.** This school is located immediately west of the Project Site on O'Brien Drive. There are currently no sidewalks or bicycle facilities on O'Brien Drive between the school and the Project Site. The Project proposes a sidewalk that would connect the Project Site with the school's driveway, as part of the Project proposed roundabout at the East Loop Road/O'Brien Drive location.
- **Cesar Chavez Ravenswood Middle School,** San Francisco 49ers Academy, Creative Montessori Learning. These schools are located on Bay Road between Willow Road and University Avenue. Pedestrian and bicycle access from the Project Site to these schools would be via Willow Road to Alberni Street and Ralmar Avenue. These streets have sidewalks along both sides. These are also residential streets with low vehicular speeds and volumes and therefore, bicycle friendly. Access to the San Francisco 49ers Academy and Creative Montessori is directly from Bay Road, which has sidewalks along both sides. Also, Bay Road has dedicated bicycle lanes.
- **Belle Haven School.** This school is located approximately 0.4 miles north of the Project Site. Pedestrian and bicycle access from the Project Site to this school would be via Ivy Drive or Hamilton Avenue. Pedestrian amenities include crosswalks and pedestrian push buttons at the intersections of Willow Road and Ivy Drive and Willow Road and Hamilton Avenue, a continuous sidewalk along the south side of Willow Road, a continuous sidewalk along both sides of Ivy Drive and Hamilton Avenue between the school and the Project Site, and bulbouts on Hamilton Avenue. However, there are no designated bicycle facilities on Ivy Drive or Hamilton Avenue.

- **Costano Elementary School.** The school is located 0.2 miles south of the Project Site on University Avenue at Adams Drive. Pedestrian and bicycle access from the Project Site is via Adams Drive or O'Brien Drive. There are limited pedestrian connections between the Project Site and the school. Sidewalk facilities are lacking along O'Brien Drive and Adams Drive, and there are no crosswalks at University Avenue and O'Brien Drive or University Avenue and Adams Drive. Class II bicycle lanes and sidewalks are proposed along O'Brien Drive and Adams Drive in Menlo Park's TIF, which would improve bicycle and pedestrian access to the school. Implementation of this improvement from the TIF Program would reduce this potential effect on bicyclists and pedestrians from the proposed project.
- **Tide Academy.** This school is located approximately 1.2 miles north of the Project Site. Pedestrian and bicycle access from the Project Site to this school would be via Ivy Drive or Hamilton Avenue. Chilco Street, and Jefferson Drive. Pedestrian amenities include crosswalks and pedestrian push buttons at the intersections of Willow Road and Ivy Drive and Willow Road and Hamilton Avenue, a continuous sidewalk along the south side of Willow Road, a continuous sidewalk along both sides of Ivy Drive, Hamilton Avenue, Chilco Street, and Jefferson Drive between the school and the Project Site, and bulbouts on Hamilton Avenue. There are also designated bicycle facilities on Chilco Street and Jefferson Drive, however, there are no designated bicycle facilities on Ivy Drive or Hamilton Avenue.

Transit Facilities

The Proposed Project would provide tram stops and shuttle stops on the Project Site for use by Meta workers. A detailed description of the tram and shuttle services is provided in Appendix I.

The Proposed Project is expected to generate an increase in transit demand, which could be accommodated by the available capacity of the SamTrans bus service. The SamTrans routes 81, 281, 296, 397, Dumbarton Express Lines, M2 Belle Haven Shuttle, and M4 Willow Road shuttle serve the immediate vicinity of the project area with approximately 15 to 25-minute headways during the AM and PM peak commute hours. Bus stops are within a typical walking distance (one-quarter mile or 5 minutes) of the Project Site. The Proposed Project would make no change to existing public transit facilities. However, by adding vehicle trips and increasing delay at intersections along bus routes, it would increase bus travel time. Bus services that would be affected in the vicinity of the Project Site include bus routes (DB, M2 Belle Haven Shuttle, M4 Willow Road Shuttle, SamTrans Route 81) along Willow Road, University Avenue, and O'Brien Drive.

Proposed intersection improvements to reduce intersection delay include improvements at Willow Road and Ivy Drive, Willow Road and Hospital Plaza/Durham Street, Willow Road and Newbridge Street, Willow Road and Bay Road, O'Brien Drive and Kavanaugh Drive, and Adam's Drive and O'Brien Drive. These improvements would help to reduce some bus delay along these routes. The City's TIF includes installing Transit Signal Priority (TSP) for queue jumps by shoulder running buses on northbound and southbound Bayfront Expressway and allowing the use of the existing right turn lane for queue jump with TSP at Willow Road and O'Brien Drive. The timing and implementation of these TSP projects are not certain

The Caltrain electrification project would enable Caltrain to provide more frequent train service at the Menlo Park, Palo Alto, and Redwood City Caltrain stations. Caltrain predicts an initial capacity increase of over 30%. It is expected that the Caltrain electrification project would accommodate the potential increase in transit ridership generated by the Proposed Project.

3. Non-CEQA Level of Service Transportation Analysis

This chapter describes the existing conditions level of service and observed traffic conditions at roadway facilities in the vicinity of the site. It also describes the method by which project traffic is estimated and any adverse effects to intersection levels of service caused by the proposed project under existing, near-term (2025), cumulative (2040), and cumulative (2040) with Dumbarton rail conditions.

Existing Intersection Lane Configurations and Traffic Volumes

The existing lane configurations at the study intersections were confirmed by observations in the field and are shown on Figure 7. Existing traffic volumes were obtained from new peak hour counts collected in year 2019 and year 2020. The existing AM and PM peak hour intersection volumes are shown in Figure 8. Intersection turning-movement count data are presented in Appendix A.

Existing Intersection Levels of Service

The results of the intersection level-of-service analysis under existing conditions show that many of the study intersections currently operate at an unacceptable level (see Table 7 and 8). As noted in the ConnectMenlo DEIR, the counted traffic volumes at the Menlo Park study intersections along Willow Road did not appropriately reflect the actual traffic demand, and isolated intersection analysis fails to capture these results. Similarly, the counted traffic volumes at the East Palo Alto study intersections in the vicinity of the US 101/University Avenue interchange do not reflect actual traffic demand. Therefore, instead of calculated level of service, the existing level of service results are reported based on level of service as identified by field observations and microsimulation to reflect “unserved demand”. The microsimulation methodology and assumptions for Willow Road are documented in Appendix B. Hexagon has also developed a microsimulation model for intersections in the vicinity of the US 101/University Avenue interchange, which has been used for other studies in East Palo Alto. This microsimulation model was used to analyze level of service for intersections near the US 101/University Avenue interchange.

The intersection level of service calculation sheets are included in Appendix C. The following study intersections (See Figure 9) currently operate at an unacceptable level of service during at least one peak hour:

11. Chrysler Drive and Constitution Drive (AM peak hour)
12. Chilco Street and Constitution Drive/MPK 22 Driveway (AM and PM peak hours)
16. Willow Road and Bayfront Expressway (AM and PM peak hours)
17. Willow Road and Hamilton Avenue (AM and PM peak hours)
19. Willow Road and Ivy Drive (AM peak hour)
20. Willow Road and O'Brien Drive (AM and PM peak hours)
21. Willow Road and Newbridge Street (AM and PM peak hours)
22. Willow Road and US 101 Northbound Ramps (AM and PM peak hours)
23. Willow Road and US 101 Southbound Ramps (PM peak hour)
24. Willow Road and Bay Road (PM peak hour)
25. Willow Road and Hospital Plaza/Durham Street (PM peak hour)
28. Willow Road and Middlefield Road (AM peak hour)
32. Adam's Drive and O'Brien Drive (PM peak hour)
33. University Avenue and Bayfront Expressway (PM peak hour)
34. University Avenue and Purdue Avenue (PM peak hour)
35. University Avenue and Adams Drive (AM and PM peak hours)
42. University Avenue and Donohoe Street (AM and PM peak hours)
43. US 101 Northbound Off-Ramp and Donohoe Street (PM peak hour)
45. University Avenue and US 101 Southbound Ramps (AM and PM peak hours)
46. University Avenue and Woodland Avenue (AM and PM peak hours)
50. E. Bayshore Road & Euclid Avenue (AM peak hour)

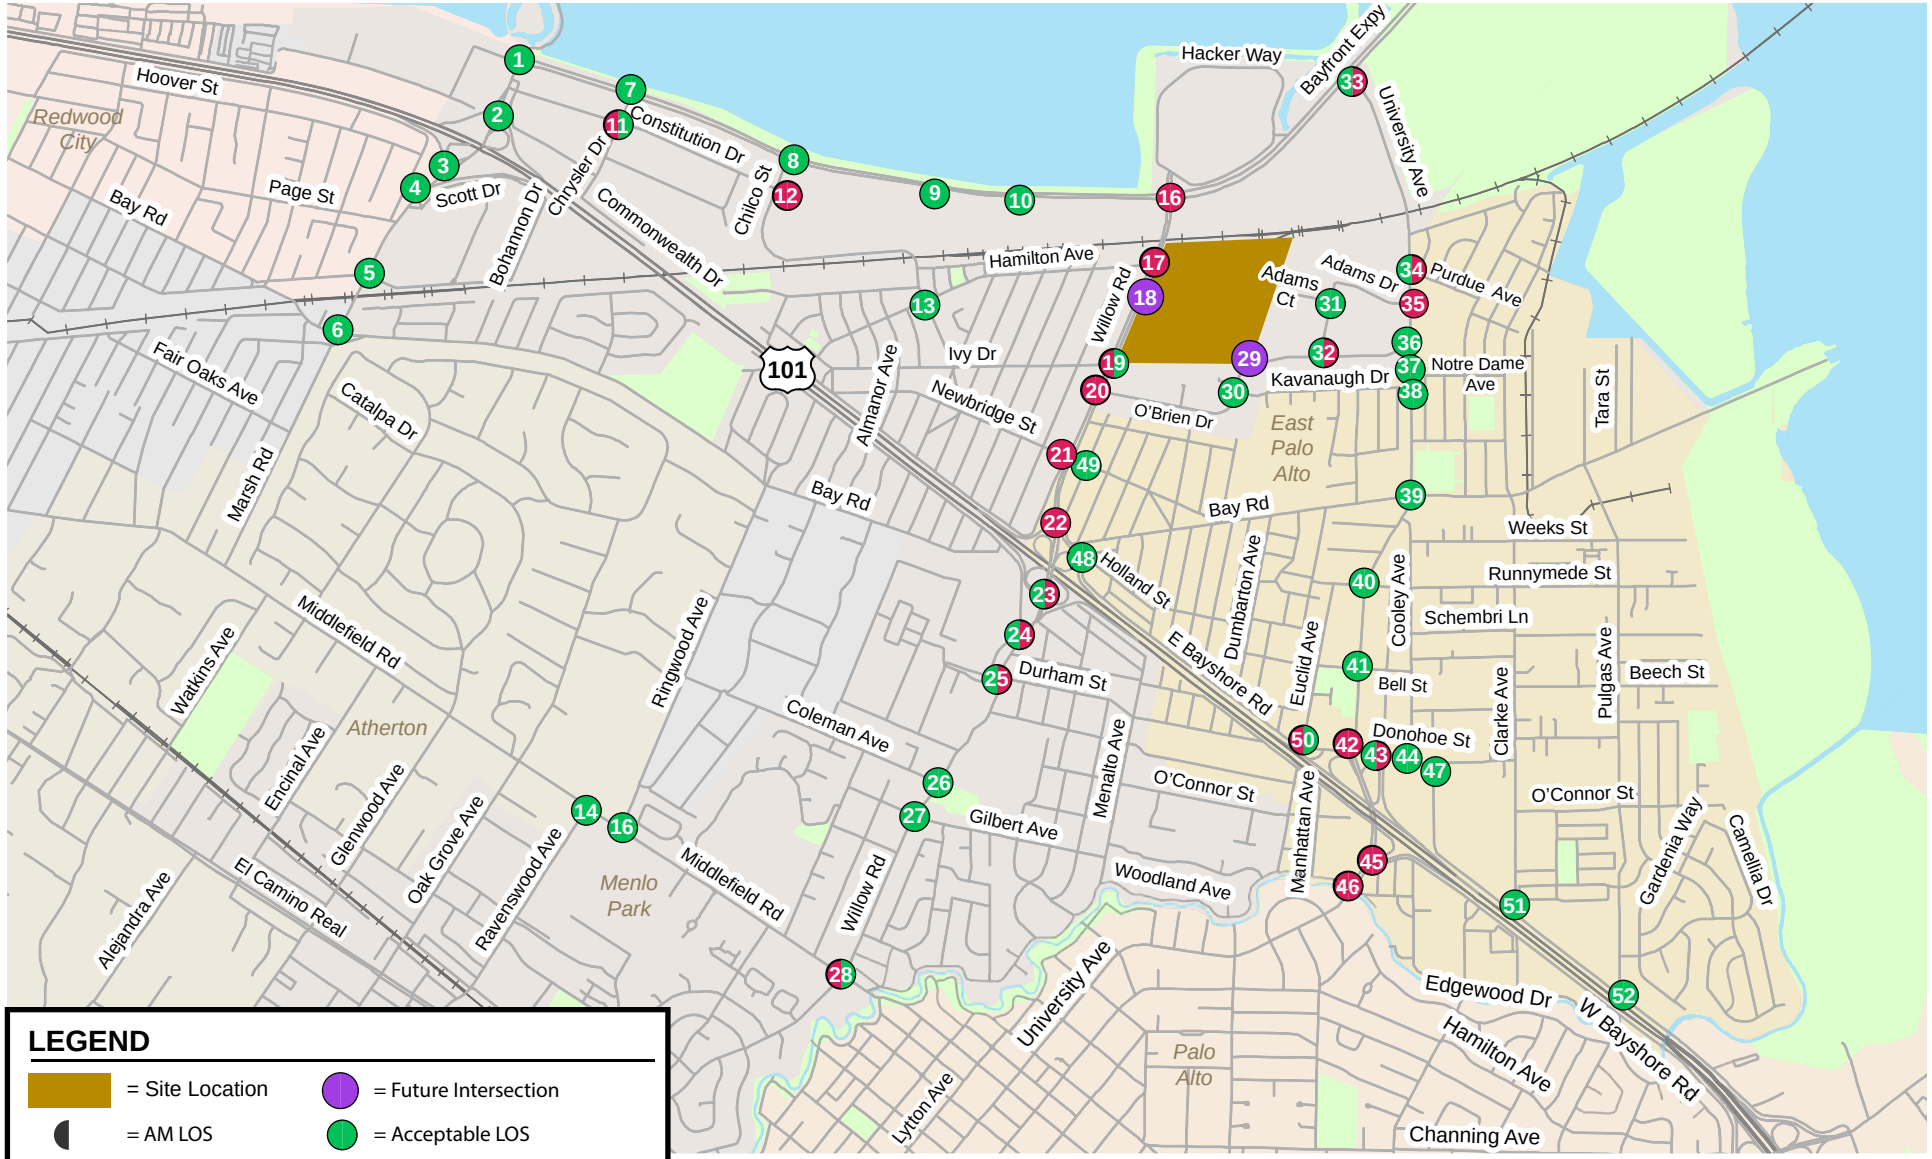

Figure 9
Existing Intersection Level of Service Summary

Existing Freeway Levels of Service

Existing weekday AM and PM peak hour traffic volumes on the study freeway segments were obtained from the *San Mateo County Congestion Management Program 2019* for segments within San Mateo County. The *Valley Transportation Authority 2018 CMP Monitoring Report* was referenced for segments within Santa Clara County. The *Alameda County Transportation Commission 2018 LOS Monitoring Report* was referenced for segments within Alameda County. As shown on Tables 9 to 11, the following freeway segments are currently operating below their respective level of service standards, or at LOS F:

San Mateo County

- SR 84 – between Willow Road and University Avenue, AM Peak Hour
- SR 84 – between University Avenue and Alameda County Line, AM & PM Peak Hours
- US 101 – between Santa Clara County Line and SR 92, AM & PM Peak Hours
- SR 109 – from SR 84 to Kavanaugh Drive, AM & PM Peak Hours

Santa Clara County

The following mixed-flow freeway segments are currently operating at LOS F:

- US 101 – from SR 85 to Rengstorff Avenue – AM & PM Peak Hours
- US 101 – from Rengstorff to San Antonio Avenue – PM Peak Hour
- US 101 – from San Antonio Avenue to Embarcadero Road – AM & PM Peak Hours
- US 101 – from Embarcadero Road to SR 85 – PM Peak Hour

The following HOV freeway segments are currently operating at LOS F:

- US 101 – from San Antonio Avenue to Embarcadero Road – PM Peak Hour
- US 101 – from Oregon Expressway to Embarcadero Road – AM Peak Hour

Alameda County

- SR 84 – Paseo Padre Parkway to San Mateo County Line – AM Peak Hour
- SR 84 – Newark Boulevard to I-880 – PM Peak Hour

Existing Freeway Ramp Capacity Analysis

This analysis consists of a volume-to-capacity ratio evaluation of the study freeway ramps. The ramp capacities were obtained from the *Highway Capacity Manual 2000 (Chapter 25),* which considers both the free-flow speed and the number of lanes on the study ramps. It was assumed that if ramp meter equipment is present, on-ramps on northbound US 101 would be metered during the AM peak hour, and on-ramps on southbound US 101 would be metered during the PM peak hour. Metered ramps are analyzed with a capacity of 900 vehicles per hour for the mixed-flow lanes. As shown on Table 12, the existing ramps currently have sufficient capacity to serve the existing traffic volumes.

Table 12
Freeway Ramp Capacity

Interchange	Ramp	Peak Hour	Lanes Type	Mixed	HOV	Meter [1]	Capacity [2]	Existing Conditions Volume [3]	V/C
US 101/Marsh Road	SB Off-ramp to Marsh Road	AM	Diagonal	2	-	-	3,800	1,332	0.35
		PM					3,800	1,156	0.30
	NB on-ramp from WB Marsh Road	AM	Diagonal	2	1	YES	1,800	1,559	0.87
		PM				-	2,000	1,472	0.74
US 101/Willow Road	NB off-ramp to Willow Road	AM	Diagonal	2	-	-	3,800	1,153	0.30
		PM					3,800	1,055	0.28
	NB on-ramp from WB Willow Road	AM	Diagonal	1	1	YES	1,800	424	0.24
		PM				-	2,000	495	0.25
	SB on-ramp from WB Willow Road	AM	Loop	1	-	-	1,900	739	0.39
		PM				YES	900	633	0.70
	SB off-ramp to Willow Road	AM	Diagonal	2	-	-	3,800	863	0.23
		PM					3,800	637	0.17
US 101/University Avenue	NB off-ramp to Donohoe Street	AM	Diagonal	1	-	-	2,000	857	0.43
		PM					2,000	1,326	0.66
	SB on-ramp from University Avenue	AM	Diagonal	2	-	-	1,800	1,143	0.64
		PM				YES	900	744	0.83

Notes:
NB = Northbound; SB = Southbound; EB = Eastbound; WB = Westbound
1. Northbound on-ramps are assumed metered during the AM peak hour. Southbound on-ramps are assumed metered during the PM peak hour.
2. Ramp capacities were obtained from *Highway Capacity Manual 2000* , and considered the free-flow speed, the number of lanes on the ramp, and ramp metering.
3. Existing volumes referenced intersection counts collected in 2019.

Observed Existing Traffic Conditions

Traffic conditions were observed in the field at each study intersection in order to identify existing operational deficiencies and to confirm the accuracy of the calculated level of service. The purpose of this effort was (1) to identify any existing traffic problems that may not be directly related to level of service, (2) identify any locations where the level of service analysis does not accurately reflect existing traffic conditions. Hexagon conducted field observations on a regular weekday during the AM and PM peak hours in May, October, and November of 2019. Some of the study intersections had no significant operational issues, and vehicular queues on all approaches were mostly able to clear in one cycle. The observed operational issues at the remaining study intersections are identified below.

Marsh Road between Bayfront Expressway and Bay Road

There were no operational deficiencies observed along this corridor during the AM peak hour.

During the PM peak hour, the eastbound traffic on Marsh Road queued from Bayfront Expressway past the 101 SB Off-Ramp. Most eastbound vehicles required more than one cycle to clear along this queue. The southbound left-turn movement at the Marsh Road/US 101 SB Off-Ramp intersection also received heavy demand. These vehicles usually waited through more than one queue to cross the intersection due to downstream spillback queues on eastbound Marsh Road.

Middlefield Road between Marsh Road and University Avenue

During the AM peak hour, southbound traffic was heavy. The southbound left-turn queue at the Ringwood Avenue/Middlefield Road intersection occasionally exceeded the left-turn pocket as vehicles traveled to Menlo-Atherton High School. The northbound left-turn queue at the Ravenswood Avenue/Middlefield Road intersection frequently filled the entire block and occasionally impacted operations at Ringwood Avenue, as vehicles in the through lane waited to merge into the left-turn lane.

During the PM peak hour, the northbound left-turn queue at the Ravenswood Avenue/Middlefield Road intersection sometimes filled the entire block and occasionally impacted operations at Ringwood Avenue as vehicles in the through lane waited to merge into the left-turn lane. Vehicles making an eastbound right-turn from Ravenswood Avenue were observed to wait to merge to the southbound left-turn lane at the Ringwood Avenue/Middlefield Road intersection. The northbound right-turn movement at the Willow Road/Middlefield Road intersection received heavy demand but was often observed to be blocked by the northbound through queue.

Bayfront Expressway between Marsh Road and University Avenue

Due to signal failures at the Bayfront Expressway and Marsh Road intersection during the day of observation, the observed AM peak hour conditions along this corridor were deemed atypical.

During the PM peak hour, the southbound traffic on Bayfront Expressway queued from University Avenue northward past upstream intersections. Most southbound vehicles required multiple cycles to clear intersections along this queue. The eastbound left-turn queue at the Chrysler Drive/Bayfront Expressway intersection extended past upstream intersections and required multiple cycles to clear. The southbound right-turn and northbound left-turn movements at the Chilco Street/Bayfront Expressway intersection sometimes required two signal cycles to clear due to eastbound spillback queues at the Chilco Street and Constitution Drive intersection. The eastbound left-turn movement frequently required two signal cycles to clear the Chilco Street/Bayfront Expressway intersection.

Chilco Street & Constitution Drive/MPK 22 Driveway

During the AM peak hour, all approaches of this unsignalized intersection were busy. Vehicles frequently made left turns at all approaches. The two unsignalized pedestrian crosswalks were heavily utilized. The westbound through-right lane frequently queued towards Bayfront Expressway and was observed to take up to a minute to clear. The queue was observed to occasionally extend to the end of the southbound right-turn pocket on Bayfront Expressway.

During the PM peak hour, eastbound spillback queues from the Chilco Street and Bayfront Expressway intersection affected traffic operations at this intersection. At the Chilco Street and Constitution Drive intersection, the westbound vehicles frequently queued towards, and sometimes onto, Bayfront Expressway.

Chrysler Drive & Constitution Drive

During the AM peak hour, there were no significant operational issues at this intersection.

During the PM peak hour, eastbound spillback queues from the Chrysler Drive and Bayfront Expressway intersection affected traffic operations at this intersection. At the Chrysler Drive and Constitution Drive intersection, the eastbound queues extended past upstream intersections. The westbound left-turn queue frequently extended into the southbound right-turn lane on Bayfront Expressway. The westbound left-turn queue was usually able to clear in one signal cycle, although it was observed to be sometimes blocked by the eastbound spillback queue. The northbound right-turn movement sometimes required multiple signal cycles to clear due to eastbound downstream queuing issues.

Willow Road between Hamilton Avenue and Gilbert Avenue

During the AM peak hour, there was heavy demand on westbound Willow Road along this corridor. Westbound vehicles often required multiple cycles to clear an intersection. As a result, the southbound right-turn and northbound left-turn movements on the side streets turning onto westbound Willow Road also required multiple cycles to clear the intersection. The westbound queue was usually able to clear at the Willow Road/Durham Street intersection due to the long through phase. The eastbound left-turn movement at the Newbridge Street intersection received heavy demand and occasionally required two signal cycles to clear. Vehicles at the US 101 northbound off-ramp turning right onto eastbound Willow Road frequently queued onto the auxiliary lane on US 101 and required multiple cycles to clear.

During the PM peak hour, there was heavy demand on eastbound Willow Road along this corridor. Eastbound vehicles often required multiple cycles to clear an intersection. As a result, the northbound right-turn and southbound left-turn movements on the side street turning onto eastbound Willow Road also required multiple cycles to clear the intersection. The westbound left-turn movement at the Hamilton Avenue intersection received heavy demand that often required two signal cycles to clear. Vehicles at the US 101 northbound off-ramp turning right onto eastbound Willow Road frequently queued onto the auxiliary lane on US 101 and required multiple cycles to clear. Vehicles at the US 101 southbound off-ramp turning left onto eastbound Willow Road were often impacted by eastbound spillback queues and were observed to block the westbound through movement. The westbound left-turn queue extended onto US 101 southbound and impacted freeway operations. Vehicles were observed to utilize the parking lane to access the westbound right-turn movement at the Willow Road/Coleman Avenue intersection.

University Avenue between Purdue Avenue and Woodland Avenue

During the AM peak hour, there was heavy demand on westbound University Avenue along this corridor. Westbound vehicles often required multiple cycles to clear an intersection between Adams Drive and Woodland Avenue. Eastbound traffic between Bay Road and the US 101 SB Ramps was also heavy and often required multiple cycles to clear. At the unsignalized intersection of University Avenue and Adams Drive, the eastbound and southbound left-turn movements occasionally had extended wait periods due to continuous westbound traffic. Protected signal phasing is recommended at the University Avenue and Runnymede Street intersection due to potentially hazardous interactions between vehicles performing permitted left-turns across heavy traffic and crossing pedestrians.

During the PM peak hour, there was heavy demand on eastbound University Avenue along this corridor. Eastbound vehicles often required multiple cycles to clear an intersection. As a result, the left-turn movements on the side streets also required multiple cycles or extended wait periods to clear the intersection. Eastbound traffic between Bay Road and Donohoe Street occasionally required more than one cycle to clear. At the unsignalized intersection of University Avenue and Purdue Avenue, vehicles were observed to make northbound right-turns, despite existing signage prohibiting that maneuver. At the University Avenue/Adams Drive intersection, vehicles were observed to pass through the intersection during a break in westbound traffic and wait in the median area until drivers allowed them to merge. The westbound left-turn movement at the University Avenue/Bay Road intersection sometimes required more than one cycle to clear. The eastbound left-turn movement at the University Avenue/Bell Street intersection frequently queued out of the turn pocket and required multiple cycles to clear.

Donohoe Street between University Avenue and Cooley Avenue

During the AM peak hour, there was heavy demand on northbound Donohoe Street along this corridor. Northbound vehicles often required multiple cycles to the clear an intersection. As a result, the westbound right-turn and eastbound left-turn movements on the side streets turning onto northbound Donohoe Street also required multiple cycles to clear the intersection. At the Cooley Avenue/Donohoe Street intersection, there was high demand for the number 1 lane. The congestion was due to spillback from the downstream intersections at University Avenue/Donohoe Street and US 101 NB Off-Ramp/Donohoe Street.

During the PM peak hour, there was heavy demand on northbound Donohoe Street along this corridor. Northbound vehicles often required multiple cycles to the clear an intersection. The eastbound left-turn vehicles at the US 101 NB Off-Ramp/Donohoe Street intersection were observed to frequently fail to clear the intersection in one green cycle due to high volume and northbound spillback queues. At the Cooley Avenue/Donohoe Street intersection, there was high demand for the number 1 lane. The congestion was due to spillback from the downstream.

Project Trips Estimates

Trip generation estimates for the mixed-use development are based on standard trip generation rates published in the Institute of Transportation Engineers (ITE) Trip Generation, 10th Edition manual. Below is a general discussion of the trip generation estimation methodology (see Table 13). Detailed trip generation analysis is provided in Appendix D.

Gross Project Trip Generation

A description of the source of trip generation rates for each land-use is provided below:

- ***Office***. Initial trip estimates for office and accessory uses are based on “ITE Land Use code 710: General Office Building”.
- ***Residential.*** The trip estimate is based on the “ITE Land Use code 221: Multifamily Housing (Mid-Rise)”, which includes apartments, townhouses, and condominiums located within the same building with at least three other dwelling units and that have between three to ten levels. Some of the apartments are designated as senior housing, which could have a lower trip rate. Thus, the trip generation estimate for the apartments is conservative.
- ***Retail.*** Trip estimates are based on “ITE Land Use code 820: Shopping Center”, which includes several types of retail uses like restaurants, movie theaters, bowling alleys etc. that are typically present in shopping centers.
- ***Hotel.*** Trip estimates are based on “ITE Land Use code 310: Hotel”.
- ***Publicly Accessible Park.*** Trip estimates are based on “ITE Land Use code 488: Soccer Complex”. The programmatic design of the park has not been determined. In order to provide a conservative estimate of potential traffic generation and allow for flexible programming for the project through the project review process, it is assumed that the park will have play structures and open field areas for warm-ups or casual play.

Transportation Demand Management (TDM)

The City of Menlo Park requires all new developments in the R-MU and O zoning districts to reduce their trip generation by 20 percent from standard trip generation rates via TDM strategies. The City has in practice applied the 20 percent reduction after crediting for any trip reductions based on a project's proximity to complimentary land uses, alternative transportation facilities, as well as reductions based on a project's mixed-use characteristics (see Appendix D for discussion on the project's trip reductions). As implemented by the City, this TDM ordinance is applied to daily trips, AM peak hour trips, and PM peak hour trips.

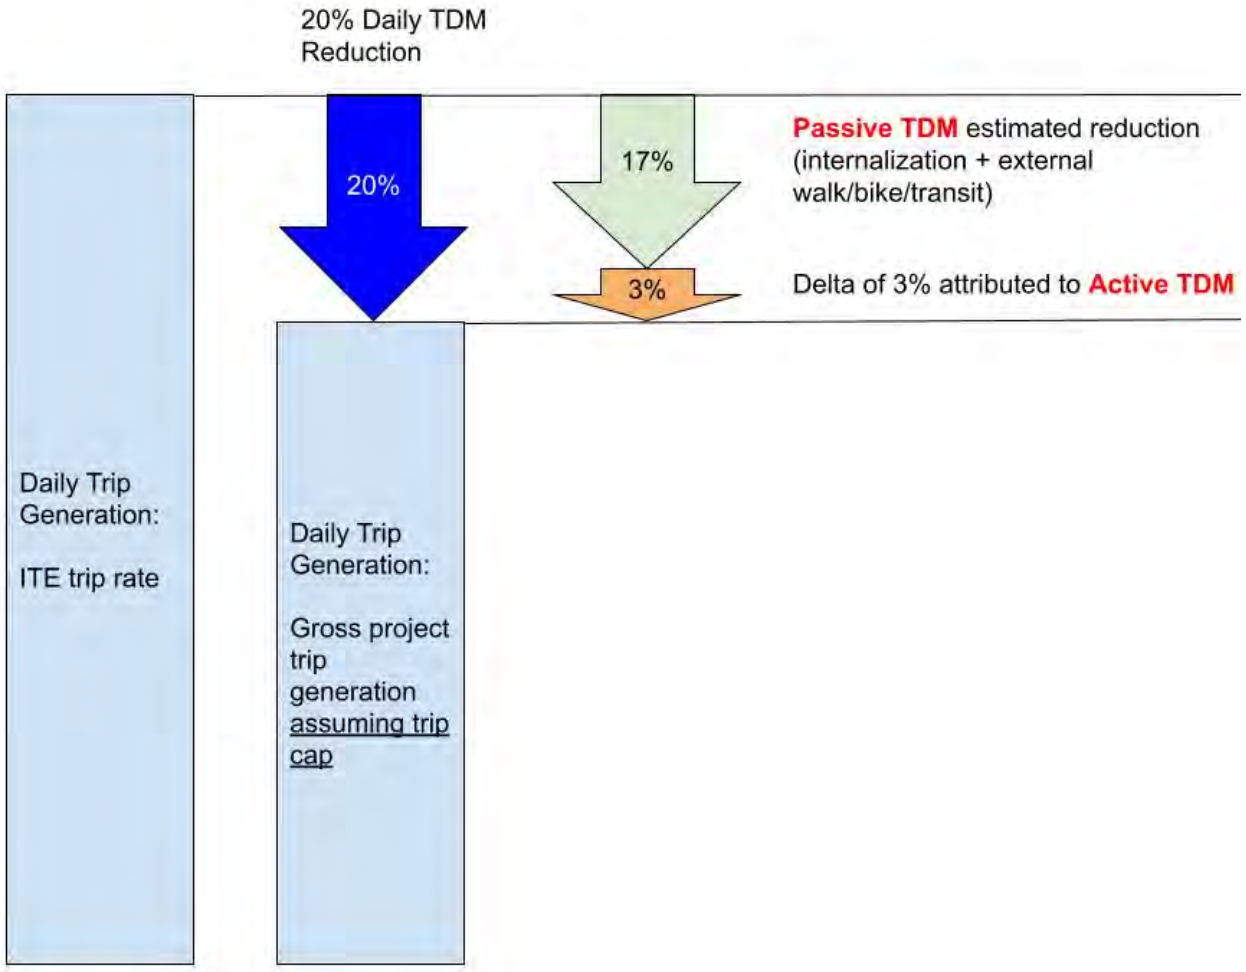
Per the Willow Village Adjustment Request: Transportation Demand Management, submitted by the applicant team, the applicant is proposing the following regarding TDM:

- For the Campus District, the applicant proposes a daily trip cap of 18,237 trips, and a trip cap of 1,670 trips during the AM and PM peak hours.
    - The daily trip cap represents a 20 percent reduction from gross ITE trip generation (see Figure 10).
    - The peak hour trip cap represents a 35-40 percent reduction from gross ITE trip generation.
- For the Residential/Shopping and Town Square Districts, the applicant proposes a 20 percent reduction from gross ITE trip generation for daily, and a 20 percent and 27 percent reduction from gross ITE trip generation during the AM and PM peak hours of commute, respectively.

TDM Monitoring

The City incorporates monitoring requirements into project conditions. The project's TDM plan is anticipated to be monitored annually to ensure effectiveness of the TDM plan. The details of the TDM monitoring plan will be developed as part of CDP, and will detail frequency and duration of monitoring for each land use, as well as the methodology to conduct monitoring. The monitoring plan will also specify corrective measures if the TDM plan is not achieving its stated effectiveness.

Figure 10
Graphical Representation of How the Transportation Analysis Modeled Daily Trip Generation for All Land Uses



Note: the TDM program would achieve a higher reduction, but only a 3% reduction from active TDM measures is needed to achieve a 20% reduction off of gross trip generation estimated using ITE trip generation rates (see discussion above).

Net Project Trip Generation

The project trip generation assumes the applicant's proposed TDM plans for the Campus District as well as for the Residential/Shopping and Town Square Districts. It should be noted that the trip reductions due to the applicant proposed TDM plans already accounted for trip reductions due to the Proposed Project's location efficiency, as well as internal capture due to the Proposed Project's mixed use nature (see Appendix D for details).

As shown in Table 13, the proposed project trips generated by the proposed land uses after accounting for the proposed TDM plans at the main Project Site would be 33,263 daily trips, 2,396 AM peak hour trips, and 2,907 PM peak hour trips.

Net project trip generation represents the number of new project trips added to the surrounding roadway network. The following categories of trips are credited from the site-specific trip cap to derive the net project trip generation.

Pass-By

The retail uses would attract some of their customers from people who are passing by the site on Willow Road or Bayfront Expressway heading towards their destination. These customers would not need to make a separate vehicle trip to come to the Project Site. Such vehicle trips are categorized as pass-by trips as they are not new trips generated on the roadway network and should be credited from the project trip generation. A pass-by trip reduction for retail trips was applied based on the average pass-by reduction rate published in the ITE Trip Generation Handbook, 3rd Edition. Pass-by data are typically available only for the PM peak hour. Hexagon assumed no pass-by trip reduction for the AM peak hour and half of the PM peak pass-by trip reduction for daily trip generation.

Existing Uses

Trips associated with the existing uses on the Project Site were credited against the new trip generation. The trips generated by the existing buildings on the site were estimated based on driveway counts conducted over three days in September 2019 per Facebook Willow Traffic Counts Memorandum, Fehr & Peers, March 26, 2020. The existing uses on the site generated an average of 11,700 trips daily, including 985 trips in the AM peak hour (699 inbound and 286 outbound trips), and 805 trips in the PM peak hour (250 inbound and 555 outbound trips).

As shown in Table 13, the net Proposed Project trips generated by the main Project Site on the roadway network would be 20,537 daily trips, including 1,411 AM peak hour trips (939 inbound trips and 472 outbound trips), and 1,914 PM peak hour trips (719 inbound trips and 1,195 outbound trips).

As shown in Table 14, the net trips generated by the Hamilton Parcels are estimated to be 218 daily trips, including 6 AM peak hour trips (3 inbound trips and 3 outbound trips), and 18 PM peak hour trips (9 inbound trips and 9 outbound trips)[15].

[15] The Hamilton Parcels are located within C-2-S zoning, which does not require implementation of a TDM Plan. Therefore, no TDM reductions were applied.

Table 13
Project Trip Generation Estimates (Main Project Site)

Land Use	ITE Land Use Code [1]	Size	Unit	Daily Rate [1]	Daily Total	AM Peak Hour Rate [1]	AM Peak Hour IN	AM Peak Hour OUT	AM Peak Hour Total	PM Peak Hour Rate [1]	PM Peak Hour IN	PM Peak Hour OUT	PM Peak Hour Total

Notes
d.u. = dwelling unit, ksf = 1,000 s.f.

1. Daily, AM, and PM peak hour average rates published in ITE Trip Generation Manual, 10th Edition, 2017 were used for each land use.
2. Office trip generation and TDM reductions reflect the proposed daily, AM and PM peak hour trip caps.
3. The publicly accessibleThe programmatic design of the park has not been determined. In order to provide a conservative estimate of potential traffic generation, it is assumed that the park will have play structures and open field areas for warm-ups or casual play. The park is planned for approximately 3.5 acres. Number of soccer fields on 3.5 acres of land was estimated based on the size of a standard soccer field. park is assumed to be programmable. ITE Land Use "Soccer Field" is analyzed as a proxy. Number of soccer fields was estimated based on the size of a standard soccer field.
4. For the Residential/Shopping and Town Square Districts, the applicant proposes a 20 percent reduction from gross ITE trip generation for daily, and a 20 percent and 27 percent reduction from gross ITE trip generation during the AM and PM peak hours of commute, respectively.
5. Pass-by trip reduction is based on the average pass-by trip reduction rate published in the ITE Trip Generation Handbook, 3rd Edition. Hexagon assumes no pass-by trip reduction during the AM peak hour and half of the PM peak pass-by reduction for daily trip generation.
6. Existing Use trip estimates based on driveway counts conducted over three days in September 2019 per Facebook Willow Traffic Counts Memorandum, Fehr & Peers, March 26, 2020. 8-9 AM in the AM peak period and 4-5 PM in the PM peak period have been considered as peak hours since they have the highest trips.

Table 14
Project Trip Generation Estimates (Hamilton Parcel)

Land Use	ITE Code [1]	Size		Daily Rate	Daily Trips	AM Peak Hour Rate	AM Peak Hour In	AM Peak Hour Out	AM Peak Hour Total	PM Peak Hour Rate	PM Peak Hour In	PM Peak Hour Out	PM Peak Hour Total
Proposed Use

External Walk, Bike, and Transit [2]					*(28)*		*(1)*	*0*	*(1)*		*(1)*	*(1)*	*(2)*
Retail Pass-By Reduction (34%) [3]					*(45)*		*0*	*0*	*0*		*(4)*	*(5)*	*(9)*
Net Project Trips on Project Network					**218**		**3**	**3**	**6**		**9**	**9**	**18**

Notes:
ksf = 1,000 square feet

[1] Daily, AM, and PM peak hour average rates published in *ITE Trip Generation Manual, 10th Edition, 2017* were used for each land use.

[2] External walk, bike, and transit reduction developed using *US EPA Mixed Use Trip Generation Model v.4, 2010* .

[3] Pass-by trip reduction is based on the average pass-by trip reduction rate published in the ITE Trip Generation Handbook, 3rd Edition. Hexagon assumes no pass-by trip reduction during the AM peak hour and half of the PM peak pass-by reduction for daily trip generation.

Trip Distribution and Assignment

The trip distribution pattern and trip assignment for the proposed uses were estimated based on the Menlo Park Travel Demand Model. The model estimated trip distribution pattern is summarized below:

- Dumbarton Bridge: approximately 11%
- US 101 to the north, including Haven Avenue: approximately 28%
- US 101 to the south, including Embarcadero Road: approximately 31%
- Marsh Road west of US 101: approximately 4%
- Willow Road west of US 101: approximately 8%
- University Avenue west of US 101: approximately 6%
- Menlo Park and East Palo Alto east of US 101: approximately 12%

Future Traffic Volumes

Both near-term (year 2025) and cumulative (year 2040) scenario forecasts of intersection turning movements, freeway traffic and ramp volumes were completed using the latest Menlo Park travel demand forecast model (citywide travel demand forecast model). The citywide model is the best available model to represent travel within the City of Menlo Park, and serves as the primary forecasting tool for the City. The model is a mathematical representation of travel within the nine Bay Area counties, as well as the Santa Cruz, San Benito, Monterey and San Joaquin counties. The base model structure was developed by the Metropolitan Transportation Commission (MTC) and further refined by the City/County Association of Governments and Santa Clara Valley Transportation Authority for use within San Mateo County and Santa Clara County. The City further refined this model for application with Menlo Park to add more detail to the zone structure and transportation network. There are 81 transportation analysis zones (TAZs) within the model to represent the City of Menlo Park.

Near-Term and Cumulative Traffic Volumes

Land use growth assumptions for Bay Area regions outside of Menlo Park and East Palo Alto for the near-term scenario (year 2025) are provided by the Association of Bay Area Governments (ABAG) and refined by VTA/C/CAG. Approved developments within the City of Menlo Park and the City of East Palo Alto were added to the existing land use to represent the year-2025 land use. The following approved projects within the City of Menlo Park and the City of East Palo Alto as of December 2020 were included:

- Menlo Gateway
- 1285 El Camino Real
- 123 Encinal Avenue
- 1010-1026 Alma Street
- 650-660 Live Oak Avenue
- 1275 El Camino Real
- Facebook Expansion Project (301-309 Constitution Drive)
- 500 El Camino Real
- New Magnet High School
- 1300 El Camino Real
- 1021 Evelyn Street
- 40 Middlefield Road
- 949 El Camino Real
- 1540 El Camino Real
- 115 El Camino Real

- 506-556 Santa Cruz Avenue
- 1125 Merrill Street
- 409 Glenwood Avenue
- 706-716 Santa Cruz Avenue
- 1345 Willow Road
- 201 El Camino Real
- 1021 Runnymede Street (East Palo Alto)

For the cumulative scenario, the City of Menlo Park land use assumed the buildout of the General Plan, as well as the portion of the proposed 123 Independence Drive project that would exceed the unrestricted dwelling units studied in the ConnectMenlo EIR. Pending developments as of December 2020 within the City of East Palo Alto were added to the near-term land use to represent the year-2040 land use for the city. Land use growth for other Bay Area regions for year 2040 were taken from Association of Bay Area Governments (ABAG) projections and refined by VTA/C/CAG. Table 15 shows the socioeconomic model inputs for the entire Bay Area separated by counties.

The forecasted intersection turning movements under all future scenarios were adjusted based on existing volumes to generate traffic volumes for near-term conditions (see Figure 11), near-term plus project conditions (see Figure 12), cumulative conditions (see Figure 13), and cumulative plus project conditions (see Figure 14).

Table 15
Socioeconomic Model Inputs for Bay Area

	Year 2040 Project Conditions Model Land Use Data			
County	Total Households	Total Population	Employed Residents	Total Jobs
San Francisco	447,340	1,076,365	559,923	759,509
San Mateo	320,377	909,511	444,478	481,116
Santa Clara	818,369	2,406,587	1,158,389	1,229,995

Cumulative with Dumbarton Rail Scenario

Dumbarton rail service has not been designed, subjected to environmental review, approved, or funded. As a result, future Dumbarton rail service is speculative at this time and might or might not occur. If it does occur, capacity, frequency, ridership and other operational features are unknown at this time. As a result, any forecast of potential future traffic with Dumbarton rail service is speculative. The following analysis is provided for informational purposes to give the public and decision makers an idea of what impact Dumbarton rail might have on traffic based on a specific set of ridership assumptions. These impacts would occur instead of the impact identified above under Cumulative (2040) Plus Project Intersection Levels of Service.

A cumulative with Dumbarton rail scenario was evaluated where the model assumed the operation of potential Dumbarton Rail service. The purpose of this scenario was to provide information on the possible effects of future Dumbarton Rail on the transportation network based on the assumptions made herein about such future service. A cumulative plus project with Dumbarton Rail scenario was compared against the cumulative with Dumbarton Rail scenario to inform the potential effects of the Project-generated traffic assuming potential Dumbarton Rail service.

Based on the *Dumbarton Rail Corridor Update* in March 2021, preliminary forecasts suggest that under 2040 conditions, the high-end ridership projections for the highest-ridership alternative would be around 24,300 riders per day. In comparison, the low-end ridership projections for the lowest-ridership alternative would be around 14,600 riders per day. As shown on Figure 15, this highest ridership forecast would be realized over a potential corridor with 10 stations located between downtown Redwood City and the Union City BART station. It should be noted that this potential corridor includes a stop on Willow Road just north of the proposed Project Site. At the time of this study's initiation, the ability to park-and-ride at the stations along this potential corridor was not available.

This study assumed the highest ridership projections as well as no park-and-ride capability at the stations. More ridership along the Dumbarton Rail corridor would mean lower traffic volumes. Therefore, the assumptions of this study would equate to evaluating the largest potential reduction in traffic volumes assuming the operation of Dumbarton Rail service.

To represent the daily ridership in the model, daily travel between TAZs within a quarter-mile radius of the stations was reduced by 24,300 daily person-level driving trips, or roughly 19,000 daily vehicular-trips. During a one-hour peak hour, based on the highest ridership projections, the Dumbarton Rail corridor would reduce approximately 1,900 vehicular trips, of which approximately half of the trip reduction would occur within the study area. These trips are assumed to be between TAZ sets within a quarter-mile radius of different stations, as the stations are assumed to not contain park-and-ride capabilities. A quarter-mile radius from the stations represents walkable distances to the stations.

Figure 16 shows the model-adjusted intersection turning movement volumes for the cumulative with Dumbarton Rail scenario. Volumes under the cumulative plus project with Dumbarton Rail scenario are shown in Figure 17. The Dumbarton Rail was estimated to reduce the Proposed Project's vehicular trip generation by approximately 4%.

Future Transportation Networks

Near-term (2025) Conditions

The transportation network under near term conditions assumes a signal at Chilco Street and Constitution Drive/MPK 22 Driveway, consistent with the Menlo Gateway EIR and the Bayfront Campus Expansion EIR. The intersection would be restriped to include an eastbound left-turn lane and a shared through-right lane, two westbound left-turn lanes and a shared through-right lane, a northbound shared through-left lane and a right-turn lane, and a southbound shared left-through-right lane and right-turn lane. The roadway network for other study intersections is assumed to be the same as under existing conditions.

Near-term (2025) plus Project Conditions

The following improvements are proposed to the Street network under plus project conditions:

- **Willow Road and Hamilton Avenue**: Hamilton Avenue would be realigned and a south leg that would provide access to the Project Site would be added to the intersection. The south leg is identified as Main Street. The proposed lane configuration for the intersection would be modified to a northbound left-turn lane and shared through-right lane, a southbound left-turn lane and shared through-right lane, an eastbound left-turn lane, through lane, and shared through-right lane, and two westbound left-turn lanes, a through lane, and a shared through-right turn lane.

- **Willow Road and Park Street**: This is a proposed new signalized intersection with Park Street providing access to the Project Site. The proposed lane configuration for the intersection would be a northbound left-turn lane and a shared left right lane, an eastbound through lane and shared through-right lane, and two westbound left-turn lanes and two through lanes.

- **O'Brien Drive/Loop Road and Main Street/O'Brien Drive**: This is a proposed new roundabout intersection. The proposed lane configuration for the intersection would be one shared left-through-right lane on all approaches.

Cumulative (2040) Conditions

The transportation network under cumulative (2040) conditions and cumulative (2040) conditions with Dumbarton rail is assumed to include the improvements under near term conditions. The following additional road improvements in East Palo Alto identified in the Ravenswood/4 Corners TOD Specific Plan Environmental Impact Report (February 22, 2013) are also assumed:

- **University Avenue and Purdue Avenue (Mitigation Measure TRA-CUM-3)**: Install a traffic signal at this intersection. Along with a new traffic signal, appropriate pedestrian and bicycle accommodation will be provided.
- **University Avenue and Bay Road (Mitigation Measure TRA-CUM-4):** Add an exclusive eastbound right-turn lane and a second eastbound left-turn lane on University Avenue, add a second northbound left-turn lane on Bay Road, add a second westbound left-turn lane on University Avenue, and modify signal phasing.
- **University Avenue and Donohoe Street (Mitigation Measure TRA-CUM-5):** Add an exclusive westbound right-turn lane on University Avenue.

Cumulative (2040) plus Project Conditions

The transportation network under cumulative (2040) plus project conditions and cumulative (2040) plus project conditions with Dumbarton rail is assumed to include the proposed project improvements described under the near term plus project conditions. The roadway network for other study intersections is assumed to be the same as under cumulative (2040) conditions.

Near-Term (2025) Intersection Levels of Service

The results of the intersection level of service analysis under near-term conditions are summarized in Tables 16 and 17. The Willow Road corridor and 101/University Avenue interchange were analyzed using the Simtraffic microsimulation model as described Chapter 2. The microsimulation model indicates that the intersections would experience capacity issues where the demand cannot be served by the intersections. Oversaturated conditions would operate at LOS F and are indicated using 'OVERSAT' in the tables below. Vistro and Traffix were used to calculate critical delay and volume to capacity ratio at the Willow Road and 101/University Avenue intersections, respectively. The intersection LOS calculation sheets are included in Appendix C. The following study intersections (see Figure 18) would operate at an unacceptable level of service during at least one peak hour:

11. Chrysler Drive and Constitution Drive (AM peak hour)
12. Chilco Street and Constitution Drive/MPK 22 Driveway (PM peak hour)
16. Willow Road and Bayfront Expressway (AM and PM peak hours)
17. Willow Road and Hamilton Avenue (AM and PM peak hours)
19. Willow Road and Ivy Drive (AM and PM peak hours)
20. Willow Road and O'Brien Drive (AM and PM peak hours)
21. Willow Road and Newbridge Street (AM and PM peak hours)
22. Willow Road and US 101 Northbound Ramps (AM and PM peak hours)
23. Willow Road and US 101 Southbound Ramps (AM and PM peak hours)
24. Willow Road and Bay Road (AM and PM peak hours)
25. Willow Road and Hospital Plaza/Durham Street (AM and PM peak hours)
28. Willow Road and Middlefield Road (AM peak hour)
30. O'Brien Drive and Kavanaugh Drive (PM peak hour)
32. Adam's Drive and O'Brien Drive (PM peak hour)
33. University Avenue and Bayfront Expressway (PM peak hour)
34. University Avenue and Purdue Avenue (PM peak hour)
35. University Avenue and Adams Drive (AM and PM peak hours)
39. University Avenue and Bay Road (PM peak hour)
42. University Avenue and Donohoe Street (AM and PM peak hours)
43. US 101 Northbound Off-Ramp and Donohoe Street (AM and PM peak hours)
44. Cooley Avenue and Donohoe Street (AM and PM peak hours)
45. University Avenue and US 101 Southbound Ramps (AM and PM peak hours)
46. University Avenue and Woodland Avenue (AM and PM peak hours)
47. East Bayshore Road and Donohoe Street (AM and PM peak hours)
50. East Bayshore Road and Euclid Avenue (AM and PM peak hours)

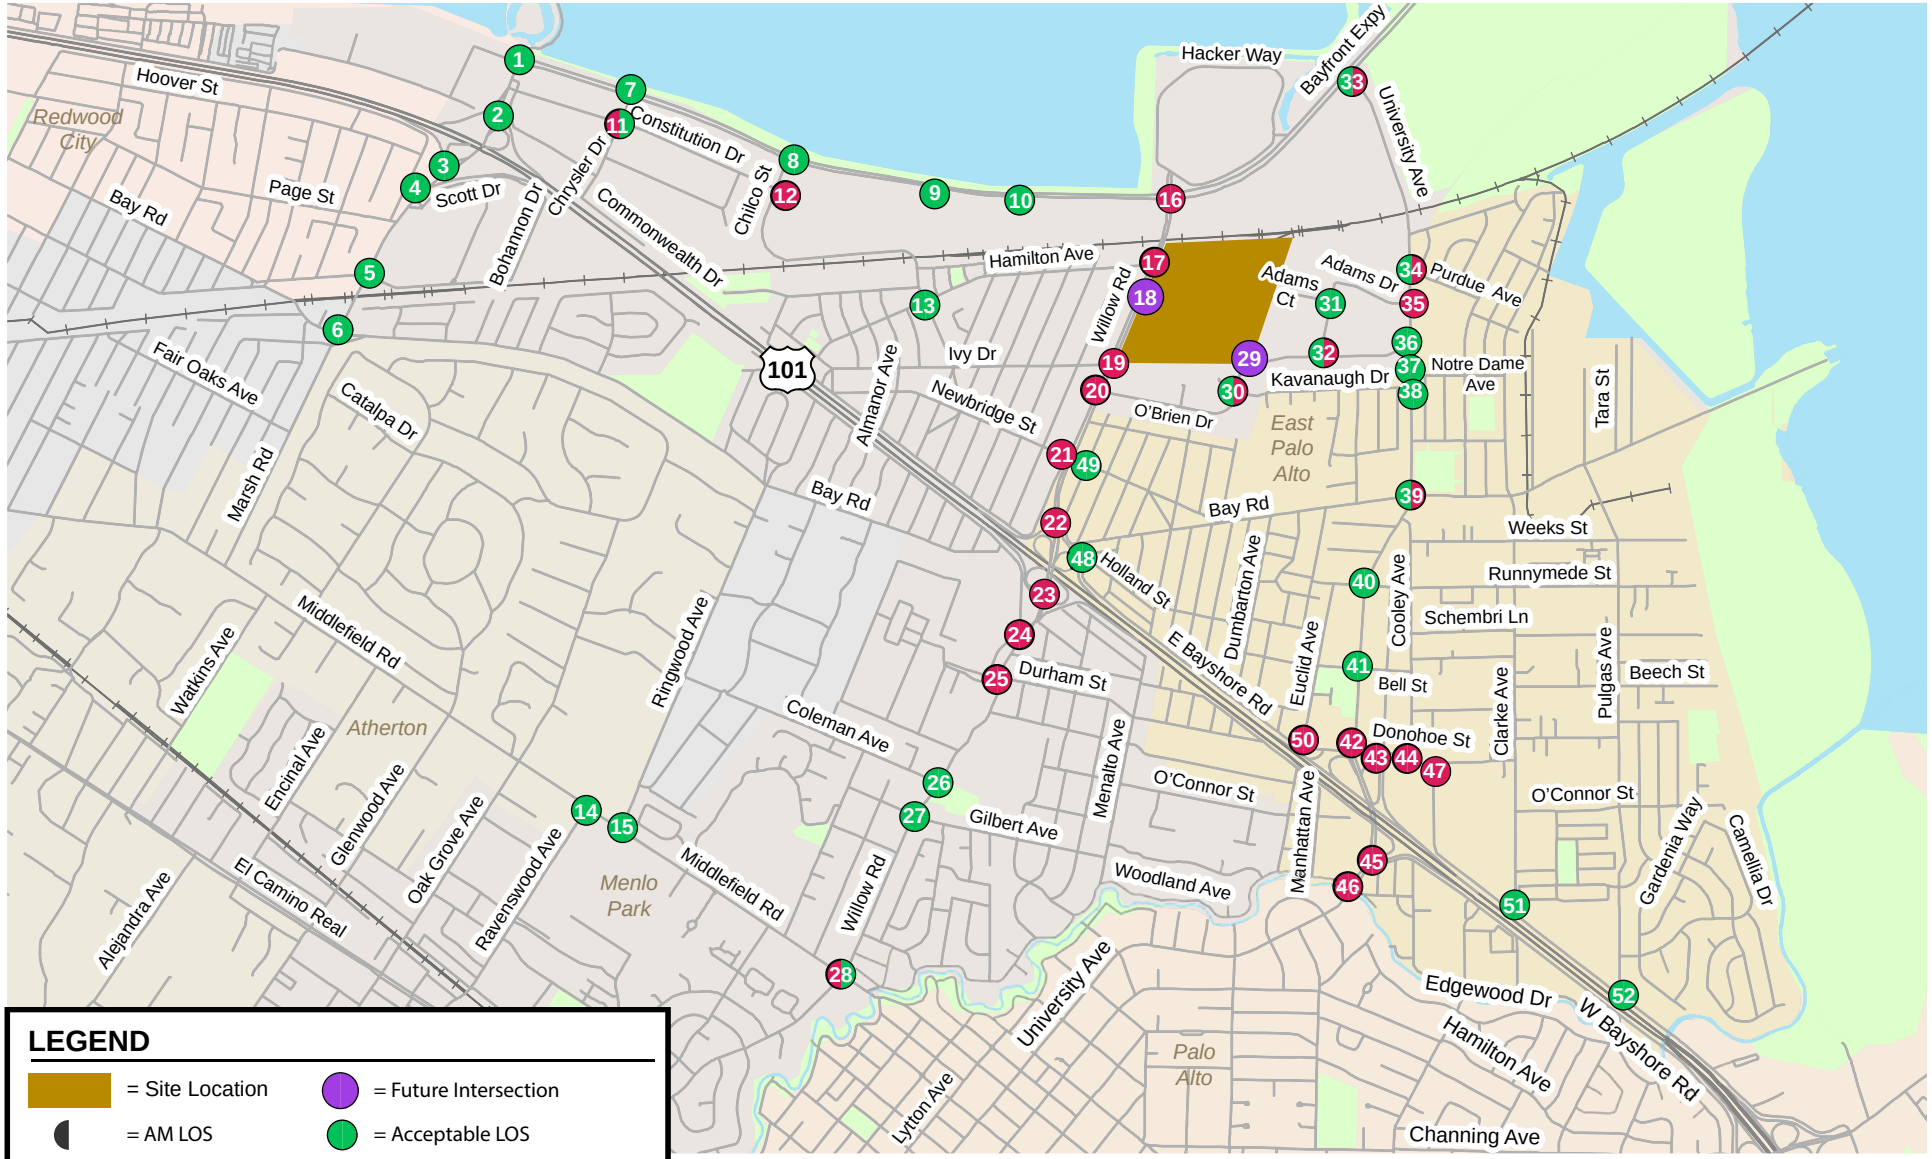

Figure 18
Near-Term Intersection Level of Service

Near-Term (2025) Plus Project Intersection Levels of Service

The results of the intersection level of service analysis under near term (2025) plus project conditions are summarized in Table 16 and 17. The Willow Road corridor and 101/University Avenue interchange were analyzed using the Simtraffic microsimulation model as described Chapter 2. The microsimulation model indicates that the intersections would experience capacity issues where the demand cannot be served by the intersections. Oversaturated conditions would operate at LOS F and are indicated using 'OVERSAT' in the tables below. Vistro and Traffix were used to calculate critical delay and volume to capacity ratio at the Willow Road and 101/University Avenue intersections, respectively. The intersection LOS calculation sheets are included in Appendix C.

Under near-term plus project conditions, the following 16 intersections (see Figure 19) would be non-compliant with local policies and would be adversely affected during either the AM or the PM peak hour as compared to near term conditions:

1. Marsh Road and Bayfront Expressway (AM peak hour)
13. Chilco Street and Hamilton Avenue (PM peak hour)
16. Willow Road and Bayfront Expressway (AM peak hour)
17. Willow Road and Hamilton Avenue (AM and PM peak hours)
18. Willow Road and Park Street (AM and PM peak hours)
21. Willow Road and Newbridge Street (AM and PM peak hours)
23. Willow Road and US 101 Southbound Ramps (AM peak hour)
24. Willow Road and Bay Road (AM peak hour)
30. O'Brien Drive and Kavanaugh Drive (AM and PM peak hours)
32. Adam's Drive and O'Brien Drive (AM and PM peak hours)
39. University Avenue and Bay Road (PM peak hour)
42. University Avenue and Donohoe Street (AM peak hour)
43. US 101 Northbound Off-Ramp and Donohoe Street (AM and PM peak hours)
44. Cooley Avenue and Donohoe Street (AM and PM peak hours)
45. University Avenue and US 101 Southbound Ramps (AM peak hour)
47. E. Bayshore Road and Donohoe Street (AM and PM peak hours)

Bold indicates intersections that already operate unacceptably under near-term conditions.

It should be noted that at some intersections the average delay is shown to decrease with the addition of Project traffic. This occurs because the intersection delay is a weighted average of all intersection movements. When traffic is added to movements with delays lower than the average intersection delay, the average delay for the entire intersection can decrease. Furthermore, the congestion and queue spillback at an adjacent intersection can constrain the traffic volume at some intersections resulting in a small decrease in average delay.

Notes:
* Denotes CMP Intersection
AWSC - All Way Stop Control; TWSC - Two Way Stop Control
[1] Average delay is reported for signalized and AWSC intersections. For TWSC intersections, the delay for the worst stop-controlled movement is reported
"OVERSAT" indicates that the SimTraffic microsimulation model indicates that the intersection would experience capacity issues where the demand cannot be served by the intersection. Oversaturated intersections would operate at LOS F.
[1]Intersections were analyzed using Synchro/SimTraffic software due to the close proximity of these intersections. Changes in average delay and critical delay calculated using
[2]The intersection is not considered as non-compliant under background plus project conditions because the critical movement of the local approach shifts with the addition of project traffic.
Bold indicates substandard level of service
Bold indicates noncompliance. The project exceeds thresholds in the City of Menlo Park's TIA Guidelines.

AWSC - All Way Stop Control; TWSC - Two Way Stop Control
[1] Average delay is reported for signalized and AWSC intersections. For TWSC intersections, the delay for the worst stop-controlled movement is reported.
"OVERSAT" indicates that the SimTraffic microsimulation model indicates that the intersection would experience capacity issues where the demand cannot be served by the intersection. Oversaturated intersections would operate at LOS F.
* Intersections were analyzed using Synchro/SimTraffic software due to the close proximity of these intersections. Changes in critical delay and v/c calculated using Traffix.
Bold indicates substandard level of service
Bold indicates adverse effect

Adverse Effects and Recommended Improvements

The intersection effects and recommended modifications to improve the intersections to pre-Project conditions or better are described below. It should be noted that the intersection analysis accounts for the Project's proposed trip reductions from gross ITE trip generation. The residential component's required TDM reduction to eliminate the VMT impact is partially accounted for as well (peak-hour trip generation assumed 10% active TDM reduction). The additional residential TDM reduction during the peak-hour resulting from the VMT impact mitigation would have resulted in approximately 50 (13 inbound and 37 outbound) fewer trips during the AM peak hour and 56 (34 inbound and 22 outbound) fewer trips during the PM peak hour. This level of trip reduction would not address any intersection adverse effects alone.

Marsh Road and Bayfront Expressway (#1)

This intersection is expected to operate at an acceptable LOS D during the AM peak hour and LOS C during the PM peak hour under near term conditions. The addition of Project traffic would cause the level of service at the intersection to worsen to an unacceptable LOS E during the AM peak hour. The intersection would operate at an acceptable LOS D during the PM peak hour. The deterioration of LOS from D to E constitutes non-compliance during the AM peak hour according to the thresholds established by the City of Menlo Park.

The recommended modification for this location is to modify the southbound approach to a shared left-through lane, shared through-right lane, and a right turn only lane. With this improvement, the intersection would operate acceptably at LOS D during both peak hours under near-term plus project conditions. This improvement is in Menlo Park's traffic impact fee (TIF) program. With implementation of these intersection modifications, the intersection would be in compliance with the TIA Guidelines and address the Proposed Project's share of the non-compliant operation.

Chilco Street and Hamilton Avenue (#13)

This intersection is expected to operate at an acceptable LOS B during the AM peak hour and LOS C during the PM peak hour under near term conditions. The addition of Project traffic would cause the level of service at the intersection to worsen to an unacceptable LOS E during the PM peak hour. The intersection would operate at an acceptable LOS B during the AM peak hour. The deterioration of LOS from C to E constitutes non-compliance during the PM peak hour according to the thresholds established by the City of Menlo Park.

Since the intersection currently operates as all-way-stop-controlled, potential modification to bring the intersection to pre-project conditions would be to signalize it. However, the intersection does not meet the signal warrant during either peak hour under near term plus project conditions. A traffic signal is not recommended for construction until signal warrants conducted with a future year's actual counts have been met. The recommended improvement includes conducting a signal warrant analyses for a period of five years after full Project completion to determine if a signal would be warranted and if warranted, install a new signal. This improvement is included in the City's TIF program.

Should the City pursue implementation of this improvement, the improvement would include new traffic signal and appropriate pedestrian and bicycle accommodation at this intersection including pedestrian countdown timers, Americans with Disabilities Act (ADA) compliant curbs, and bicycle detection loops. Signalization of this intersection could also encourage cut-through traffic along Chilco Street and on Hamilton Avenue when regional routes such as Bayfront Expressway, Willow Road or US 101 become congested. Potential traffic calming measures should also be considered in conjunction with a traffic signal if signal warrants are met in a future year.

With implementation of these intersection modifications (e.g. signal warrant analysis, potential signal installation, and related bicycle and pedestrian accommodations), the intersection would be in compliance with the TIA Guidelines which would address the Proposed Project's share of the non-compliant operation.

Willow Road Corridor (#16, #17, #18, #21, #23, #24)

Willow Road between Bayfront Expressway and Hospital Plaza/Durham Street is expected to experience capacity issues due to unserved demand at the intersections. These intersections would operate unacceptably under near term conditions during both peak hours. With the addition of Project traffic, intersections along the corridor would continue to operate unacceptably during both peak hours.

The intersections of Willow Road and Bayfront Expressway and Willow Road and US 101 southbound ramps would experience an increase in delay of over four seconds with the addition of project traffic in the AM peak hour and PM peak hour, respectively, and would be non-compliant per Menlo Park's guidelines for state-controlled intersections.

The intersections of Hamilton Avenue and Newbridge Street at Willow Road would experience an increase in delay of over 0.8 seconds with the addition of project traffic on the local approach to the intersection in both peak hours and the intersection of Bay Road at Willow Road would experience an increase in delay of over 0.8 seconds with the addition of Project traffic on the local approach to the intersection during the AM peak hour and would be non-compliant per Menlo Park's guidelines. Willow Road and Park Street, which is a new intersection under project conditions is also assumed to be non-compliant during both peak hours due to unserved demand at this intersection as determined in the microsimulation model developed for this corridor and described in Chapter 3.

The City of Menlo Park is implementing an adaptive traffic signal coordination system on the Willow Road corridor to improve traffic flow. Adaptive traffic control is a technology that automatically adjusts traffic signal timing based on actual traffic demand at an intersection. This measure will improve the intersection operations and could reduce the intersection delay. The reduction in delay due to adaptive signal coordination is not expected to bring the corridor intersections into compliance with the City's TIA guidelines or to substantially reduce the delay caused by the Project.

Physical intersection improvements (identified in the City's TIF program) that would improve intersection operations at the non-compliant intersections are:

- **Willow Road and Newbridge Street (#21)**- The TIF program proposes to modify the signal timing to a protected left-turn phasing operation on Newbridge Street, provide a leading left-turn phase on the southbound movement and a lagging left-turn phase on the northbound movement, and optimize signal timing. With implementation of these intersection modifications under project conditions, the critical movement delay would be reduced for the northbound movement to lower than no project conditions. However, the improvement would not address the southbound deficiency. Further improvements to address the southbound deficiency are not feasible.

- **Willow Road and Bay Road (#24) –** The TIF program proposes to modify the southbound approach at this intersection to two left-turn lanes and one right-turn lane and to modify the westbound approach to add a right-turn lane. With these improvements under project conditions, the critical movement delay at the local approach would be reduced to lower than no project conditions. This improvement would address the adverse effect on the intersection due to Project traffic. With implementation of these intersection modifications, the Willow Road and Bay Road intersection would be in compliance with the TIA Guidelines which would address the Proposed Project's share of the non- compliant operation. With implementation of the recommended improvements from the TIF program for the Willow Road and Bay Road intersection the deficiency attributable to the Proposed Project would be addressed. As mentioned previously, these improvements are included in the City's TIF program.

The Metropolitan Transportation Commission (MTC) Dumbarton Forward project would restripe Bayfront Expressway to add bus-only lanes on the shoulders during peak periods and implement signal timing improvements. The bus-only lanes would generally help the progression of shuttles and buses along the corridor. The signal timing improvements are also assumed to help with the general progression along Bayfront. However, specific details are unknown at this time regarding the improvements at the Willow Road and Bayfront Expressway intersection. The improvements' effectiveness in addressing the Project traffic generated adverse effect on traffic operations at this intersection cannot be determined. Furthermore, since this project is not led by the City of Menlo Park, implementation cannot be guaranteed.

Physical improvements are considered infeasible due to right-of-way constraints and/or adverse effects on pedestrian and bicycle travel at the intersections of Willow Road and Bayfront Expressway, Willow Road and US 101 southbound ramps, Willow Road and Hamilton Avenue, and Willow Road and Park Street.

The TIF program also proposes multimodal improvements along this section of Willow Road. These include an eastbound Willow Road one-way Class IV separated bikeway between Hamilton Avenue and the US 101/Willow Road Interchange, a westbound Willow Road one-way Class IV separated bikeway between the Dumbarton Rail Corridor and the US 101/Willow Road Interchange, high-visibility crosswalks and pedestrian signals on all legs at the intersection of Willow Road and O'Brien Drive, Class II bicycle lanes on eastbound Willow Road from O'Keefe Street to Bay Road, and Class II bicycle lanes on westbound Willow Road from Bay Road to Durham Street.

Implementing recommended multi-modal facilities along the corridor (from the City's TIF program) could shift some motor vehicle traffic to alternative modes of travel and reduce congestion. With implementation of these multi-modal improvements, the intersection deficiencies could be further reduced and partially address the Proposed Project's share of the non- compliant operations along Willow Road.

O'Brien Drive and Kavanaugh Drive (#30)

This intersection is expected to operate at an acceptable LOS B during the AM peak hour and an unacceptable LOS D during the PM peak hour under near term conditions. With the addition of project traffic, the intersection would operate at an unacceptable LOS F during both peak hours. This constitutes non-compliance during both peak hours according to the thresholds established by the City of Menlo Park.

Since the intersection currently operates as all-way-stop-controlled, potential modification to bring the intersection to pre-project conditions would be to signalize it. The intersection would meet the MUTCD signal warrant during both peak hours under project conditions (See Appendix F). The intersection lane configuration would need to be modified to a westbound left-turn lane and through lane, northbound left turn lane and right turn lane, and eastbound shared through-right lane. With this improvement, the intersection would operate acceptably at LOS B during the AM peak hour and LOS C during the PM peak hour under near term plus project conditions.

The recommended improvement to bring this intersection back to pre-Project conditions is the installation of the new traffic signal and appropriate pedestrian and bicycle accommodation. This includes the proposed Class II bicycle lanes along O'Brien Drive between Willow Road and University Avenue, pedestrian countdown timers, Americans with Disabilities Act (ADA) compliant curbs, and bicycle detection loops. However, a decision for signalization should not be made until signal warrants conducted with a future year's actual counts have been met. It is important to note that the intersection would be located approximately 300 feet west of the proposed roundabout at O'Brien Drive and Loop Road. Prior to a decision for signalizing this intersection, further analysis should be conducted to ensure that queues resulting from the signal would not back into the roundabout and cause a gridlock situation.

Alternatively, traffic calming measures could be installed to discourage the use of Kavanaugh Drive, which is a residential street, and encourage vehicles to use O'Brien Drive and Adam's Drive instead. Kavanaugh Drive is located within the City of East Palo Alto, and the City of Menlo Park does not have jurisdiction to install traffic calming along this street. Other measures such as peak period turning movement restrictions could be considered to discourage traffic from using Kavanaugh Drive and improve intersection operations.

Monitoring of traffic operations at this intersection for a period of five years after full Project completion should be conducted to determine if signalization or alternative improvements are needed. If warranted, implementation of the new traffic signal would address the Proposed Project's share of the non-compliant operation and bring the intersection into compliance with the TIA Guidelines. If the alternative measures are implemented, the intersection may or may not be brought into compliance with the TIA Guidelines and address the Proposed Project's share of the non-compliant operation.

Adams Drive and O'Brien Drive (#32)

This intersection is expected to operate at an acceptable LOS C during the AM peak hour and an unacceptable LOS D during the PM peak hour under near term conditions. With the addition of Project traffic, the intersection would operate at an unacceptable LOS F during both peak hours. This constitutes non-compliance during both peak hours according to the thresholds established by the City of Menlo Park.

Since the intersection currently operates as two-way-stop-controlled, potential modification to bring the intersection to pre-project conditions would be to signalize it. The intersection would meet the MUTCD signal warrant during the PM peak hour under project conditions (see Appendix F). The intersection lane configuration would need to be modified to a westbound shared left-right lane, southbound left-turn lane and through lane, and northbound shared through-right lane. With this improvement, the intersection would operate acceptably at LOS B during the AM peak hour and LOS C during the PM peak hour under near term plus project conditions.

The recommended improvement to bring this intersection back to pre-Project conditions is the installation of the new traffic signal and appropriate pedestrian and bicycle accommodations at this intersection and within the vicinity. This includes the proposed Class II bicycle lanes along O'Brien Drive between Willow Road and University Avenue, pedestrian countdown timers, Americans with Disabilities Act (ADA) compliant curbs, and bicycle detection loops.

The expected intersection operational issues under background plus project conditions would be due to the increased through traffic on O'Brien Drive between the Project Site and University Avenue. Menlo Park's TIF program identifies an improvement to signalize the nearby intersection at University Avenue and Adams Drive in East Palo Alto. This improvement may provide an alternative route for Project vehicles to access the Project Site via University Avenue.

Monitoring of traffic operations at this intersection for a period of five years after full Project completion should be conducted to determine if signalization or alternative improvements are needed. If warranted, implementation of the new traffic signal would address the Proposed Project's share of the non-compliant operation and bring the intersection into compliance with the TIA Guidelines. If the alternative measures are implemented, the intersection may or may not be brought into compliance with the TIA Guidelines and address the Proposed Project's share of the non-compliant operation.

University Avenue and Bay Road (#39)

This intersection is expected to operate at an acceptable LOS D during the AM peak hour and an unacceptable LOS E during the PM peak hour under near term conditions. With the addition of Project traffic, the intersection would continue to operate acceptably in the AM peak hour. In the PM peak hour, the increase in the average critical delay would be greater than four seconds. This constitutes non-compliance during the PM peak hour according to the thresholds established by the City of East Palo Alto.

Potential modification to bring the intersection to pre-Project conditions would be to add an exclusive eastbound right-turn lane and a second eastbound left-turn lane on University Avenue, add a second northbound left-turn lane on Bay Road, add a second westbound left-turn lane on University Avenue, and modify signal phasing. This is also a mitigation measure identified in the Ravenswood/4 Corners TOD Specific Plan Environmental Impact Report (February 22, 2013), which would be implemented under cumulative conditions. With this improvement under project conditions, the average delay at the intersection would be better than under near term no project conditions. Since this intersection is located within the City of East Palo Alto, the recommended measure to bring the intersection back to pre-Project conditions and address the Project's share of the non-compliant operation would be to make a fair share (34%) contribution towards this improvement. Fair share is calculated as the percentage of net project traffic generated divided by the overall cumulative traffic growth at this intersection. The Menlo Park TIF includes improvements at the University Avenue and Bay Road intersection, but not sufficient improvements to bring the intersection back to pre-Project conditions, as described above. However, the Project's fair share contribution towards this intersection would be calculated considering credit from its TIF payment.

US 101/University Avenue Interchange (#42, #43, #44, #45, #47)

The US 101/University Avenue interchange is expected to experience capacity issues due to unserved demand at the intersections in its vicinity including University Avenue and Donohoe Street, US 101 northbound off-ramp and Donohoe Street, Cooley Avenue and Donohoe Street, University Avenue and US 101 southbound ramps, University Avenue and Woodland Avenue, E. Bayshore Road and Donohoe Street, and E. Bayshore Road and Euclid Avenue. These intersections would operate unacceptably under near term conditions during both peak hours. With the addition of Project traffic, these intersections would continue to operate unacceptably during both peak hours. The increase in delay is expected to be greater than four seconds, and the increase in the volume to capacity ratio is expected to be greater than 0.01 under project conditions at University Avenue and Donohoe Street in the AM peak hour, US 101 northbound off-ramp and Donohoe Street during both peak hours, Cooley Avenue and Donohoe Street during both peak hours, E. Bayshore Road and Donohoe Street during both peak hours, and University Avenue and US 101 southbound ramps in the AM peak hour. This constitutes non-compliance according to the thresholds established by the City of East Palo Alto.

East Palo Alto plans to widen the northbound approach on Donohoe Street at the US 101 northbound off-ramp to accommodate four through lanes to improve the vehicular throughput at this intersection. This improvement will require median modifications and narrowing the southbound Donohoe Street approach to Cooley Avenue to include two through lanes and a full length left-turn lane. In addition, the traffic signals will be coordinated with adjacent traffic signals on Donohoe Street.

East Palo Alto also plans to install a new traffic signal at the US 101 northbound on-ramp and Donohoe Street and Bayshore Road and Euclid Avenue to coordinate with other closely spaced traffic signals along Donohoe Street. Along with new traffic signals, appropriate pedestrian and bicycle accommodation will be provided. This includes pedestrian countdown timers, Americans with Disabilities Act (ADA) compliant curbs, and bicycle detection loops. In order to align with the proposed driveway for the University Plaza Phase II site on the north side of Donohoe Street, the US 101 on-ramp will be shifted approximately 30 feet to the south. In addition, the northbound approach on Donohoe Street will be restriped to accommodate a short exclusive left-turn pocket (approximately 60 feet in length), a shared left-through lane, and a shared through-right lane. These improvements would require widening of the US 101 northbound on-ramp to accommodate two lanes that taper down to a single lane before this ramp connects with the loop on-ramp from eastbound University Avenue. A northbound right turn only will also be added to Bayshore Road and Euclid Avenue. Planned Donohoe Street improvements are included in Appendix E.

With these improvements, average delay at these intersections would be below that under near term conditions without the Project. Since this intersection is located within the City of East Palo Alto, the recommended improvement measure to bring the intersection/interchange back to pre-Project conditions and address the Project's share of the non- compliant operation would be for the Project sponsor to make a fair share contribution towards these improvements. Because the improvements in this corridor are all interconnected and dependent on each other to work, the recommended improvement measure would be for the Project sponsor to contribute its fair share to improvements at all six intersections in this corridor. Fair share is calculated as the percentage of net project traffic generated of the overall cumulative traffic growth at this intersection.

- Donohoe Street & Cooley Avenue: 10% fair share
- Donohoe Street & US 101 Northbound Off-Ramp: 24% fair share
- Donohoe Street & University Avenue: 31% fair share
- Donohoe Street & US 101 Northbound On-Ramp: 8% fair share
- Donohoe Street/Bayshore Road & Euclid Avenue: 2% fair share
- US 101 Southbound Ramps & University Avenue: 33% fair share

The Menlo Park TIF includes improvements at the University Avenue and Donohoe Street and University Avenue and US 101 southbound ramps intersections, which funding would go toward the planned coordinated system of intersections. The Project's fair share contribution towards these two intersections would be calculated considering credit from its TIF payment.

Cumulative (2040) Intersection Levels of Service

The results of the intersection level of service analysis under cumulative conditions are summarized in Tables 18 and 19. The Willow Road corridor and 101/University Avenue interchange were analyzed using the Simtraffic microsimulation model as described Chapter 2. The microsimulation model indicates that the intersections would experience capacity issues where the demand cannot be served by the intersections. Oversaturated conditions would operate at LOS F and are indicated using 'OVERSAT' in the tables below. Vistro and Traffix were used to calculate critical delay and volume to capacity ratio at the Willow Road and 101/University Avenue intersections, respectively. The intersection LOS calculation sheets are included in Appendix C. The following study intersections (see Figure 20) would operate at an unacceptable level of service during at least one peak hour:

1. Marsh Road and Bayfront Expressway (AM and PM peak hours)
2. Marsh Road and US 101 Northbound off-ramp (AM peak hour)
5. Marsh Road and Bohannon Drive/Florence Street (AM peak hour)
6. Marsh Road and Bay Road (AM peak hour)
8. Chilco Street and Bayfront Expressway (PM peak hour)
11. Chrysler Drive and Constitution Drive (AM and PM peak hours)
12. Chilco Street and Constitution Drive/MPK 22 Driveway (AM and PM peak hours)
13. Chilco Street and Hamilton Avenue (PM peak hour)
16. Willow Road and Bayfront Expressway (AM and PM peak hours)
17. Willow Road and Hamilton Avenue (AM and PM peak hours)
19. Willow Road and Ivy Drive (AM and PM peak hours)
20. Willow Road and O'Brien Drive (AM and PM peak hours)
21. Willow Road and Newbridge Street (AM and PM peak hours)
22. Willow Road and US 101 Northbound Ramps (AM and PM peak hours)
23. Willow Road and US 101 Southbound Ramps (AM and PM peak hours)
24. Willow Road and Bay Road (AM and PM peak hours)
25. Willow Road and Hospital Plaza/Durham Street (AM and PM peak hours)
28. Willow Road and Middlefield Road (AM peak hour)
30. O'Brien Drive and Kavanaugh Drive (AM and PM peak hours)
32. Adam's Drive and O'Brien Drive (AM and PM peak hours)
33. University Avenue and Bayfront Expressway (PM peak hour)
35. University Avenue and Adams Drive (AM and PM peak hours)
39. University Avenue and Bay Road (PM peak hour)
42. University Avenue and Donohoe Street (AM and PM peak hours)
43. US 101 Northbound Off-Ramp and Donohoe Street (AM and PM peak hours)
44. Cooley Avenue and Donohoe Street (AM and PM peak hours)
45. University Avenue and US 101 Southbound Ramps (AM and PM peak hours)
46. University Avenue and Woodland Avenue (AM and PM peak hours)
47. E. Bayshore Road and Donohoe Street (AM and PM peak hour)
49. Saratoga Avenue and Newbridge Street (AM and PM peak hours)
50. East Bayshore Road and Euclid Avenue (AM and PM peak hours)

Cumulative (2040) Plus Project Intersection Levels of Service

The results of the intersection level of service analysis under near cumulative (2040) plus project conditions are summarized in Tables 18 and 19. The intersection LOS calculation sheets are included in Appendix C. Under cumulative plus project conditions, the following 17 intersections (see Figure 21) would be non-compliant with local policies during either the AM or the PM peak hour as compared to cumulative conditions. All of these intersections would already be operating at unacceptable levels of service under cumulative conditions.

5. Marsh Road and Bohannon Drive/Florence Street (AM peak hour)
13. Chilco Street and Hamilton Avenue (AM and PM peak hours)
18. Willow Road and Park Street (AM and PM peak hours)
19. Willow Road and Ivy Drive (PM peak hour)
21. Willow Road and Newbridge Street (AM and PM peak hours)
24. Willow Road and Bay Road (AM and PM peak hours)
25. Willow Road and Hospital Plaza/Durham Street (AM and PM peak hours)
30. O'Brien Drive and Kavanaugh Drive (AM peak hour)
32. Adam's Drive and O'Brien Drive (AM and PM peak hours)
43. US 101 Northbound Off-Ramp and Donohoe Street (AM and PM peak hours)
44. Cooley Avenue and Donohoe Street (PM peak hour)
45. University Avenue and US 101 Southbound Ramps (PM peak hour)
46. University Avenue and Woodland Avenue (AM and PM peak hours)
49. Saratoga Avenue and Newbridge Street (AM peak hour)
50. East Bayshore Road and Euclid Avenue (AM peak hour)

Bold denotes intersections that would be non-compliant under cumulative plus project conditions during either AM or PM peak hours but are compliant under near-term plus project conditions during both peak hours.

It should be noted that at some intersections the average delay is shown to decrease with the addition of Project traffic. This occurs because the intersection delay is a weighted average of all intersection movements. When traffic is added to movements with delays lower than the average intersection delay, the average delay for the entire intersection can decrease. Furthermore, the congestion and queue spillback at an adjacent intersection can constrain the traffic volume at some intersections resulting in a small decrease in average delay.

Notes:
* Denotes CMP Intersection
AWSC - All Way Stop Control; TWSC - Two Way Stop Control
[1] Average delay is reported for signalized and AWSC intersections. For TWSC intersections, the delay for the worst stop-controlled movement is reported
"OVERSAT" indicates that the SimTraffic microsimulation model indicates that the intersection would experience capacity issues where the demand cannot be served by the intersection. Oversaturated intersections would operate at LOS F.
[1]Intersections were analyzed using Synchro/SimTraffic software due to the close proximity of these intersections. Changes in average delay and critical delay calculated using Vistro.

[2]The intersection is not considered as non-compliant under cumulative plus project conditions because the critical movement of the local approach shifts with the addition of project traffic.
Bold indicates substandard level of service
Bold indicates noncompliance. The project exceeds thresholds in the City of Menlo Park's TIA Guidelines.

Adverse Effects and Recommended Improvements

For intersections that are non-compliant under both near-term plus project conditions and cumulative plus project conditions, the recommended improvements proposed under near term plus project conditions would be sufficient to address cumulative non-compliance. Improvements for intersections that are non-compliant only under cumulative plus project conditions are described below.

Marsh Road and Bohannon Drive/Florence Street (#5)

This intersection is expected to operate at an unacceptable LOS E during the AM peak hour and an acceptable LOS D during the PM peak hour under cumulative conditions. The addition of Project traffic would cause the average critical delay to increase by more than 0.8 during the AM peak hour. The intersection would continue to operate at an acceptable LOS D during the PM peak hour. This constitutes non-compliance during the AM peak hour according to the thresholds established by the City of Menlo Park.

Modification of the westbound approach at this intersection to a left-turn lane, two through lanes, and a right-turn lane would improve the average delay to better than cumulative no project conditions. Menlo Park's TIF program proposes Class II buffered bike lanes along Marsh Road from Bay Road to Scott Road in both directions and the removal of on-street parking in the eastbound direction. The restriping of the vehicle travel lanes to include a westbound right-turn only lane and the proposed Class II buffered bike lane would require narrowing the travel lanes to 11 feet and removal of the median. While this is possible, removal of the median would require removing at least one tree as well as the signal pole in the median. Upgrades to at least one mast arm would be required to replace the removed median signal. Physical improvements at this intersection are considered infeasible due to right-of-way constraints and/or adverse effects on pedestrian and bicycle travel. The City's TIF program includes multi-modal improvements along the Marsh Road corridor such as Class II buffered bike lanes along Marsh Road from Bay Road to Scott Road, and installing sidewalks along the north-side of Marsh Road between Page Street and Bohannon Drive/Florence Street. Implementing recommended multi-modal facilities along the corridor (from the City's TIF program) could shift some motor vehicle traffic to alternative modes of travel and reduce congestion. With implementation of these multi-modal improvements, the intersection deficiencies could be further reduced and partially address the Proposed Project's share of the non-compliant operations at this intersection.

Willow Road and Ivy Drive (#19)

Willow Road and Ivy Drive is an intersection on the Willow Road Corridor, which is expected to experience capacity issues due to unserved demand at the intersections. This intersection would operate unacceptably under cumulative conditions during both peak hours. With the addition of Project traffic, it would continue to operate unacceptable during both peak hours. In the PM peak hour, the increase in the critical movement delay of the local approach would be greater than 0.8 seconds. This constitutes non-compliance during the PM peak hour according to the thresholds established by the City of Menlo Park.

The Menlo Park TIF proposes to install a right-turn overlap phase on southbound Ivy Drive and restrict eastbound Willow Road U-turns. This would improve the critical movement delay of the local approach to better than cumulative no project conditions. The Project is required to pay traffic impact fees according to the City's current TIF schedule.

Willow Road and Hospital Plaza/Durham Street (#25)

Willow Road and Hospital Plaza/Durham Street is an intersection on the Willow Road Corridor, which is expected to experience capacity issues due to unserved demand at the intersections. This intersection would operate unacceptably under cumulative conditions during both peak hours. With the addition of Project traffic, it would continue to operate unacceptably during both peak hours. In the AM and PM peak hour, the increase in the critical movement delay of the local approach would be greater than 0.8 seconds. This constitutes non-compliance during both peak hours according to the thresholds established by the City of Menlo Park.

The recommended improvement measure for this intersection is restriping northbound Durham Street as a shared left-through lane and right-turn lane, and adding a northbound right turn overlap phase. With this improvement, the critical movement delay of the local approach would improve to better than cumulative no project conditions in the AM peak hour. The PM peak hour would continue to be non-compliant. If this recommended improvement measure is implemented, the Project should contribute its fair share (25%) towards the improvement. Fair share is calculated as the percentage of net project traffic generated of the overall cumulative traffic growth at this intersection.

University Avenue and Woodland Avenue (#46)

University Avenue and Woodland Avenue is in the vicinity of the US 101/University Avenue interchange and is expected to experience capacity issues due to unserved demand at the intersections. This intersection would operate unacceptably under cumulative conditions during both peak hours. With the addition of Project traffic, it would continue to operate unacceptably during both peak hours. In the AM and PM peak hour, the increase in the average critical delay would be greater than four seconds and the increase in the volume to capacity ratio would be greater than 0.01. This constitutes non-compliance during both peak hours according to the thresholds established by the City of East Palo Alto.

The recommended Donohoe Street improvements (see Appendix E) at Euclid Avenue and at the US 101 northbound on-ramp would improve traffic flow on University Avenue and eliminate the queue spillback that extends from Donohoe Street past Woodland Avenue. While the University Avenue and Woodland Avenue intersection is expected to continue to operate at LOS F during both peak hours, the Donohoe Street improvements would reduce the average delay at the intersection below cumulative conditions without the Project. With these improvements, the intersection would comply with the City of East Palo Alto's level of service policy. As discussed under the background plus Project discussion above, the project would pay its fair share costs towards the intersection improvements at the 6 intersections of the University Avenue/Donohoe Street/US 101 corridor.

Saratoga Avenue and Newbridge Street (#49)

This intersection is expected to operate at an acceptable LOS F during the AM peak hour and an unacceptable LOS E during the PM peak hour under cumulative conditions. With the addition of Project traffic, the intersection average critical delay at the intersection would increase by four seconds and the volume to capacity ratio would increase by 0.01 during the AM peak hour. This constitutes as non-compliance during the AM peak hour according to the thresholds established by the City of East Palo Alto.

Since the intersection currently operates as two-way-stop-controlled, potential modification to bring the intersection to pre-project conditions would be to signalize it. The intersection would meet the MUTCD signal warrant during both peak hours under project conditions (see Appendix F). With this improvement, the intersection would operate acceptably at LOS C during the AM peak hour and LOS B during the PM peak hour under cumulative plus project conditions. However, since the intersection is located only 200 feet south of Willow Road, signalization is not recommended. Short of signalization, no other improvements are feasible. Furthermore, given this intersection is located outside of the City of Menlo Park, the City cannot ensure implementation of any improvements. This intersection is also not listed with improvements in the City of East Palo Alto TIF.

Bayshore Road and Euclid Avenue (#50)

Bayshore Road and Euclid Avenue is in the vicinity of the US 101/University Avenue interchange and is expected to experience capacity issues due to unserved demand at the intersections. This intersection would operate unacceptably under cumulative conditions during both peak hours. With the addition of Project traffic, it would continue to operate unacceptably during both peak hours. In the AM peak hour, the increase in the average critical delay would be greater than four seconds and the increase in the volume to capacity ratio would be greater than 0.01. This constitutes non-compliance during the AM peak hour according to the thresholds established by the City of East Palo Alto.

Since the intersection currently operates as all-way-stop-controlled, potential modification to bring the intersection to pre-project conditions would be to signalize it and add a westbound right turn only lane. This improvement is included in the recommended Donohoe Street improvements (see Appendix E, Transportation/Traffic, of this EIR). The proposed improvements at Euclid Avenue and at the US 101 northbound on-ramp would improve traffic flow on University Avenue and eliminate the queue spillback that extends from Donohoe Street past Woodland Avenue. This would reduce the average delay at the intersection below cumulative conditions without the project. With these improvements, the intersection would be in compliance with the City of East Palo Alto's level of service policy. As discussed under the background plus project discussion above, the Project would pay its fair share costs towards the intersection improvements at the 6 intersections of the University Avenue/Donohoe Street/US 101 corridor, which includes the intersection at Bayshore Road and Euclid Avenue.

Cumulative (2040) Plus Dumbarton Rail Intersection Levels of Service

The results of the intersection level of service analysis under cumulative conditions with the Dumbarton Rail are summarized in Table 20 and 21. All study intersections are expected to operate better cumulative conditions with the Dumbarton rail than without the Dumbarton rail. The intersection LOS calculation sheets are included in Appendix C. The following study intersection would improve to acceptable LOS with the Dumbarton Rail during at least one peak hour:

6. Marsh Road and Bay Road (AM peak hour)

Cumulative (2040) Plus Project with Dumbarton Rail Intersection Levels of Service

The results of the intersection level of service analysis under cumulative (2040) plus project conditions with the Dumbarton rail are summarized in Tables 20 and 21. Compared to cumulative plus project conditions without the Dumbarton Rail, the delay at all of the intersections would improve with Dumbarton Rail. While the overall motor vehicle operations would experience reduced delay with Dumbarton Rail, when evaluating for intersection LOS compliance, the determination is based on the relative increase in delay due to the Project compared to no project conditions (cumulative conditions with Dumbarton Rail). Comparing “cumulative plus project with Dumbarton Rail” conditions to “cumulative plus project without Dumbarton Rail” conditions, the following study intersection would no longer be non-compliant:

25. Willow Road & Durham Street

The following additional study intersections would be non-compliant under cumulative plus project conditions with the Dumbarton rail as compared to cumulative plus project conditions without the Dumbarton Rail:

6. Marsh Road and Bay Road (AM peak hour)
11. Chrysler Drive and Constitution Drive (AM peak hour)
16. Willow Road and Bayfront Expressway (AM peak hour)

Under cumulative conditions with or without the Project, the road network is over saturated. Since the Dumbarton rail would reduce vehicular traffic in the area due to the increase in transit mode share, the Menlo Park Travel Demand model assigns more Project-generated traffic at some intersections where vehicular capacity is now available. Menlo Park’s level of service standards and adverse effect criteria are very stringent where a small change in traffic can trigger a non-compliance at an intersection. Therefore, the relative increase in delay due to the Project at some intersections between “cumulative with Dumbarton Rail” and “cumulative plus project with Dumbarton Rail” would be greater than the Menlo Park’s threshold, causing additional intersections to be non-compliant under cumulative plus project conditions with the Dumbarton rail.

Adverse Effects and Recommended Improvements

For intersections that are non-compliant under cumulative plus project conditions and cumulative plus project with Dumbarton rail conditions, the improvements proposed under cumulative plus project conditions would be sufficient to address cumulative non-compliance. Improvements for intersections that are non-compliant only under cumulative plus project with Dumbarton rail conditions are described below. As noted below, no additional feasible improvements are identified and the improvement measures identified below are for informational purposes only.

Marsh Road and Bay Road (#6)

This intersection is expected to operate at an acceptable LOS D during both peak hours under cumulative conditions with the Dumbarton rail. The addition of Project traffic would cause the intersection to operate at LOS E during the AM peak hour. The intersection would continue to operate at an acceptable LOS D during the PM peak hour. This constitutes non-compliance during the AM peak hour according to the thresholds established by the City of Menlo Park.

Physical improvements at this intersection are considered infeasible due to right-of-way constraints and/or adverse effects on pedestrian and bicycle travel. Menlo Park's TIF program proposes Class II buffered bike lanes along Marsh Road from Bay Road to Scott Road in both directions. The improvement may lead to an overall increase in bicycle mode share but would not offset the Project traffic.

Chrysler Drive and Constitution Drive (#11)

This intersection is expected to operate at an unacceptable LOS F during both peak hours under cumulative conditions with Dumbarton rail. With the addition of Project traffic, the average critical delay would increase by more than 0.8 seconds during the AM peak hour. The intersection would continue to operate acceptably during the PM peak hour. This constitutes non-compliance during the AM peak hour according to the thresholds established by the City of Menlo Park.

Physical improvements at this intersection are considered infeasible due to right-of-way constraints and/or adverse effects on pedestrian and bicycle travel.

Willow Road and Bayfront Expressway 9#16)

Improvements for this intersection are discussed under the near term plus project section as part of the Willow Road corridor improvements, and is not repeated here.

Notes:
* Denotes CMP Intersection
AWSC - All Way Stop Control; TWSC - Two Way Stop Control
[1] Average delay is reported for signalized and AWSC intersections. For TWSC intersections, the delay for the worst stop-controlled movement is reported
"OVERSAT" indicates that the SimTraffic microsimulation model indicates that the intersection would experience capacity issues where the demand cannot be served by the intersection. Oversaturated intersections would operate at LOS F.
[1]Intersections were analyzed using Synchro/SimTraffic software due to the close proximity of these intersections. Changes in average delay and critical delay calculated using Vistro.
[2]The intersection is not considered as non-compliant under cumulative plus project conditions because the critical movement of the local approach shifts with the addition of project traffic.
Bold indicates substandard level of service
Bold indicates noncompliance. The project exceeds thresholds in the City of Menlo Park's TIA Guidelines.

Bold indicates substandard level of service
Bold indicates adverse effect

Intersection Vehicle Queuing

The analysis of intersection levels of service was supplemented with a vehicle queuing analysis for intersection left-turning movements where the proposed project would add significant trips per lane in the vicinity of the Project Site and affect intersection operations (see Figure 22). This analysis provides a basis for estimating future storage requirements at these intersections (see Table 22). Vehicle queues were estimated using the methodology described in Chapter 1. The following turn movements were selected for evaluation:

- Northbound left-turn at Marsh Road and Bayfront Expressway
- Eastbound left-turn at Willow Road and Bayfront Expressway
- Eastbound left-turn and Southbound left-turn at Willow Road and Ivy Drive
- Southbound left-turn at Willow Road and US 101 southbound ramps
- Southbound left-turn at Willow Road and Bay Road
- Westbound shared left-through lane and Eastbound shared through-right lane at O'Brien Drive and Kavanaugh Drive
- Southbound shared left/through lane at Adams Drive and O'Brien Drive
- Eastbound left-turn and Southbound left-turn at University Avenue and O'Brien Drive
- Eastbound left-turn at University Avenue and Kavanaugh Drive

Locations where the estimated 95th percentile queues would exceed the available storage capacity for the movement are discussed below. Queuing issues are operational issues resulting from signal timing and queue storage provisions. Queuing issues are not considered a CEQA issue related to hazards.

Eastbound Left-turn at Willow Road and Bayfront Expressway (#16)

The existing vehicle storage for the eastbound left turn pocket on Willow Road at Bayfront Expressway is 300 feet, which provides enough space for about 12 vehicles. Under existing conditions, the 95th percentile queue would exceed the storage of the left turn pocket by 12 vehicles in the AM peak hour. Under near-term conditions, the 95th percentile queue would exceed the storage length of the turn pocket by 15 vehicles during the AM peak hour and four vehicles during the PM peak hour. The Proposed Project would add three vehicles to the 95th percentile queue during the AM peak hour and PM peak hour. There is no room to extend the left turn pocket due to the emergency vehicle only lane cut in the median.

Eastbound Left-turn at Willow Road and Ivy Drive (#19)

The existing vehicle storage for the eastbound left turn pocket on Willow Road at Ivy Drive is 125 feet, which provides enough space for about 5 vehicles. Under existing conditions, the 95th percentile queue would be accommodated by the left turn pocket. Under near-term conditions, the 95th percentile queue exceeds the storage length of the turn pocket by three vehicles during the AM peak hour. The Proposed Project would add one vehicle to the 95th percentile queue during the AM peak hour and one vehicle during the PM peak hour. There is no room to further extend this left-turn.

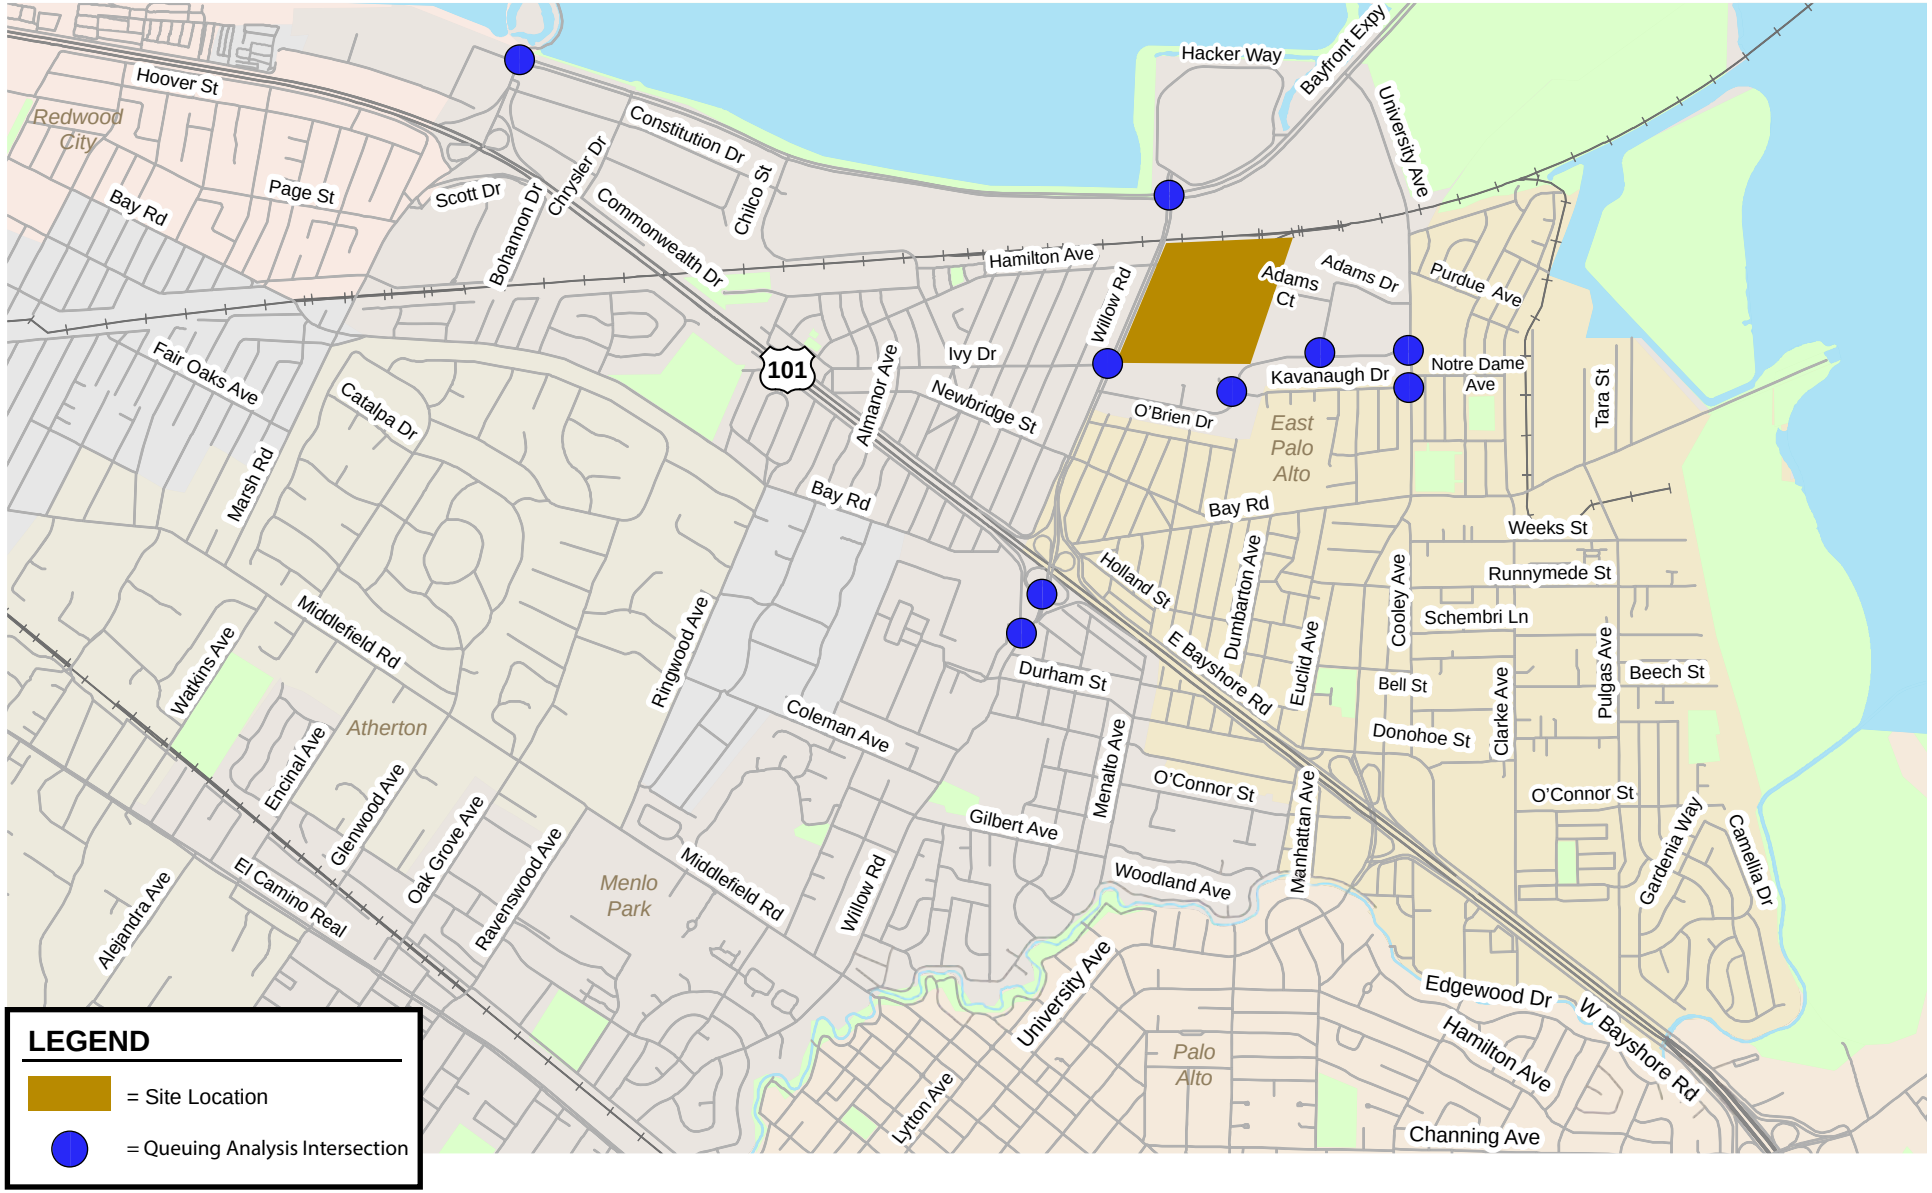

Figure 22
Queuing Analysis Locations

Southbound Left-turn at Willow Road and Bay Road (#24)

The existing vehicle storage for the southbound left turn pocket on Willow Road at Bay Road is 250 feet, which provides enough space for about 10 vehicles. Under existing conditions, the 95th percentile queue would exceed the storage length of the left turn pocket by 6 vehicles. Under near-term conditions, the 95th percentile queue exceeds the storage length of the turn pocket by 13 vehicles during the AM peak hour and one vehicle during the PM peak hour. The Proposed Project would add six vehicles to the 95th percentile queue during the AM peak hour and three vehicles during the PM peak hour. Menlo Park's TIF has a project to add a second left-turn lane to this intersection, which would add additional storage for left-turning vehicles. The exact length of the addition will be determined during the design phase for the intersection improvement. Construction of the recommended improvement would reduce the queuing deficiency created by the Proposed Project.

Eastbound Left-turn and Southbound left-turn at University Avenue and O'Brien Drive (#36)

The existing vehicle storage for the eastbound left turn pocket on University Avenue at O'Brien Drive is 125 feet, which provides enough spaces for about 5 vehicles. Under existing conditions, the 95th percentile queue exceeds the storage length of the turn pocket by 3 vehicles during the AM peak hour. The Proposed Project would add 22 vehicles to the 95th percentile queue during the AM peak hour. There is no room to lengthen the eastbound left turn pocket.

The existing vehicle storage for the southbound left turn pocket on O'Brien Drive at University Avenue is 60 feet, which provides enough spaces for 2 vehicles. Under existing conditions, the 95th percentile queue exceeds the storage length of the turn pocket by one vehicle during the AM peak hour and 11 vehicles during the PM peak hour. The Project would add one vehicle to the 95th percentile queue during the AM peak hour. There would be no increase to the 95th percentile queue length during the PM peak hour. There is room to extend the left turn pocket to accommodate the estimated 95th percentile queue of 325 feet.

Menlo Park's Traffic Impact Fee (TIF) program identifies an improvement to signalize the nearby intersection at University Avenue and Adams Drive in East Palo Alto. This improvement may provide an alternative route for Project vehicles to access the Project Site via University Avenue, and alleviate potential queuing issues at this intersection.

Freeway Facilities Analysis

In analyzing the freeway segments, the citywide travel demand forecast model was used to forecast the increase in traffic volumes between existing and near term plus project conditions. For the purpose of this study, freeway levels of service under cumulative conditions are calculated based on volume to capacity (V/C) ratio. A freeway segment is assumed to operate at LOS F under future conditions if,

- The freeway segment already operates at LOS F under existing conditions, or
- The ConnectMenlo model forecasts the freeway segment to operate at a V/C ratio above 1 under future conditions.

Definition of Adverse Freeway Effects

San Mateo County

Within San Mateo County, the project is said to create an adverse effect on traffic conditions on a freeway segment if for either peak hour:

1. The analysis indicates that the combination of the proposed project and future traffic demand will result in the freeway segment operating at a level of service that exceeds the standard adopted by the current CMP and the proposed project increases traffic demand on the freeway segment by an amount equal to one percent (1%) or more of the segment capacity, or
2. The project will add traffic demand equal to one percent (1%) or more of the segment capacity if the freeway segment is currently not in compliance with the adopted LOS standard.

Santa Clara County

VTA CMP guidelines define that a project would cause an adverse effect on freeway operations if for either peak hour:

1. The project would deteriorate freeway levels of service from an acceptable level to an unacceptable level, or
2. If the freeway already operates at an unacceptable level under existing conditions, and the project would add traffic exceeding one percent (1%) of the freeway capacity.

Alameda County

The Alameda County CMP does not have a policy for determining a threshold of significance for CMP requirements. The freeway segment analysis (see Table 25 below) is provided only for information.

Freeway Analysis

To determine the Proposed Project's potential freeway adverse effects, a select-zone analysis within the Menlo Park model was performed to estimate the increase in project traffic volume between existing conditions and near term with project conditions. Freeway segments that would experience a freeway adverse effect generated by the Proposed Project are identified below.

San Mateo County

As shown on Table 23, the proposed project would add traffic greater than 1% capacity to the following study freeway segments operating below its LOS standard:

- SR 84 – from Willow Road to Alameda County Line – PM Peak Hour
- SR 84 – from Alameda County Line to Willow Road – AM Peak Hour
- US 101 – between Santa Clara County Line and Whipple Avenue – AM & PM Peak Hours
- US 101 – from Whipple Avenue to SR 92 – PM Peak Hour
- US 101 – from SR 92 to Whipple Avenue – AM Peak Hour

Santa Clara County

As shown on Table 24, the proposed project would add traffic greater than 1% capacity to the following mixed-flow freeway segments operating below its LOS standard:

- US 101 – from SR 85 to Embarcadero Road – AM & PM Peak Hours
- US 101 – from Embarcadero Road to SR 85 – PM Peak hour

The proposed project would add traffic greater than 1% capacity to the following HOV freeway segment operating below its LOS standard:

- US 101 – from Oregon Expressway to Embarcadero Road – AM Peak Hour

Freeway Improvements

It should be noted that the near term plus project conditions model run assumed the US 101 express lane project in San Mateo County. Improvements to eliminate the adverse freeway effects on US 101 and on SR 84 within San Mateo County would require additional capacity improvements and/or additional TDM measures that would reduce peak-hour vehicle trip-making by more than 70%. San Mateo County currently has no plans to further improve US 101 beyond the identified express lane projects. There are also no identified plans to improve the Bayfront Expressway (SR 84) corridor. Such an aggressive TDM plan would also not be feasible.

Within Santa Clara County, Valley Transportation Authority's Valley Transportation Plan 2040 identifies freeway express lane projects along US 101 that would convert the existing HOV lanes to express lanes and add a second express lane in each direction. This improvement would increase the capacity of the freeway and would adequately address the freeway impacts.

The potential Dumbarton Rail corridor would slightly reduce the Project contribution to the identified adverse effects but would not eliminate any. Therefore, the Project's adverse effects on US 101 and on SR 84 freeway segments in San Mateo County would remain.

Freeway Ramp Analysis

A freeway ramp analysis is conducted under near term plus project conditions to determine whether freeway ramps would continue to have sufficient capacity to serve the forecasted traffic demand. For the purpose of this study, the project is said to create an adverse effect on a freeway ramp if:

- The project would cause the volume-to-capacity (V/C) ratio of the freeway ramp to exceed 1.0; or
- The project would increase the amount of traffic on a freeway ramp that is already exceeding its capacity by more than one percent (1%) of the ramp's capacity.

As shown on Table 26, under near term plus project conditions, all study freeway ramps would continue to have sufficient capacity to serve the anticipated demand.

		PM					2,000	1,326	0.66	1,547	0.77
	SB on-ramp from University Avenue	AM	Diagonal	2	-	-	1,800	1,143	0.64	1,167	0.65
		PM				YES	900	744	0.83	810	0.90

Notes:
NB = Northbound; SB = Southbound; EB = Eastbound; WB = Westbound
1. Northbound on-ramps are assumed metered during the AM peak hour. Southbound on-ramps are assumed metered during the PM peak hour.
2. Ramp capacities were obtained from *Highway Capacity Manual 2000* , and considered the free-flow speed, the number of lanes on the ramp, and ramp metering.
3. Existing volumes referenced intersection counts collected in 2019.

Roadway ADT Analysis

This analysis included the evaluation of roadway average daily traffic (ADT) for 10 roadway segments (see Table 27 below) to determine the project's effect on City street segments. According to the City of Menlo Park *Transportation Impact Analysis Guidelines* published in July 2020, a project-generated traffic impact on City street segments would be considered potentially noncompliant if:

1. On Main Street, Avenue-Mixed Use, and Avenue-Neighborhood, a traffic impact may be considered potentially noncompliant if the existing ADT is:
    1) Greater than 19,000, and there is a net increase of 100 trips or more in ADT due to project related traffic;
    2) The ADT is greater than 10,000 but less than 18,000, and the project related traffic increases the ADT by 12.5%, or the ADT becomes 18,000 or more; or
    3) The ADT is less than 10,000, and the project related traffic increases the ADT by 25%.
2. On Mixed-Use Collector, and Neighborhood Collector, a traffic impact may be considered potentially noncompliant if the existing ADT is:
    1) Greater than 9,000, and there is a net increase of 50 trips or more in ADT due to project related traffic;
    2) The ADT is greater than 5,000 but less than 9,000, and the project related traffic increases the ADT by 12.5% or the ADT becomes 9,000 or more; or
    3) The ADT is less than 5,000, and the project related traffic increases the ADT by 25%.
3. On Neighborhood Connector, Bicycle Boulevard, and Local Access, a traffic impact may be considered potentially noncompliant if the existing ADT is:
    1) Greater than 1,350, and there is a net increase of 25 trips or more in ADT due to project related traffic;
    2) The ADT is greater than 750 but less than 1,350, and the project related traffic increases the ADT by 12.5% or the ADT becomes 1,350; or
    3) The ADT is less than 740, and the project related traffic increases the ADT by 25%.

The roadway ADT analysis was conducted under cumulative with project conditions. To determine net Project added traffic, a select zone analysis was conducted using the Menlo Park model under cumulative with project conditions and existing conditions. As shown on Table 27, the Project would generate non-compliance at the following roadway segments:

- Willow Road, east of Durham Street
- Willow Road, east of Blackburn Avenue
- Middlefield Road, south of Willow Road
- Marsh Road, east of Bohannon Drive
- O'Brien Drive, south of Willow Road
- O'Brien Drive, north of University Avenue
- Bay Road, north of Willow Road

Table 27
Roadway ADT Analysis

Roadway	Classification	Average Daily Traffic			Compliance Analysis	
		Existing [1]	Cumulative with Project	Net Increase in Project Traffic	Applicable Criteria	Compliant?
Willow Road, east of Durham Street	Avenue - Mixed Use	28,875	31,400	550	7.B.1(1)	**No**
Willow Road, east of Blackburn Avenue	Avenue - Mixed Use	22,962	24,050	410	7.B.1(1)	**No**
Middlefield Road, north of Willow Road	Avenue - Mixed Use	18,188	20,037	64	7.B.1(1)	Yes
Middlefield Road, south of Willow Road	Avenue - Mixed Use	21,058	23,687	285	7.B.1(1)	**No**
Marsh Road, east of Bohannon Drive	Mixed Use Collector	33,128	39,213	669	7.B.2(1)	**No**
Hamilton Avenue, south of Madera Avenue	Neighborhood Collector	2,866	3,589	265	7.B.2(3)	Yes
O'Brien Drive, south of Willow Road	Mixed Use Collector	7,409	13,942	2,600	7.B.2(2)	**No**
O'Brien Drive, north of University Avenue	Mixed Use Collector	4,635	16,232	6,457	7.B.2(3)	**No**
Adams Drive, north of University Avenue [2]	Mixed Use Collector	3,265	3,763	84	7.B.2(3)	Yes
Bay Road, north of Willow Road	Neighborhood Collector	6,362	12,637	841	7.B.2(2)	**No**

Notes:
[1] Average Daily Traffic data was obtained from the City of Menlo Park
[2] Average Daily Traffic was estimated using factors derived from ADT data and peak hour counts
Bold indicates a project-generated non-compliance for study roadway

Internal Site Access, Circulation, and Parking

Appendix H includes the analysis of the main Willow Village site as well as the Hamilton parcels. The site plan review evaluated the internal site's intersection operations, potential queuing issues, and general site access and circulation for the proposed seven new internal streets, 14 parking garage driveways, and 20 new intersections. The results of the level of service analysis show that the intersection of Driveway B & East Loop Road would operate at LOS D during the AM peak hour. Vehicles turning left out of Driveway B would be expected to experience an average delay of 31 seconds while waiting for a sufficient opening on East Loop Road. During the AM peak hour, approximately 101 vehicles (16 heading eastbound and 85 heading westbound) would be expected to exit the garage, which would be one to two vehicles per minute. Therefore, although exiting drivers would experience some wait time, operations at Driveway B are expected to be adequate. The results of the queuing analysis show that the intersection of Hamilton Avenue/Main Street & Willow Road is expected to have insufficient turn lane storage to accommodate the anticipated traffic volumes under near-term plus project conditions. However, it is assumed that vehicles would choose to instead enter the project site via Park Street. Hexagon recommends the following regarding the internal project circulation:

Circulation Related Recommendations

- To prevent southbound queues from spilling back onto Willow Road on Park Street and Main Street, Hexagon recommends coordinating the adjacent signals.

Sight Distance Related Recommendations

- As discussed under Mitigation Measure TRA-3 (see Transportation Chapter of the draft EIR), prior to issuance of the building permit for the North Garage, the applicant shall revise the access design to provide adequate sight distance for the eastern driveway or other design solutions to reduce hazards to a less than significant level, to the satisfaction of the Public Works Director. Potential solutions that would reduce hazards to a less than significant level include restricting the eastern driveway to inbound vehicles only or prohibiting exiting left turns, modifying landscaping or relocating the driveway to the west to allow for adequate sight distance for exiting vehicles, or installing an all-way stop or signal. If driveway A were restricted to inbound vehicles only, all outbound vehicles would use Driveway B, which would provide adequate sight distance for vehicles exiting the north office garage. Driveway B might need multiple exiting lanes to limit queuing inside the garage for exiting vehicles. Alternatively, Driveway A could be moved farther west on East Loop Road so that adequate sight distance could be provided.
- Prior to final design, the project applicant should ensure that landscaping and vegetation would not obstruct visibility at the parking garage driveways.
- Hexagon recommends including 30 feet of red curb on both sides of all garage driveways to prevent vehicles from parking and obstructing the vision of exiting drivers.
- If vehicles exiting the garages cannot see oncoming pedestrians on the sidewalk, Hexagon recommends installing warning signs to alert pedestrians when vehicles are exiting the garages.
- If any driveways are moved from their position on the current site plan, sight distance should be reevaluated.

Parking Garage Circulation Related Recommendations

- Prior to final design, it is recommended that all driveway widths meet the City's requirements.
- At garage driveways where gates and garage doors are proposed, Hexagon recommends conducting an operational analysis to ensure that gate opening and closing times would not create queuing issues or cause vehicles to spill onto the roadway network.
- Prior to final design, the residential parking on level P1 of building RS2 should be shown to be gated and separated from the retail parking on levels 1 and 2. In addition, the roll-up gate in building RS3 should be clearly shown to separate the retail parking in level B1 and the residential parking in level B2.
- It is recommended that all drive aisle and parking stall widths meet the City's requirements.
- It is recommended that adequate turnaround space is provided at all dead-end drive aisles.

Parking Related Recommendations

- If individual vehicles are not able to be retrieved in the tandem puzzle parking, the tandem spaces should be assigned to one residential unit.
- Prior to final design, Hexagon recommends that the required number of ADA and EV parking spaces be provided in all parking garages.

Pedestrian Related Recommendations

- Hexagon recommends that a crosswalk is provided at the intersection of Center Street & East Street and that midblock crosswalks are provided on Center Street and Park Street to reduce block size and improve pedestrian convenience.

Hamilton Parcels Recommendations

- The Hamilton Avenue Parcels are located within the C-2-S zoning district, which per Menlo Park Municipal Code Section 16.37(7), will have parking requirements established by the planning commission for each development. The Hamilton Avenue Parcel North proposes total potential development up to 22,402 square feet and 93 spaces. The Hamilton Avenue Parcel South proposes total development of 5,760 s.f. and 13 spaces. It is recommended that the project applicant confirm that sufficient parking is provided for the proposed total development as part of future architectural control and use permit applications with the City.

1. INTRODUCTION

Ramboll US Consulting Inc. conducted an air quality and greenhouse gas (GHG) assessment for the construction and operation of the proposed mixed-use development at Willow Village in Menlo Park, California (referred to hereafter as the “Proposed Project” or “Project”) for Peninsula Innovation Partners, LLC. The scope and methods used in this assessment are consistent with recommended analyses for projects requiring review under California Environmental Quality Act (CEQA). The CEQA analysis in this report addresses criteria air pollutants (CAP) and CAP precursors, GHGs, toxic air contaminants (TACs) and local air quality and health impacts associated with the Project construction and operation at off-site sensitive receptors. For informational purposes, this report also includes analysis of the health impacts associated with Project construction and operation at on-site sensitive receptors. The analysis in this report will be independently reviewed by the City of Menlo Park, California (referred to as the "City") and peer reviewed by ICF, the City's environmental consultant for possible incorporation into the Environmental Impact Report (EIR) for the Project.

This emissions and Health Risk Assessment (HRA) methodology document describes the scope and methodology for evaluation of air quality, GHG, and health impacts from Project construction and operational emissions, and cumulative impacts at on-site and adjacent off-site sensitive receptors. This document also describes the thresholds of significance that were used, which were consistent with the 2017 Bay Area Air Quality Management District (BAAQMD) CEQA Air Quality Guidelines where appropriate.

1.1 Project Description

1.1.1 Existing Conditions

The main Project site is a 59-acre plot adjacent to Willow Road between the Dumbarton Corridor and O’Brien Avenue. The Project site also includes three parcels west of Willow Road on both sides of Hamilton Avenue, referred to as the Hamilton Avenue Parcels North and South. The main Project site includes 20 existing office, commercial, industrial and warehouse buildings totalling approximately 1,000,000 square feet, along with associated parking. One emergency diesel generator is currently on-site. The area in the general vicinity of the Project consists primarily of residential, mixed-use, commercial, industrial, and educational/institutional uses. The educational/institutional buildings of Mid-Peninsula High School’s campus are adjacent to the Project site to the southwest. To the west is a residential neighborhood. South of the main Project site are mixed-use commercial, industrial, and residential buildings. Though there are commercial operations in the general vicinity of the Project site, there is a lack of amenities in the site vicinity such as grocery stores, pharmacies, and public gathering spaces. **Figure 1** shows the location and boundary of the Proposed Project in Menlo Park and **Figure 2** shows sensitive receptor locations.

1.1.2 Proposed Project

The Proposed Project on the main Project Site would be a mixed-use development that would include up to 1,730 residential units, up to 200,000 square feet of retail uses, a 193-room hotel, up to 1,600,000 square feet of space for office and accessory uses consisting of up to 1.25 million square feet of office uses and the balance (350,000 square feet of office use is maximized) of accessory uses, a publicly accessible park, a dog park, a town square, and

associated parking spaces.[1] The proposed land use summary is shown in **Table 1**. The main Project Site would consist of three planning districts: The Town Square District, the Residential/Shopping District, and the Campus District. The Town Square District would allow space for a range of activities and events from recreation to seasonal markets. The Residential/Shopping District would provide multifamily rental residences and parking, retail, grocery, and park space. The Campus District is planned to consist of office space organized around a pedestrian promenade as well as accessory space and public-serving retail amenities. The Project also would include the re-alignment of Hamilton Avenue, relocation of the existing services station and addition of retail area on the Hamilton Avenue Parcels North and South. The Project Applicant has committed to powering all buildings entirely by electricity. Natural gas may be used for commercial culinary uses only, as allowed under Menlo Park building code.

Project construction would include demolition of all existing structures (including existing buildings, parking spaces, and other features on the main Project Site) and removal of the generator on-site. It is assumed that the earliest-constructed residential buildings would be occupied during the construction activities associated with the subsequent construction activities and, even though not required by CEQA, future residents are considered as on-site receptors for purposes of this air quality analysis.

The Project would also include off-site improvements. To serve the Project's requested electrical demand, four 12 kilovolt feeders need to be installed from Ravenswood Substation. This includes work at the substation itself, which is northeast of the Project site along Bayfront Expressway, and installing the underground feeders from the substation to the Project. The Project would also include intersection improvements in the form of signal changes, lane stripping, and sidewalk improvements.

Land uses for the existing conditions to be demolished and the Proposed Project are shown in **Table 1**.

1.2 Objective and Methodology

The purpose of the air quality and GHG analysis is to assess potential criteria air pollutant and GHG emissions, as well as health risks and hazards that would result from the construction and operation of the Proposed Project consistent with guidelines and methodologies from air quality regulatory agencies, specifically, the BAAQMD, the California Air Resources Board (ARB), the California Office of Environmental Health Hazard Assessment (OEHHA), and the US Environmental Protection Agency (USEPA). The analysis in this report followed the BAAQMD 2017 CEQA Guidelines where appropriate. In addition to the evaluation of an individual project, the CEQA Guidelines recommend an analysis of cumulative impacts when the project's incremental effect is cumulatively considerable. (14 Cal. Code Regs., § 15130, subd. (a).) For an air quality HRA, the cumulative analysis is performed when a project is in an area that includes other air emissions sources within a "zone of influence" of 1,000 feet surrounding the project. This report evaluates the risks and hazards associated with Project construction and operational activities on on-site receptors,

[1] Only actively programmed open space, such as parks, were evaluated in this analysis. The remainder of the open space would not generate new emissions outside emissions covered in other land uses.

off-site receptors and the cumulative impact to both on-site and off-site sensitive receptors from Project construction and surrounding sources.

1.2.1 Resources

Ramboll directly or indirectly relied on emissions estimation guidance from government sponsored organizations, government-commissioned studies of energy use patterns, Project-specific studies, and emissions estimation software as described below. In cases noted below, third-party studies were also relied upon to support analyses and assumptions made outside of the approach described above. Where Project-specific data estimates were available, they were used preferentially instead of model defaults. The methodology used to calculate this emissions inventory is described in detail in the following sections, including citations to information used in this inventory.

1.2.1.1 CalEEMod

Ramboll primarily utilized the methodology from the California Emissions Estimator Model (CalEEMod) version 2020.4.0 to assist in quantifying the criteria pollutant emissions in the inventories presented in this report for the Project. CalEEMod is a statewide program designed to calculate both criteria and GHG emissions from development projects in California. This model was developed under the auspices of the South Coast Air Quality Management District (SCAQMD) and received input from other California air districts. It is currently supported by numerous lead agencies for use in quantifying the emissions associated with development projects undergoing environmental review. CalEEMod utilizes widely accepted models for emission estimates combined with appropriate default data that can be used if site-specific information is not available.

CalEEMod provides a platform to calculate annual operational criteria pollutant emissions from a land use development project. Specifically, the model aids the user in estimating operational emissions associated with a fully built out land use development. This includes emissions from on-road mobile vehicle traffic associated with the land uses, emissions from landscaping equipment and other off-road mobile sources, emissions from natural gas usage in the buildings, emissions associated with electricity usage in the buildings and electricity usage associated with water usage. This also includes emissions associated with solid waste disposal.

CalEEMod uses sources such as the USEPA AP-42 emission factors,[2] ARB's approved on-road and off-road equipment emission models such as the EMission FACtor model (EMFAC) and In-Use Off-Road Equipment model (OFFROAD), and studies commissioned by California agencies such as the California Energy Commission and CalRecycle. OFFROAD is an emission factor model used to calculate emission rates from off-road mobile sources (e.g., construction equipment, agricultural equipment) (CARB 2011a). The off-road diesel equipment emission factors used by CalEEMod are based on the ARB OFFROAD2011 program. ARB has released an updated OFFROAD version, OFFROAD2017, that includes updates to population information and emission factors. OFFROAD2017 was used in this analysis. EMFAC is an emission factor model used to calculate emissions rates from on-road

[2] The USEPA maintains a compilation of Air Pollutant Emission Factors and process information for several air pollution source categories. The data is based on source test data, material balance studies, and engineering estimates. Available at: https://www.epa.gov/air-emissions-factors-and-quantification/ap-42-compilation-air-emissions-factors. Accessed: October 2021.

vehicles (e.g. passenger vehicles) (CARB 2011b). The emission factors used by CalEEMod for on-road vehicles are based on the ARB EMFAC2017 program. ARB recently released EMFAC2021, an update to EMFAC2017, that includes various changes, notably the incorporation of USEPA and ARB regulations and standards (e.g., Advanced Clean Trucks and the Heavy Duty Omnibus). EMFAC2021 was incorporated into this analysis.

In addition, CalEEMod contains default values and existing regulatory methodologies to use in each specific local air district or county. Appropriate state-wide default values can be utilized if regional default values are not defined. Ramboll used default factors for San Mateo County for the emissions inventory, unless otherwise noted in the methodology descriptions below.

1.3 Thresholds for Evaluation

1.3.1 Criteria Pollutants and Precursors

Project construction and operation emissions of CAPs and precursors were evaluated and compared with the BAAQMD's 2017 CEQA Guidelines thresholds of significance. Project operational emissions at full buildout were compared to the annual and daily operational thresholds of 54 pounds (lbs) per day and 10 tons per year (tpy)of Reactive Organic Gases (ROG), oxides of nitrogen (NO_X), and $PM_{2.5}$ and 82 lbs per day and 15 tpy of fine particulate matter less than 10 micrometers in aerodynamic diameter (PM_{10}). Project construction emissions were compared to the average daily construction thresholds of 54 lbs per day of ROG, NO_X, and $PM_{2.5}$ and 82 lbs per day of PM_{10}. BAAQMD thresholds of significance for construction-related PM_{10} and $PM_{2.5}$ mass emissions apply to exhaust emissions only and do not include fugitive dust emissions, which are addressed through BAAQMD's Best Management Practices (BMPs). Because construction would overlap with operations of other components of the Project, emissions during construction were combined with the operational emissions that are expected to occur during that calendar year and then compared to operational thresholds.

As noted above, the BAAQMD threshold for fugitive dust emissions during construction is compliance with its BMPs.

CEQA also requires evaluation of whether the Project would conflict with or obstruct implementation of the applicable air quality plan. Analysis of the Project's consistency with the applicable air quality plan is shown in Appendix A.

1.3.2 Greenhouse Gases

BAAQMD's 2017 CEQA Guidelines do not recommend a threshold for GHG emissions from construction. BAAQMD recommends quantifying and disclosing construction GHG emissions. Emissions from Project construction are estimated and disclosed.

BAAQMD's 2017 CEQA Guidelines include a recommendation for a GHG emissions threshold for operations for the year 2020. Since the project will be built out after 2020, this operational threshold is not appropriate for use. Due to lack of a recommended threshold from BAAQMD, the Project is evaluated against a two-tiered threshold that is based on guidance from expert agencies, including CARB and the Office of Planning and Research (OPR).

Building emissions, such as energy use, water use, area sources, and solid waste, are evaluated against a net zero threshold because a project that does not alter the existing environment has no impact on the environment.

GHG impacts from vehicles are evaluated using the City's VMT threshold. This threshold provides information on whether the project is consistent with applicable plans and goals to reduce GHG emissions by reducing VMT, including Plan Bay Area. In addition, using the same VMT threshold for both transportation and mobile-source GHG impacts ensures consistency throughout the EIR.

CEQA also requires evaluation of a project's consistency with an applicable plan, policy or regulation adopted for the purpose of reducing environmental impacts, including plans adopted to reduce the emissions of GHGs. The analysis of the Project's consistency with applicable plans to reduce GHG emissions is shown in Appendix B.

1.3.3 Health Risks and Hazards

The HRA evaluates the estimated cancer risk, non-cancer chronic and acute hazard index (HI), and fine particulate matter less than 2.5 micrometers in aerodynamic diameter ($PM_{2.5}$) concentration associated with construction and operation of the Project. The cumulative analysis estimates the total excess lifetime cancer risks, non-cancer HI, and $PM_{2.5}$ concentrations that are attributable to off-site rail, mobile, and stationary sources within the 1,000-foot "zone of influence" in addition to effects from the construction and operation of the Project.

The HRA evaluates potential sensitive receptor locations including "people—children, adults, and seniors—occupying or residing in:

- Residential dwellings, including apartments, houses, condominiums;
- Schools;
- Daycare centers;
- Parks;
- Hospitals; and
- Senior-care facilities." (BAAQMD 2012a)

To meet these objectives, this HRA was conducted consistent with the following guidance:

- Air Toxics Hot Spots Program Risk Assessment Guidelines (Office of Environmental Health Hazard Assessment [OEHHA] 2015a);
- May 2017 BAAQMD CEQA Guidelines (BAAQMD 2017);
- BAAQMD Recommended Methods for Screening and Modeling Local Risks and Hazards (BAAQMD 2012a); and
- BAAQMD Health Risk Assessment Modeling Protocol (BAAQMD 2020c).

The results of the construction and operational health risk analyses are compared with the BAAQMD 2017 CEQA significance thresholds for single sources separately. Then the impacts from construction and operations combined, during the time that construction and operations would overlap, are compared to the single source thresholds. Finally, the maximum scenario for the combined construction and operational impacts are combined with the impacts of off-site sources of toxic air contaminants TACs and compared against the BAAQMD 2017 CEQA cumulative thresholds. The thresholds are:

Single Source Impacts:

- An excess lifetime cancer risk level of more than 10 in one million;
- Non-cancer chronic and acute HIs greater than 1.0; and
- An incremental increase in the annual average $PM_{2.5}$ of greater than 0.3 micrograms per cubic meter ($\mu g/m^3$).

Cumulative Impacts:

- An excess lifetime cancer risk level of more than 100 in one million;
- A chronic non-cancer HI greater than 10.0; and
- An incremental increase in the annual average $PM_{2.5}$ concentration of greater than 0.8 $\mu g/m^3$.

As discussed in detail in **Section 3**, health impacts from the Project are based on emissions of TACs from diesel and gasoline combustion. Diesel particulate matter (DPM) does not have an acute non-cancer toxicity value, so an acute HI from diesel exhaust is not estimated. BAAQMD does not estimate acute HI from roadways in its Roadway Screening Analysis Calculator (BAAQMD 2015) since impacts from all roadways were well below thresholds.[3] Therefore, acute HI from Project traffic also was not estimated.

We understand the City received guidance from BAAQMD that $PM_{2.5}$ from fugitive dust from earth movement activity during construction should be included in the comparison to the $PM_{2.5}$ concentration threshold, which contradicts previous guidance Ramboll received from BAAQMD. To be conservative, fugitive dust is included in this analysis. Additionally, resuspended road dust from Project traffic is included in this analysis.

1.3.4 Odor

To evaluate odor impacts, the ConnectMenlo EIR identifies a three-pronged approach "[r]eview of projects using BAAQMD's odor screening distances during future CEQA review, implementation of the [General Plan Policies], and compliance with BAAQMD Regulation 7 would ensure that odor impacts are minimized and are *less than significant*." (City of Menlo Park 2016)

The Project was evaluated against this three-prong approach in **Section 3**.

1.4 Document Organization

This scope of work is divided into seven sections as follows:

Section 1.0 – Introduction: describes the purpose and scope of the air quality analysis, the objectives and methodology used, and outlines the document organization.

Section 2.0 – Criteria Air Pollutant and Greenhouse Gas Emission Estimates: describes the methods used to estimate CAP, TAC, and GHG emissions from the Project, and includes the Project CAP and GHG emissions results and comparison to the applicable thresholds of significance.

[3] A previous version of BAAQMD's tools for estimating health impacts from roadways stated that the maximum acute and chronic HI from all traffic on roadways was well below 0.1, so screening values were not provided by BAAQMD. In the current version of its tools, acute and chronic HI are not provided.

Section 3.0 – Estimated Air Concentrations: discusses the air dispersion modeling, the selection of the dispersion models, the data used in the dispersion models (*e.g.*, terrain, meteorology, source characterization), and identifies receptor locations evaluated in the HRA.

Section 4.0 – Carbon Monoxide Analysis: discusses evaluation of potential carbon monoxide impacts.

Section 5.0 – Odor Analysis: discusses potential odor sources and the evaluation of the Project against the three-pronged approach proposed in the ConnectMenlo EIR.

Section 6.0 – Health Risk Assessment : provides an overview of the methodology for conducting the HRA, and includes the Project HRA results and comparison to the BAAQMD threshold of significance.

Section 7.0 – Cumulative Analysis: summarizes the approach used in the HRA cumulative analysis. The analysis of criteria air pollutants and GHG emissions is inherently cumulative.

Section 8.0 – References: includes a listing of all references cited in this report.

2. CRITERIA AIR POLLUTANT, TOXIC AIR CONTAMINANT, AND GREENHOUSE GAS EMISSION ESTIMATES

Project and net incremental (Project minus Existing) CAP, TAC, and GHG emissions from Proposed Project construction and operational sources were estimated. Methodologies used to calculate CAP, TAC, and GHG emissions are summarized below.

2.1 Existing Conditions Calculation Methodology

All CAP, TAC and GHG emissions for existing operations on the Project site were calculated for year 2019 as data from 2020 and 2021 would not be representative of normal operations due to reduced activity resulting from the COVID-19 pandemic. Emissions estimates include activity in existing buildings slated for demolition, use of emergency generators, and traffic associated with these buildings. Existing land uses at the Project site include offices, warehouses, and parking lots, as well as retail at the Hamilton Avenue Parcels North and South. Emissions from existing offices, warehouses, and parking lots slated for demolition were estimated using CalEEMod with default data assumptions and data provided by the Project Applicant. The carbon intensity factor was adjusted for 2019 as described in **Section 2.3.4.1**. Existing retail, located at the Hamilton Parcels North and South, were not included in the existing emissions calculation, which is conservative because any retail that is replaced would likely be more efficient and less emissions intensive than the existing uses due to stricter building codes. Existing emergency generator information was provided by the Project Applicant. Existing operational traffic information was provided by the Transportation Engineer.[4]

2.2 Calculation Methodologies for Construction Emissions

A detailed construction equipment list was provided by the Project Applicant, which includes the type, quantity, construction schedule and hours of operation anticipated for each piece of equipment for each year of construction.[5] This data was used to estimate construction emissions using calculation methodologies consistent with CalEEMod2020.4.0. It was assumed that all construction off-road equipment is diesel powered except for those specified as electric powered by the Project Applicant. All diesel-fueled off-road equipment emissions of PM_{10} were assumed to be DPM, which is a TAC.

The Proposed Project construction is assumed to start after project entitlements and last roughly five years.[6] A mix of construction equipment would operate over the course of any given day. **Table 2** shows a summary of the expected construction schedule provided by the Project Applicant. Construction of the Project includes construction on-site and at the off-

[4] The Transportation Engineer, Hexagon, provided daily Project VMT and trip rates on October 5, 2021.

[5] This schedule and equipment list is subject to change as Project details evolve. A conservative construction start date and schedule was analyzed to identify maximum impacts of Project construction.

[6] Construction is conservatively assumed to start December 15, 2021. The analysis uses a start date that is earlier than possible to be sure that the impact analysis is conservative. Emissions and impacts would decrease the later the actual construction start date is due to the incorporation of cleaner equipment into the construction fleet with time.

site improvements.[7] Construction emissions were calculated for off-road equipment, on-road vehicles, and off-gassing activities.

As discussed in **Section 1.3.1**, BAAQMD thresholds for fugitive dust are compliance with its Best Management Practices. However, as discussed in **Section 1.3.3**, emissions from fugitive dust are included in the estimation of $PM_{2.5}$ concentration.

2.2.1 Construction Phasing

The analysis described here does not rely on the default construction phasing schedule from CalEEMod, as a detailed schedule was provided by the Project Applicant. **Table 2**, provided by the Project Applicant, summarizes the expected construction schedule.

This analysis assumes that construction of buildings will overlap, that the complete build out would occur in roughly five years and that the buildings constructed would be occupied and fully operational as soon as construction of each building is completed. This is conservative because occupancy and operation of each building would likely ramp up over time, rather than immediately upon completion of construction. The analysis also assumes that operational emissions from completed buildings would overlap with construction emissions from buildings that are still being constructed.

The construction program would commence after existing uses have vacated from the Willow Village site.[8,9] The preliminary construction schedule assumes that construction would begin after project entitlements and would last for roughly five years, as indicated in **Table 2**. Construction diesel equipment would be expected to operate between the hours of 7 AM to 6 PM, consistent with the Menlo Park noise ordinance,[10] with construction with heavy duty equipment exceeding 60 decibels (dBA) occurring Monday through Friday from 8 AM to 6 PM. However, equipment would not be expected to run its engine during this entire period. The equipment list for the construction of the Campus and Town Square Districts is shown in **Table 3**. The equipment list for the construction of the Residential/Shopping District is shown in **Table 4**.

Initial construction activities affecting the full site area include demolition of the existing buildings and parking lots, followed by grading and utilities.

2.2.2 Emissions from Diesel Construction Off-road Equipment

Emissions calculations associated with off-road construction equipment were based on the construction schedule and the type, size, fuel type, tier level, hours of operation and

---

[7] Off-site improvements considered are construction at the Ravenswood Substation, underground installation of the feeder lines, and intersection improvements that include diesel equipment operation.

[8] The existing dialysis center may remain open for several months after demolition commences. If this were to occur, changes to the analysis would be negligible. The dialysis center would not be considered a sensitive receptor based on BAAQMD guidance, so the impacts of construction on the dialysis center do not need to be analyzed. The existing operational emissions associated with the dialysis center remaining and the shifting of emissions from the demolition of the dialysis center would not change conclusions as these would be minor changes.

[9] The analysis only considers net new retail in the Hamilton Avenue Parcels North and South, so does not consider the existing retail in this area to be vacated.

[10] Construction activity is assumed to start at 7 AM to conservatively consider more morning hours in the dispersion analysis, but no equipment will be operated that would violate the Menlo Park noise ordinance, which has low noise level thresholds for construction equipment prior to 8 AM.

utilization factor for each piece of equipment submitted by the Project Applicant. A Project-specific construction equipment list is presented in **Table 3** and **Table 4**.[11] For diesel-powered off-road construction equipment, methodologies consistent with CalEEMod are used to estimate emissions. Where Project-specific equipment information was not available, CalEEMod default horsepower were used. Load factors for each piece of equipment were based on the default load factor from CalEEMod.

The CalEEMod methodology for off-road construction equipment emissions relied on the ARB In-Use Off-Road Equipment model (OFFROAD2011) as well as specific emission factors by engine tier. However, ARB released a new version of its off-road emissions estimator model, OFFROAD2017, which was used to estimate emissions from the Project. Emission factors from OFFROAD2017 that are used in this analysis are shown in **Table 5**.

Emissions are calculated outside of CalEEMod using the same methodologies and emissions factors as CalEEMod. Emissions were calculated using the following formula, which is consistent with CalEEMod.

$$E_C = \sum (EF_C * HP * LF * Hr * Red * C)$$

Where:

E_C: off-road equipment exhaust emissions in pounds (lbs.)

EF_C: emission factor (g/bhp-hr) (CalEEMod defaults)

HP: equipment horsepower (CalEEMod defaults or Project-specific)

LF: equipment load factor (CalEEMod defaults)

Hr: equipment operating hours

Red: reduction from Diesel Particulate Filter (DPF), as applicable

C: unit conversion factor

Unmitigated emissions were based on fleetwide average emission factors from OFFROAD2017, as shown in **Table 5**. For mitigated emissions, emission factors from CalEEMod associated with Tier 4 final engines are used for 95 percent of the equipment operation before residents move on-site in Year 5 and 98 percent of the equipment after residents move on-site in Year 5. The other 5 percent and 2 percent of equipment (before and after on-site residents, respectively) are assumed to have Tier 2 engines. Mitigated emission factors are based on the weighted average of 95 percent and 98 percent (before and after on-site residents, respectively) Tier 4 final emission factors and 5 percent and 2 percent (before and after on-site residents, respectively) Tier 2 emission factors, since all equipment may not be available as Tier 4 final. This equates to equipment with Tier 2 engines or better operating for up to 618,028 horsepower-hours before residents occupy the on-site buildings and up to 34,716 horsepower-hours after residents occupy the on-site buildings.

[11] Emissions are not estimated for intersection improvements without diesel equipment use. Emissions are assumed to be minor since the activity duration is short and trucks would not be idling at the intersection for long periods of time. Travel to the site is assumed to be included in the worker trip counts.

2.2.3 Emissions from Electric Construction Equipment

GHG emissions from the use of electrical off-road equipment were estimated based on type and usage of each equipment. The Project Applicant provided the equipment that will be electrically powered. Yearly electricity consumption by construction equipment was estimated to calculate emissions by multiplying the carbon dioxide equivalents (CO_2e) intensity factor with the electricity consumption for each year. Emissions from electric construction equipment are shown in **Table 6**.

2.2.4 On-road Construction Trips

Construction trip rates were provided by the Project Applicant for each general area. Construction trips by area are shown in **Table 7a**. Trip lengths are shown in **Table 7b**. For demolition and grading hauling trip generation rates, total haul truck trip counts were provided by Project Applicant.

Emission factors from EMFAC2021,[12] the ARB Emission Factors model for on-road emissions, were used for emissions of CAPs and GHGs. The emission factors used for on-road construction trips of the Proposed Project cover the anticipated years of construction. EMFAC2021 incorporates the Pavley Clean Car Standards and the Advanced Clean Cars (ACC) program.

Running exhaust, running loss, tire wear, and brake wear emission factors were estimated with a gram/mile factor. These emissions were calculated as shown below:

$$E_M = \sum (EF_M * VMT)$$

Where:

VMT or Vehicle Miles Traveled: Trip Length*Trip Number

EF_M: emission factor (g/mile) from EMFAC2021

Emissions from vehicle idling exhaust, starting exhaust, and evaporative emissions were estimated with a gram/trip emission factor. Idling emission factors were only estimated for heavy duty trucks as idling emissions occur during extended idling events while the truck is operating but not traveling any significant distance (e.g., during loading and unloading). In EMFAC2021, an extended idling event is defined as "a continuous segment of vehicle activity that meets three criteria: all instantaneous vehicle speeds being lower than 5 mph, the total distance of less than 1 mile, and the total duration of more than 5 minutes" (CARB, 2021). EMFAC takes account of idling emissions from light duty vehicles and other vehicle types in running emissions estimates. These emissions were estimated as shown below:

$$E_T = \sum (EF_T * Trip\ Number)$$

Where:

EF_T = emissions factor (g/trip) from EMFAC2021.

[12] ARB has published off-model adjustment factors to account for the "Safer Affordable Fuel-Efficient Vehicles Rule Part One: One National Program" (SAFE 1) adopted by the USEPA and the National Highway Traffic Safety Administration (NHTSA). These adjustment factors will not be incorporated into this analysis as this regulation is currently under litigation and the USEPA and NHTSA have proposed rulemakings to repeal SAFE 1.

Trip Number = trips provided by Project Applicant

Idling time is modeled to be consistent with California Airborne Toxics Control Measure (ATCM) to limit diesel-fueled commercial motor vehicle idling (California ARB 2016).

Road dust emissions are calculated using ARB methodology. The on-road entrained dust emission factor derivation is shown in **Table 8**.

2.2.5 Fugitive Dust

Fugitive dust contributes to PM_{10} and $PM_{2.5}$ emissions and is generated by the various activities occurring at the Project site. The following subsections describe the methodology used to calculate fugitive dust emissions from Project activities.

Fugitive dust emissions are not included in the comparison to thresholds for mass emissions as these thresholds for construction are for exhaust only. However, to be conservative, fugitive dust emissions are included in the estimation of $PM_{2.5}$ concentration based on recent guidance provide to the City by the BAAQMD.

2.2.5.1 Demolition

Fugitive dust emissions from mechanical dismemberment and debris loading during demolition were estimated using CalEEMod methodology and assumptions. The emission factor is calculated on a per-ton of building waste weight. Building waste weight was estimated based on the volume of building waste from demolition provided by the Project Applicant. Mitigated emissions assume a 55% reduction due to watering two times a day. Dust emissions from demolition are presented in **Table 9a.**

2.2.5.2 Grading

Fugitive dust emissions from grading equipment (i.e., graders and scrapers) occur during the grading and utility phases. Grading emissions were estimated using CalEEMod methodology and assumptions. The emission factor for grading is calculated on a per-VMT basis. Equipment VMT was calculated using the maximum area disturbed per day, based on Project-specific data and CalEEMod default assumptions. Mitigated emissions assume a 55% reduction due to watering two times a day. Grading emissions are presented in **Table 9b.**

2.2.5.3 Material Loading

Fugitive dust from material loading activities includes the unloading of materials construction and loading of soil onto the haul trucks during the grading and utilities excavation phases. Material loading fugitive dust emissions were estimated using CalEEMod methodology and assumptions. The emission factor for material loading is calculated on a per-ton basis. Material loaded in cubic yards is based on Project-specific data. Mitigated emissions assume a 55% reduction due to watering two times a day. Emissions from material loading are presented in **Table 9c.**

2.2.6 Watering for Dust Control

GHG emissions associated with the electricity consumed during watering for construction dust control were calculated based on the total water consumption, electricity used for watering, and the electricity carbon intensity for water supply, distribution and treatment over the construction period using CalEEMod equivalent methodologies. Total water consumption is from the Project Applicant. The electricity intensity used is Pacific Gas and

Electric's (PG&E) GHG emission factor.[13] Emissions from construction water use are presented in **Table 10**.

CAP and GHG emissions from water trucks operation were calculated using EMFAC2021 emission factors with other on-road construction trips as described in **Section 2.2.4**.

2.2.7 Architectural Coatings and Paving Off-Gas Emissions

Emissions from architectural coating and paving off-gas emissions were estimated using methodologies consistent with CalEEMod.

Paving emissions were based on the square footage of roadway and parking lots that need to be paved. This square footage was provided by the Project Applicant. The parking lot and the estimated square footage of roadways were summed together to determine the overall paved surface area assumed for the Project. This was used to calculate asphalt off-gassing emissions from the Project using default CalEEMod methodologies and factors, as shown in **Table 11**.

Architectural coating emissions were based on the square footage of different land uses as well as CalEEMod defaults regarding the amount of coated areas for the various land uses, as shown in **Table 12**. Unmitigated emissions from architectural coating during Project construction assumed compliance with BAAQMD paint volatile organic compound (VOC) regulations, while mitigated emissions assume that Project indoor painting during construction will utilize super-compliant coatings, which are paints that have been reformulated to exceed the SCAQMD's Rule 1113 (Architectural Coatings) requirements.

2.2.8 Construction CAP and GHG Emissions Summary

A summary of maximum annual average daily construction CAP emissions is shown in **Summary Table A**, below. More detail on unmitigated construction CAP emissions from the Project are summarized in **Table 13** and mitigated construction CAP emissions from the Project are summarized in **Table 14**. CAP emissions are reported in units of annual average daily emissions for each year of construction. For construction that will occur throughout the full year, annual emissions were averaged over 365 days of construction each year to give average daily emissions in lbs per day to get an average emission rate to compare against thresholds.[14] Construction will not occur throughout the full year during the first and last years of construction. In these scenarios, the annual construction emissions for the first and last years were averaged over the number of days construction will occur in the respective year. Mitigated emissions assume 95 percent of construction equipment before residents move on-site and 98 percent of construction equipment after residents move on-site has Tier 4 Final engines. The remaining equipment could have Tier 2 engines or better. Mitigated emissions also assume indoor painting during construction will utilize super-compliant coatings, which are paints that have been reformulated to exceed the SCAQMD's Rule 1113 (Architectural Coatings) requirements.

[13] The Project would receive its power from Peninsula Clean Energy. However, the electricity to pump water from its source to the Project is not under control of the Project, so the carbon intensity of electricity from PG&E powered electricity will be used.

[14] Activity is expected on most Saturdays. Even if 6 days per week (312 days per year) were used to average emissions, conclusions would not change.

Total GHG emissions for construction are summarized in **Table 15**. GHG emissions are reported in total metric tons of carbon dioxide equivalents.

Summary Table A. Summary of Maximum Annual Average Daily Construction CAP Emissions and Annual Construction GHG Emissions

	ROG	NO_X	PM_{10}	$PM_{2.5}$	CO_2e
	lb/day				MT/year
BAAQMD Threshold of Significance	54	54	82	54	N/A
Unmitigated Emissions	63	124	5.8	5.4	23,050
Exceed Threshold?	*Yes*	*Yes*	*No*	*No*	*N/A*
Mitigated Emissions	28	47	0.78	0.77	23,050
Exceed Threshold?	*No*	*No*	*No*	*No*	*N/A*
Source: Table 13, Table 14, and Table 15					

2.3 Calculation Methodologies for Operational Emissions

The net (Project minus Baseline) CAP, GHG and TAC operational emissions were evaluated. Sources of operational emissions from the existing site improvements (Baseline) and Project include operation of the buildings (area, energy, water, waste), emergency diesel generators, and on-road vehicles. The Baseline condition has one emergency diesel generator, and the Project would have thirteen emergency diesel generators.

Operational emissions that are concurrent with construction activities are presented by year in order to determine the combined construction and operational emissions for each year of construction, as discussed further in **Section 2.4**. Partial buildout emissions for both operational and mobile sources were scaled using the portion of each building area that becomes operational for each year of construction, as shown in **Table 16**.

Project and Baseline operational emissions were estimated using CalEEMod equivalent methodologies, as discussed below.

2.3.1 On-road Mobile Sources

Vehicles on the roadway emit CAPs, GHGs[15] and TACs in their exhaust and through evaporation, tire and brake wear, and fugitive dust from roadways. Mobile emissions were calculated using Project-specific trip generation and VMT by vehicle type and emission factors from EMFAC2021 for San Mateo County. To estimate annual emissions, trips and

[15] GHG emissions from mobile sources are estimated for informational purposes. GHG impacts are evaluated based on VMT, as discussed in Section 1.3.2.

VMT were multiplied by the relevant emission factor of pollutants. More details on this calculation are provided below. The fleet mix and trip generation for the Project, and the Campus District in particular, are unique to the Project due to the Project's unique Transportation Demand Management (TDM) program, trip cap, and vehicle fleets. Therefore, using generalized approaches in CalEEMod would not appropriately estimate emissions for the Project. Project specific information was used to develop emissions calculations using EMFAC2021 directly.

2.3.1.1 Vehicle Trips and VMT

Project traffic included residential and worker trips as well as service vehicle and vendor trips, and retail and commercial trips. The Transportation Engineer provided project-specific daily vehicle trips and vehicle miles travelled (VMT) for the Campus District and Baseline conditions at the Project site broken down by fleet category and the total daily vehicle trips and VMT in the Town Square and Residential/Shopping District broken down by land use. The trip rates and VMT of the Hamilton Avenue Parcels North and South were provided separately and combined with retail land use totals in the mobile emission calculations. These trip rates account for the Project-specific TDM program proposed for the Campus District, the Town Square District, and the Residential/Shopping District and the trip cap proposed for the Campus District.

We understand the Project's TDM program will reduce the amount of vehicle traffic generated by creating measures, strategies and incentives to encourage workers and residents to use alternate modes of transportation. The TDM measures include, but are not limited to the following measures:

- Improve Biking/Walking Network
- Provide Bicycle Amenities
- Improved public transit service (coordinated with San Mateo County Transit District)
- Car Share Program
- Tram Service
- Commuter Shuttles
- Parking Management
- Emergency Ride-Home Program
- Carpool and Vanpool Programs
- A Commute Assistance Center
- On-Site Housing

The Transportation Engineer provided weekday trip rates provided in Appendix C; therefore average daily trip rates for each land use and fleet category were estimated by scaling the Project specific trip rates with a ratio derived from CalEEMod weekday and weekend trip rates by land use. Average daily trip rates were calculated as a weighted average of the weekday and weekend trip rates. For partial buildout years, the trips and VMT were scaled by the proportion that each land use was operational during each year of construction, as shown in **Table 16.**

The weekday trip rates and daily VMT as provided by the Transportation Engineer are shown in **Table 17**. The trip rates and VMT are summarized in **Table 18** for baseline, full buildout and partial buildout.

Campus District. Trips and VMT for the Campus District were calculated using Project-specific fleet mixes and Project specific trip and VMT information from the Transportation Engineer.

The Project TDM program will employ several methods of reducing vehicle emissions including: commuter shuttles that take workers to and from work, a fleet of trams that move employees between campuses reducing the number of worker cars on the road, and on-demand vehicles that workers can summon for short trips around the campuses. These measures would reduce Campus District VMT. Specific trip rates and VMT were developed for each of these unique fleets and matched with fleet appropriate emission factors. Trams are proposed to operate at the same level of activity as the Baseline conditions; therefore, tram trips and VMTs are not considered in the emissions analysis because no net increase is proposed.

Campus District emissions were broken down into the following categories:

- Cars
- Trucks
- Shuttles
- On-Demand Vehicles

Cars, Trucks, Shuttles, and On-Demand Vehicle fleets are Project-specific fleets associated with the Campus District land use. It is anticipated that the shuttles, and on-demand vehicles will service all of Meta Platforms, Inc, ("Meta") campuses and often make multiple stops on one trip. Trip rates and VMT associated with the Campus District were provided by the Transportation Engineer.

Town Square District and Residential/Shopping District. Trips and VMT for the Town Square District and Residential/Shopping District were also provided by the Transportation Engineer and account for TDM reductions required by the City. These Mixed-Use trips and VMTs are assigned to the San Mateo County Mix fleet type, which includes all vehicle categories. The trips associated with the Hamilton Avenue Parcels North and South are added to the trips associated with the Town Square and Residential/Shopping Districts.

Existing site. Trips and VMT at the existing site were estimated by the Transportation Engineer for the same vehicle categories as the Campus District.

2.3.1.2 Fleet Mixes

As mentioned above, the existing site has, and Campus District is anticipated to have, a unique fleet mix due to Meta's proposed trip cap and extensive TDM program. The vehicle fleets for the Town Square District, Residential/Shopping District, and Hamilton Avenue Parcels North and South are based on the default fleet mix for San Mateo County in EMFAC2021, consistent with the methodology used in CalEEMod. A summary of the fleet mix categories is shown in **Table 19**. Where a mix of EMFAC vehicle categories is used, the mix is based on the ratio of EMFAC2021 VMT for each vehicle type. The Shuttle fleet mix was assumed to be all diesel to conservatively estimate health risks.

2.3.1.3 Emission Factors

Mobile emission factors from running, idling, and starting vehicle exhaust, as well as evaporative running loss, tire wear, and brake wear emissions were calculated using EMFAC2021 in San Mateo County for each of the fleet mix categories. Running exhaust, running loss evaporative, tire wear, and brake wear emissions were determined using factors with units of g/mile while idling and starting exhaust and other evaporative emissions were determined using factors with units of g/trip.

Total emissions from EMFAC2021 were converted to emission factors using the total VMT or trips for the relevant vehicle classes. The average emission factor for each fleet mix category was then calculated using the ratio of VMT or trips between vehicle classes.

Emission factors were calculated for each fleet mix category for the baseline year of 2019, full buildout, and each intermediate year where the Project would be operating concurrent with construction. For the purposes of this analysis, this is assumed to be 2024-2026, consistent with buildout of specific buildings in the construction analysis. The fleet-average mobile emission factors decrease over time due to fleet turnover and regulations such as ACC. For fleet mix categories associated with the Campus District, vehicles are assumed to be either gasoline or diesel, or natural gas in the case of certain vehicles in the fleet for trucks. Electric vehicles (EVs) were not included in the Campus District fleets because Project-specific reductions for vehicle charging were applied later, as discussed in **Section 2.3.2.1.** Emission factors for fleet mix categories associated with the Town Square District, Residential/Shopping District, and Hamilton Avenue Parcels North and South include gasoline, diesel, natural gas, and EVs based on default EV penetration for San Mateo County from EMFAC2021. EVs do not emit CAPs beyond PM from brake wear and tire wear. **Table 20a** and **Table 20b** show the CAP and GHG emission factors from EMFAC that were used in the analysis for Project and Baseline.

Vehicles driving on roadways would also emit $PM_{2.5}$ and PM_{10} in the form of re-suspended road dust as described in **Section 2.2.5**. Road dust $PM_{2.5}$ and PM_{10} emissions were added to exhaust $PM_{2.5}$ and PM_{10} emissions for comparison against BAAQMD's total operational $PM_{2.5}$ and PM_{10} mass emissions significance thresholds. The re-suspended road dust emission factors are summarized in **Table 8.**

2.3.1.4 Emissions

Emission factors for each vehicle class were multiplied by the annual trips and VMT calculated as described above. For partial buildout years, the emissions were scaled by the proportion that each land use was operational during each year of construction, as shown in **Table 16**.

Mobile CAP and GHG emissions before reductions associated with the EV charging are summarized in **Table 21a** and **Table 21b**.

2.3.2 EV Charging Emissions Reductions

The Project will have a comprehensive EV charging network. Emissions reductions associated with the increase in EV miles traveled (eVMTs) due to the addition of EV charging at the Project are taken into account. EVs emit fine particulate matter (PM) brake wear and tire wear at the same rate as other vehicles (per EMFAC2021); therefore, these emissions are excluded from the emissions reductions taken for EVs.

The reductions associated with increased eVMT due to Project charging infrastructure are addressed differently for the Town Square and the Residential/Shopping District and the Campus District. The EV chargers in Town Square and the Residential/Shopping District would be utilized by the general public where there is less control over the use. The Campus District has a comprehensive program to for EV charging for its workers, as discussed below.

The reductions associated with EV charging are based on ARB's VISION program (California ARB 2020), which evaluates various scenarios regarding California's growth and adoption of technologies in the transportation sector. The program has developed and enhanced predictive traffic models since 2012. The VISION traffic models have been used by CARB to support transportation policy decisions and inform air quality and climate planners.

2.3.2.1 EV Charging Emissions Reductions for Campus District

As discussed above, Meta offers an advanced EV charging program to its workers. Charging on campus is free and valets move cars into chargers to maximize charging time. Therefore, the Campus District would be expected to produce more EV penetration in its fleet than would be seen in the general public in the Town Square and the Residential/Shopping District. This is a further benefit to the community because workers can charge their EVs on campus using carbon free electricity instead of in their homes where electricity may not be carbon free.

The Project Applicant provided the annual electricity use for charging at Meta's existing campuses in 2019 in Menlo Park, including the existing charging at the Project site. The existing main Project site electricity use was used to estimate reductions associated with the baseline conditions, as shown in **Table 22**.

The anticipated amount of charging in the Campus District was calculated based on the historical charging in 2019, as shown in **Table 22**. The provided studies were used to calculate an average ratio of kilowatt-hours to square footage from the existing campuses. This ratio was applied to the projected square footage of the Campus District at full buildout to determine anticipated energy usage. To account for expected increases in fleet EV penetration by full buildout, the anticipated energy usage was scaled by the increase in eVMT 2026 in the Mobile Source Strategy (MSS) scenario of CARB's VISION program compared to the percentage of eVMT associated with the existing main Project site. The more aggressive MSS scenario was used to scale the Campus District eVMT because the EV incentives offered by Meta are expected to contribute to greater EV adoption by Meta workers when compared to the fleet average.

The electricity use for charging in baseline and full buildout was used to estimate the number of miles driven by EVs charged at the Campus District based on a fuel economy of 0.30 kilowatt-hours (kWhs) per mile.[16] The eVMT for the Campus District is shown in **Table 22.**

The electricity for EV charging at the Project would be supplied with 100% carbon-free energy, as discussed in more detail in **Section 2.3.2.2.** Mobile emissions for the Campus District were calculated assuming all VMT and trips were gasoline or diesel and then removing the equivalent gasoline or diesel emissions that are replaced by eVMT and EV trips, for both baseline and the Project. Therefore, the associated reductions in CAP and GHG

[16] The fuel economy is based on electric fleet data from fueleconomy.gov. Available at: https://www.fueleconomy.gov/.

emissions are calculated from the replacement of gasoline and diesel-powered vehicles with EVs for the same travel.

2.3.2.2 EV Charging Reductions for Town Square and the Residential/Shopping District

The EV chargers installed with the Project in the Town Square and the Residential/Shopping District contribute to emissions reductions due to increased eVMT charged by the Project chargers, similar to reductions associated with the Campus District. However, the Town Square and the Residential/Shopping District is not controlled by one employer, and vehicular travel associated with this area is largely from the general public. Therefore, reductions associated with eVMT were estimated using data derived from statewide trends in ARB's VISION program.

ARB is currently preparing the 2020 MSS model as part of the VISION program to anticipate fleet changes in accordance with the ambitious targets set by recent legislative actions. The new model incorporates the 2020 MSS scenario, which estimates eVMTs reflecting the target identified in EO N-79-20, assuming 100% of passenger vehicle sales in California are zero emissions vehicles (ZEV) or plug-in hybrid vehicles (PHEV), and GHG emissions assumed to have reduced by 2.0% per year from 2026 to 2035. The emissions reductions associated with this Project were determined to be the difference between the eVMT under the reference or "as-is" scenario and the MSS scenario, since the additional charging infrastructure associated with the Project will be an essential link towards reaching the targets set in the MSS.

As discussed in **Section 2.3.1.1**, the Town Square and the Residential/Shopping District fleet mix is based on EMFAC2021 and includes the default percentage of EV travel. To calculate the respective reductions from the Project chargers in the Town Square and the Residential/Shopping District, the percent of eVMT under the 2020 MSS model was determined for both the reference and MSS scenarios based on the model. The percentage of EV travel in the reference scenario is assumed to be similar to the EV travel in EMFAC2021. Because the 2020 MSS model only accounts for passenger vehicles, the percent of eVMT from the model was multiplied by the percentage of passenger vehicle VMT of the total fleet VMT from EMFAC2021. The resulting percentage, representing the vehicles within the fleet that could use the Project's chargers was then multiplied by the trip rates and VMT associated with the Town Square and the Residential/Shopping District by year. The eVMT offered by the Project chargers was then calculated based on usage assumptions for the charger of 10 hours per day and 365 days per year, where 1 hour of charging offers on average 25 miles of eVMT, as shown in **Table 23**. Charger usage was assumed based on typical operating time for retail charging. However, as shown in Table 23, emissions reductions are limited by projected demand of eVMT and EV trips, not charger availability.

The emissions reductions associated with the installation of the EV chargers in the Town Square and the Residential/Shopping District was calculated using the difference in charger eVMT between the reference and MSS scenarios. The reductions in CAP and GHG emissions were calculated using the emission factors and methodologies described in **Section 2.3.1.3** for the Town Square and the Residential/Shopping District.

The combined EV CAP and GHG emissions reductions from the Campus District and the Town Square and the Residential/Shopping District are shown in **Table 24a** and **Table 24b**. A

summary of the total mobile CAP and GHG emissions with and without reductions associated with EV vehicles are in **Table 25a** and **Table25b**.

2.3.3 On-site Generators

The Project would include thirteen new emergency generators and the removal of the single existing emergency generator. Project and Baseline emissions for the emergency generators are based on the BAAQMD rule limiting the hours of non-emergency operation for emergency standby diesel engines to a maximum of 50 hours per year of testing and maintenance, which is consistent with the maximum allowed testing time from the ATCM for Stationary Compression Ignition Engines (CARB 2011). $PM_{2.5}$ and PM_{10} emissions were calculated using emission factors based on ARB engine tier standards for diesel generator engines. NOx and ROG emissions were calculated by converting non-methane hydrocarbon (NMHC) emission factor values provided in ARB's Tier standards to the intended emission factors using EPA conversion factors (USEPA 2010) if explicit values are not provided for the specific tier level. When an emission factor was specified as a combined NMHC+NOx factor, the NMHC/NOx ratio of 5%/95% were taken from BAAQMD guidance (BAAQMD 2004). GHG emissions were calculated using CalEEMod default emission factors. All emission factors can be found in **Table 26**. Generator information, such as size of engine, quantity, and engine tier, was provided by the Project Applicant, as shown in **Table 27**. A summary of on-site generator emissions can be found in **Table 27**.

2.3.4 Energy

Energy emissions include indirect emissions from electricity used by buildings and direct natural gas combustion emissions. Indirect emissions are typically due to electricity generation from off-site power plant locations. Emissions from natural gas combustion can be generated from commercial usage (e.g., cooking and heating) and industrial usage (e.g., boilers).

CAP and GHG emissions from energy sources at the existing main Project site were evaluated based on energy use at the site in 2019, as shown in Appendix A. Existing land uses at the site include offices, a health center, industrial, commercial, and warehouse buildings, and parking lots. Emissions were estimated using CalEEMod equivalent methodologies with energy usage data provided by the Project Applicant. The carbon intensity factor for 2019 was used as described in **Section 2.3.4.1**.

Electricity usage rates for the Project were provided by the Project Applicant based on Project-specific estimates, as shown in Appendix A, which assume space heating and cooling, domestic hot water heating, and residential cooking equipment would be powered by electricity rather than natural gas. Natural gas would be used in supermarket and restaurant land uses for commercial cooking equipment only. Energy use associated with the net new retail at the Hamilton Avenue Parcels North and South are based on CalEEMod defaults. A portion of the retail in these parcels would be demolished and rebuilt. Evaluating only the net new area is conservative because newer, more energy efficient buildings will replace older buildings built under an older version of building energy code.

In an effort to reduce GHG emissions, the Project would be entirely electrically powered, with the exception of commercial culinary uses. The residential buildings would be entirely electrically powered. Therefore, energy use totals for the Project are based on Project-specific electricity and natural gas usage studies provided by the Project Applicant. A summary of energy use provided is shown in **Table 28**.

The Project also would include the installation of solar PV arrays that would generate about 3,900,000 kWh per year of electricity.

The buildings on the main Project Site also must comply with applicable Menlo Park Municipal Code requirements, stating:

> *For all new construction, a project will meet 100 percent of energy demand (electricity and natural gas) through any combination of the following measures:*
>
> *(i) Onsite energy generation,*
>
> *(ii) Purchase of 100 percent renewable electricity through Peninsula Clean Energy or Pacific Gas and Electric Company (PG&E) in an amount equal to the annual energy demand of the project,*
>
> *(iii) Purchase of local renewable energy generation in Menlo Park in an amount equal to the annual energy demand of the project, and*
>
> *(iv) Purchase of certified renewable energy credits and/or certified renewable energy offsets annually in an amount equal to the annual energy demand of the project.*

The Campus District would meet this code requirement by eliminating the use of natural gas, except for culinary purposes (limited to the restaurant uses), and committing to purchasing 100 percent carbon free electricity from Peninsula Clean Energy (PCE).

Portions of the Town Square, Campus, and/or the Residential/Shopping District would include natural gas for cooking in the retail area. To meet this code requirement, the on-site solar would offset any emissions from the natural gas combustion for cooking and any electricity that may not be carbon free.

The compliance method is discussed further in the memorandum from Signature Development Group to the City of Menlo Park dated December 2, 2021 regarding Willow Village 100% Renewable Energy Memo.

The analysis accounts for state laws that require municipal utility providers, such as PG&E, to incrementally increase the percent of electricity it supplies from carbon free sources between now and 2045, when the electricity mix must be 100 percent carbon-free.

2.3.4.1 Electricity

To estimate emissions, the estimated electricity usage of the Project was multiplied by the carbon intensity of the electrical grid. Carbon intensities of electricity are GHG emission rates from a given source in terms of the amount of GHG released in pounds per megawatt hour (MWh) of energy produced and are different depending on the source of electricity.

Electrical power is supplied to the study area by PCE, although the option to purchase electricity from PG&E is available. The carbon intensity from the PCE Standard plan, using the PCE power sources that supply energy under that plan, were used to estimate emissions from existing conditions and is shown in **Table 29**. The PCE Standard plan currently utilizes - and is committed to utilizing 86% renewable sources of energy through 2030.[17]

[17] Peninsula Clean Energy comes from 51% renewable sources, 35% hydroelectric sources and 14% unspecified sources. Unspecified sources were assumed to have the same carbon intensity as the non-renewable PG&E mix of power. Available at: https://www.peninsulacleanenergy.com/energy-sources/

As discussed above, as part of its sustainability strategy, the Project Applicant has committed to purchasing 100 percent carbon free energy from PCE for Campus District uses to reduce its GHG emissions, which is also consistent with the City zoning code. Any electricity in the Town Square, Campus and/or the Residential/Shopping District that is not carbon free would be offset with on-site solar. Therefore, a carbon intensity factor of zero was used for Project emissions.

As discussed above, the on-site solar would produce more electricity than would be needed to offset the non-carbon-free portion of electricity use and the natural gas use. Therefore, the additional electricity generated from the on-site solar PV would offset electricity that would have been generated by the utility, likely through non-renewable sources or peaker plants. The renewable energy generated onsite that is not consumed by the Project would thus be available for other projects, further reducing GHG emissions from electricity for the Project. However, to be conservative, this additional reduction in non-renewable energy was not taken into account in this analysis.

Indirect electricity emissions for the Project were estimated by combining the carbon intensity and projected usage for each year using methodologies consistent with CalEEMod as shown in **Table 30**.

2.3.4.2 Natural Gas

Natural gas combustion emits GHGs and CAPs. Natural gas usage rates are based on Project-specific estimates provided by the Project Applicant and reflect the fact that all buildings would be primarily electric and would use natural gas only for culinary purposes in the supermarket and restaurant land uses. Residential units would be electric, including space heating and cooling, domestic hot water heating, and residential cooking equipment.

As discussed above, compliance with the City Municipal Code requires any natural gas usage to be offset by on-site renewable energy generation, off-site new renewable energy generation or offsets. However, to be conservative, GHG emissions from natural gas combustion are estimated for the Project since the carbon intensity of the reduction in grid electricity production due to the on-site solar is not known at this time.

For years before full buildout, the natural gas used at full buildout was multiplied by the percent of retail land uses that would be completed during each year.

CalEEMod default emission factors for natural gas combustion were used, as shown in **Table 29**. Direct emissions from the combustion of natural gas for both existing conditions and Project conditions can be found in **Table 30**.

2.3.5 Water and Wastewater

Water and wastewater use emits GHGs from the electricity used to convey, treat, and distribute water and wastewater and the release of methane (CH_4) and nitrous oxide (N_2O) directly from the wastewater.

The amount of electricity required to convey, treat, and distribute water depends on the volume of water as well as the sources of the water. Indirect emissions from electricity to supply, treat, and distribute water decrease over time as the average carbon intensity of electricity use decreases due to the California Renewables Portfolio Standard (RPS), a law designed to meet statewide GHG reduction targets. The electricity used to pump the water to the site is not under the control of the Project and therefore cannot be guaranteed to be

generated with 100% renewable or carbon free energy from PCE. Therefore, GHG emissions from water transport are based on the carbon intensity of PG&E. The RPS required 33% of electricity supplied by utilities to come from renewable sources by 2020. The RPS was recently expanded with Senate Bill SB 100 to require 60% of electricity to be from renewable sources by 2030 and 100% of electricity to be from carbon neutral sources by 2045 (SB-100 2018). PG&E's estimated carbon intensity factor was adjusted for existing conditions, for each year of concurrent construction and operation and for full buildout based on the criteria established in the California RPS, as shown in **Table 29**.

GHG emissions from water and wastewater sources at the existing site were evaluated based on 2019 data. Existing land uses at the site include retail, offices, a health center, industrial manufacturing, research and development, and warehouse buildings, and parking lots. As discussed above, only net new square footage at the Hamilton Avenue Parcels North and South were included in the Project analysis because that represents the change from existing, baseline conditions.

Water use rates for the Project were provided by the Project Applicant, as shown in **Appendix C**. Water use at the Hamilton Avenue Parcels North and South were estimated using CalEEMod default rates. Summarized usage rates can be found in **Table 31**.

Emissions from water and wastewater use at existing offices, warehouses, and parking lots were estimated using CalEEMod equivalent methodologies with default data assumptions for San Mateo County, based on existing land use areas as listed in **Table 1**.

Water and wastewater emissions are summarized in **Table 32**.

2.3.6 Solid Waste Disposal

Indirect GHG emissions associated with waste disposal include CH_4 generation from the decomposition of waste and the CO_2 emissions associated with the combustion of CH_4, if applicable. GHG emissions associated with non-landfill diverted waste streams were not considered because it is generally assumed that these diversions do not result in any appreciable amounts of GHG emissions. Waste diversion alternatives may result in differences in life-cycle emissions of GHGs, but it is not appropriate to combine life-cycle emissions for only one category of emissions.

Biogenic CO_2 emissions were not included when the ARB analyzed the GHG emissions inventory under Assembly Bill 32 (AB32). Therefore, they were not included in the emissions inventory.

Emissions from the disposal of solid waste were calculated using default solid waste generation rates from CalEEMod for San Mateo County. In order to reduce waste disposal, Meta diverts 82% of solid waste from landfill disposal.[18] The diverted waste would be composted or recycled. As a result, an 82% reduction was applied to the default solid waste generation rates for the Campus District, as shown in **Table 33**. In 2016, the City implemented zero waste management plan with the goal of diverting 90% of waste from Life Sciences, Office, and Mixed Use Residential zoning districts by 2035 (City of Menlo Park); however, these diversion rates were conservatively excluded from the analysis.

[18] The 82% diversion rate was determined using waste disposal and diversion data for 2019 provided by the Project Applicant via email communication on August 2, 2021, as shown in **Appendix A**.

GHG emissions from solid waste disposal sources at the existing site were evaluated. Existing land uses at the site include offices, a health center, industrial, commercial, and warehouse buildings, and parking lots. Emissions from existing land uses that would be affected by the Project and Project emissions were estimated using CalEEMod equivalent methodologies with default data assumptions based on existing land use areas as listed in **Table 1.**. A diversion rate of 82% was also applied to the existing office building land use since the waste diversion program is currently in place.

Solid waste disposal emissions from both the existing site and the Project can be found in **Table 34**.

2.3.7 Area Sources

GHG and CAP emissions from area sources, such as landscaping equipment, consumer products, and architectural coating, were estimated using CalEEMod default values and equivalent methodologies based on the type and size of land uses associated with the Proposed Project. The residential units would not include any hearths, so emissions from hearths were not estimated.

GHG emissions from area sources at the existing site were evaluated for 2019.[19] Emissions were estimated using CalEEMod equivalent methodologies with default data assumptions based on existing land use areas as listed in **Table 1**.

2.3.7.1 Architectural Coating

Operational architectural coatings include the reapplication of paint and coatings on interior and exterior surfaces, which result in emissions of ROGs. CalEEMod default assumptions were used to calculate the building surface area that would be coated, as well as the application rate and indoor and outdoor ROG emission factors based on BAAQMD Regulation 8 Rule 3 paint VOC regulations (BAAQMD 2009). The unmitigated architectural coating emissions are summarized in **Table 35**. Mitigated emissions assume that Project indoor painting will utilize super-compliant coatings, which are paints that have been reformulated to exceed the SCAQMD's Rule 1113 (Architectural Coatings) requirements,[20] as shown in **Table 36**Table 36.

2.3.7.2 Consumer Products

Consumer product emissions come from various non-industrial solvents, including cleaning supplies, kitchen aerosols, cosmetics, and toiletries, which emit ROGs during their use.

CalEEMod provides a statewide consumer products emission factor based on the ARB 2008 emissions inventory. (CAPCOA 2020b) For this analysis, a San Mateo County specific emission factor was developed based on the emissions from consumer products from the ARB 2020 emissions inventory for San Mateo County and the building square footage in the county using the same methodologies utilized in CalEEMod, as shown in **Table 37.**Table 37

[19] As discussed above, only net new square footage at the Hamilton Avenue Parcels North and South were included in the Project analysis because "net new" represents the change from baseline.

[20] Assumes "super compliant" architectural coatings for indoor building surfaces based on more stringent VOC limits from South Coast Air Quality Management District (SCAQMD) Rule 1113. South Coast Air Quality Management District. Super Compliant Architectural Coatings per Rule 1113. Available at: http://www.aqmd.gov/home/programs/business/business-detail?title=super-compliant-coatings&parent=other-low-voc-products.

The emission factor for the parking area and parks are the default values for the land uses from the CalEEMod User's Guide.

Consumer product emissions are summarized in **Table 38**.

2.3.7.3 Landscaping Equipment

Emissions from landscaping equipment were calculated using CalEEMod and based on information regarding building square footage and acreage, as well as CalEEMod defaults. The recent law (Assembly Bill 1346) banning the sale of gasoline-powered landscaping equipment by 2024 was conservatively not accounted for, since it is unknown how the law will affect emissions due to non-electric equipment already in operation. These emissions are shown in **Table 39** and CalEEMod output files are shown in **Appendix D.**[21]

2.3.8 Net Operational CAP and GHG Emissions Summary

As discussed above, the Project would replace existing office, recreational, commercial, industrial and warehouse buildings, and surface parking facilities. Therefore, total operational emissions associated with the Proposed Project are the difference between emissions from the new land uses and emissions from existing land uses that would no longer be present. Existing emissions were subtracted from Proposed Project emissions for total net emissions from the Project. During Project operation, annual operational emissions were averaged over 365 days to give average daily operational emissions.

Net unmitigated and mitigated CAP emissions are summarized in **Table 40** and **Table 41**, respectively. Operational GHG emissions are summarized in **Table 42**. Mobile GHG emissions are 16,766 MT/yr. These emissions are not included in the estimate of net GHG emissions since GHG impacts from mobile sources are evaluated based on VMT, as discussed in Section 1.3.2.

Summary **Table B**, below, summarizes these emissions.

Summary Table B. Summary of Maximum Annual Average Daily Net Operational CAP Emissions and Annual Net Operational GHG Emissions

	ROG	**NO_X**	**PM_{10}**	**$PM_{2.5}$**	**CO_2e**
	lb/day				MT/year
BAAQMD Threshold of Significance	54	54	82	54	N/A
Unmitigated Emissions	88	21	37	7.0	-1,056
Exceed Threshold?	*Yes*	*No*	*No*	*No*	*N/A*

[21] CalEEMod was only used to estimate landscape emissions only. Appendix D contains the non-default inputs to CalEEMod used to calculate these landscape emissions.

Mitigated Emissions	80	21	37	7.0	-1,056
Exceed Threshold?	*Yes*	*No*	*No*	*No*	*N/A*
Source: Table 40, Table 41, and Table 42.					

2.4 Combined Construction and Operational Emissions Summary

This analysis conservatively assumed that the buildings constructed in each year of the construction program would be occupied and fully operational upon completion. This is conservative because occupancy and operation of each phase would likely ramp up over time.

Construction is expected to occur during Project operation because the Project will be constructed over a period of several years. In years when construction is scheduled to coincide with Project operation, construction emissions were combined with operational emissions. The combined construction and operational emissions were compared with average daily emissions thresholds, using the 365 days per year to average annual emissions for both construction and operations, as shown in **Table 43** and **Table 44**.[22]

Summary Table C. Summary of Annual Average Daily Net Construction and Operational CAP Emissions for Maximum Year

	ROG	**NO_X**	**PM_{10}**	**$PM_{2.5}$**
	lb/day			
BAAQMD Threshold of Significance	54	54	82	54
Unmitigated Emissions	97	72	37	7.0
Exceed Threshold?	*Yes*	*Yes*	*No*	*No*
Mitigated Emissions	80	21	37	7.0
Exceed Threshold?	*Yes*	*No*	*No*	*No*
Source: Table 43 and Table 44				

[22] As discussed above, activity is expected on most Saturdays. Even if 6 days per week (312 days per year) were used to average emissions for construction, conclusions would not change.

2.5 Proposed Mitigation Measures

As discussed, several mitigation measures were incorporated into the analysis. The measures are summarized below

Architectural Coatings. The applicant shall use super-compliant architectural coatings during construction and operation for all buildings, which shall have VOC content that meet SCAQMD Rule 1113 Architectural Coatings as revised on February 5, 2016.

Tier 4 Construction Equipment. To reduce construction emissions to below the 2017 BAAQMD CEQA Air Quality Guidelines, the Project Applicant shall either:

- Ensure all off-road construction equipment with greater than 25 hp and operating for more than 20 hours total over the entire duration of construction activities have engines that meet or exceed either USEPA or ARB Tier 4 Final offroad emission standards. The exception to this requirement is for a cumulative total 618,028 horsepower-hours over the duration of construction activities before residents move on-site in Year 5 and 34,716 horsepower-hours over the duration of construction activities after residents move on-site in Year 5 can be operated with off-road construction equipment that meets Tier 2 standards or better.

or

- Prior to commencing construction, provide supplemental analysis prepared by a qualified air quality specialist to the City for approval that shows that emissions of ROG and NO_X, excess lifetime cancer risk, and $PM_{2.5}$ concentration would not exceed the thresholds from the 2017 BAAQMD CEQA Air Quality Guidelines using the mix of equipment proposed by the applicant.

Construction Fugitive Dust Emissions. The following BAAQMD Best Management Practices (BMPs) for fugitive dust control shall be required for all construction activities within the project area. These measures would reduce fugitive dust emissions primarily during soil movement and grading, but also during vehicle and equipment movement on unpaved project sites.

Basic BMPs that Apply to All Construction Sites

1. All exposed surfaces (e.g., parking areas, staging areas, soil piles, graded areas, and unpaved access roads) shall be watered two times per day.

2. All haul trucks transporting soil, sand, or other loose material off site shall be covered.

3. All visible mud or dirt track-out onto adjacent public roads shall be removed using wet power vacuum street sweepers at least once per day. The use of dry power sweeping is prohibited.

4. All vehicle speeds on unpaved roads shall be limited to 15 miles per hour (mph).

5. All streets, driveways, and sidewalks to be paved shall be completed as soon as possible. Building pads shall be laid as soon as possible after grading unless seeding or soil binders are used.

6. Idling times shall be minimized either by shutting equipment off when not in use or reducing the maximum idling time to five minutes (as required by the California airborne

toxics control measure Title 13, Section 2485 of CCR). Clear signage shall be provided for construction workers at all access points.

7. All construction equipment shall be maintained and properly tuned in accordance with manufacturer's specifications. All equipment shall be checked by a certified mechanic and determined to be running in proper condition prior to operation.

8. A publicly visible sign shall be posted with the telephone number and person to contact regarding dust complaints. This person shall respond and take corrective action, if necessary, within 48 hours. BAAQMD's phone number shall also be visible to ensure compliance with applicable regulations.

3. ESTIMATED AIR CONCENTRATIONS

To evaluate the health risks and concentration of air toxics upon the surrounding community, BAAQMD recommends estimating concentrations using air pollution dispersion modeling. The methodologies used to evaluate emissions for the Proposed Project and cumulative HRA impacts are based on the most recent BAAQMD CEQA Guidelines (BAAQMD 2017) and the most recent Air Toxics Hot Spots Program Risk Assessment Guidelines (OEHHA 2015a).

3.1 Chemical Selection and Sources of Emissions

The Project would emit TACs from the combustion of gasoline and diesel fuels. The cancer risk and chronic non-cancer analyses in the HRA for the Project were based on DPM concentrations from diesel combustion and total organic gases (TOG) concentrations from gasoline combustion.

Diesel exhaust, a complex mixture that includes hundreds of individual constituents, is identified by the State of California as a known carcinogen (California Environmental Protection Agency [Cal/EPA], OEHHA 1998). Under California regulatory guidelines, DPM is used as a surrogate measure of exposure for the mixture of chemicals that make up diesel exhaust as a whole. Cal/EPA and other proponents of using the surrogate approach to quantifying cancer risks and non-cancer chronic HI associated with the diesel mixture indicate that this method is preferable to use of a component-based approach. A component-based approach involves estimating risks for each of the individual components of a mixture. Critics of the component-based approach believe it will underestimate the risks and HI associated with diesel as a whole mixture because the identity of all chemicals in the mixture may not be known and/or exposure and health effects information for all chemicals identified within the mixture may not be available. Furthermore, Cal/EPA has concluded that "potential cancer risk from inhalation exposure to whole diesel exhaust will outweigh the multi-pathway cancer risk from the speciated components" (OEHHA 2015b). BAAQMD states "diesel exhaust particulate matter should be used as a surrogate for all TAC emissions from diesel-fueled compression-ignition internal combustion engines" (BAAQMD Rule 2-5).

The Cal/EPA-approved toxicity values for DPM were used to evaluate health impacts from construction and operational diesel fueled sources (Cal/EPA 2020).

Health effects from exhaust and evaporation from gasoline combustion were based on specific TAC emissions. Emissions of TOG from gasoline-fueled vehicles were speciated using organic chemical profiles from BAAQMD as shown in **Table 45** (BAAQMD 2012a).[23] The Cal/EPA-approved toxicity values for each TAC were used to evaluate health impacts from operational gasoline fueled sources (Cal/EPA 2020) as shown in **Table 46**.

There is currently no acute non-cancer toxicity value available for DPM and acute HI from roadways is expected to be minimal, as discussed in **Section 1.3**. Thus, an acute HI from the Project was not estimated.

[23] Speciation profile is from BAAQMD's Recommended Methods for Screening and Modeling Local Risks and Hazards (BAAQMD 2021a), Table 14, Toxic Speciation of TOG due to Tailpipe Emissions, and Table 15, Toxic Speciation of TOG due to Evaporative Losses.

3.1.1 Construction Phase

The cancer risk and chronic hazards in the HRA for the Project construction were based on TAC emissions from off-road diesel construction equipment, on-road vendor vehicles, and on-road diesel hauling trucks. Accordingly, the chemicals evaluated in the HRA for the construction phase were DPM emissions in diesel exhaust and $PM_{2.5}$ emissions from exhaust, tire wear and brake wear, and fugitive dust. DPM emissions are assumed to be equal to exhaust PM_{10} from on- and off-road construction equipment.

Demolition of existing buildings has the potential to release additional TACs from the release of TACs in the buildings themselves. TACs that should be considered in building demolition include lead and asbestos. Before demolition, we understand the potential for lead paint or asbestos will be identified and all lead paint and asbestos will be removed in accordance with ARB and BAAQMD rules and regulations before demolition of the building occurs. Because the lead and asbestos remediation would occur before demolition and construction and would follow all regulations to reduce impacts to below a level of concern, these sources were not included in the HRA.

3.1.2 Operational Phase

The cancer risk and chronic non-cancer analysis for the Project operation are based on TAC emissions from on-road traffic and diesel-powered emergency generators. The chemicals evaluated in the HRA include $PM_{2.5}$ emissions (assumed to be engine exhaust from vehicles and generators, and brake wear, tire wear, and entrained dust from vehicles), DPM emissions (assumed to be exhaust PM_{10} from combustion from diesel vehicles and on-site generators) and speciated evaporative and exhaust TOGs from on-road emissions from gasoline vehicles.

BAAQMD recommends evaluating impacts from all roadways with traffic of over 10,000 vehicles per day. Major roadways around the Project site include Bayfront Expressway, University Ave, and Willow Road. In addition, vehicles associated with the Project are also expected to use Adams Drive, Adams Court, and O'Brien Drive. Regardless of whether Project traffic exceeds 10,000 vehicles per day on these roadways, health impacts from Project traffic on these roadways were evaluated at on- and off-site receptors in the vicinity of these roadways.

Project traffic consists of on-site, off-site, and shuttle traffic. Onsite traffic is represented by the Cars fleet type and shuttle traffic is represented by the Shuttles fleet type. Offsite traffic for the Campus District is represented by a unique fleet mix, as described in **Section 2.3.1.1**, which combines Cars, Trucks, On-Demand, and Shuttles fleet types; however, shuttles are represented in its own fleet mix, as described above. Offsite traffic for the Town Square and Residential/Shopping District is represented by the default San Mateo County Mix. A summary of traffic volumes by roadway segment and fleet is summarized in **Table 47.**[24]

All fleet types except the Shuttle fleet mix are expected to contain vehicles that run on both diesel, whose health impacts are evaluated using DPM, and gasoline, whose health impacts are evaluated using evaporative and exhaust TOG. The Shuttle fleet mix is conservatively

[24] An on-site assessment of Hamilton Avenue Parcels North and South was not analyzed because volumes are minor and driving distance on-site are short.

assumed to be comprised of all diesel, as a result, all emissions from the Shuttle fleet mix contain only DPM emissions while emissions from all other fleet types contain both DPM emissions and evaporative and exhaust TOG. The DPM emission factor for Cars, On-Demand, Trucks, and the San Mateo Default Fleet vehicle types was determined from the PM_{10} running and idling exhaust emission factors discussed above. These PM_{10} emission factors account for emissions from both gasoline and diesel; however, DPM emissions are only attributable to diesel-run vehicles. Therefore, the portion of the total PM_{10} that is actually DPM was calculated as the sum of PM_{10} running and idling exhaust emissions from diesel vehicles divided by the sum of all PM_{10} running and idling exhaust emissions for vehicles. A summary of traffic emission factors can be found in **Table 48**.

3.2 AERMOD Modeling

The most recent version of the American Meteorological Society/Environmental Protection Agency regulatory air dispersion model (AERMOD Version 21112) was used to evaluate ambient air concentrations of DPM, $PM_{2.5}$ and TOGs at on- and off-site receptors (USEPA 2021). For each receptor location, the model generates air concentrations that result from emissions from multiple sources. In this case, air dispersion factors as unit emissions were modeled and air concentrations were calculated in a subsequent post-processing step.

Air dispersion models such as AERMOD require a variety of inputs such as source parameters, meteorological data, topographical data, and receptor parameters. When site-specific information is unknown, default parameter sets that are designed to produce conservative (i.e., overestimates of) air concentrations were used (USEPA 2021).

3.2.1 Meteorological Data

Air dispersion modeling applications require the use of meteorological data that ideally are spatially and temporally representative of conditions in the immediate vicinity of the site under consideration. For this analysis, meteorological data collected from Palo Alto Airport (KPAO) and San Carlos Airport (KSQL) were used.

The Palo Alto Airport is located approximately 2.2 miles southeast of the Project site, making it a good candidate for representative meteorological data for dispersion modeling. The meteorological conditions shown in the data from Palo Alto Airport most closely matched on-site measurements observed adjacent to the Project site, which makes it the preferred station for representative data. Unfortunately, like many smaller Automated Surface Observing System (ASOS) stations, meteorological data are only collected during daylight hours. However, the San Carlos Airport collects data 24-hours per day. San Carlos Airport is 6 miles north west of the Project site and is the next closest meteorological station to the Project Site.

In an effort to develop a complete data set, in AERMET the Palo Alto Airport was selected as the “on-site” meteorological station and the San Carlos Airport, was selected as the “surface” station in AERMET. With these assumptions, data from the Palo Alto Airport will be used when available and data from the San Carlos Airport will be used when data is not available from Palo Alto Airport (i.e., non-daylight hours).

Meteorological data from 2012-2016 was used as these years were the most recent years with the most complete data set of meteorological data. A precipitation analysis was performed for both the on-site and surface stations using surface parameters obtained using the latest version of AERSURFACE, v20060. The data were processed using the Adjust U*

option (ADJ_U*), a method that reduces overprediction of modeled concentrations that occur in stable conditions with low wind speeds due to underprediction of the surface friction velocity (u*).

3.2.2 Terrain and Land Use Considerations

Elevation and land use data were imported from the National Elevation Dataset (NED) maintained by the United States Geological Survey ([USGS] 2013) in NED 1/3 arc sec.

An important consideration in an air dispersion modeling analysis is whether or not to model an area as urban. Due to the proximity of the project to the San Francisco Bay and marshland, the default rural option was used in the modeling. The rural option tends to produce more conservative concentrations than the urban option due to the enhanced turbulence associated with urban environments due to the additional mixing associated with the heat island effect.

3.2.3 Building Downwash

Turbulent eddies can form on the downwind side of buildings and may cause a plume from a stack or point source located near the building to be drawn towards the ground to a greater degree than if the building were not present. This is referred to as the "building downwash" effect. The effect can increase the resulting ground-level pollutant concentrations downwind of a building. AERMOD takes this effect into account for sources modeled as point sources. The dimensions and locations of all on-site buildings were used, to allow AERMOD to incorporate algorithms to evaluate the downwash effect on dispersion of point sources. Building heights were obtained from the proposed Willow Village Master Plan Conditional Development Permit (Peninsula Innovation Partners 2021). The direction-specific building downwash dimensions were determined by the latest version (04274) of the Building Profile Input Program, PRIME (BPIP PRIME). As discussed in **Section 3.2.5**, point sources were used only to model the Project generators, so building downwash was only evaluated in the Project operational generator modeling.

3.2.4 Emission Rates

Emissions were modeled using the χ/Q ("chi over q") method, such that each source has a unit emission rate (i.e., 1 gram per second [g/s]), and the model estimates dispersion factors (with units of micrograms per cubic meter (([µg/m^3])/[g/s]). Actual emission rates were multiplied by the dispersion factors to obtain concentrations.

3.2.4.1 Construction Emission Rates

For the construction phase, emitting activities were modeled to reflect the actual hours of the day that construction activity would occur. Emissions were modeled as occurring between 7 AM and 6 PM, consistent with the expected construction hours for the Project.[25] The AERMOD EMISFACT option was used to limit emissions to this time period.

For annual average ambient air concentrations over the construction phase, the estimated annual average dispersion factors were multiplied by the annual average emission rates. The emission rates would vary day to day, with some days having no emissions. To estimate an annual average, the model assumes a constant emission rate during the entire year. Thus,

[25] Construction activity is assumed to start at 7 AM to conservatively consider more morning hours in the dispersion analysis, but no equipment will be operated that will violate the Menlo Park noise ordinance, which has a lower construction noise threshold from 7 AM to 8 AM than from 8 AM to 6 PM.

the average emissions rates were calculated by taking the total mass of emissions and dividing by the hours considered in the model (11 hours per day, 365 days per year). The equipment would be expected to operate at most 8 hours per day, but this 8-hour period can occur anytime in the 11-hour window from 7 AM to 6 PM. Because the exact timing of when the equipment would operate is not known, the eight hours of emissions were averaged over these 11 hours of meteorology. While construction using heavy equipment is expected to generally occur Monday through Friday, the emissions were averaged over 365 days per year as meteorology conditions are not dependent upon day of the week. Weekends were not excluded from the meteorology data in order to generate more representative averages.

3.2.4.2 Operational Emission Rates

Emergency generators were assumed to be tested at any hour of day; as a result, no variable emission rate factor was applied.

Traffic emission rates were calculated based on the actual fleet breakdown, as provided by the Project Applicant. The diurnal pattern of traffic volumes for operations (high volumes during rush hour and during the day, with low volumes overnight) was incorporated using the AERMOD EMISFACT option and percentage of traffic by hour. The traffic by hour was developed using ratios of hourly trip rates from EMFAC2021 in San Mateo County for all vehicle types, as shown in **Table 49**. Traffic by hour for the shuttles were developed using the shuttle schedule, as shown in **Table 49**.

3.2.5 Source Parameters

3.2.5.1 Construction Sources

Source location and parameters are necessary to model the dispersion of air emissions. For construction, area sources were used to represent the on-site activity in AERMOD. The on-site construction exhaust sources were modeled with a release height of 5 meters (m) (SCAQMD 2008) and an initial vertical dimension of 1.16 m (USEPA 2019). Fugitive dust sources from grading, demolition, and truck hauling during construction were modeled with a release height of 0 meters and an initial vertical dimension of 1 m (SCAQMD 2008). Construction activity associated with off-site feeder lines were represented as adjacent volume sources. Construction area source group locations are presented in **Figures 3, 4a and 4b**.[26]

Exhaust and fugitive dust emissions from heavy-duty haul and vendor trucks on roadways were modeled using line sources. The line source width was the width of the road plus six meters, the modeled release height was 2.55 m, and the initial vertical dimension was 2.37 m, consistent with the USEPA haul road guidance (USEPA 2012). On-road construction worker trips would have negligible impact and therefore were not included in the HRA analysis for excess lifetime cancer risk and chronic HI. $PM_{2.5}$ emissions associated with on-road construction worker trips were included in the construction HRA analysis for $PM_{2.5}$ concentration modeling. Construction on-road source group locations are presented in **Figure 5**. **Table 50** summarizes the construction modeling parameters that were used in AERMOD.

[26] Since it is not known whether the feeder lines associated with the PG&E work for off-site improvements would be installed in University Avenue or Willow Road, emissions were conservatively applied to both routes, essentially doubling the emissions for the health risk assessment for this activity.

3.2.5.2 Operational Sources

The Project generators were modeled as point sources. Project-specific stack heights, taken as the height of the building, were used in combination with default modeling parameters for generator sources, including stack diameter, temperature, and velocity, as reported by BAAQMD (STI 2011). The impact of the existing generator that will be removed was modeled using specifications provided by the Project Applicant and subtracted from the impact of the proposed new generators.

On-road traffic sources were modeled as line sources following USEPA guidelines for this type of activity (USEPA 2012). Onsite passenger vehicles were modeled with a release height of 1.70 m, consistent with the San Francisco Community Risk Reduction Plan – HRA (SFDPH). Modeled on-site vehicle routes can be found in **Figure 6**. Since passenger vehicles occupy the majority of off-site Project traffic, off-site traffic was modeled with a release height of 1.70 m, consistent with the San Francisco Community Risk Reduction Plan (SFDPH). Modeled off-site traffic routes can be found in **Figure 7**; as discussed, modeled roadways include Bayfront Expressway, Willow Road, University Avenue, and O'Brien Drive.

Intercampus shuttles were modeled separately, using a release height of 3.39 m, based on the actual vehicle type provided by the Project Applicant, as discussed in more detail in **Table 51.** Modeled shuttle routes can be found in **Figure 8**. The initial vertical dimensions for all pollutants were calculated consistent with USEPA Haul Road Guidance (i.e., plume height/2.15).

Table 51 summarizes the operational phase modeling parameters that were used in AERMOD.

3.2.6 Receptors

TAC concentrations were estimated at both on-site and off-site sensitive receptor populations. As discussed in **Section 1.3.3**, sensitive receptors include areas with residents, schools, daycare centers, parks, hospitals and senior care facilities. Recreational areas near the Project site were also evaluated.

Residential and recreational receptors were identified using zoning maps for Menlo Park (City of Menlo Park 2019) and East Palo Alto (City of East Palo Alto 2017). Residential and recreational areas were modeled as a grid with 20 m (65.6 feet) spacing within 500 m of the Project site and 40 m spacing within 1,000 m of the project site.

Other sensitive receptor locations were identified using a report from Environmental Data Resources (EDR). The EDR report identified schools, daycare centers, nursing homes and hospitals near the Project site. These locations were modeled as discrete locations.

Off-site receptors were modeled at the breathing height of 1.8 m, consistent with the BAAQMD CEQA Air Quality Guidelines (BAAQMD 2017).

On-site receptors were modeled at the breathing height for each floor of the proposed buildings.

Maximum average annual dispersion factors were estimated for each receptor location.

Figure 2 includes a map of both off-site and on-site sensitive receptor locations that were used in the HRA.

3.2.7 Modeling Adjustment Factor

OEHHA (2015a) recommends applying an adjustment factor to the annual average concentration modeled assuming continuous emissions (i.e., 24 hours per day, seven days per week), when the actual emissions are less than 24 hours per day and exposures are concurrent with activities occurring as part of the Project.

For construction activities, emissions only impact receptors during certain hours of the day when activities are occurring. However, the emissions modeled during those hours were annualized assuming 24 hour per day in the modeling outputs. Thus, a modeling adjustment factor (MAF) was applied to the annual average concentration used in the evaluation to account for an emissions schedule that is not occurring 24 hours per day, seven days per week, where the exposure takes place preferentially during construction hours.

Operational activities are expected to occur all day; therefore, the annual average concentration was not adjusted for concentrations from operational activities.

Resident children were assumed to be exposed to annual construction and operational emissions (averaged from actual operating hours) 24 hours per day, seven days per week. This assumption is consistent with the modeled annual average air concentration for construction (24 hours per day, seven days per week). Thus, the annual average concentration for construction was not adjusted for the residential population.

The MAF for the daycare center and school receptors assumes receptors are present only during the hours of the day emissions are occurring. Therefore, a MAF of 2.55 was applied to the annual average concentration for construction ([24 hours/11 hours] * [7 days/6 days]) for the daycare and school populations, since construction would occur seven days per week.[27]

The MAF for the recreational receptor assumes receptors may be present throughout the hours of the day emissions are occurring. A MAF of 2.55 was applied to the annual average concentration for construction ([24 hours/11 hours] * [7 days/6 days]) for the recreational population, since construction would occur seven days per week. The MAFs are presented in **Table 52**. [28]

[27] Even if the MAF was based on a construction schedule of 5 days per week, conclusions would not change. The maximally exposed individual receptor is a resident, which is not affected by the MAF.

[28] Even if the MAF was based on a construction schedule of 5 days per week, conclusions would not change. The maximally exposed individual receptor is a resident, which is not affected by the MAF.

4. CARBON MONOXIDE ANALYSIS

Carbon Monoxide (CO) emissions from traffic are expected to be below significance levels if the following criteria is met:

1. Project is consistent with an applicable congestion management program established by the county congestion management agency for designated roads or highways, regional transportation plan, and local congestion management agency plans.
2. The project traffic would not increase traffic volumes at affected intersections to more than 44,000 vehicles per hour.
3. The project traffic would not increase traffic volumes at affected intersections to more than 24,000 vehicles per hour where vertical and/or horizontal mixing is substantially limited (e.g., tunnel, parking garage, bridge underpass, natural or urban street canyon, below-grade roadway). (BAAQMD 2017)

The San Mateo County Congestion Management Program (CMP) requires new development projected to add 100 or more peak hour trips to the CMP roadway network to implement Transportation Demand Management (TDM) measures that would reduce project impacts. As discussed above, the Project has a comprehensive TDM program that reduces VMT consistent with City requirements and with the TDM program, the Project would not conflict with the CMP. As shown in **Table 47,** traffic at all roadways around the Project are expected to be lower than 44,000 vehicles per hour. The Willow Road Tunnel may be considered an intersection where vertical and/or horizontal mixing is limited. Traffic through the Willow Road Tunnel would be much below 24,000 vehicles per hour since this tunnel is only used by Project shuttles and trams, bicycles, and pedestrians. The Project is not projected to produce more than 24,000 trips per hour. Therefore, additional analysis is not needed. As such, operational traffic is expected to be a minor contributor to operational CO emissions.

Emergency generators would also emit CO. Emergency generators are subject to permitting with the BAAQMD and are subject to federal and state emissions standards that are designed to avoid impacts on the community and environment. Therefore, emergency generators are not expected to cause CO hotspots.

5. ODOR ANALYSIS

The Project is a mixed use commercial and residential development, and therefore is not anticipated to be a potential odor source. However, the Project was evaluated against the three-pronged approach proposed in the ConnectMenlo EIR.

First, the Project was evaluated against the land uses identified in BAAQMD's Odor Screening Distances (BAAQMD 2017). BAAQMD's Odor Screening Distances Table identifies land uses that could create objectional odors and distances where odors are not expected to be experienced. The Project may contain minor composting and recycling operations typical of a mixed-use development. Recycling and composting facilities are land uses listed in BAAQMD's Odor Screening Distances Table. However, these operations at the Project would not be considered similar in size to what would be considered a Composting Facility or Recycling Facility and therefore should not be considered.

The Project would also contain a wastewater pump station in the southwest corner of the site. Wastewater Pumping Facilities are land uses listed in BAAQMD's Odor Screening Distances Table. While the Wastewater Pumping Facilities considered in the Odor Screening Distance is likely a much larger scale than the one envisioned for the Project, the pumping station at Willow Village may have the potential to emit objectionable odors. Therefore, the pump station design should include a molecular neutralizer that would convert hydrogen sulfide to harmless, biodegradable effluent, ensuring that odors from the pump station would be appropriate for urban areas. With the installation of the molecular neutralizer, the Project is not expected to expose sensitive land uses to objectionable odors expected in urban areas.

As stated in the ConnectMenlo EIR, the following General Plan goals and policies would serve to minimize potential conflicts between land uses:

- Goal LU-2: Maintain and enhance the character, variety and stability of Menlo Park's residential neighborhoods.
    - Policy LU-2.3: Mixed Use Design. Allow mixed-use projects with residential units if project design addresses potential compatibility issues such as traffic, parking, light spillover, dust, odors, and transport and use of potentially hazardous materials.
- Goal LU-4: Promote the development and retention of business uses that provide goods or services needed by the community that generate benefits to the City, and avoid or minimize potential environmental and traffic impacts.
    - Policy LU-4.5: Business Uses and Environmental Impacts. Allow modifications to business operations and structures that promote revenue generating uses for which potential environmental impacts can be mitigated.

As stated above, the Project is not expected to create objectionable odors to sensitive receptors and thus would not create compatibility uses related to odor as stated in Policy LU-2.3. Specifically, the office, residential, and commercial uses proposed by the Project are compatible with each other because none produce substantial objectionable odors. All cooking areas in commercial kitchens will be covered with hoods. The exhaust from culinary uses is intended to go to the roof of the buildings and be disbursed with grease rated fans. In this case the odors dissipate before they can get back to occupied areas. For areas with

low roofs needing grease exhaust that is adjacent to occupied areas, the Project proposes to use a pollution control unit (PCU) to clean the air. The wastewater pumping station would be equipped with a molecular neutralizer, which would reduce odors before release to the environment to acceptable levels in urban areas. Further, consistent with Policy LU-4.5, the Project would develop and retain business uses without creating objectionable odors. Therefore, the Project is consistent with the goals and policies in the General Plan related to odor.

Last, BAAQMD Regulation 7 contains requirements on the discharge of odorous substances after the Air Pollution Control Officer (APCO) receives odor complaints from ten or more complainants within a 90-day period, alleging that a person has caused odors perceived at or beyond the property line of such person and deemed to be objectionable by the complainants in the normal course of their work, travel or residence [BAAQMD 7-102]. The operations within the Project will be subject to this regulation and will comply with the requirements if the regulation becomes applicable via BAAQMD 7-102, which is not expected. Therefore, the Project would be in compliance with BAAQMD Regulation 7.

Because the Project does not contain land uses in BAAQMD's odor screening distances, is consistent with the goals and policies of the General Plan related to odor, and would be in compliance with BAAQMD Regulation 7, the impact of the Project would be considered less than significant with respect to odors.

6. HEALTH RISK ASSESSMENT

In February 2015, OEHHA released the updated Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments (OEHHA 2015a), which combines information from previously released and adopted technical support documents to delineate OEHHA's revised risk assessment methodologies based on current science. The BAAQMD issued guidelines on adopting the OEHHA 2015 Guidance Manual (BAAQMD 2020c). This evaluation utilizes the 2015 methodology; details of which are discussed below.

6.1 Project Construction Sources Evaluated

As discussed in **Section 3.1**, excess lifetime cancer risk, non-cancer chronic hazard index and $PM_{2.5}$ concentration were evaluated for on-site and off-site sensitive receptor exposure to emissions from Proposed Project construction (construction off-road equipment and nearby off-site vehicles). Because buildings will be completed with residents moving in as construction occurs around them, the impact of subsequent construction on on-site residents was evaluated, as discussed below. All modeled construction source groups included in the HRA are presented in **Table 53**. Construction source group locations are presented in **Figures 3, 4,** and **5**.

6.2 Project Operational Sources Evaluated

For Project operations, excess lifetime cancer risk, non-cancer chronic hazard index and $PM_{2.5}$ concentration from on-site and off-site sensitive receptor exposure to emissions from Proposed Project generators and Proposed Project operational-related traffic were evaluated. The existing generator currently located at the Project site and existing traffic counts from uses that will be removed as part of the Project were evaluated and subtracted from Project risks in the HRA analysis, resulting in health impacts from net new operational emissions. Operational source group locations are presented in **Figures 6**, **7**, and **8**.

Health risks were estimated from construction and operations, separately as well as together to conservatively estimate the combined cancer risk effect of construction activities and Project operation.

6.3 Exposure Assessment

Potentially Exposed Populations: This analysis evaluates on- and off-site sensitive receptors based on OEHHA 2015 Hot Spots Guidelines.

Emissions and exposure to sensitive populations would vary across the four year and eleven-month construction period. Therefore, multiple exposure scenarios were evaluated to capture the period of maximum impact on each sensitive population and location. Health impacts were evaluated in four exposure scenarios: 1) exposure beginning at the start of construction; 2) exposure beginning at the start of Grading and Utilities construction for the second area; 3) exposure beginning at the conclusion of Town Square and Residential/Shopping District construction when residents would move in; and 4) exposure beginning at the conclusion of Project construction when the Project is fully operational. **Figure 9** shows a Gantt chart of the construction schedule and the four exposure scenarios.

The four exposure scenarios were developed to capture the maximum risks from Project construction and operations. Due to the complex timing of Project construction, the selection of exposure scenarios took into consideration the magnitude of potential activity associated with each year. Scenario 1 starts at the beginning of construction and captures initial

demolition and grading. Scenario 2 starts after construction has begun and is intended to capture the maximum amount of overlapping construction activities that would occur during Project construction. Starting a receptor's exposure any time after these two scenarios would ignore the heaviest construction that occurs at the beginning of the Project. Therefore, these two exposure scenarios are designed to capture the maximum construction impacts. Scenario 3 starts when on-site residents move into the completed buildings while construction is still ongoing around them and captures overlapping construction and operational impacts on on-site residents for informational purposes. Lastly, Scenario 4 captures the fully operational Project once construction has concluded. The four exposure scenarios capture the maximum amount of health risk for on- and off-site receptors experiencing impacts from construction and operations.

For Scenarios 1 and 2, the following off-site receptor types were analyzed: resident child, daycare child, elementary school child, high school child. For Scenario 3, the following on-site receptor types were analyzed: resident child and recreational child. Senior residents living in the affordable senior building were conservatively analyzed using the resident child receptor type, since children have higher exposure parameters (including breathing rate and age sensitivity factor) than seniors. Scenario 3 analyzes the risk experienced by on-site receptors that would move into the completed buildings while construction is still ongoing around them. Maximum construction risks for off-site receptors are captured in Scenarios 1 and 2 since those exposure scenarios start closer to the start of construction and include more activity, which corresponds to higher impacts. Therefore, off-site receptor types are not included in Scenario 3. For Scenario 4, all of the above receptor types were analyzed. Similar to Scenario 3, senior residents living in the affordable senior building conservatively analyzed using the resident child receptor type. Two daycare receptor types were analyzed. One daycare child receptor type assumed infants could attend the daycare. One daycare child receptor type assumed only children over 18 months could attend, which is the age range for the daycare at Wund3r School located south of the Project site.[29]

Exposure Assumptions: The exposure parameters used to estimate excess lifetime cancer risks for all potentially exposed populations for the construction evaluation for this analysis were obtained using risk assessment guidelines from OEHHA (OEHHA 2015a) and BAAQMD (BAAQMD 2020c). **Table 54** shows the proposed exposure parameters that were used for the HRA.

Calculation of Intake: The dose estimated for each exposure pathway is a function of the concentration of a chemical and the intake of that chemical. The intake factor for inhalation, IF_{inh}, can be calculated as follows:

$$IF_{inh} = \frac{DBR * FAH * EF * ED * CF}{AT}$$

Where:

IF_{inh} = Intake Factor for Inhalation (m^3/kg-day)

DBR = Daily Breathing Rate (L/kg-day)

[29] The Wund3r School is a year-round academic and play-based program for children ages 18-months through Pre-K.

FAH = Frequency of time at home (unitless)

EF = Exposure Frequency (days/year)

ED = Exposure Duration (years)

AT = Averaging Time (days)

CF = Conversion Factor, 0.001 (m^3/L)

The chemical intake or dose was estimated by multiplying the inhalation intake factor, IF_{inh}, by the chemical concentration in air, C_i. When coupled with the chemical concentration, this calculation is mathematically equivalent to the dose algorithm given in the current OEHHA Hot Spots guidance (OEHHA 2015a).

6.3.1 Toxicity Assessment

The toxicity assessment characterizes the relationship between the magnitude of exposure and the nature and magnitude of adverse health effects that may result from such exposure. For purposes of calculating exposure criteria to be used in risk assessments, adverse health effects are classified into two broad categories – cancer and non-cancer endpoints. Toxicity values that are used to estimate the likelihood of adverse effects occurring in humans at different exposure levels are identified as part of the toxicity assessment component of a risk assessment.

Toxicity values for all TACs are summarized in **Table 46**.

6.3.2 Age Sensitivity Factors

The estimated excess lifetime cancer risks for a resident were adjusted using age sensitivity factors (ASFs) that account for an "anticipated special sensitivity to carcinogens" of infants and children as recommended in the OEHHA Technical Support Document (OEHHA 2009) and OEHHA 2015 Guidance (2015a). Cancer risk estimates were weighted by a factor of 10 for exposures that occur from the third trimester of pregnancy to two years of age and by a factor of three for exposures that occur from two years through 15 years of age. No weighting factor (i.e., an ASF of one, which is equivalent to no adjustment) was applied to ages 16 and older. **Table 54** presents the ASF values that were used for the HRA. **Table 55** through **Table 58** show the age sensitivity weighted intake factors by year and age bin by exposure scenario.

6.4 Risk Characterization

6.4.1 Estimation of Cancer Risks

Excess lifetime cancer risks are estimated as the upper-bound incremental probability that an individual will develop cancer over a lifetime as a direct result of exposure to potential carcinogens. The estimated risk is expressed as a unitless probability. The cancer risk attributed to a chemical is calculated by multiplying the chemical intake or dose at the human exchange boundaries (e.g., lungs) by the chemical-specific cancer potency factor (CPF).

The equation that was used to calculate the potential excess lifetime cancer risk for the inhalation pathway is as follows:

$$Risk_{inh} = C_i \times CF \times IF_{inh} \times CPF \times ASF$$

Where:

$Risk_{inh}$ = Cancer risk; the incremental probability of an individual developing cancer as a result of inhalation exposure to a particular potential carcinogen (unitless)

C_i = Annual average air concentration for $chemical_i$ ($\mu g/m^3$)

CF = Conversion factor (mg/µg)

IF_{inh} = Intake factor for inhalation (m^3/kg-day)

CPF_i = Cancer potency factor for $chemical_i$
$(mg\ chemical/kg\ body\ weight\text{-}day)^{-1}$

6.5 Estimation of Chronic Noncancer Hazard Indices

The potential for exposure to result in adverse chronic noncancer effects was evaluated by comparing the estimated annual average air concentration (which is equivalent to the average daily air concentration) to the noncancer chronic reference exposure level (cREL) for each chemical. When calculated for a single chemical, the comparison yields a ratio termed a hazard quotient (HQ).

$$HQ_i = C_i / cREL$$

Where:

HQ_i = Chronic hazard quotient for chemical i

C_i = Annual average concentration of chemical i ($\mu g/m^3$)

$cREL_i$ = Chronic noncancer reference exposure level for chemical i ($\mu g/m^3$)

6.6 Comparison to Thresholds

Health impacts from construction for each exposure scenario were compared to BAAQMD thresholds discussed in **Section 1.3.3**. Health impacts from operation starting at full buildout were compared to BAAQMD thresholds. Health impacts from Project construction and overlapping Project operations were added together to estimate the combined health risk impacts of construction activities and Project operation for each exposure scenario and were compared to the BAAQMD thresholds.

6.7 Health Risk Assessment Results

Health impacts from Project construction and Project operations were added together to estimate the combined health risk impacts of construction activities and operation for Scenarios 1, 2, and 3 discussed above.

6.7.1 Impacts from the Project

A summary of results from the HRA is shown in **Summary Table D**. A breakdown of excess lifetime cancer risk from Project construction, operational generators, and operational traffic at the MEIR is shown in **Table 59**. The table also shows the Scenario for which the maximum was identified. Similar breakdowns for chronic HI and $PM_{2.5}$ concentration are shown in **Table 60** and **Table 61**, respectively. These tables also show the Scenario for which the maximums were identified, as well as the year for which the maximum occurred since chronic HI and $PM_{2.5}$ concentrations are annual impacts. Mitigated impacts assume construction equipment have an average of 95 percent and 98 percent Tier 4 Final engines before and after residents move on-site, respectively, and 5 percent and 2 percent Tier 2

engines before and after residents move on-site, respectively. Mitigated impacts include reductions to fugitive dust due to watering.

Summary Table D. Summary of Health Risk Assessment Results

	BAAQMD Threshold of Significance	Unmitigated				Mitigated			
		On-site MEIR	*Exceed Threshold?*	Off-site MEIR	*Exceed Threshold?*	On-site MEIR	*Exceed Threshold?*	Off-site MEIR	*Exceed Threshold?*
Excess Lifetime Cancer Risk (in a million)	10	172	*Yes*	58	*Yes*	9.8	*No*	9.2	*No*
Chronic HI	1	0.23	*No*	0.11	*No*	0.011	*No*	0.014	*No*
$PM_{2.5}$ Concentration ($\mu g/m^3$)	0.3	1.1	*Yes*	0.56	*Yes*	0.13	*No*	0.18	*No*
Source: Table 59, Table 60, and Table 61 of the Appendix									

7. CUMULATIVE ANALYSIS

Consistent with the BAAQMD CEQA guidelines, the combined impacts from off-site and on-site sources were evaluated within the "zone of influence" of the Project. Off-site sources include BAAQMD permitted stationary sources, roadways with over 10,000 vehicles per day, and railways.

The cumulative impact was evaluated at the maximally exposed individual sensitive receptor (MEISR) for Project construction and operations. There is an on-site MEISR for informational purposes and, as required by CEQA, an off-site MEISR. The MEISR is the receptor with the highest incremental cancer risk, chronic HQ, and $PM_{2.5}$ concentration from the Project across all populations and exposure scenarios.

Health impacts from all identified sources within 1,000 feet of the Project were evaluated at this single location and added to the results from the Project's impacts. The sources that were considered in this analysis are described below.

Results at the MEISR were compared to the significance thresholds for cumulative impacts:

- An excess lifetime cancer risk level of more than 100 in one million;
- A chronic non-cancer HI greater than 10; and
- An incremental increase in the annual average $PM_{2.5}$ concentration of greater than 0.8 µg/m^3.

7.1 Stationary Sources

BAAQMD provides a stationary source GIS map tool to use to evaluate the impacts of off-site stationary sources (BAAQMD 2020a). Consistent with BAAQMD guidance, a request was sent to BAAQMD to provide the emissions from nearby stationary sources within 1,000 feet of the Project boundary. Using emissions made available by BAAQMD, risks, chronic hazard index, and $PM_{2.5}$ concentrations were estimated through the Risk and Hazards Emissions Screening Calculator, Beta Version 4.0 (BAAQMD 2020b).

Where appropriate, the impacts calculated using emissions provided by BAAQMD were scaled by the Diesel Internal Combustion Engine Distance Multiplier (BAAQMD 2012b) or Gasoline Dispensing Facility Multiplier (BAAQMD 2012c), per BAAQMD guidance. A summary of nearby stationary source impacts at the Project MEIR is summarized in **Table 62**.

7.2 Roadway Sources

BAAQMD recommends evaluating impacts from all roadways with traffic of over 10,000 vehicles per day within the "zone of influence." To evaluate potential health risk impacts from existing traffic on major roadways above 30,000 AADT and highways, BAAQMD provides raster files of health impacts. Ramboll pulled the corresponding values for the on-site and off-site MEISRs from the raster file. The BAAQMD tool represents the impact from the background traffic on the roadways as opposed to the impacts of net Project traffic as described in **Section 6.2**. These tools were used to estimate cancer risk and $PM_{2.5}$ concentrations from vehicle travel on major roadways and highways surrounding the Project. These tools do not provide specific estimates for chronic HI because the screening levels were found to be extremely low (BAAQMD 2015). Thus, there are no chronic hazard values associated with highways or major streets over 30,000 AADT. The tools developed by BAAQMD are based on an older version of EMFAC, traffic data that is a few years old, and an

operational start year of 2017. However, they represent a conservative estimate of health impacts, largely due to the reduction in emissions of the vehicle fleet between 2017 and when project buildout will occur.

BAAQMD recommends evaluating roadways in the area where existing traffic is over 10,000 vehicles per day and under 30,000 vehicles per day, which is the limit for roadways to consider in their raster tool. The Transportation Engineer provided background trip volumes for nearby roadways with volumes between 10,000 and 30,000 vehicles per day. Of the roadways with background traffic in this range, only O'Brien Drive was located within the zone of influence. A summary of background traffic volumes on O'Brien Drive is summarized in **Table 63**. The impacts associated with background traffic on O'Brien Drive were quantified and included in the cumulative analysis. To perform this analysis, Ramboll used methodology consistent with the Project traffic HRA, as described in **Sections 3.1.2** and **3.2.5.2**.

7.3 Railway Sources

BAAMQD provides raster files with health impacts from railways. The Project is adjacent to a railway that is rarely used and Caltrain is over 1,000 feet from the Project. The health impacts from the raster file were used to estimate the potential impact from railways at the MEISRs.

7.4 Cumulative Summary

As described above, nearby cumulative sources include existing stationary sources, highways, major streets, and railways. Impacts from these cumulative sources are combined with Project construction, operational generator, and operational traffic impacts at the on-site and off-site Project MEIRs. A summary of cumulative impacts at the Project MEIR is shown in **Table 64** and **Summary Table E** below.

Summary Table E. Summary of Cumulative Health Risk Assessment Results

	BAAQMD Threshold of Significance	**Mitigated**			
		On-site MEIR	***Exceed Threshold?***	**Off-site MEIR**	***Exceed Threshold?***
Excess Lifetime Cancer Risk (in a million)	100	25	*No*	23	*No*
Chronic HI	10	0.015	*No*	0.016	*No*
$PM_{2.5}$ Concentration ($\mu g/m^3$)	0.8	0.44	*No*	0.68	*No*
Source: Table 64 of the Appendix

TABLES

Table 1
Land Use Summary
Willow Village
Menlo Park, California

Land Use[1]	CalEEMod® Land Use	Size	Units[2]	Square Footage
Existing Conditions (2019)				
Office	General Office Building	252	ksf	251,530
R&D	Research and Development	124	ksf	123,870
Warehouse	Unrefrigerated Warehouse-No Rail	501	ksf	500,780
Lab & Manufacture	Manufacturing	24	ksf	23,570
Health Center	Health Club	24	ksf	24,060
Former Fire Department Building	General Light Industry	80	ksf	80,100
Parking	Enclosed Parking with Elevator	2,300	Spaces	920,000

Partial Buildout by Year[3]			
Land Use Type[4]	**Percent Operational by Year**		
	Year 4	**Year 5**	**Year 6**
Office	3.1%	58%	95%
Retail	10%	59%	98%
Residential	0%	16%	64%
Hotel	0%	41%	100%
Parking	53%	75%	96%
Park	89%	95%	100%

Full Buildout			
Land Use Type[4]	**Size**	**Units[2]**	**Square Footage**
Office	1,600	ksf	1,600,000
Retail	208	ksf	207,690
Residential	1,730	DU	1,695,976
Hotel	193	Rooms	172,000
Parking	1,869	ksf	1,869,240
Park	404	ksf	403,837

Notes:

1. Land uses analyzed based on information provided by the Project Applicant, as found in the Project Description. "Office" land use mapped to General Office Building and Research and Development; "Office/Lab" mapped to General Office Building, Research and Development, Health Club, and Manufacturing; "Warehouse" mapped to Unrefrigerated Warehouse-No Rail and General Light Industry, and "Warehouse/Office" mapped to Unrefrigerated Warehouse-No Rail and Research and Development CalEEMod land use types on a building-by-building basis.
2. The Project Applicant provided Project land uses in units of square footage, hotel rooms, and dwelling units. For the existing parking land use, each parking space is assumed to be 400 sqft. This assumption is based on CalEEMod defaults.
3. Partial buildout for Year 4, Year 5, and Year 6 were calculated based on the portion of building area for each land use type that becomes operational each year, based on the construction schedule, as shown in Table 2.
4. For Hamilton Avenue Parcels North and South, only net new square footage was included in the analysis. This is under the conservative assumption that the existing retail area and the retail land use that will replace it have similar operational emissions.

Abbreviations:

DU - dwelling unit
sqft - square foot
ksf - 1,000 square feet
CalEEMod® - California Emissions Estimator Model

	Surface Improvements	Month 14	Month 15	23
Intersection Improvements	O'Brien and Kavanaugh	Month 14	Month 14	15
	Adams and O'Brien	Month 14	Month 14	10
	Willow Road and Ivy Drive	Month 14	Month 14	10

Notes:

1. Area 1 includes Parcel 2, Parcel 3, North Garage, Office Building 4, Hotel, Town Square, and Meeting, Collaboration, Park. Area 2 includes Parcel 6, Parcel 7, South Garage, Office Building 1, Office Building 2, Office Building 3, Office Building 5, and Office Building 6. Area 3 includes Parcel 4 and Parcel 5, along with the Tunnel Construction.

[2.] Construction schedule and phasing information were provided by the Project Applicant. Construction is conservatively assumed to start December 15, 2021. The analysis uses the earliest possible start date to assess conservative impacts. Emissions and impacts would decrease if the construction start date is delayed due to the incorporation of cleaner equipment into the construction fleet with time.

[3.] Project construction will generally occur on Mondays through Fridays between the hours of 7 AM and 6 PM.

Notes:

1. Information on Project equipment list, horsepower, quantity, and hours per equipment per year were provided by the Project Applicant. Cumulative hours per building represents the sum of hours per equipment across all years. All off-road equipment is assumed to have diesel engines except aerial lifts and cranes which were assumed to be electric, as designated by Project Applicant.

2. Work trucks are assumed to be similar to light-heavy duty trucks (Onsite LHDT1) as defined in EMFAC2021. Concrete Trucks, Dump Trucks, Semi Trucks, and Water Trucks are assumed to be similar to heavy-heavy duty trucks (Onsite HHDT). Emission factors are from EMFAC2021 ("Emission Rates" mode) for LHDT1 and HHDT diesel vehicles (aggregated model year) in San Mateo County. RUNEX emission factors (and IDLEX emission factors for HHDT) are specific to vehicle speed of 15 mph. All other emission factor types are for aggregated speed. Emission factors were multiplied by the appropriate usage parameter based on the units. Emission factors in units of g/trip, g/mi, and g/vehicle/day, were multiplied by trips, miles, and total vehicles, respectively, in order to obtain mass emissions.

   An average emission factors is calculated using the following criteria:
   - Number of LHDT1/HHDT vehicles and schedule are provided by the client.
   - Hours are calculated as number of equipment * utilization percent * number of construction days * hours/day as provided by the client.
   - Miles are calculated as hours * the speed limit (15 miles per hour).
   - Trips are calculated assuming there is one trip per hour, calculated as number of hours * 1 trip/hour.
   - Total Vehicles are calculated as number of equipment for a given subphase * equipment utilization percent * number of construction subphase days as provided by the client.

Notes:

1. Area 1 includes Parcel 2, Parcel 3, North Garage, Office Building 4, Hotel, Town Square, and Meeting, Collaboration, Park. Area 2 includes Parcel 6, Parcel 7, South Garage, Office Building 1, Office Building 2, Office Building 3, Office Building 5, and Office Building 6. Area 3 includes Parcel 4 and Parcel 5, along with the Tunnel Construction.
2. Information on Project equipment list, horsepower, quantity, and utilization factor were provided by the Project Applicant. All off-road equipment is assumed to have diesel engines except aerial lifts which were assumed to be electric, as designated by Project Applicant. Utilizations for duration represent the usage percentage during the indicated equipment date range. Utilization percentage is multiplied by the number of hours per day in the calculation of off-road emissions.
3. Work trucks are assumed to be similar to light-heavy duty trucks (Onsite LHDT1) as defined in EMFAC2021. Concrete Trucks, Dump Trucks, Semi Trucks, and Water Trucks are assumed to be similar to heavy-heavy duty trucks (Onsite HHDT). Emission factors are from EMFAC2021 ("Emission Rates" mode) for LHDT1 and HHDT diesel vehicles (aggregated model year) in San Mateo County. RUNEX emission factors (and IDLEX emission factors for HHDT) are specific to vehicle speed of 15 mph. All other emission factor types are for aggregated speed. Emission factors were multiplied by the appropriate usage parameter based on the units. Emission factors in units of g/trip, g/mi, and g/vehicle/day, were multiplied by trips, miles, and total vehicles, respectively, in order to obtain mass emissions.

   An average emission factors is calculated using the following criteria:
   - Number of LHDT1/HHDT vehicles and schedule are provided by the client.
   - Hours are calculated as number of equipment * utilization percent * number of construction days * hours/day as provided by the client.
   - Miles are calculated as hours * the speed limit (15 miles per hour).
   - Trips are calculated assuming there is one trip per hour, calculated as number of hours * 1 trip/hour.
   - Total Vehicles are calculated as number of equipment for a given subphase * equipment utilization percent * number of construction subphase days as provided by the client.

Notes:

1. Construction schedule and phasing information were provided by the Project Applicant. Construction is conservatively assumed to start December 15, 2021 and full buildout is expected to occur in 2027. The analysis uses the earliest possible start date to assess conservative impacts. Emissions and impacts would decrease if the construction start date is delayed due to the incorporation of cleaner equipment into the construction fleet with time.
2. Emission factors in (g/bhp-hr) were calculated by dividing OFFROAD's pollutant emissions by both OFFROAD's equipment horsepower hours per year and the equipment's default load factor from CalEEMod.

Notes:

1. Area 1 includes Parcel 2, Parcel 3, North Garage, Office Building 4, Hotel, Town Square, and Meeting, Collaboration, Park. Area 2 includes Parcel 6, Parcel 7, South Garage, Office Building 1, Office Building 2, Office Building 3, Office Building 5, and Office Building 6. Area 3 includes Parcel 4 and Parcel 5, along with the Tunnel Construction.
2. Information on Project equipment list, fuel type, quantity, horsepower, and utilization factor were provided by the Project Applicant. The equipment kilowatt usage was determined by converting from horsepower to kilowatts.
3. The energy intensity factors were taken from the local utility Pacific Gas & Electric. See Table 29 for derivation of factors. Values shown above are scaled linearly between the 2020 and 2026 values. Values were scaled to meet the requirements for 33% of energy from renewable sources in 2020 and 50% of energy from renewable sources in 2026 as required under Senate Bill 100.

Abbreviations:

CalEEMod® - CALifornia Emissions Estimator MODel
kW - kilowatt
kWh - kilowatt-hour
MWh - megawatt-hour
MT - metric tons
lb - pound
CO_2e - carbon dioxide equivalent

Notes:

1. Area 1 includes Parcel 2, Parcel 3, North Garage, Office Building 4, Hotel, Town Square, and Meeting, Collaboration, Park. Area 2 includes Parcel 6, Parcel 7, South Garage, Office Building 1, Office Building 2, Office Building 3, Office Building 5, and Office Building 6. Area 3 includes Parcel 4 and Parcel 5, along with the Tunnel Construction.
2. Construction trip rates were provided by the Project Applicant for each subphase.
3. CalEEMod® default fleet mixes were used for Worker (LD_Mix), Vendor (MHDT/HHDT), and Hauling (HHDT) trips. LD_Mix was assumed to be 100% gasoline vehicles and MHDT/HHDT and HHDT were assumed to be 100% diesel vehicles.
4. Worker mobile trips for Town Square and Residential/Shopping District and Campus District phases are presented in separate phase-wide subphases as reported by the Project Applicant.

Abbreviations:

LD_Mix - light duty mix
MHDT - medium-heavy duty trucks
HHDT - heavy-heavy duty trucks
CalEEMod® - CALifornia Emissions Estimator MODel
VMT - vehicle miles traveled

Table 7b
Construction Trip Lengths
Willow Village
Menlo Park, CA

Trip Type	One-Way Trip Length (mi)
Worker[1]	10.8
Vendor[2]	40.0
Haul[3]	22.9
Haul - Grading & Utilities Subphases[4]	8.2

Notes:

1. Consistent with CalEEMod methodology, worker trip length is based on the default Home-to-Work trip length for San Mateo County as reported in the CalEEMod® user guide, Appendix D.
2. Vendor trip length was provided by the Project Applicant. Most construction supplies will be available within 40 miles of the Project site. This is a conservative assumption as it is twice the default vendor trip length reported in CalEEMod.
3. Haul trip length was provided by the Project Applicant. A 50/25/25 split was assumed between Zanker Landfill, Ox Mountain Landfill, and Kirby Canyon landfill. The primary landfill was assumed to be Zanker Landfill, due to proximity.
4. Haul trip length for Grading & Utilities subphases was provided by the Project Applicant.

Abbreviations:

CalEEMod - CALifornia Emissions Estimator MODel

mi - mile

Table 8
Fugitive Road Dust Emission Factors
Willow Village
Menlo Park, California

Road Dust Equation[1]

E [lb/VMT] = k*(sL)^0.91 * (W)^1.02 * (1-P/4N)

Parameter	Value
k = particle size multiplier for PM_{10} [lb/VMT]	0.0022
sL = roadway silt loading [grams per square meter - g/m^2]	0.032
W = average weight of vehicles traveling the road [tons]	2.4
P = number of "wet" days in county with at least 0.01 in of precipitation during the annual averaging period	74
N = number of days in the averaging period	365
PM_{10} speciation profile fraction	0.46
$PM_{2.5}$ speciation profile fraction	0.069
E = Fugitive PM_{10} Emission Factor [g/VMT]	0.10
E = Fugitive $PM_{2.5}$ Emission Factor [g/VMT][2]	0.015
E = Fugitive PM_{10} Emission Factor with Street Sweeping Reduction [g/VMT][3]	0.075
E = Fugitive $PM_{2.5}$ Emission Factor with Street Sweeping Reduction [g/VMT][3]	0.011

Notes:

1. Road dust equation is based on the U.S. EPA AP-42 Chapter 13.2.1: Paved Roads. Parameter values were obtained from the 2021 California ARB Miscellaneous Process Methodology using major roadways silt loading, annual San Mateo county "wet" days, and statewide average vehicle fleet weight.
2. $PM_{2.5}$ emission factor was scaled from the PM_{10} value based on the ARB's guidance.
3. A 26% reduction in the PM_{10} emission factor was taken for street sweeping of arterial/collector streets, based on SCAQMD's Fugitive Dust Table XI-C. The $PM_{2.5}$ emissions factor was scaled from the PM_{10} value based on the ARB's guidance.

Abbreviations:

ARB - Air Resource Board
lb - pounds
g - grams
m^2 - square meters
PM - particulate matter
$PM_{2.5}$ - particulate matter less than 2.5 microns in diameter
PM_{10} - particulate matter less than 10 microns in diameter
SCAQMD - South Coast Air Quality Management District
USEPA - United States Environmental Protection Agency
VMT - vehicle miles traveled

	Year 2	84						0.15		0.066
Area 2	Year 2	48						0.08		0.038
Hamilton Avenue Parcels North and South	Year 4	22	3,563	4,504			0.66	0.0073	0.30	0.0033

Notes:

1. Area 1 includes Parcel 2, Parcel 3, North Garage, Office Building 4, Hotel, Town Square, and Meeting, Collaboration, Park. Area 2 includes Parcel 6, Parcel 7, South Garage, Office Building 1, Office Building 2, Office Building 3, Office Building 5, and Office Building 6. Area 3 includes Parcel 4 and Parcel 5, along with the Tunnel Construction.
2. The modeled fugitive dust source groups included in the health risk assessment are shown in Figures 3 and 4. Figure 3 shows the modeled locations of Area 1 and Area 2, and Figure 4 shows the modeled location of Hamilton Avenue Parcels North and South (which is labeled as "RETAIL" in the figure).
3. Area 3 (Parcels 4, 5, and Tunnel Construction) do not require demolition, and thus do not have any associated fugitive dust emissions from demolition activities.
4. Conversion of building waste to tons assumes an average soil density of 1.5 grams per cubic centimeter, per the CalEEMod® User's Guide, Appendix A Truck Loading.
5. Emission factor calculated following guidance in the CalEEMod® User's Guide, Appendix A Mechanical or Explosive Dismemberment, which is based of AP 42 Section 13.2.4.3 for batch drop operations. The equation is:
   $EF = k*(0.0032)*(U/5)^{1.3}/(M/2)^{1.4}$ (lb/ton of debris)
   - 0.053 = $k_{PM2.5}$ Particle size multiplier (dimensionless)
   - 4.92 = U, mean wind speed (mph)
   - 2 = M, material moisture content (%)
6. Emission factor calculated following guidance in the CalEEMod® User's Guide, Appendix A Debris Loading, which is based of AP 42 Section 13.2. The equation is:
   $EF = k*EF_{L\text{-}TSP}$
   - 0.35 = k_{PM10} Particle size multiplier (dimensionless)
   - 0.053 = $k_{PM2.5}$ Particle size multiplier (dimensionless)
   - 0.058 = $EF_{L\text{-}TSP}$, lb/ton
7. Fugitive $PM_{2.5}$ emissions from demolition will be controlled by watering the construction site two times per day, which is estimated to reduce emissions by 55% per CalEEMod® recommendation.
8. The mass emissions shown below are converted from ton per year to gram per second for the health risk assessment. The conversion is based on 365 days per year and 11 hours per day, consistent with the modeled hours from 7 AM - 6 PM.

Abbreviations:

CalEEMod® - California Emissions Estimator Model
cy - cubic yards
EF - emission factor
lb - pounds
$PM_{2.5}$ - particulate matter less than 2.5 microns in aerodynamic diameter
VMT - vehicle miles traveled
yr - years

	Year 5	1	0.69	0.17	0.11	0.0013	0.052	5.7E-04

Notes:

1. Area 1 includes Parcel 2, Parcel 3, North Garage, Office Building 4, Hotel, Town Square, and Meeting, Collaboration, Park. Area 2 includes Parcel 6, Parcel 7, South Garage, Office Building 1, Office Building 2, Office Building 3, Office Building 5, and Office Building 6. Area 3 includes Parcel 4 and Parcel 5, along with the Tunnel Construction.
2. The modeled fugitive dust source groups included in the health risk assessment are shown in Figures 3. The name of the construction area aligns with the name of the source groups presented in the figure.
3. Maximum graded area is based on Project-specific estimate.
4. VMT per day calculated following guidance in the CalEEMod® User's Guide, Appendix A, which is based on AP-42, Section 11.9 for grading equipment. The equation is:
   $VMT = A_S/W_b \times (43{,}560 \text{ sqft/acre})/(5{,}280 \text{ ft/mile})$, where:
   A_S = A_S, acres graded per day (varies by sub-activity)
   12 = W_b, blade width of grading equipment (CalEEMod® default)
5. Emission factor calculated following guidance in the CalEEMod® User's Guide, Appendix A, which is based on AP-42, Section 11.9 for grading equipment. The equation is:
   $EF_{PM2.5} = 0.04 \times (S)^{2.5} \times F_{PM2.5}$, where:
   7.1 = S, mean vehicle speed (mph) (AP-42 default)
   0.031 = $F_{PM2.5}$, $PM_{2.5}$ scaling factor (AP-42 default)
6. Fugitive $PM_{2.5}$ emissions from demolition will be controlled by watering the construction site two times per day, which is estimated to reduce emissions by 55% per CalEEMod® recommendation.
7. The mass emissions shown below are converted from ton per year to gram per second for the health risk assessment. The conversion is based on 365 days per year and 11 hours per day, consistent with the modeled hours from 7 AM - 6 PM.

Abbreviations:

CalEEMod® - California Emissions Estimator Model
EF - emission factor
ft - feet
lb - pounds
mph - miles per hour
$PM_{2.5}$ - particulate matter less than 2.5 microns in aerodynamic diameter
VMT - vehicle miles traveled
yr - years

	Grading and Utilities	Year 4	27		3.7E-04	1.8E-07	1.7E-04	8.3E-08
		Year 5	617		3.8E-04	4.2E-06	1.7E-04	1.9E-06

Notes:

1. Area 1 includes Parcel 2, Parcel 3, North Garage, Office Building 4, Hotel, Town Square, and Meeting, Collaboration, Park. Area 2 includes Parcel 6, Parcel 7, South Garage, Office Building 1, Office Building 2, Office Building 3, Office Building 5, and Office Building 6. Area 3 includes Parcel 4 and Parcel 5, along with the Tunnel Construction.
2. The modeled fugitive dust source groups included in the health risk assessment are shown in Figures 3 and 4. Figure 3 shows the modeled locations of Area 1, Area 2, and Area 3, and Figure 4 shows the modeled location of Hamilton Avenue Parcels North and South (which is labeled as "RETAIL" in the figure).
3. Emission factor calculated following guidance in the CalEEMod® User's Guide, Appendix A, which is based on AP-42, Section 13.2.4 for aggregate handling. The equation is:
   $EF = k \times (0.0032) \times (U/5)^{1.3} / (M/2)^{1.4}$, where the following default values are used:
   0.053 = $k_{PM2.5}$, $PM_{2.5}$ particle size multiplier
   2.2 = mean wind speed (U), meters per second
   4.9 = mean wind speed (U), miles per hour
   12 = material moisture content (M), %
4. Fugitive $PM_{2.5}$ emissions from demolition will be controlled by watering the construction site two times per day, which is estimated to reduce emissions by 55% per CalEEMod® recommendation.
5. The mass emissions shown below are converted from ton per year to gram per second for the health risk assessment. The conversion is based on 365 days per year and 11 hours per day, consistent with the modeled hours from 7 AM - 6 PM.

Abbreviations:

CalEEMod® - California Emissions Estimator Model
EF - emission factor
lbs - pounds
$PM_{2.5}$ - particulate matter less than 2.5 microns in aerodynamic diameter

								Year 6	**0.094**

Notes:

[1] Area 1 includes Parcel 2, Parcel 3, North Garage, Office Building 4, Hotel, Town Square, and Meeting, Collaboration, Park. Area 2 includes Parcel 6, Parcel 7, South Garage, Office Building 1, Office Building 2, Office Building 3, Office Building 5, and Office Building 6. Area 3 includes Parcel 4 and Parcel 5, along with the Tunnel Construction.

[2] Information on Project water use was provided by the Project Applicant.

[3] Energy usage is calculated by applying the electric intensity factor for outdoor water to total water usage. An electric intensity factor of 3,500 kWh/million gallons was taken from Table 9.2 in Appendix D of the CalEEMod User's Guide as the sum of supply water, treat water and distribute water electric intensity factors. Since the water use reported here is only for construction fugitive dust control, operational indoor water use-related emissions and wastewater treatment-related emissions are not estimated here.

[4] The energy intensity factors were taken from the local utility Pacific Gas & Electric. See Table 29 for derivation of factors. Values shown above are scaled linearly between the 2020 and 2026 values. Values were scaled to meet the requirements for 33% of energy from renewable sources in 2020 and 50% of energy from renewable sources in 2026 as required under Senate Bill 100.

Abbreviations:

CO_2e - Carbon dioxide-equivalent
gal - Gallons
GHG - Greenhouse gases
kWh - kilowatt-hours
MWh - megawatt-hours
lbs - pounds
MT - Metric Tons
CalEEMod - California Emissions Estimate Model

Table 12
Project Construction Architectural Coating Off-Gassing Emissions
Willow Village
Menlo Park, CA

Notes:

1. VOC content of paint is assumed to be consistent with BAAQMD Regulation 8, Rule 3 for flat and nonflat coatings. VOC is assumed to be equivalent to ROG for these purposes.
2. Paint VOC content is consistent with or more stringent than BAAQMD Regulation 8 Rule 3 (Architectural Coatings). Emissions are estimated assuming that indoor painting will utilize "super-compliant" VOC architectural coatings that meet the more stringent limits in South Coast Air Quality Management District Rule 1113. For outdoor paint, assumes use of coatings with VOC content of 150 g/L, consistent with BAAQMD requirements. VOC is assumed to be equivalent to ROG for these purposes.
3. The emission factor is calculated using CalEEMod default architectural coating emissions parameters. The default assumptions account for the painting surface area relative to the floor square footage assuming 1 gallon of paint covers 180 sqft of surface area.
4. Consistent with CalEEMod Appendix A, recreational areas were excluded from the floor square footage in calculating VOC emissions due to architectural coatings.
5. Project square footage by land use was provided by the Project Applicant.
6. ROG emissions are allocated to each year based on the construction schedule for each building or parcel.

Abbreviations:

BAAQMD - Bay Area Air Quality Management District
CalEEMod - California Emissions Estimator MODel
CEQA - California Environmental Quality Act
ft^2 - square feet
g - gram
gal - gallons
L - liters
lb - pounds
ROG - reactive organic gas
sqft - square feet
VOC - volatile organic compound

Year 5	**63**	45	2.1	2.0
Year 6	35	12	0.68	0.62
Threshold[5]	54	54	82	54

Notes:

1. Construction emissions were estimated with methodology equivalent to CalEEMod 2020.4.0. Emissions were estimated using on-road emissions factors from EMFAC2021 and off-road construction equipment emission factors from OFFROAD2017. Onroad trips and offroad construction equipment use were provided by the Project Applicant.
2. Unmitigated construction emissions from offroad equipment are calculated using fleet-average emission factors.
3. Area 1 includes Parcel 2, Parcel 3, North Garage, Office Building 4, Hotel, Town Square, and Meeting, Collaboration, Park. Area 2 includes Parcel 6, Parcel 7, South Garage, Office Building 1, Office Building 2, Office Building 3, Office Building 5, and Office Building 6. Area 3 includes Parcel 4 and Parcel 5, along with the Tunnel Construction.
4. The mass emissions shown above are converted from pound per year to gram per second for the health risk assessment. The conversion is based on 365 days per year and 11 hours per day, consistent with the modeled hours from 7 AM - 6 PM.
5. Thresholds are from BAAQMD California Environmental Quality Act (CEQA) Guidelines. Bolded values indicate threshold exceedances. Fugitive emissions sources are excluded from comparison to this threshold.

Abbreviations:

CAP - criteria air pollutant
CalEEMod - California Emissions Estimate Model
ROG - reactive organic gases
NO_X - nitrous oxide

Threshold[5]	54	54	82	54

Notes:

1. Construction emissions were estimated with methodology equivalent to CalEEMod® 2020.4.0. Emissions were estimated using on-road emissions factors from EMFAC2021 and off-road construction equipment emission factors from OFFROAD. Onroad trips and offroad construction equipment use were provided by the Project Applicant.
2. Mitigated construction emissions from offroad equipment are calculated using Tier 4 Final emission factors for 95 percent of the equipment before residents move on-site in Year 5 and 98 percent of the equipment after residents move on-site in Year 5. The other 5 percent and 2 percent (before and after on-site residents, repspectively) of non-Tier 4 equipment are assumed to be Tier 2.
3. Area 1 includes Parcel 2, Parcel 3, North Garage, Office Building 4, Hotel, Town Square, and Meeting, Collaboration, Park. Area 2 includes Parcel 6, Parcel 7, South Garage, Office Building 1, Office Building 2, Office Building 3, Office Building 5, and Office Building 6. Area 3 includes Parcel 4 and Parcel 5, along with the Tunnel Construction.
4. The mass emissions shown above are converted from pound per year to gram per second for the health risk assessment. The conversion is based on 365 days per year and 11 hours per day, consistent with the modeled hours from 7 AM - 6 PM.
5. Thresholds are from BAAQMD California Environmental Quality Act (CEQA) Guidelines. Fugitive emissions sources are excluded from comparison to this threshold.

Summary of Project Construction Annual GHG Emissions by Year

Year	Emissions[4,5]			
	CO_2	CH_4	N_2O	CO_2e
	MT/year			
Year 1	157	0.0083	0.020	163
Year 2	4,514	0.44	0.44	4,657
Year 3	7,605	1.1	0.30	7,722
Year 4	4,871	0.40	0.25	4,954
Year 5	4,304	0.28	0.23	4,379
Year 6	1,157	0.059	0.056	1,175
			Total	**23,050**

Notes:

1. Emissions were estimated using onroad emissions factors from EMFAC2021 and offroad construction equipment emission factors from OFFROAD. Onroad trips and offroad construction equipment use were provided by the Project Applicant.
2. Area 1 includes Parcel 2, Parcel 3, North Garage, Office Building 4, Hotel, Town Square, and Meeting, Collaboration, Park. Area 2 includes Parcel 6, Parcel 7, South Garage, Office Building 1, Office Building 2, Office Building 3, Office Building 5, and Office Building 6. Area 3 includes Parcel 4 and Parcel 5, along with the Tunnel Construction.
3. Carbon dioxide equivalent emissions were determined using IPCC 5th Assessment Report Global Warming Potentials for CH_4 and N_2O.
4. The Summary of Project Construction Annual GHG Emissions by Year is the sum of the values represented above as well as Construction Water Use Emissions, shown in Table 10.
5. The BAAQMD does not have an adopted Threshold of Significance for construction-related GHG emissions.

Abbreviations:

CalEEMod® - California Emissions Estimate Model
GHG - greenhouse gases
CH_4 - methane
CO_2 - carbon dioxide
N_2O - nitrous oxide
CO_2e - carbon dioxide equivalent
MT - metric ton
IPCC - Intergovernmental Panel on Climate Change

Parcels 4 + 5		--	2.4%	40%	--	4.4%	--	0%	0%	11%
Hamilton Avenue Parcels North and South		--	3.7%	--	--	--	--	0%	54%	100%
Partial Buildout by Year and Land Use Type[3]	**Year 4**	3.1%	10%	0%	0%	53%	86%			
	Year 5	58%	59%	16%	41%	75%	94%			
	Year 6	95%	98%	64%	100%	96%	100%			

Notes:

1. Construction area/subphasing information and full buildout square footage by building provided by Project Applicant.
2. The percentage of year that each building is operational is calculated using the last day of construction for each building. For each partial year of construction, the building is assumed to be operational during the fraction of the year between the last day of construction and the end of that year. The building is assumed to be 0% operational for each full year of construction and 100% operational for each year full year after the end of construction.
3. Partial buildout for Year 4, Year 5, and Year 6 were calculated based on the portion of building area that becomes operational each year over the total building area for each land use type.

Abbreviations:

% - percent

Table 17
Traffic Data Provided by the Transportation Engineer
Willow Village
Menlo Park, California

Daily Trips Rates and VMT

Land Use	Fleet Type / Land Use	Trip Rate Units[1]	Weekday Trips per Day per Unit[1]	Weekday daily VMT[2]
			TOTAL	TOTAL
Main Project Site - Existing Conditions	Cars	per 1,000 s.f.	9.19	110,860
	Trucks	per 1,000 s.f.	0.22	2,640
	Shuttles	per 1,000 s.f.	0.66	21,088
	On-Demand	per 1,000 s.f.	0.66	7,919
Campus District - Full Buildout	Cars	per 1,000 s.f.	10.05	178,766
	Trucks	per 1,000 s.f.	0.23	4,056
	Shuttles	per 1,000 s.f.	0.44	21,088
	On-Demand	per 1,000 s.f.	0.68	12,168
Town Square and the Residential/Shopping District - Full Buildout	Residential	per d.u.	4.35	71,524
	Retail[3]	per 1,000 s.f.	25.07	33,594
	Hamilton Avenue Parcels North and South[3]	per 1,000 s.f.	28.31	1,461
	Park	per acre	42.80	1,147
	Hotel	per room	6.69	14,814

Notes:

1. Daily project trip rates were provided by the Transportation Engineer in terms of trip rates per land use amount.
2. Daily Project VMT provided by the Transportation Engineer include reductions for pass-by and diverted trips. Daily VMT is given in VMT per day.
3. The trip rates and VMT for Hamilton Avenue Parcels North and South were provided separately and added to retail totals in calculations.

Abbreviations:

VMT - Vehicle miles traveled
s.f. - Square feet
d.u. - Dwelling unit

Table 18
Trip Rates and VMT for Existing Conditions and Project Operations
Willow Village
Menlo Park, California

Notes:

1. Partial years are scaled from the full buildout based on the portion of each land use that becomes operational for each year of construction. See Table 16 for more details.
2. The fleet type for each land use was provided by the Transportation Engineer. The Campus District will have various fleets for specific uses. Town Square and the Residential/Shopping District land uses (Residential, Retail, Park, and Hotel) are analyzed assuming a default San Mateo fleet. Hamilton Avenue Parcels North and South are combined with retail land uses. See Table 19 for more information.
3. Daily VMT and trip rates were provided by the Transportation Engineer on October 5, 2021. Total trip rates are calculated using land uses in Table 1.
4. Weekday VMT and trip rates provided by the Transportation Engineer were scaled to average trip rates using the ratio between CalEEMod® weekday and weekend one-way trip rates.
5. Annual trips and VMT are calculated by multiplying daily values by 365 for all fleets with the exception of shuttles and on-demand, which are multiplied by 260 days/year.

Abbreviations:

VMT - vehicle miles traveled

Table 19
Summary of Fleet Mix Categories
Willow Village
Menlo Park, California

Land Use	Fleet Type	EMFAC2007 Category[1]	Fuel[1,2]
Town Square and the Residential/Shopping District[3]	San Mateo County Mix	All	Mix of Gasoline, Diesel, Electric, and Natural Gas
Campus District[4]	Cars	LDA, LDT1, LDT2, MCY Mix	Mix of Gasoline and Diesel
	On-Demand	LDA	Gasoline
	Shuttles	Motor Coach, All Other Buses Mix	Diesel
	Trams	LDT1, LDT2	Mix of Gasoline and Diesel
	Trucks	HHDT, LHDT1, LHDT2, MHDT Mix	Mix of Gasoline, Diesel, and Natural Gas

Notes:

1. EMFAC2007 categories and fuel types were chosen to match vehicle type descriptions provided by Meta Transportation Operations Team.
2. Electric vehicles were not considered in the emission factors of the Campus District fleets because Campus District-specific emissions reductions are applied later.
3. Land uses other than the Campus District were assumed to have the same distribution of vehicle types as San Mateo County, per EMFAC2021. Hamilton Avenue Parcels North and South were combined with the retail land uses having the EMFAC2021 fleet for San Mateo County.
4. Default split between EMFAC categories assumed for all fleets associated with the Office (Existing and Full Buildout).

Abbreviations:

HHDT - heavy-heavy duty trucks
LDA - light duty auto (passenger cars)
LDT- light duty trucks
LHDT - light-heavy duty trucks
LHDT - light-heavy duty trucks
MHDT - medium-heavy duty trucks
MCY - motorcycles

Notes:

1. Emission factors for each fleet type were developed by creating weighted emission factors based on the vehicle classes in each fleet type. EMFAC emissions were summed across each year for each vehicle class within a fleet type, then a vehicle class emission factor based on VMT and trip counts for the vehicle class was calculated. Emission factors for each vehicle class within a fleet type were weighted based on total VMTs and trips to create a fleet-wide emission factor for each year.
2. Emission factors for the Project fleets (all except the San Mateo Fleet) were calculated without electric vehicles because electric vehicle reductions are calculated separately.
3. The existing conditions for this analysis used emission factors from 2019. Partial buildout years 4, 5, and 6 used emission factors from years 2024, 2025, and 2026, respectively. Full buildout emissions used emission factors from 2026 to conservatively estimate emissions.

Abbreviations:

ROG - Reactive organic gases
NO_x - Nitrogen oxides
PM_{10} - Particulate matter less than 10 microns in diameter
$PM_{2.5}$ - Particulate matter less than 2.5 microns in diameter
RUNEX - Running exhaust emissions
RUNLOSS - Evaporative losses
STREX - Start exhaust tailpipe emissions
IDLEX - Idle exhaust emissions
DIURN - Diurnal Evaporative Hydrocarbon Emissions
HOTSOAK - Hot soak evaporative hydrocarbon emissions

Table 21a
Mobile CAP Emissions Before EV Reductions
Willow Village
Menlo Park, California

Notes:

1. Hamilton Avenue Parcels North and South were provided separately and added to the retail land use totals.
2. Trip counts and VMTs by land use type were broken out by year using a scaling factor representing the percent of each fleet that is operational in a given year leading up to full buildout. This percent was determined based on the square footage of the land use associated with each fleet that is operational in a given year relative to that land use's full buildout square footage. See Table 16 for more details on scaling. See Table 18 for Project Trip Rates and VMT.
3. Criteria air pollutants are calculated by year using emission factors for the associated year and fleet from EMFAC2021. Electric vehicles are not included in the emission factors for Campus District fleets (all fleet types except San Mateo Fleet), as reductions associated with EVs are considered separately. Project emission factors are shown in Table 20a.
4. Full buildout emissions are conservatively calculated using 2026 emission factors.

Abbreviations:

EV - electric vehicle
lb - pound
NO_x - nitrogen oxides
VMT- vehicle miles traveled
PM_{10} - particulate matter less than 10 microns in diameter
$PM_{2.5}$ - particulate matter less than 2.5 microns in diameter
ROG - reactive organic gases

Notes:

1. Hamilton Avenue Parcels North and South were provided separately and added to the retail land use totals.
2. VMT and trip rates were provided by the Transportation Engineer on October 5, 2021 and are summarized in Table 18.
3. Greenhouse Gases are calculated by year using emission factors for the associated year and fleet from EMFAC2021. Electric vehicles are not included in the emission factors for Campus District fleets (all fleet types except San Mateo Fleet), as reductions associated with EVs are considered separately. Project emission factors are shown in Table 20b.
4. Full buildout emissions are conservatively calculated using 2026 emission factors.

Abbreviations:

GHG - Greenhouse Gas
CO_2 - carbon dioxide
CH_4 - methane
N_2O - Nitrous Oxide
CO_2e - Carbon dioxide equivalent
EV - electric vehicle
MT - Metric Ton
VMT- vehicle miles traveled

Table 22
EV Assumptions for Campus District
Willow Village
Menlo Park, California

Campus District EV Parameters

Description	Units	Value
Electricity required per mile charged[1]	kWh/mi	0.30
Total Charging Energy of Meta Campuses[2]	kWh/year	3,791,856
Total Area of Meta Campuses[2]	sqf	4,753,594
Total Meta Campus Energy per Area[2]	kWh/sqf	0.80
Existing Conditions Fleet eVMT per Total VMT[3]	Percent	5.5%
Full Buildout Fleet MSS eVMT per Total VMT[4]	Percent	14%
Electricity Loss Factor[5]	Percent	10%
Existing Conditions Charging Energy Usage[6]	kWh/year	534,955
Full Buildout Charging Energy Usage[7]	kWh/year	2,925,608

eVMTs from Project Chargers at the proposed Campus District

Year	Land Use Category[8]	Project Increase in Annual eVMTs[9]
		eVMT/year
Existing Conditions	Campus District	1,783,182
Partial Buildout - Year 4		298,927
Partial Buildout - Year 5		5,701,922
Partial Buildout - Year 6		9,259,481
Full Buildout		9,752,026

Notes:

1. An average EV fuel economy of 0.30 kWh per mile was used. The fuel economy is based on electric fleet data from fueleconomy.gov. Available at: https://www.fueleconomy.gov/.
2. Meta provided energy usage and areas for EV charging at their existing campuses: Classic, Bayfront, Chilco, Willow, Gateway. The provided data was used to evaluate an average ratio of EV charging energy usage per campus area.
3. The percent eVMT for existing conditions is calculated by dividing the eVMT in existing conditions by the annual VMT from the 'Car' and 'On-Demand' vehicle types in existing conditions. For existing conditions VMT, see Table 18.
4. ARB is currently preparing its 2020 Mobile Source Strategy (MSS) update to the ARB VISION Model (version 2.1) estimating future fleet characteristics. The Mobile Source Strategy projects eVMTs reflecting the aspirational target identified in EO N-79-20, assuming 100% of passenger vehicle sales in California are ZEV or PHEV, and GHG emissions assumed to have reduced by 2.0% per year from 2026 to 2035. The increase in annual eVMTs charged by the Campus District is scaled from the increase in fleet eVMT from existing conditions to full buildout.
5. A 10% Loss Factor was applied to the annual project energy uses to account for expected losses. Source available at: https://www.fueleconomy.gov/

Table 22
EV Assumptions for Campus District
Willow Village
Menlo Park, California

6. The EV charging energy consumption for existing conditions was based on existing charger energy usage data for Willow Village for 2019 provided by the Project applicant. The total energy usage was reduced assuming a 10% loss factor.

7. The EV charging energy consumption for the Project at full buildout was determined using an average ratio of existing charging sites kWh/sqf and multiplying it by the Campus District land use area at full buildout (1.6 million sqf). This number was scaled by the increase in fleet eVMT from existing conditions to full buildout based on the MSS scenario of the VISION model. A 10% loss factor was applied to the total energy usage per year. All relevant data sources were provided by the Project applicant.

8. Meta offers an EV charging program to its workers. Charging on campus is free and valets move cars into chargers to maximize charging time. Therefore, the EV charging annual electricity for the Campus District was provided based on studies from Meta's existing campuses in the area. The electricity for EV charging at the Project would be supplied with 100% renewable energy.

9. For years where the Campus District is only operational a proportion of the year, the annual kWh is multiplied by a scaling fraction for the Campus District land use, found in Table 16.

Abbreviations:

EV - Electric vehicle (includes battery electric or plug-in hybrid technology)
eVMT- Electric vehicle miles traveled
kWh - Kilowatt hour
sqf- Square foot
MSS - Mobile Source Strategy

Notes:

1. The miles charged per hour charged is representative of a typical charge rate for an EV of 6.25 kWh per hour and a fuel economy of 0.30 kWh per mile. The charge rate is based on capability of existing battery-electric vehicles and Level 2 charging stations. Reference: Chargepoint. 2017. Level Up Your EV Charging Knowledge. Available at: https://www.chargepoint.com/blog/level-your-ev-charging-knowledge/. The fuel economy is based on electric fleet data from fueleconomy.gov. Available at: https://www.fueleconomy.gov/.
2. The two scenarios analyzed are the Reference and the Mobile Source Strategy scenarios. ARB is currently preparing its 2020 Mobile Source Strategy (MSS) update to the ARB VISION Model (version 2.1). The 2020 MSS uses "scenario planning to take an integrated approach to identifying the technology trajectories and programmatic concepts" to model projected years of electric vehicle miles for assessed scenarios. The Mobile Source Strategy projects eVMTs reflecting the aspirational target identified in EO N-79-20, assuming 100% of passenger vehicle sales in California are ZEV or PHEV, and GHG emissions assumed to have reduced by 2.0% per year from 2026 to 2035. The 2020 update only considers passenger vehicles (LDA, LDT1, LDT2, and MDV). To determine the eVMT percent of the passenger vehicle fleets, the 2020 MSS update was downloaded in July 13, 2021. The increase in annual eVMTs charged by the Project from the Reference Scenario to the MSS Scenario is used to determine the eVMTs the Project can take credit for based on providing additional charging infrastructure for the state to reach aspirational EV fleet penetration.
3. The number of chargers in the Town Square and the Residential/Shopping District was provided by the Project Applicant in the Willow Village Mixed Use Development Concept Level Energy Use Summary, dated June 14, 2021, detailing chargers available for all mixed-use traffic. 249 EV Charging Stations are available to serve the 1,694 residential spaces and 500 commercial spaces.
4. Meta offers a valet service to charge EVs from 7am to 7pm, average daily hours of availability for charging per charger is conservatively assumed to be 10 hours per day. When demand is met, the full 10 hours will be used for charging, with each vehicle cycling out of the charging spot before or as the car reaches full charge. The number of chargers are available for all Town Square and the Residential/Shopping District land uses, and it is expected that there will be 10 hours a day of active charging taking place due to the frequency of turnover associated with retail, restaurant, hotel, and park land uses. Town Square and the Residential/Shopping District land uses are assumed to operate 365 days per year. Any charging inefficiencies associated with cars remaining plugged in after reaching full charge is assumed to balance out due the likelihood of more than 10 hours of activity a day associated with Town Square and the Residential/Shopping District activity.
5. Town Square and the Residential/Shopping District Total VMT and trips includes all proposed Project residential, retail, park, and hotel land uses, consistent with Table 18. Retail land uses include Hamilton Parcels North and South and are added to total VMT and trips.
6. EV Annual Trips and EV Annual VMT are determined based on Project trips and VMTs and the VISION Reference Scenario percent of Electric Fleet. These eVMTs (electric vehicle miles traveled) represents the number of project VMTs that are driven by electric vehicles.
7. 249 EV Charging Stations are proposed for the full buildout. To reflect the EV charging stations that will come online during construction in the partial years leading up to full buildout, a scaling factor was applied based on the ratio of square feet of the parking land use that is built out in a given year to the total square feet that will be built. The scaling factor for a given year was applied to the 249 chargers at full buildout. To see scaling factors used, refer to the parking land use from Table 16.
8. Total annual charge hours available from the project are determined by multiplying the average daily hours of charging per charger (10 hours) by the annual days of charger activity (365 days). The annual charge hours available from the project are then multiplied by 25 miles charged per charge hour to determine the number of eVMT available from the project.
9. The Project EV chargers for Town Square and the Residential/Shopping District land uses are determined to be at capacity, meaning used fully for all available charge hours per day, when the electric vehicle miles associated with the Project are in excess of the maximum electric vehicle miles the Project chargers can charge. If there is a surplus of chargers relative to EVs coming to the site, then the Project chargers are under-capacity, and only a fraction of chargers will be used as the number of EVs coming to the site are fewer than the total number of charger capacity. If there is a surplus of EVs coming to the site relative to the chargers at the site, all chargers will be used and the site will be at capacity. In the scenario when the chargers are at capacity, the full capacity of VMTs the site can charge are assumed to be charged.

Abbreviations:

EV - electric vehicle (includes battery electric or plug-in hybrid technology)
Hr - hour
TDM - Transportation Demand Management
VMT - vehicle miles travelled
eVMT - electric vehicle mile traveled

Notes:

1. Expected eVMT and trips charged by the Project chargers in Town Square and the Residential/Shopping District land uses are calculated based on the San Mateo Fleet, charger usage assumptions, ARB's Vision Model, and traffic data provided by the Transportation Engineer. For calculation details, see Table 23.

2. Emissions reductions from EV charging represent the decrease in emissions from increases in electric vehicle use due to the installation of EV chargers throughout the site. For Town Square and the Residential/Shopping District land uses, the eVMT and trips from additional Project chargers is calculated based on the difference between the MSS scenario and the baseline scenario, representing the additional eVMT due to the installation of additional chargers.

3. Emissions reductions use emission factors developed in EMFAC2021 that represent passenger vehicles (LDA, LDT1, LDT2, MCY). The eVMTs determined for Town Square and the Residential/Shopping District are based on ARB's VISION Model, which includes expected electric vehicle fleet % for passenger vehicles only (LDA, LDT1, LDT2, MCY).

4. EVs emit particulate matter brake wear and tire wear, therefore those emissions are not considered in the reductions.

5. Expected eVMT charged by additional Project chargers is measured based on anticipated charging energy usage provided by the Project Applicant. For calculation details see Table 22.

6. Trip counts from Project chargers were calculated by dividing the increased eVMTs from project chargers by the average VMTs per trip for the passenger vehicles (Cars) in a given year, based on traffic data provided by the Transportation Engineer.

Abbreviations:

eVMT - electric vehicle miles traveled
lb - pound
EV - electric vehicle
ROG - reactive organic gases
NOx - nitrogen oxides
PM_{10} - particulate matter less than 10 microns in diameter
$PM_{2.5}$ - particulate matter less than 2.5 microns in diameter

Full Buildout	**5.0**	**3.7**	**6.6**	**1.3**

Notes:

1. Calculations of CAP emissions before reductions are shown in detail in Table 21a. Net emissions subtract the emissions from the existing conditions in 2019.
2. PM10 and PM2.5 emissions include exhaust, tire wear, brake wear, and fugitive dust. Fugitive dust emissions factors are calculated in Table 8.
3. The Existing Conditions includes EV reductions associated with existing Project Site chargers.
4. CAP Emissions after reductions account for the reductions associated with EVs as shown in Table 24a. The emissions reductions are subtracted from the total Project emissions.

Abbreviations:

lb - pound
MT - metric ton
EV - electric vehicle
ROG - reactive organic gases
NOx - nitrogen oxides
PM_{10} - particulate matter less than 10 microns in diameter
$PM_{2.5}$ - particulate matter less than 2.5 microns in diameter

Table 25b
Summary of Mobile GHG Emissions
Willow Village
Menlo Park, California

Total Emissions Before Reductions:[1]

Year	GHG Emissions without Reductions (MT/year)			
	CO_2	CH_4	N_2O	CO_2e
Total Emissions by Year				
Existing Conditions[2]	15,660	0.46	1.2	16,024
Full Buildout	36,439	1.0	1.9	37,016
Net Emissions				
Full Buildout	**20,779**	**0.55**	**0.67**	**20,992**

Total Emissions with Reductions:[3]

Year	GHG Emissions with Reductions (MT/year)			
	CO_2	CH_4	N_2O	CO_2e
Total Emissions by Year				
Existing Conditions[2]	15,660	0.46	1.2	16,024
Full Buildout	32,247	0.88	1.7	32,790
Net Emissions				
Full Buildout	**16,587**	**0.42**	**0.57**	**16,766**

Notes:

1. Calculations of GHG emissions before reductions are shown in detail in Table 21b. Net emissions subtract the emissions from the existing conditions in 2019.
2. The Existing Conditions includes EV reductions associated with existing Project Site chargers.
3. GHG Emissions after reductions account for the reductions associated with EVs as shown in Table 24b. The emissions reductions are subtracted from the total Project emissions.

Abbreviations:

GHG - Greenhouse Gas
CO_2 - carbon dioxide
CH_4 - methane
N_2O - Nitrous Oxide
CO_2e - Carbon dioxide equivalent
MT - metric ton
EV - electric vehicle

Table 26
Generator Emission Factors for Diesel Engines
Willow Village
Menlo Park, California

Fuel	Engine Tier	Generator Size Range (hp)		Engine Emission Factors[1] (g/bhp-hr)				
		Minimum	Maximum	ROG	NO_x	PM_{10}	$PM_{2.5}$	CO_2e
Diesel	Tier 2	750	1,200	0.26	4.6	0.15	0.15	523
Diesel	Tier 3	300	600	0.16	2.9	0.15	0.15	523
Diesel	Tier 4	1,200	--	0.15	0.50	0.020	0.020	523

Notes:

1. Engine emission factors for PM_{10} and $PM_{2.5}$ (assumed all engines are diesel fueled and that all PM_{10} is diesel particulate matter) based on ARB standards for diesel generator engines. Emission factors for TOG and ROG were converted from NMHC values provided in the Tier standards using EPA hydrocarbon conversion factors. When an emission factor was specified as a combined NMHC+NOx factor, the NMHC/NOx ratio of 5%/95% were taken from BAAQMD guidance. The emission factors for CO_2e are based on diesel emergency generator CO_2 and CH_4 emission factors from CalEEMod User's Guide Appendix D, Table 12.1, along with a GWP of 25 for CH_4.

Abbreviations:

ARB - [California] Air Resources Board

BAAQMD - Bay Area Air Quality Management District

CalEEMod - CALifornia Emissions Estimator MODel

CEIDERS - California Emission Inventory Data and Reporting System

CO_2e - carbon dioxide equivalents

EPA - US Environmental Protection Agency

g/bhp-hr - Grams per Brake Horsepower Hour

GWP - global warming potential

1,490	1	1.2E-02	4.1E-02	1.6E-03	1.6E-03	39
2,900	2	4.8E-02	1.6E-01	6.4E-03	6.4E-03	152
Total Emissions		0.15	1.3	0.047	0.047	399

Notes:

1. Number, size, and fuel of emergency generators were provided by the Project Applicant.
2. All generators over 1,000 HP were assumed to be Tier 4, consistent with BAAQMD BACT guidelines.
3. Operation for routine maintenance and testing was conservatively assumed to be 50 hours per year, the maximum allowable by the Airborne Toxics Control Measure (ATCM) for Stationary Compression Ignition Engines (17 CCR 93115).

Abbreviations:

BACT - Best Available Control Technology
CO_2 - carbon dioxide
CO_2e - carbon dioxide equivalents
g - grams
hp - horsepower
hr - hour
MT - metric tons
NOx - oxides of nitrogen
PM - particulate matter
PM_{10} - PM less than 10 microns in diameter
$PM_{2.5}$ - PM matter less than 2.5 microns in diameter
ROG - reactive organic gases
yr - year

References:

Table 28
Energy Usage for Existing Conditions and Project Operations
Willow Village
Menlo Park, California

Land Use	Floor Area (sqft) (DU - Residential)	Annual Electricity Use (MWh/yr)	Annual Natural Gas Use (MMBtu/yr)
Existing Conditions (2019)[1]			
All	1,923,910	12,050	30,039
Total Existing Energy Usage		12,050	30,039
Full Buildout[2,3]			
Office	1,600,000	23,828	0
Retail	207,690	4,517	2,195
Residential	1,730	16,855	0
Hotel	172,000	2,528	0
Parking	1,869,240	32,183	0
Park	403,837	38	0
Total Full Buildout Energy Usage		79,950	2,195

Notes:

1. Energy use rates for existing conditions were provided for 2019 by the Project Applicant via email on August 10, 2021.
2. Electricity and natural gas usage rates for the retail, residential, and parking land uses were provided by PAE in the June 14, 2021 memorandum. Electricity usage rates for Office, Hotel, and Park were provided by Hines on June 21, 2021. The hotel and office do not use natural gas. The electricity usage includes 27,986 MWh/year of electricity use associated with the Campus District EV charging stations, which is summarized in the parking land use category. Electricity and energy use rates for the Willow Road Retail were calculated based on the CalEEMod defaults the retail land use type in Climate Zone 5.
3. Natural gas for the project is only used for Hamilton Avenue Parcels North and South and the supermarket and restaurant land uses, which are summarized in the retail category.

Abbreviations:

CalEEMod - California Emissions Estimator Model
DU - dwelling unit
kBTU - thousand British Thermal Units
kWh - kilowatt-hour
MMBTU - million British Thermal Units
MWh - Megawatt-hour
sqft - square feet
yr - year

Table 29
Energy Usage Emission Factors
Willow Village
Menlo Park, California

Historical Electricity Intensity - PG&E

Annual Electricity Data	2016	2017	2018	Average[1]	Units
CO_2 Intensity Factor per Total Energy Delivered[2]	294	210	206	237	lbs CO_2/MWh delivered
CO2e Intensity Factor per Total Energy Delivered	296	213	209	239	lbs CO_2e/MWh delivered
% of Total Energy From RPS-Eligible Renewables[3]	33%	33%	39%	35%	-
CO_2 Intensity Factor per Total Non-RPS-Eligible Energy[4]	437	314	338	364	lbs CO_2/MWh delivered
CO_2e Intensity Factor per Total Non-RPS-Eligible Energy[4]	441	318	342	368	lbs CO_2e/MWh delivered

Estimated Intensity Factor for Total Energy Delivered by PG&E[5]

Year	2016	2017	2018	Average[5]	Units
2019 (35%)	294	210	206	237	lbs CO_2/MWh delivered
	296	213	209	239	lbs CO_2e/MWh delivered
2024 (44%)	240	173	186	200	lbs CO_2/MWh delivered
	242	175	188	202	lbs CO_2e/MWh delivered
2025 (47%)	229	165	177	191	lbs CO_2/MWh delivered
	231	167	179	193	lbs CO_2e/MWh delivered
2026 (50%)	219	157	169	181	lbs CO_2/MWh delivered
	220	159	171	183	lbs CO_2e/MWh delivered
2030 (60%)	175	126	135	145	lbs CO_2/MWh delivered
	176	127	137	147	lbs CO_2e/MWh delivered

Estimated Intensity Factor for Total Energy Delivered by PCE[6]

Model Year	2016	2017	2018	Average[1]	Units
86% Renewable (2019 - 2030)	59	42	45	49	lbs CO_2/MWh delivered
	62	45	48	51	lbs CO_2e/MWh delivered
100% Renewable (Campus District)	0	0	0	0	lbs CO_2/MWh delivered
	0	0	0	0	lbs CO_2e/MWh delivered

Greenhouse Gas Energy Emission Factors

Greenhouse Gas	CO_2	CH_4	N_2O	CO_2e	Units
Global Warming Potential[7]	1	25	298	-	-
2019 - 2030 Electricity Use Emission Factor[8]	49	0.029	0.0062	51	lb/MWh
	2.2E-02	1.3E-05	2.8E-06	2.3E-02	MT/MWh
Natural Gas Use Emission Factor[9]	118	0.0023	0.0022	118	lb/MMBTU
	0.0053	0.0000	0.0000	0.0054	MT/therm

Criteria Air Pollutant Energy Emission Factors[v]

Land Use Type	ROG	NOx	PM_{10}	$PM_{2.5}$	Units
Residential	0.011	0.092	0.0075	0.0075	lb/MMBtu
Nonresidential	0.011	0.10	0.0075	0.0075	lb/MMBtu

Notes:

1. This average uses the most recent three years of data.
2. Total CO_2 intensity factors from The Climate Registry. Available at: https://www.theclimateregistry.org/our-members/cris-public-reports/. Accessed: April 2021.
3. Percent of total energy from eligible renewables is from the PG&E 2017, 2018, and 2019 Corporate Responsibility Report.
4. The emissions metric presented here was calculated based on the total CO2 intensity factor divided by the percent of energy delivered from non-RPS-eligible sources. This CO2 intensity factor includes both fossil fuel and carbon-free sources of energy, such as largescale hydro and nuclear. Diablo Canyon Nuclear Plant, which accounts for a portion of the carbon-free energy in this CO2 intensity factor, is planned to be closed by 2024-2025 (https://www.pge.com/en_US/safety/how-the-system-works/diablo-canyon-power-plant/diablo-canyon-power-plant/engagement-panel.page). According to SB 1090 (approved 9/2018), "The [California Public Utilities] commission shall ensure that integrated resource plans are designed to avoid any increase in emissions of greenhouse gases as a result of the retirement of the Diablo Canyon Units 1 and 2 powerplant." This was incorporated into CPUC section 712.7(2)(b). Based on this information, the total Non-RPS-Eligible energy CO2 intensity factor was assumed to remain constant.
5. The RPS of 44% by 2024, 52% by 2027, and 60% for 2030 are consistent with SB 100. The RPS for 2026 and 2027 were estimated by assuming a linear increase between 2024 and 2027. Available at: https://leginfo.legislature.ca.gov/faces/billNavClient.xhtml?bill_id=201720180SB100. The average percentage of energy from renewables for 2016-2018 is greater than the 2020 RPS of 33% as required by SB100. Thus, it is assumed that the 2016-2018 average CO2 and CO2e intensity factors remain constant through 2020, at which point the carbon intensity then decreases each year to comply with the future RPS requirements.
6. The intensity factor for total energy delivered was estimated by multiplying the percentage of energy delivered from non-RPS-eligible renewable energy by the CO_2 emissions per total non-RPS-eligible energy metric calculated above.

Table 29
Energy Usage Emission Factors
Willow Village
Menlo Park, California

7. Global Warming Potentials (GWP) are based on the IPCC Fourth Assessment Report. CH4 and N2O emission factors are from the CalEEMod® version 2020.4.0 defaults for PGE, and are conservatively assumed not to change from these estimates. As more renewable energy is integrated into the electricity grid, these intensity factors will also decrease.
8. Peninsula Clean Energy comes from 51% renewable sources, 35% hydro electric and 14% unspecified sources. The 14% unspecified sources were assumed to come from the same mix as the non-renewable PG&E mix of power. This is assumed to remain constant until 2030, after which the renewable percentage of the power mix is assumed to linearly increase to 100% in 2045, conistent with SB 100. Available at:
9. Natural Gas Use emission factors from Table 8.2 of CalEEMod User's Guide Appendix D.

Abbreviations:

CalEEMod - California Emissions Estimator Model
CH_4 - methane
CO_2 - carbon dioxide
CO_2e - carbon dioxide equivalents
CPUC - California Public Utilities Commission
GWP - global warming potential
lb - pound(s)
MMBtu - million British Thermal Units
MT - metric ton(s)
MWh - megawatt-hour
N_2O - nitrous oxide
NO_x - nitrogen oxides
PCE - Peninsula Clean Energy
PG&E - Pacific Gas & Electric
PM - particulate matter
$PM_{2.5}$ - PM less than 2.5 microns in diameter
PM_{10} - PM less than 10 microns in diameter
ROG - reactive organic gases
RPS - Renewable Portolio Standard
SB - Senate Bill

Total Full Buildout Emissions	0.012	0.11	8.2E-03	8.2E-03	118	0
Partial Buildout[3]						
Total Year 4 Emissions	0.0012	0.011	8.3E-04	8.3E-04	12	0
Total Year 5 Emissions	0.0070	0.064	4.9E-03	4.9E-03	70	0
Total Year 6 Emissions	0.012	0.11	8.0E-03	8.0E-03	115	0

Notes:

1. CAP emissions result from the combustion of natural gas. As a result, CAP emissions were only calculated for natural gas usage. In compliance with the City of Menlo Park Municipal Code, natural gas usage for the Project will be offset; however, since the carbon intensity of the offset production is not known at this time, GHG emissions from natural gas were conservatively included alongside electricity GHG emissions.
2. Emissions were calculated based on energy use, shown in Table 28, and energy emission factors, shown in Table 29. Existing electricity is sourced from PCE. Project electricity will be sourced from 100% renewable sources; as such, emissions from Project electricity use are expected to be zero. Project natural gas will only be used in retail land uses for commercial cooking equipment.
3. Partial buildout emissions were calculated from full buildout using scaling factors by land use type and year, as shown in Table 16.

Abbreviations:

CAP - Criteria Air Pollutants
CO_2e - carbon dioxide equivalents
GHG - Greenhouse Gas
MT - metric ton(s)
NOx - nitrogen oxides
PM - particulate matter
$PM_{2.5}$ - PM less than 2.5 microns in diameter
PM_{10} - PM less than 10 microns in diameter
ROG - reactive organic gases
yr - year

Total Year 5 Emissions[3]	24	22	20	7.9	74
Total Year 6 Emissions[3]	49	54	47	19	168

Notes:

1. Emissions shown in this table were calculated using default values and methods from CalEEMod Version 2020.4.0. The Water Electricity Intensity, Water Treatment Types, and Wastewater Treatment Direct Emission Factors used in the calculation can be found in Tables 9.2, 9.3 and 9.4 of Appendix D of the CalEEMod user guide, respectively. These calculations were performed using water use rates, shown in Table 31, and energy emission factors, shown in Table 29.
2. Consistent with CalEEMod, indoor water use was assumed to be processed as wastewater and outdoor water use was assumed to not be processed as wastewater.
3. Partial buildout direct emissions from Septic Tank, Aerobic, and Facultative Lagoon wastewater treatment were calculated from full buildout using scaling factors by land use type and year, as shown in Table 1. For partial buildout indirect electricity emissions from water usage and wastewater treatment, usage rates rather than emission were scaled to account for year specific energy emission factors from PG&E, as shown in Table 29.

Abbreviations:

CalEEMod - California Emissions Estimator Model
CO_2e - carbon dioxide equivalents
MT - metric ton
yr - year

Menlo Park, California

Solid Waste Generation[1]

Land Use	Size	Units	Solid Waste Disposal Rate (ton/year)
Existing Conditions (2019)			
Office	251,530	sqft	42
Commercial	123,870	sqft	10
Industrial - Warehouse	500,780	sqft	471
Industrial - Manufacturing	23,570	sqft	29
Recreational	24,060	sqft	137
Light Industrial	80,100	sqft	99
Parking	920,000	sqft	0
Full Buildout Conditions			
Office	1,600,000	sqft	268
Retail	207,690	sqft	218
Residential	1,730	DU	796
Hotel	0,193	sqft	106
Parking	1,869,240	sqft	0
Park	403,837	sqft	0.83

Notes:

1. Solid Waste Generation Rates are from Table 10.1 of Appendix D of the CalEEMod User's Guide. An 82% diversion rate, provided by the Project Applicant via email communication dated August 2, 2021, is applied to default solid waste generation rates for the existing and project office land use to account for recycling and composting. The diversion rate is generated using data from Recology with the assumption that all bins are at 100% capacity and 0% contamination.

Abbreviations:

CalEEMod - California Emissions Estimator Model

DU - dwelling unit

sqft - square feet

Parking		0	0	0
Park		0.17	0.010	0.42
Total Full Buildout Emissions		282	17	698
Partial Buildout[2]				
Total Year 4 Emissions[2]		6.3	0.37	16
Total Year 5 Emissions[2]		92	5.5	229
Total Year 6 Emissions[2]		220	13	544

Notes:

1. Emissions shown in this table were calculated using default values and methods from CalEEMod Version 2020.4.0. These calculations were performed using default waste use rates by land use type and an 82% diversion rate for office land use types provided by the Project Applicant, shown in Table 33, and default solid waste landfill gas emission factors from Table 10.2 of CalEEMod User's Guide Appendix D.

2. Partial buildout emissions were calculated from full buildout using scaling factors by land use type and year, as shown in Table 16.

Abbreviations:

CalEEMod - California Emissions Estimator Model
CH_4 - methane
CO_2 - carbon dioxide
CO_2e - carbon dioxide equivalents
LFG - Landfill Gas
MT - metric ton

Hotel	172,000	344,000	10%	100	150	179
Parking	1,869,240	112,154	10%	0	150	19
Park	403,837	0	10%	0	0	0
Total Full Buildout Emissions						4,473
Partial Buildout[5]						
Total Year 4 Emissions[5]						83
Total Year 5 Emissions[5]						1,567
Total Year 6 Emissions[5]						3,515

Notes:

1. Consistent with CalEEMod Appendix A, residential building surface area was assumed to be 2.7 times the floor area, and non-residential 2 times the floor area. Also consistent with CalEEMod Appendix E, the parking painted area was assumed to be 6% of the total surface area for surface lots.
2. Consistent with CalEEMod Appendix A, 10% of all surfaces were assumed to be coated each year.
3. Consistent with CalEEMod Appendix D Table 6.1, which is based on BAAQMD Regulation 8 Rule 3 paint VOC regulations, use VOC EF of 100 g/L for flat paints, generally used indoors, and 150 g/L for all other architectural coatings.
4. Uses CalEEMod Appendix A assumption that 1 gallon of paint covers 180 square feet. Building surface area is assumed to be 75% indoors and 25% outdoors, consistent with CalEEMod Appendix A. Parking garages are assumed to have no indoor surfaces.
5. Partial buildout emissions were calculated from full buildout using scaling factors by land use type and year, as shown in Table 16.

Abbreviations:

BAAQMD - Bay Area Air Quality Management District
CalEEMod - California Emissions Estimator Model
EF - emission factor
g - grams
L - liters
lb - pound
sqft - square feet
VOC - volatile organic compound
yr - year

Table 36
Mitigated Architectural Coating Emissions from Existing Conditions and Project Operations
Willow Village
Menlo Park, California

Land Use	Floor Area	Building Surface Area[1]	Application Rate[2]	Indoor Paint VOC EF[3]	Outdoor Paint VOC EF[3]	Architectural Coating VOC Emissions[4]
	(sqft)	(sqft)		(g/L)	(g/L)	(lb/yr)
Full Buildout						
Office	1,600,000	3,200,000	10%	10	150	668
Retail	207,690	415,380	10%	10	150	87
Residential	1,695,976	4,579,135	10%	10	150	955
Hotel	172,000	344,000	10%	10	150	72
Parking	1,869,240	112,154	10%	0	150	19
Park	403,837	0	10%	0	0	0
					Total Full Buildout Emissions	1,801
Partial Buildout[5]						
					Total Year 4 Emissions[5]	40
					Total Year 5 Emissions[5]	635
					Total Year 6 Emissions[5]	1,417

Notes:

1. Consistent with CalEEMod Appendix A, residential building surface area was assumed to be 2.7 times the floor area, and non-residential 2 times the floor area. Also consistent with CalEEMod Appendix E, the parking painted area was assumed to be 6% of the total surface area for surface lots.
2. Consistent with CalEEMod Appendix A, 10% of all surfaces were assumed to be coated each year.
3. Paint VOC content is consistent with or more stringent than BAAQMD Regulation 8 Rule 3 (Architectural Coatings). Emissions were estimated assuming that indoor painting will utilize "super-compliant" VOC architectural coatings that meet the more stringent limits in South Coast Air Quality Management District Rule 1113. For outdoor paint, assumed use of coatings with VOC content of 150 g/L, consistent with BAAQMD requirements. VOC was assumed to be equivalent to ROG for these purposes.
4. Uses CalEEMod Appendix A assumption that 1 gallon of paint covers 180 square feet. Building surface area is assumed to be 75% indoors and 25% outdoors, consistent with CalEEMod Appendix A. Parking garages are assumed to have no indoor surfaces.
5. Partial buildout emissions were calculated from full buildout using scaling factors by land use type and year, as shown in Table 16.

Abbreviations:

BAAQMD - Bay Area Air Quality Management District
CalEEMod - California Emissions Estimator Model
EF - emission factor
g - grams
L - liters
lb - pound
sqft - square feet
VOC - volatile organic compound
yr - year

Table 37
Consumer Product Emission Factor Refinement
Willow Village
Menlo Park, California

Year[1]	Consumer Products VOC inventory (tons/day)[2]	San Mateo County Population[3]	Total Building Square Footage[4]	Consumer Products VOC Emission Factor (lb/square foot/day)
2010	4.93	718,451	537,446,060	1.83E-05
2020	5.20	764,442	571,850,190	1.82E-05

Notes:

1. 2010 data are used because total building square footage was available only for 2010. Building square footage for 2020 was estimated by multiplying 2010 building square footage with the ratio of population in 2020 to that in 2010.
2. VOC inventory obtained from California Air Resources Board's emission inventory for Consumer Products under Solvent Evaporation for the respective years.
3. Population estimates obtained from US Census Bureau's QuickFacts for San Mateo County for the respective years.
4. Total building square footage for 2010 obtained from FEMA HAZUS-MH software.

Abbreviations:

lb - pound

VOC - Volatile Organic Compound

Table 38
Consumer Product Emissions from Existing Conditions and Project Operations
Willow Village
Menlo Park, California

Land Use	Building Area	Consumer Products VOC EF[1,2]	Days per Year	Consumer Products VOC emissions
	(sqft)	(lb/sqft/day)		(lb/yr)
Existing Conditions (2019)				
Office	251,530	1.8E-05	365	1,670
Commercial	123,870	1.8E-05	365	822
Industrial - Warehouse	500,780	1.8E-05	365	3,324
Industrial - Manufacturing	23,570	1.8E-05	365	156
Recreational	24,060	1.8E-05	365	160
Light Industrial	80,100	1.8E-05	365	532
Parking	920,000	3.5E-07	365	119
Existing Conditions Emissions				6,783
Full Buildout				
Office	1,600,000	1.8E-05	365	10,621
Retail	207,690	1.8E-05	365	1,379
Residential	1,695,976	1.8E-05	365	11,258
Hotel	172,000	1.8E-05	365	1,142
Parking	1,869,240	3.5E-07	365	242
Park	403,837	5.2E-08	365	7.6
Total Full Buildout Emissions				24,649
Partial Buildout[3]				
Total Year 4 Emissions[3]				599
Total Year 5 Emissions[3]				9,447
Total Year 6 Emissions[3]				19,982

Notes:

1. The consumer products VOC EF for office, retail, and residential land uses was derived using methodology consistent with CalEEMod with adjusted parameters for San Mateo County, as described in Table 37. The default emissions factor assumes 2020 consumer products VOC inventory for San Mateo County. The default building square footage used is from 2010, which was updated to 2020 using population growth of San Mateo County, as shown in Table 37.
2. Consumer product VOC EFs for parking and open space were taken from CalEEMod 2020.4.0. These defaults take into account pesticide and fertilizer use in city parks and degreaser use in parking areas.
3. Partial buildout emissions were calculated from full buildout using scaling factors by land use type and year, as shown in Table 16.

Abbreviations:

ARB - Air Resources Board
CalEEMod - California Emissions Estimator Model
EF - emission factor
lb - pound
sqft - square feet
VOC - volatile organic compound
yr - year

Net Full Buildout Emissions	**16**	**3.7**	**6.7**	**1.3**	**88**	**21**	**37**	**7.0**

Notes:

1. Emissions estimated using methods consistent with CalEEMod® version 2020.4.0.
2. Operational emissions shown represent activity and emissions across 365 days per year.
3. Operational emissions from existing conditions were calculated using CalEEMod® default data and emission factors based on the existing land use type and energy use rates provided by the Project Applicant.
4. Full buildout operational emissions are based on electricity, natural gas, and water usage rates provided by the Project Applicant alongside CalEEMod® defaults for architectural coating, consumer product, landscaping, and waste emissions. Net emissions were calculated as the difference between full buildout emissions and existing condition emissions.
5. Natural gas usage for the project would be used exclusively for supermarket and commercial cooking.
6. Partial buildout emissions were calculated from full buildout using scaling factors by land use type and year, as shown in Table 16.
7. Net emissions were calculated as the difference between partial buildout emissions for each year and existing condition emissions.

Abbreviations:

Full Buildout	--	--	--	--	88	21	37	7.0	88	21	37	7.0
BAAQMD Significance Threshold									54	54	82	54

Notes:

1. Emissions estimated using methods consistent with CalEEMod® version 2020.4.0.
2. Net new operational emissions are scaled for partial years of phased operations by the percent that each parcel is operational for each year relative to full buildout, as shown in Table 16.
3. Unmitigated construction emissions can be found in Table 13. Net unmitigated operational emissions were calculated by subtracting the emissions from the existing conditions from the project emissions, as reported in Table 42.

Abbreviations:

CalEEMod - California Emissions Estimator Model
CAP - Criteria Air Pollutant
lb - pounds
NO_x - nitrogen oxides
PM - particulate matter
$PM_{2.5}$ - PM less than 2.5 microns in diameter
PM_{10} - PM less than 10 microns in diameter
ROG - reactive organic gases
yr - year

Onsite Roadways[2]

Source Group Name	Distance (m)	Volume (vehicles/day)	VMT (mi/day)
ONSITE	2570	10,782	17,217

Intercampus Shuttles[3]

Source Group Name	Distance (m)	Volume (vehicles/day)	VMT (mi/day)
SHUTTLES	7278	361	1,633

Notes:

1. Net new offsite traffic volumes for both the Campus District and the Town Square were provided by Hexagon in the data request received in October 2021. Offsite traffic for the Campus District was modeled using a percent breakdown of the fleet (88% cars, 6% on-demand, 2% trucks), provided by Hexagon. Offsite traffic for the Town Square and Residential/Shopping District was modeled as the default San Mateo fleet. A summary of fleet mix categories can be found in Table 19. Modeled offsite roadway segments can be found in Figure 8.

2. Net new onsite traffic volumes were provided by Hexagon in the data request received in October 2021. Onsite traffic volumes were taken as the sum of all net new onsite traffic volumes divided by two to account for round trips. Onsite traffic was modeled exclusively as the cars fleet type. A summary of the cars fleet mix can be found in Table 19. Modeled onsite roadway segments can be found in Figure 7.

3. Shuttle traffic volumes, which account for the remaining 4% of the offsite fleet mix, were conservatively modeled as the sum of all inbound and outbound vehicle trips across all regions and routes, divided by two to account for round trips. Inbound and outbound vehicle trips were provided by the Project Applicant in June 2021. A summary of the shuttles fleet mix can be found in Table 19. Modeled shuttle roadway segments can be found in Figure 9.

Abbreviations:

VMT - Vehicle Miles Traveled m - meter mi - mile

Table 48
Traffic Emission Factors
Willow Village
Menlo Park, California

Vehicle Type	% Diesel[1]	DPM[1,2]	$PM_{2.5}$[2]	TOG[2]	
				Evaporate	Exhaust
		g/mi			
San Mateo Default Fleet	41%	7.4E-04	0.019	0.033	0.021
Cars	2%	1.9E-05	0.017	0.037	0.017
Trucks	94%	0.011	0.051	0.033	0.089
Shuttles	100%	0.0043	0.024	--	--
On-Demand	2%	2.0E-05	0.017	0.032	0.0091

Notes:

1. The DPM emission factor for Cars, On-Demand, Trucks, and the San Mateo Default Fleet vehicle types is reduced by the the fraction of total PM_{10} emissions that are from diesel for each fleet type. This fraction was calculated as the sum of PM_{10} running and idling exhaust emissions from all diesel vehicles in the fleet over the sum of all PM_{10} running and idling exhaust emissions for all vehicles in the fleet.
2. A detailed description of mobile emission factors can be found in Table 20. DPM emissions are represented by the running exhaust PM_{10} emission factor for 2026; $PM_{2.5}$ emissions are represented by the sum of the running exhaust, brake wear, tire wear, and controlled resuspended road dust emission factors for 2026; TOG exaporate emissions are represented by the TOG running loss emission factor for 2026; and TOG exhaust emissions are represented by the TOG running exhaust emission factor for 2026.

Abbreviations:

DPM - diesel particulate matter

g - gram

mi - mile

$PM_{2.5}$ - particulate matter less than 2.5 microns in diameter

PM_{10} - particulate matter less than 10 microns in diameter

TOG - total organic gases

Table 49
Diurnal Traffic Patterns for San Mateo Fleet and Shuttles
Willow Village
Menlo Park, California

Hour of Day	Percent of Total Daily San Mateo Fleet VMT[1]	Shuttle Schedule[2] (number of shuttles)
1	1.1%	0
2	0.5%	0
3	0.6%	0
4	0.2%	0
5	0.5%	16
6	0.9%	44
7	3.7%	130
8	7.7%	115
9	7.1%	52
10	4.4%	2
11	4.7%	0
12	5.9%	0

Table 50
Construction Source Parameters
Willow Village
Menlo Park, California

Source	Source Type	Number of Sources[1]	Release Height[2] (m)	Source Width (m)	Initial Horizontal Dimension (m)	Initial Vertical Dimension[3] (m)
Construction Equipment	Area	Multiple	5.0	--	--	1.16
On-Road Trucks	Line	Multiple	2.55	Width of Road + 6	--	2.37
Feeder Line Equipment	Volume	Multiple	5.0	2.0	0.93	1.16

Notes:

1. The number of modeled construction equipment sources is based on the number of distinct construction work areas. The number of on-road vehicle sources is based on the geometry of the truck or traffic routes.

2. BAAQMD does not have guidance on construction modeling, therefore construction equipment parameters used are based on BAAQMD's San Francisco Citywide Health Risk Assessment (SFDPH). According to the SFDPH methodology, release height of a modeled area source representing construction equipment is set to 5 meters. On-road truck release height will be based on USEPA haul road guidance, assuming vehicle heights of 3 meters for heavy-duty vehicles and 2 meters for light-duty vehicles.

3. According to USEPA's AERMOD guidance, initial vertical dimension of the modeled construction equipment area sources is the release height divided by 4.3. According to the USEPA Haul Road Guidance, the initial vertical dimension for line sources is the top of plume height divided by 2.15, where the top of the plume is equal to 2*Release Height. According to USEPA's AERMOD guidance, the initial horizontal dimension for construction volume sources is the source width divided by 2.15.

Abbreviations:

AERMOD - Atmospheric Dispersion MODeling

Pumping Station Generator	Point	1	2.9	739.82	45.3	0.18	--
Hamilton Avenue Generator	Point	1	2.99	739.82	45.3	0.18	--
Town Square Generator	Point	1	25.91	739.82	45.3	0.18	--

Notes:

1. Since passenger vehicles occupy the majority of offsite and onsite vehicle traffic, the on-road passenger vehicle source parameters were used to model cars, trucks and on-demand vehicle traffic. The source parameters are consistent with the San Francisco Citywide Health Risk Assessment Technical Support Document (SFDPH) and a vehicle height of 2 meters and USEPA Haul Road Guidance. The source width is the width of the road plus 6 meters to account for the turbulent mixing of air behind vehicles.
2. Intercampus shuttles were modeled using the actual vehicle height of 4 meters as provided by the Project Applicant and USEPA Haul Road Guidance. The source width is the width of the road plus 6 meters to account for the turbulent mixing of air behind vehicles.
3. Project generators were modeled using default values for exit temperature, velocity, and diameter from the San Francisco Citywide Health Risk Assessment Technical Support Document, which are consistent with median stack parameters from the BAAQMD technical memorandum. Release heights of the exhaust are assumed to be the height of the building.

Abbreviations:

AERMOD - Atmospheric Dispersion MODeling
BAAQMD - Bay Area Air Quality Management District
K - Kelvin
m - meter
s - second
USEPA - United States Environmental Protection Agency

Table 52
Modeling Adjustment Factor
Willow Village
Menlo Park, California

Receptor Type	Modeling Adjustment Factor
Residential	1
Recreational	2.55
Daycare Child	2.55
Daycare Child (18 months +)	2.55
Elementary School	2.55
High School	2.55

Notes:

1. Modeling adjustment factors are calculated based on the methodology from BAAQMD's Health Risk Assessment Modeling Protocol (2020).
2. The MAF for all non-residential receptor types is calculated to adjust from 24 hours/day to 11 hours/day and from 7 days/week to 6 days/week ([24 hours/11 hours] * [7 days/6 days] = 2.55).

	Willow Road and Ivy Drive	--	TRUCKS	Vendor trips and Worker trips

Notes:

1. Area 1 includes Parcel 2, Parcel 3, North Garage, Office Building 4, Hotel, Town Square, and Meeting, Collaboration, Park. Area 2 includes Parcel 6, Parcel 7, South Garage, Office Building 1, Office Building 2, Office Building 3, Office Building 5, and Office Building 6. Area 3 includes Parcel 4 and Parcel 5, along with the Tunnel Construction.
2. Source group locations are presented in Figures 3, 4, and 5.
3. Source groups RS4 and RS5 are modeled together as RS45.
4. All on-road source groups are modeled as On-Road Trucks and all off-road source groups are modeled as Construction Equipment.
5. The EXCAVATE source group is modeled as the HTL and TS source groups combined, as excavation will occur near the proposed Hotel and Town Square. This is shown as the Specific Hotel Excavation Area in Figure 3.
6. On-road emissions from hauling and vendor trips are allocated to an on-road source group and off-road source group. Any emissions derived from a g/mile process (e.g., running, brakewear, tirewear, runloss) are allocated to the phase's corresponding on-road source group. Any emissions derived from a g/trip process (e.g., idling, startup, etc.) are allocated to the phase's corresponding off-road source group. This allocation allows for a more accurate representation of where emissions from the g/trip processes occur, since they would be happening on-site.
7. On-road construction worker trips were expected to have negligible impact and were therefore not included in the HRA analysis for excess lifetime cancer risk and chronic HI. $PM_{2.5}$ emissions associated with on-road construction worker trips were included in the construction HRA analysis for $PM_{2.5}$ concentration modeling.

Abbreviations:

HI - hazard index

HRA - health risk assessment

$PM_{2.5}$ - particulate matter less than 2.5 microns in diameter

Table 54
Exposure Parameters
Willow Village
Menlo Park, California

Receptor Type	Receptor Age Group[1]	Exposure Parameters						
		Daily Breathing Rate (DBR)[2,3,4,5]	Annual Exposure Duration (ED)[6]	Fraction of Time at Home (FAH)[7]	Exposure Frequency (EF)[8]	Averaging Time (AT)	Intake Factor, Inhalation (If_{inh})	Age Sensitivity Factor (ASF)[9,10]
		(L/kg-day)	(years)	(unitless)	(days/year)	(days)	(m^3/kg-day)	(unitless)
Resident	3rd Trimester	361	1	1	350	25,550	0.0049	10
	Age 0-<2 Years	1090	1	1			0.015	10
	Age 2-<9 Years	631	1	1			0.0086	3
	Age 2-<16 Years	572	1	1			0.0078	3
	Age 16-30 Years	261	1	0.73			0.0026	1
Daycare Child	Age 0-<2 Years	750	1	1	250		0.0073	10
	Age 2-<9 Years	415	1	1			0.0041	3
Daycare Child (18 months +)	Age 0-<2 Years	750	1	1	250		0.0073	10
	Age 2-<9 Years	415	1	1			0.0041	3
Elementary School Child	Age 2-<9 Years	640	1	1	180		0.0045	3
High School Child	Age 2-<16 Years	520	1	1	180		0.0037	3
Recreational	Age 0-<2 Years	300	1	1	180		0.0021	10
	Age 2-<9 Years	160	1	1			0.0011	3
	Age 2-<16 Years	130	1	1			9.2E-04	3
	Age 16-30 Years	60	1	0.73			3.1E-04	1

Notes:

1. Age bin 2-<9 Years will be used where applicable, and age bin 2-<16 Years will be conservatively used for ages 9-<16 Years.
2. Daily breathing rates for residents reflect default breathing rates from Cal/EPA 2015 as follows:
   95th percentile 24-hour daily breathing rate for age 3rd trimester and 0-<2 years
   80th percentile 24-hour daily breathing rate for age 2-<9 years
   80th percentile 24-hour daily breathing rate for age 2-<16 years
   80th percentile 24-hour daily breathing rate for age 16-30 years
3. Daily breathing rates for daycare children assumes 2 hour moderate intensity and 6 hour light intensity activity.
4. Daily breathing rates for elementary and high school children assume 95th Percentile Eight-Hour Breathing Rates for Moderate Intensity Activities.
5. Daily breathing rates for recreational receptors assume 95th Percentile Eight-Hour Breathing Rates for Moderate Intensity Activities, scaled to 2 hours per day.
6. Annual exposure duration represents one full year. Specific exposure durations in each age bin are given in Tables 55, 56, 57, and 58.
7. Fraction of time spent at home is conservatively assumed to be 1 (i.e. 24 hours/day) for all age bins except Age 16-30 Years. Fraction of time spent at home is assumed to be 0.73 for Ages 16-30 Years.
8. Exposure frequency was determined as follows:
   Residents: reflects default residential exposure frequency from Cal/EPA 2015.
   Daycare: reflects default worker exposure frequency from Cal/EPA 2015, assuming a daycare child is at the daycare center when the parents are at work.
   School: reflects default number of school days per year.
   Recreational: reflects default number of school days per year, assuming 2 hours of exposure each day.
9. Age sensitivity factors account for an "anticipated special sensitivity to carcinogens" of infants and children as recommended in the OEHHA Technical Support Document (Cal/EPA 2009) and current OEHHA guidance (Cal/EPA 2015). This approach is consistent with the cancer risk adjustment factor calculations recommended by BAAQMD (BAAQMD 2016).
10. Adjustment factor is applicable to each receptor type listed for the age group relevant to that receptor type.

Abbreviations:

AT - averaging time
Cal/EPA - California Environmental Protection Agency
DBR - daily breathing rate
EF - exposure frequency
FAH - fraction of time at home
kg - kilogram
L - liter

Year 31					1	0.0026				1	0.00031										
Year 32					1	0.0026															

Notes:

1. Exposure Scenario 1 begins at the start of construction in Year 1.
2. The exposure duration for all years is 1, as the health risk assessment is based on annual emissions. While the 3rd Trimester is only 3 months, the exposure duration for the first year is set to 1 since annual average concentrations are used to calculate risks.
3. Age bin 2-16 Years was selected to conservatively represent ages 9-16.
4. The Intake Factors have been multiplied by the Age Sensitivity Factors and weighted by the exposure duration for each age bin.
5. Intake Factors are based on exposure assumptions in Table 44.
6. Exposure for High School receptors is conservatively included in the 2-16 age bin.

Abbreviations:

IF - intake factor
m^3 - cubic meter
kg - kilogram

References:

OEHHA. 2015. Air Toxics Hot Spots Program Risk Assessment Guidelines. Guidance Manual for Preparation of Health Risk Assessments. February.

Notes:

1. Exposure Scenario 3 begins at the conclusion of Town Center and Residential/Shopping District construction when residents move onsite in 2025.
2. The exposure duration for all years is 1, as the health risk assessment is based on annual emissions. While the 3rd Trimester is only 3 months, the exposure duration for the first year is set to 1 since annual average concentrations are used to calculate risks.
3. Age bin 2-16 Years was selected to conservatively represent ages 9-16.
4. The Intake Factors have been multiplied by the Age Sensitivity Factors and weighted by the exposure duration for each age bin.
5. Intake Factors are based on exposure assumptions in Table 44.

Abbreviations:

IF - intake factor

m^3 - cubic meter

kg - kilogram

Notes:

1. Scenario 4 begins at the conclusion of Project construction when the Project is fully operational in 2027.
2. The exposure duration for all years is 1, as the health risk assessment is based on annual emissions. While the 3rd Trimester is only 3 months, the exposure duration for the first year is set to 1 since annual average concentrations are used to calculate risks.
3. Age bin 2-16 Years was selected to conservatively represent ages 9-16.
4. The Intake Factors have been multiplied by the Age Sensitivity Factors and weighted by the exposure duration for each age bin.
5. Intake Factors are based on exposure assumptions in Table 44.
6. Exposure for High School receptors is conservatively included in the 2-16 age bin.

Abbreviations:

IF - intake factor
m^3 - cubic meter
kg - kilogram

Table 59
Project Cancer Risk at Off-Site and On-Site MEIR
Willow Village
Menlo Park, California

Source Category	Lifetime Excess Cancer Risk[1] (in a million)					
	Construction + Operations				Operations Only	
	Unmitigated[2]		Mitigated[2]			
Project Contribution	On-Site MEIR[3,5]	Off-Site MEIR[4,5]	On-Site MEIR[3,5]	Off-Site MEIR[4,5]	On-Site MEIR[3,5]	Off-Site MEIR[4,5]
	Scenario 3	Scenario 2	Scenario 3	Scenario 2	Scenario 3	Scenario 4
Construction	170	57	7.2	7.6	--	--
Operational Generators	1.6	0.65	1.4	0.65	1.4	0.55
Operational Traffic	1.1	0.89	1.1	0.89	2.0	2.9
Total Project Contribution	172	58	9.8	9.2	3.3	3.4

Notes:

1. Excess lifetime cancer risk from construction and operations are combined since cancer risk is evaluated over a 30-year lifetime. Thus, the risk takes into account exposure to Project emissions beginning during construction and continuing through operations. Off-site receptors are exposed to all Project construction and subsequent Project operations. On-site receptors are exposed to overlapping construction emissions and subsequent Project operations.

   The cancer risks were estimated using the following equation:

   Riskinh = Ci x CF x IFinh x CPFi x ASF
   Where:
   Riskinh = Cancer Risk for the Inhalation Pathway (unitless)
   Ci = Annual Average Air Concentration for Chemical "i" (µg/m3)
   CF = Conversion Factor (mg/µg)
   IFinh = Intake Factor for Inhalation (m3/kg-day)
   CPFi = Cancer Potency Factor for Chemical "i" (mg/kg-day)-1
   ASF = Age Sensitivity Factor (unitless)

2. The Unmitigated Project reflects default construction off-road equipment fleet. The Mitigated Project reflects use of 95 percent Tier 4 construction off-road equipment before residents move on-site and 98 percent Tier 4 construction off-road equipment after residents move on-site. The other 5 percent and 2 percent (before and after on-site residents, respectively) are assumed to have Tier 2 engines. Unmitigated emissions are estimated to be much larger than mitigated emissions as a result of two assumptions made during the calculations: 1) the emission factor for Tractors/Loaders/Backhoes with low HP ratings is significantly higher than that of subsequently higher HP ranges and many construction equipment fall under this classification; and 2) many pieces of construction equipment such as Bobcats were conservatively classified as Tractors/Loaders/Backhoes rather than other equipment types with lower emission factors.

3. On-site Project MEIR was identified as the on-site sensitive receptor location with the maximum total cancer risk attributed to the emissions associated with the Project.

4. Off-site Project MEIR was identified as the off-site sensitive receptor location with the maximum total cancer risk attributed to the emissions associated with the Project.

5. On-site and off-site MEIR locations are documented below:

Table 59
Project Cancer Risk at Off-Site and On-Site MEIR
Willow Village
Menlo Park, California

MEIR by Scenario	MEIR Location[6]					
	Construction + Operations				Operations Only	
	On-Site MEIR[3]	Off-Site MEIR[4]	On-Site MEIR[3]	Off-Site MEIR[4]	On-Site MEIR[3]	Off-Site MEIR[4]
	Scenario 3	Scenario 2	Scenario 3	Scenario 2	Scenario 3	Scenario 4
UTMx (m)	575,225	575,500	575,245	575,500	575,275	574,840
UTMy (m)	4,148,065	4,147,960	4,148,135	4,147,960	4,148,145	4,147,800
Receptor Height (m)	4.8	1.8	4.8	1.8	1.8	1.8
Receptor Type	Residential	Residential	Residential	Residential	Residential	Residential

6. Three exposure scenarios were modeled. Scenario 1 evaluates off-site receptors and begins at the start of construction. Scenario 2 evaluates off-site receptors and begins at the start of Area 2 Grading and Utilities construction. Scenario 3 evaluates on-site receptors and begins at the conclusion of Town Center and Residential/Shopping District construction when Area 1 residents move in.

Abbreviations:

kg - kilogram
m - meter
MEIR - maximally exposed individual receptor
mg - miligram
UTMx - Universal Transverse Mercator x-coordinate
UTMy - Universal Transverse Mercator y-coordinate
ug - microgram

Table 60
Project Chronic Hazard Index at Off-Site and On-Site MEIR
Willow Village
Menlo Park, California

Source Category	Lifetime Excess Chronic Hazard Index[1] (unitless)					
	Construction + Operations				Operations Only	
	Unmitigated[2]		Mitigated[2]			
Project Contribution	On-Site MEIR[3,5] Scenario 3	Off-Site MEIR[4,5] Scenario 1	On-Site MEIR[3,5] Scenario 3	Off-Site MEIR[4,5] Scenario 1	On-Site MEIR[3,5] Scenario 3	Off-Site MEIR[4,5] Scenario 1
Construction	0.23	0.11	8.9E-03	0.011	--	--
Operational Generators	4.0E-04	6.6E-04	4.0E-04	2.1E-04	3.3E-04	3.0E-03
Operational Traffic	2.1E-03	1.4E-03	2.1E-03	3.3E-03	6.0E-03	1.3E-03
Total Project Contribution	**0.23**	**0.11**	**0.011**	**0.014**	**6.3E-03**	**4.3E-03**

Notes:

1. The potential for exposure to result in adverse chronic non-cancer effects is evaluated by comparing the estimated annual average air concentration (which is equivalent to the average daily air concentration) from construction and operations to the non-cancer chronic REL for each chemical. When calculated for a single chemical, the comparison yields a ratio termed a hazard quotient or HQ. To evaluate the potential for adverse chronic non-cancer health effects from simultaneous exposure to multiple chemicals, the hazard quotients for all chemicals are summed, yielding a hazard index or HI.

   The chronic HI for each receptor was estimated using the following equation:

   $HI_{inh} = C_i / cREL$

   Where:

   HI_{inh} = Chronic HI for the Inhalation Pathway (unitless)

   C_i = Annual Average Air Concentration for Chemical "i" ($\mu g/m^3$)

   cREL = Chronic Reference Exposure Level ($\mu g/m^3$)

2. The Unmitigated Project reflects default construction off-road equipment fleet. The Mitigated Project reflects use of 95 percent Tier 4 construction off-road equipment before residents move on-site and 98 percent Tier 4 construction off-road equipment after residents move on-site. The other 5 percent and 2 percent (before and after on-site residents, respectively) are assumed to have Tier 2 engines. Unmitigated emissions are estimated to be much larger than mitigated emissions as a result of two assumptions made during the calculations: 1) the emission factor for Tractors/Loaders/Backhoes with low HP ratings is significantly higher than that of subsequently higher HP ranges and many construction equipment fall under this classification; and 2) many pieces of construction equipment such as Bobcats were conservatively classified as Tractors/Loaders/Backhoes rather than other equipment types with lower emission factors.

3. On-site Project MEIR was identified as the on-site sensitive receptor location with the maximum chronic HI attributed to the emissions associated with the Project.

4. Off-site Project MEIR was identified as the off-site sensitive receptor location with the maximum chronic HI attributed to the emissions associated with the Project.

5. On-site and off-site MEIR locations are documented below:

RAMBOLL

Table 61
Project $PM_{2.5}$ Concentration at Off-Site and On-Site MEIR
Willow Village
Menlo Park, California

Source Category	Excess $PM_{2.5}$ Concentration[1] ($\mu g/m^3$)					
	Construction + Operations				Operations Only	
	Unmitigated[2]		Mitigated[2]			
Project Contribution	On-Site MEIR[3,5]	Off-Site MEIR[4,5]	On-Site MEIR[3,5]	Off-Site MEIR[4,5]	On-Site MEIR[3,5]	Off-Site MEIR[4,5]
	Scenario 3	Scenario 1	Scenario 3	Scenario 1	Scenario 3	Scenario 1
Construction	1.1	0.52	0.038	0.063	--	--
Operational Generators	2.0E-03	3.3E-03	1.7E-03	1.3E-03	1.6E-03	1.3E-03
Operational Traffic	0.040	0.030	0.092	0.12	0.11	0.12
Total Project Contribution	**1.1**	**0.56**	**0.13**	**0.18**	**0.11**	**0.12**

Notes:

1. $PM_{2.5}$ concentrations at off-site receptors include contributions from multiple phases of Project construction and subsequent Project operations. $PM_{2.5}$ concentrations at on-site receptors include contributions from overlapping construction emissions and subsequent Project operations.

   The $PM_{2.5}$ concentration at each receptor was estimated using the following equation:

   $C_i = E \times D_i$

   Where:

   C = Concentration of $PM_{2.5}$ at receptor "i" ($\mu g/m^3$)

   D_i = Dispersion factor associated with unit emissions at receptor "i" ($\mu g/m^3$)/(g/s)

   E = Emission Rate (g/s)

2. The Unmitigated Project reflects default construction off-road equipment fleet. The Mitigated Project reflects use of 95 percent Tier 4 construction off-road equipment before residents move on-site and 98 percent Tier 4 construction off-road equipment after residents move on-site. The other 5 percent and 2 percent (before and after on-site residents, respectively) are assumed to have Tier 2 engines. Unmitigated emissions are estimated to be much larger than mitigated emissions as a result of two assumptions made during the calculations: 1) the emission factor for Tractors/Loaders/Backhoes with low HP ratings is significantly higher than that of subsequently higher HP ranges and many construction equipment fall under this classification; and 2) many pieces of construction equipment such as Bobcats were conservatively classified as Tractors/Loaders/Backhoes rather than other equipment types with lower emission factors.

3. On-site Project MEIR was identified as the on-site sensitive receptor location with the maximum chronic HI attributed to the emissions associated with the Project.

4. Off-site Project MEIR was identified as the off-site sensitive receptor location with the maximum chronic HI attributed to the emissions associated with the Project.

5. On-site and off-site MEIR locations are documented below:

Notes:

1. Consistent with BAAQMD guidance, Ramboll included all facilities within 1,000 feet of the Project boundary as per the BAAQMD Permitted Stationary Sources Risks and Hazards Map. Facility information was obtained from the Permitted Stationary Sources Risks and Hazards Map with additional details provided by BAAQMD.

2. Unscaled health risk values were estimated using facility emissions provided by BAAQMD and BAAQMD's Health Risk Calculator Tool. These values were scaled by distance using the diesel IC engines multiplier tool or the BAAQMD's generic distance decay curve, as indicated above. If a stationary source is located over 1,000 feet away from the MEIR, the decay factor is zero (i.e., the impact of the stationary source is zero at the MEIR).

Abbreviations:

IC - internal combustion

ICE - internal combustion engine

MEIR - maximally exposed individual receptor

$\mu g/m^3$ - micrograms per cubic meters

$PM_{2.5}$ - particulate matter less than 2.5 micrometers in diameter

Total	**23**	**0.016**	**0.68**	**25**	**0.015**	**0.44**
BAAQMD Threshold	**100**	**10**	**0.80**	**100**	**10**	**0.80**

Notes:

1. Details for existing stationary sources are shown in the preceeding table. If the cell is marked with "--", no risk was calculated. For roadways, highways, major streets, and railways, chronic HI is not calculated in the BAAQMD screening tools.
2. Consistent with BAAQMD guidance, Ramboll included all facilities within 1,000 feet of the Project boundary as per the BAAQMD Permitted Stationary Sources Risks and Hazards Map. Facility information was obtained from the Permitted Stationary Sources Risks and Hazards Map with additional details provided by BAAQMD. Values have been adjusted accordingly for distance from the MEIRs using BAAQMD guidance.
3. BAAQMD recommends evaluating roadways in the area where existing traffic is over 10,000 vehicles per day and under 30,000 vehicles per day, which is the limit for roadways to consider in their raster tool. Hexagon provided background trip volumes for nearby roadways with volumes between 10,000 and 30,000 vehicles per day. Of the roadways with background traffic in this range, only O'Brien Drive was located within the zone of influence. The impacts associated with background traffic on O'Brien Drive were quantified and included in the cumulative analysis.
4. Nearby major streets, highway, and railway cancer and $PM_{2.5}$ impacts were taken from BAAQMD raster files for the Project area. The BAAQMD's raster screening tools do not estimate chronic hazards since the screening levels were found to be extremely low. Thus, there are no chronic hazard values associated with highways, railways, or major streets.
5. Major streets, as evaluated in the BAAQMD raster screening tools, include all streets with average daily traffic above 30,000 vehicles per day.

Abbreviations:

µg - microgram
HI - hazard index
m^3 - cubic meter
MEIR - maximum exposed individual receptor
$PM_{2.5}$ - fine particulate matter less than 2.5 micrometers in diameter

APPENDIX A
CONSISTENCY WITH APPLICABLE AIR PLANS

CEQA ANALYSIS
CONFLICT WITH OR OBSTRUCT IMPLEMENTATION OF THE APPLICABLE AIR QUALITY PLAN
WILLOW VILLAGE
MENLO PARK, CALIFORNIA

San Mateo County is currently designated a nonattainment area for the federal ozone standard, a maintenance area for the federal CO standard, and nonattainment for state ozone, PM_{10}, and $PM_{2.5}$ standards. The most recently adopted regional air quality plan is the Bay Area Air Quality Management District (BAAQMD) 2017 Clean Air Plan, which includes all feasible measures to reduce emissions of NO_X and ROG, which are ozone precursors, reduce transport of ozone and its precursors, and reduce emissions of fine particulate matter and toxic air contaminants. The Plan focuses on protecting public health and the climate. The Plan is established pursuant to air quality panning requirements defined in the California Health and Safety Code.

In determining consistency with the Clean Air Plan, this analysis considers whether the Project would (1) support the primary goals of the Clean Air Plan, (2) include applicable control measures from the Clean Air Plan, and (3) avoid disrupting or hindering implementation of control measures identified in the Clean Air Plan.

The 2017 Clean Air Plan defines a control strategy based on reducing emissions from all key sources, reducing "super-GHGs",[1] decreasing demand for fossil fuels, and decarbonizing the energy system. The control strategy contains 85 control measures that are specific actions to reduce air pollutants and GHGs in the San Francisco Bay Area Air Basin. These control strategies are grouped into the following categories:

- Stationary source measures;
- Transportation control measures;
- Energy control measures;
- Building control measures;
- Agricultural control measures;
- Natural and working lands control measures;
- Waste management control measures;
- Water control measures; and
- Super-GHG control measures

Many of the 85 control measures are beyond the scope and control of the Project. Some address stationary sources and will be implemented by BAAQMD using its permit authority and therefore are not suited to implementation through local planning efforts or project approval actions. The Clean Air Plan measures potentially applicable to the Project are listed below along with how the Project would be consistent with the measures. The measures are largely directed at BAAQMD action. The summary below describes how Project features would support the BAAQMD's implementation of the measures.

[1] "Super-GHGs" are defined in the Clean Air Plan as methane, black carbon, and fluorinated gases.

Table 1. Consistency of Project with CAP Community Strategies		
Measure	**Measure Description**[2]	**Project Consistency**
TR1 - Clean Air Teleworking Initiative	Develop teleworking best practices for employers and develop additional strategies to promote telecommuting. Promote teleworking on Spare the Air Days.	**Supporting.** Many of the Project's employees have the ability to telecommute and the Project promotes commuting by non-single-occupancy vehicles through its TDM (see below).
TR2 - Trip Reduction Programs	Implement the regional Commuter Benefits Program (Rule 14-1) that requires employers with 50 or more Bay Area employees to provide commuter benefits. Encourage trip reduction policies and programs in local plans, e.g., general and specific plans while providing grants to support trip reduction efforts. Encourage local governments to require mitigation of vehicle travel as part of new development approval, to adopt transit benefits ordinances in order to reduce transit costs to employees, and to develop innovative ways to encourage rideshare, transit, cycling, and walking for work trips. Fund various employer-based trip reduction programs.	**Supporting.** The Project would implement Transportation Demand Management (TDM) programs for the Campus District, Town Square District, and Residential/Shopping District. The Project's TDM programs may include, but is not limited to, the following measures: • Improve biking/walking network • Provide bicycle amenities • Improve public transit service • Car share program • Tram service • Commuter shuttles • Parking management • Emergency ride-home program • Carpool and vanpool programs • Commute assistance center • On-site housing The Project would include a commuter shuttle service for Campus District workers and a Campus District trip cap.
TR5 - Transit Efficiency and Use	Improve transit efficiency and make transit more convenient for riders through continued operation of 511 Transit, full implementation of Clipper® fare payment system and the Transit Hub Signage Program.	**Supporting**. While the explicit requirements of this measure are outside the control of the Project, the Project would be making improvements to intersections, bike lanes and pedestrian connections that will upgrade infrastructure that will benefit roadways, pedestrian and bicycle circulation systems, which will benefit transit efficiency.
TR8 - Ridesharing	Promote carpooling and vanpooling by providing funding to continue regional and local ridesharing programs, and support the expansion of carsharing programs. Provide incentive funding for pilot	**Supporting.** The proposed Project would implement trip reduction programs as part of the TDM programs that may include, but is not limited to, carpool and vanpool programs, tram service, and commuter shuttles.

[2] Bay Area Air Quality Management District, 2017. Spare the Air Cool the Climate: Final 2017 Clean Air Plan. Available at: https://www.baaqmd.gov/~/media/files/planning-and-research/plans/2017-clean-air-plan/attachment-a_-proposed-final-cap-vol-1-pdf.pdf

	projects to evaluate the feasibility and cost-effectiveness of innovative ridesharing and other last-mile solution trip reduction strategies. Encourage employers to promote ridesharing and carsharing to their employees.	
TR9 - Bicycle and Pedestrian Access and Facilities	Encourage planning for bicycle and pedestrian facilities in local plans, e.g., general and specific plans, fund bike lanes, routes, paths and bicycle parking facilities.	**Supporting.** The Project promotes walking, biking, and other sustainable transportation through approximately two miles of dedicated pedestrian walks, one mile of bicycle paths and lanes, and a two-acre elevated park that provides safe and convenient access to Willow Village while relieving traffic circulation on the road below. The elevated park would connect the Project Site to the adjacent Belle Haven neighborhood via an overpass at Willow Road with bicycle and pedestrian access from Hamilton Avenue Parcel North. The Project would create a bicycle- and pedestrian-friendly environment that enhances connectivity between the Project Site and surrounding areas. The Project would also include the addition of the Willow Tunnel, which would provide pedestrian and bicycle access to the Bay Trail via a separate path, reducing the use of surface streets. The Project provides a connection from existing pedestrian and bicycle paths to the Bay Trail. Safety lighting for vehicles and pedestrians would be provided. Passenger loading and building servicing would be designed to minimize conflicts between pedestrians and vehicles.
TR10 - Land Use Strategies	Support implementation of Plan Bay Area, maintain and disseminate information on current climate action plans and other local best practices, and collaborate with regional partners to identify innovative funding mechanisms to help local governments address air quality and climate change in their general plans.	**Supporting.** The Project consists of a dense, walkable, mixed-used development that balances jobs and housing while considering safety, traffic, retail amenities, and other community needs. The Project would be designed to meet LEED Gold standards or equivalent, and implements features that reduce air pollutant and greenhouse gas emissions, such as extensive TDM program, electrification of buildings, besides culinary, and purchase of 100% carbon-free electricity. More discussion on the Project's consistency with Plan Bay Area can be found in Appendix B.
TR13 - Parking Policies	Encourage parking policies and programs in local plans, e.g., reduce minimum parking requirements; limit the supply of off-street parking in transit-oriented areas; unbundle the price of parking spaces; support implementation of demand-based pricing (such as "SF Park") in high-traffic areas.	**Supporting.** The Project would limit parking below permitted City code maximum and would include shared parking. The Project also proposes a reduced parking ratio for senior housing. The price of parking spaces would be unbundled for market-rate housing.
TR14 - Cars and Light Trucks	Commit regional clean air funds toward qualifying vehicle purchases and infrastructure development. Partner with private, local, state and federal	**Supporting.** The Project would offer an advanced EV charging program to Campus District employees. Electric vehicle (EV) charging in the Campus District is free and valets move cars into chargers to maximize charging time.

	programs to promote the purchase and lease of battery-electric and plug-in hybrid electric vehicles.	The proposed Project would also install EV charging stations in the Residential/Shopping District and Town Square District.
TR22 - Construction, Freight and Farming Equipment	Provide incentives for the early deployment of electric, Tier 3 and 4 off-road engines used in construction, freight and farming equipment. Support field demonstrations of advanced technology for off-road engines and hybrid drive trains.	**Supporting**. The majority of the construction equipment used during the construction of the Project would have Tier 4 engines.
EN1 - Decarbonize Electricity Production	Engage with PG&E, municipal electric utilities and CCEs to maximize the amount of renewable energy contributing to the production of electricity within the Bay Area as well as electricity imported into the region. Work with local governments to implement local renewable energy programs. Engage with stakeholders including dairy farms, forest managers, water treatment facilities, food processors, public works agencies and waste management to increase use of biomass in electricity production.	**Supporting.** The Project would install solar photovoltaic that would be designed to produce approximately 3,900,000 kWh per year of renewable electricity. The Project would purchase 100% carbon free electricity for the Campus District and any non-carbon free power used in the Residential/Shopping and Town Square Districts would be offset by the solar produced onsite.
BL1 - Green Buildings	Collaborate with partners such as KyotoUSA to identify energy-related improvements and opportunities for onsite renewable energy systems in school districts; investigate funding strategies to implement upgrades. Identify barriers to effective local implementation of the CALGreen (Title 24) statewide building energy code; develop solutions to improve implementation/enforcement. Work with ABAG's BayREN program to make additional funding available for energy-related projects in the buildings sector. Engage with additional partners to target reducing emissions from specific types of buildings.	**Supporting**. This action is directed at the Air District. However, the Project incorporates the goals associated with this measure. The Project would comply with building energy code and would be designed to meet LEED Gold standards or equivalent.
BL2 - Decarbonize Buildings	Explore potential Air District rulemaking options regarding the sale of fossil fuel-based space and water heating systems for both residential and commercial use. Explore incentives for property owners to replace their furnace, water heater or natural-gas powered appliances with zero-carbon alternatives. Update Air District guidance documents to recommend that commercial and multi-family	**Supporting**. This action is directed at the Air District. However, the Project incorporates the goals associated with this measure. The Project would be entirely electrically powered with the exception of commercial culinary uses, which supports the decarbonization of buildings.

	developments install ground source heat pumps and solar hot water heaters.	
BL4 - Urban Heat Island Mitigation	Develop and urge adoption of a model ordinance for "cool parking" that promotes the use of cool surface treatments for new parking facilities, as well existing surface lots undergoing resurfacing. Develop and promote adoption of model building code requirements for new construction or re-roofing/roofing upgrades for commercial and residential multi-family housing. Collaborate with expert partners to perform outreach to cities and counties to make them aware of cool roofing and cool paving techniques, and of new tools available.	**Supporting**. The Project would include cool roofs and may include cool parking. The Project would demolish existing parking lots and would provide parks and vegetation lined roadways. Surface parking would largely be replaced by parking structures with solar ready rooftops.
NW2 - Urban Tree Planting	Develop or identify an existing model municipal tree planting ordinance and encourage local governments to adopt such an ordinance. Include tree planting recommendations the Air District's technical guidance, best practices for local plans and CEQA review.	**Supporting.** The Project would install approximately 700 new trees in the streets, parks and planned open spaces. Trees would be on average a 36" box or greater at the time of installation.
WA3 - Green Waste Diversion	Develop model policies to facilitate local adoption of ordinances and programs to reduce the amount of green waste going to landfills.	**Supporting**. The Project would implement a waste reduction strategy in the Campus District that has shown to divert over 80 percent of waste in existing campuses.
WA4 - Recycle and Waste Reduction	Develop or identify and promote model ordinances on community-wide zero waste goals and recycling of construction and demolition materials in commercial and public construction projects.	
WR2 - Support Water Conservation	Develop a list of best practices that reduce water consumption and increase on-site water recycling in new and existing buildings; incorporate into local planning guidance.	**Supporting**. The Project would be designed to meet LEED Gold standards or equivalent and would implement features that reduce water consumption. The Project would also utilize recycled water. The source of recycled water for Willow Village is West Bay Sanitary District's Bayfront Recycled Water Plant that is anticipated to generate recycled water to accommodate existing and future development within Menlo Park's Bayfront District. In the event that West Bay Sanitary District is unable to advance the Bayfront Recycled Water Plant, as an alternative the project proposes on-site recycled water facilities consisting of four plants; one serving the office district, one serving the town square district and two

		serving the residential/shopping district. Combined the four on-site plants would meet the peak non-potable water demands for the project.

The Project would meet community needs through planned local retail spaces, restaurants, a grocery store and pharmacy, as well as publicly accessible parks and planned open spaces. Construction phasing prioritizes amenities that serve the community, such as the grocery store and the park, which will serve to reduce VMT, particularly since the existing community is underserved with respect to grocery stores and pharmacies.

In addition, as discussed in the Transportation Impact Study, the TDM programs would meet City of Menlo Park Municipal Code requirements. The Project would also add new retail and a grocery store and pharmacy to an area that lacks these resources. The TDM programs would reduce traffic in the area, but also reduce emissions of criteria air pollutants and toxic air contaminants locally.

The Project plan includes these numerous design and operational measures to promote sustainability and environmental stewardship, which would act to reduce Project-related area and mobile source emissions. By implementing these measures while also considering community needs, the Project supports the goals of the Clean Air Plan and is consistent with applicable control measures from the plan. As discussed above, the Project includes many applicable control measures in its plan, as summarized in Table 1 above.

APPENDIX B
CONSISTENCY WITH GREENHOUSE GAS PLANS

CEQA ANALYSIS
CONFLICT WITH APPLICABLE PLANS, POLICIES OR REGULATIONS ADOPTED FOR THE PURPOSE OF REDUCING THE EMISSIONS OF GREENHOUSE GASES
WILLOW VILLAGE
MENLO PARK, CALIFORNIA

There are local, regional, and state policies, plans and regulations aimed at reducing emissions of greenhouse gases. The Project's consistency with the City of Menlo Park Climate Action Plan (CAP), along with SB 743, Plan Bay Area 2040, Plan Bay Area 2050, Advanced Clean Cars Initiative and the State's Zero-Emission Vehicles Mandate, and CARB's 2017 Scoping Plan Update is reviewed. Final Plan Bay Area 2050 was approved on October 21, 2021, but consistency with both Plan Bay Area 2040 and Plan Bay Area 2050 are presented to be conservative.

The City of Menlo Park CAP has been adopted for the purposes of reducing GHG emissions locally. Although not legislatively adopted, Executive Order S-03-05 establishes a long-term statewide goal to reduce GHG emissions to 80 percent below 1990 levels by 2050. SB 743 was passed to reduce greenhouse gas emissions and promote multi-modal transportation networks, providing clean, efficient access to destinations and improving public heath through active transportation. Plan Bay Area has been adopted to establish targets and strategies intended to meet the region's needs for housing at all income levels, while reducing GHGs associated with private passenger and light duty truck traffic. The Advanced Clean Cars Initiative and the State's Zero-Emission Vehicles Mandate were established to set a target of reaching 1.5 million ZEVs (meaning battery electric vehicles and fuel cell electric vehicles) and plug-in hybrid electric vehicles on California's roadways by 2025. CARB's 2017 Scoping Plan outlines the main strategies for California to achieve the legislated GHG emissions target for 2030 and "substantially advance toward our 2050 climate goals." It identifies the reductions needed by each GHG emissions sector (e.g., industry, transportation, electricity generation).

Consistency with City of Menlo Park Climate Action Plan

As discussed above, the City of Menlo Park adopted a CAP in 2009 to reduce municipal government and community GHG emissions. In July 2020, the City released a report[1] that updated the CAP with emissions for the years 2005 and 2017 and forecasted emissions to 2030. The 2030 Climate Action Plan provided a list of CAP projects intended to achieve a goal of "zero emissions by 2030". The report was amended in April 2021 to incorporate the scope of work for 2021 implementation. As such, the Project is evaluated for consistency with the 2030 Climate Action Plan Amended 2021, as shown in Table 1.

As shown in Table 3.5-6, the Project would not conflict with any of the applicable measures in the City's CAP. Further, because the Project would not result in GHG emissions that exceed the applicable thresholds, the Project would not impede achievement of the City's CAP GHG emissions reduction target. For the reasons described below, the Project does not conflict with the implementation of the CAP.

Table 1. Consistency of Project with CAP Community Strategies		
Category	**Strategy**	**Project Consistency**
Energy	Explore policy/program options to convert 95% of existing buildings to all-electric by 2030	**Not applicable.** The Project is new construction and would not convert any existing buildings. The proposed Project would be entirely electrically powered with the exception of commercial culinary uses. The residential buildings would be entirely electrically powered.
	Eliminate the use of fossil fuels from municipal operations	**Not applicable.** The proposed Project is not a municipal project.
Transportation	Support setting citywide goal for increasing EVs and decreasing gasoline sales	**Consistent.** The proposed Project would offer an advanced EV charging program to Campus employees. EV charging in the Campus District is free and valets move cars into chargers to maximize charging time. The proposed Project would also install EV charging stations in the Residential/Shopping District.
	Expand access to EV charging for multifamily and commercial properties	**Consistent.** The proposed Project would install EV charging capabilities consistent with the City of Menlo Park Code, including residential and commercial areas on the main Project Site, expanding access to EV chargers.
	Reduce vehicle miles traveled (VMT) by 25% or an amount recommended by the Complete Streets Commission	**Consistent.** The proposed Project would implement TDM programs for the Campus District, Town Square District, and Residential/Shopping District. The Project's TDM programs may include, but are not limited to, the following measures: • Improve biking/walking network • Provide bicycle amenities • Improve public transit service • Car share program • Tram service • Commuter shuttles • Parking management • Emergency ride-home program • Carpool and vanpool programs • Commute assistance center • On-site housing The TDM programs would meet City of Menlo Park Municipal Code TDM requirements. The Project would also add new retail and a grocery store to an area that lacks these resources.
Water	Develop a climate adaptation plan to protect	**Not applicable.** This action is directed toward the City. However, the proposed Project is incorporating resiliency with respect to sea level rise and flooding into its civil plan. As part of the

	the community from sea level rise and flooding	design effort, building finished floor elevations will be proposed to meet City of Menlo Park code and to accommodate a future rise in sea levels: • Raise the building sites through grading activities to a minimum grade elevation of 13 ft NAVD, a minimum of 2 feet above the Base Flood Elevation of 11 ft NAVD. • Proposed buildings will have a minimum finished floor elevation of at least 14 ft NAVD88 and are set high enough such that it is likely site adaptations would not be necessary for even the highest estimates of sea level rise for the useful life of the project. • The entire project storm drain system is designed to drain to the City storm drain main in willow, which in turn drains to the Ravenswood Pump Station (operated by CalTrans) located northeast of the Project site along Bayfront Expressway. The storm drain system is therefore not hydraulically connected to the Bay and will not be impacted by sea level rise.

Consistency with SB 743

SB 743 eliminated vehicular congestion, traditionally expressed as Level of Service (LOS), as the operative metric for identifying transportation impacts, and replaced it with Vehicle Miles Traveled (VMT). The Project would not exceed the City's thresholds of significance for VMT, which are consistent with OPR's 2018 Technical Advisory on Evaluating Transportation Impacts in CEQA, which OPR published to address the changes from SB 743.[2] Therefore, the Project does not conflict with the implementation of SB 743.

Consistency with Plan Bay Area 2040 and Plan Bay Area 2050

Pursuant to California Senate Bill 375, the Association of Bay Area Governments (ABAG) and the Metropolitan Transportation Commission (MTC) adopted *Plan Bay Area 2050* to establish the region's long-term strategic plan focused on the interrelated elements of housing, the economy, transportation, and the environment. *Plan Bay Area 2050*'s core strategy is encouraging growth in existing communities along the existing transportation network, focusing new development in Priority Development Areas (PDAs) and Transit Priority Areas (TPAs) within urbanized centers where there is more public transit and other mobility options available to reduce driving by cars and light trucks. In addition to significant transit and roadway performance investments to encourage focused growth, *Plan Bay Area 2050* directs funding to neighborhood active transportation and complete streets projects, climate initiatives, lifeline transportation and access initiatives, pedestrian and bicycle safety programs, and PDA planning. The *Plan Bay Area 2050* report was recently approved in October 2021, before which *Plan Bay Area 2040* was the most recent final version. The Project is conservatively evaluated for consistency with *Plan Bay Area 2040* and *Plan Bay Area 2050*, as shown in Tables 2 and 3 below. For the reasons described below, the Project does not conflict with the implementation of *Plan Bay Area 2040* or *Plan Bay Area 2050*.

[2] Governor's Office of Planning and Research, State of California. 2018. Technical Advisory on Evaluating Transportation Impacts in CEQA. December. Available at: http://opr.ca.gov/docs/20190122-743_Technical_Advisory.pdf

Table 2. Consistency of Project with Plan Bay Area 2040		
Category	**Strategy**	**Project Consistency**
Climate Protection	Reduce per-capita CO_2 emissions	**Consistent**. The proposed Project would be entirely electrically powered with the exception of commercial culinary uses. The residential buildings would be entirely electrically powered. The proposed Project would offer an advanced EV charging program to Facebook employees. EV charging in the Campus District is free and valets move cars into chargers to maximize charging time. The proposed Project would also install EV charging stations in the Residential/Shopping District. The proposed Project would implement a TDM program for the entire project. The Project's TDM program may include, but is not limited to, the following measures: • Improve biking/walking network • Provide bicycle amenities • Improve public transit service • Car share program • Tram service • Commuter shuttles • Parking management • Emergency ride-home program • Carpool and vanpool programs • Commute assistance center • On-site housing
Adequate Housing	House the region's population	**Consistent**. The proposed Project would include up to 1,730 residential dwelling units.
Healthy and Safe Communities	Reduce adverse health impacts	**Consistent**. The proposed Project would not result in the exposure of future residents or nearby off-site sensitive receptors to adverse health effects exceeding BAAQMD thresholds for excess cancer risk, chronic HI, or $PM_{2.5}$ concentration. Furthermore, the Project would use Tier 4 construction equipment for the majority of Project construction activities, as specified in the mitigation measure, which reduces the health impact on the community. The Project's TDM and EV programs also reduce the health impact from mobile sources.
Open Space and Agricultural Preservation	Direct development within urban footprint	**Consistent**. The proposed Project would include a publicly accessible park, a dog park, an elevated park, and a town square to provide green space to the residents, employees, visitors, and surrounding neighborhood. The proposed Project is redevelopment of an underutilized site in the urban footprint.

Equitable Access	Decrease share of lower-income households' budgets spent on housing and transportation	**Consistent**. The proposed Project would include 308 units of affordable housing. Furthermore, the Project would bring amenities (e.g., local serving retail like a grocery store and pharmacy) to an existing neighborhood that does not have amenities, which would reduce transportation needs.
	Increase share of affordable housing	**Consistent**. The proposed Project would include 308 units of affordable housing.
	Do not increase share of households at risk of displacement	**Consistent**. The proposed Project would include the demolition of existing office, industrial, and warehouse buildings and construction of up to 1,730 new residential dwelling units. The Project would not result in displacement of existing housing.
Economic Vitality	Increase share of jobs accessible in congested conditions	**Consistent**. The proposed Project would collocate jobs and housing in a congested area.
	Increase jobs in middle-wage industries	**Consistent**. The proposed Project would add up to 200,000 square feet of retail in an area currently without amenities, and a hotel, increasing middle-wage jobs.
	Reduce per-capita delay on freight network	**Not applicable.** This action is not directly applicable to the proposed Project.
Transportation System Effectiveness	Increase non-auto mode share	**Consistent**. The proposed Project would develop housing units, retail and office space near existing residential, office, commercial, and light manufacturing uses, reducing the demand for travel by single occupancy vehicles. The proposed Project would also implement a TDM program that may include, but is not limited to, the following measures: • Improve biking/walking network • Provide bicycle amenities • Improve public transit service • Car share program • Tram service • Commuter shuttles • Parking management • Emergency ride-home program • Carpool and vanpool programs • Commute assistance center • On-site housing
	Reduce vehicle operating and maintenance costs due to pavement conditions	**Consistent.** The roads would be maintained consistent with municipal requirements.

	Reduce per-rider transit delay due to aged infrastructure	**Not applicable.** This action is not directly applicable to the proposed Project. The Project will be making improvements to intersections, bike lanes and pedestrian connections that will upgrade infrastructure that will benefit transit.

Table 3. Consistency of Project with Plan Bay Area 2050

Category		Strategy	Project Consistency
Housing Strategies	Protect and Preserve Affordable Housing	Further strengthen renter protections beyond state law	**Not applicable**. This action is not directly applicable to the proposed Project as this requires Municipal action.
		Preserve existing affordable housing	**Not applicable**. This action is not directly applicable to the proposed Project. The proposed Project would include the demolition of existing office, industrial, and warehouse buildings and construction of up to 1,730 new residential dwelling units. The Project would not result in displacement of existing affordable housing and would add additional affordable housing to the area.
	Spur Housing Production for Residents of All Income Levels	Allow a greater mix of housing densities and types in Growth Geographies	**Not applicable.** This action is not directly applicable to the proposed Project as it is not located in a Growth Geography; however, the proposed Project would develop housing units, retail, and office space near existing residential, office, commercial, and light manufacturing uses.
		Build adequate affordable housing to ensure homes for all	**Consistent**. The proposed Project would include 308 units of affordable housing.
		Integrate affordable housing into all major housing projects	**Consistent**. The proposed Project would include 308 units of affordable housing.
		Transform aging malls and office parks into neighborhoods	**Consistent**. The proposed Project would demolish aging office, industrial, and warehouse buildings and would include construction of up to 1,730 new residential dwelling units as part of a mix use neighborhood also including retail, hotel, and office uses.

	Create Inclusive Communities	Provide targeted mortgage, rental and small business assistance to Equity Priority Communities	**Not applicable**. This action is not directly applicable to the proposed Project as this requires Municipal action.
		Accelerate reuse of public and community-owned land for mixed-income housing	**Not applicable**. This action is not directly applicable to the proposed Project as it does not utilize any public or community-owned land.
Economic Strategies	Improve Economic Mobility	Implement a statewide universal basic income	**Not applicable**. This action is not directly applicable to the proposed Project as it requires statewide action.
		Expand job training and incubator programs	**Not applicable**. This action is not directly applicable to the proposed Project as this requires Municipal action.
		Invest in high-speed internet in underserved low-income communities	**Not applicable**. This action is not directly applicable to the proposed Project as this requires Municipal action.
	Shift the Location of Jobs	Allow greater commercial densities in Growth Geographies	**Not applicable**. This action is not directly applicable to the proposed Project; however, the proposed Project would add up to 200,000 square feet of retail in an area currently without amenities, and a hotel.
		Provide incentives to employers to shift jobs to housing-rich areas well served by transit	**Not applicable**. This action is not directly applicable to the proposed Project; however, the proposed Project would co-locate jobs and housing.
		Retain and invest in key industrial lands	**Not applicable**. This action is not directly applicable to the proposed Project which is not located on key industrial lands.
Transportation Strategies	Maintain and Optimize the Existing System	Restore, operate and maintain the existing system	**Not applicable**. This action is not directly applicable to the proposed Project. However, the Project would be making improvements to intersections, bike lanes and pedestrian connections that will upgrade infrastructure that will benefit roadways, pedestrian and bicycle circulation systems.
		Support community-led transportation enhancements in Equity Priority Communities.	**Not applicable.** This action is not directly applicable to the proposed Project. However, the Project would be making improvements to intersections, bike lanes and pedestrian connections that will enhance transportation in the community.

		Enable a seamless mobility experience	**Not applicable**. This action is not directly applicable to the proposed Project as it requires coordination among the regions existing transit agencies.
		Reform regional transit fare policy	**Not applicable**. This action is not directly applicable to the proposed Project as it requires coordination among the regions existing transit agencies.
		Implement per-mile tolling on congested freeways with transit alternatives	**Not applicable**. This action is not directly applicable to the proposed Project as it requires regional/Caltrans action.
		Improve interchanges and address highway bottlenecks	**Not applicable**. This action is not directly applicable to the proposed Project. The Project would be implementing TDM programs and making improvements to intersections, bike lanes and pedestrian connections that will improve transportation and decrease single-occupancy commuter vehicles.
		Advance other regional programs and local priorities	**Not applicable**. This action is not directly applicable to the proposed Project. The Project will be making improvements to local intersections, bike lanes and pedestrian connections, which help fulfill local transportation priorities.
	Create Healthy and Safe Streets	Build a Complete Streets network	**Consistent**. The proposed Project would enhance streets to promote walking, biking, and other micro-mobility by improving biking and walking networks and providing bicycle amenities.
		Advance regional Vision Zero policy through street design and reduced speeds	**Consistent.** The Project would comply with City of Menlo Park requirements in support of Vision Zero.
	Build a Next-Generation Transit Network	Enhance local transit frequency, capacity and reliability	**Not applicable.** This action is not directly applicable to the proposed Project; however, the proposed Project would include a private shuttle and tram system for the office uses.
		Expand and modernize the regional rail network	**Not applicable.** This action is not directly applicable to the proposed Project as this requires regional and state level action.

		Build an integrated regional express lanes and express bus network	**Not applicable.** This action is not directly applicable to the proposed Project as this requires regional and Caltrans action.
Environmental Strategies	Reduce Risks from Hazards	Adapt to sea level rise	**Not applicable.** This action is directed toward the City. However, the proposed Project is incorporating resiliency with respect to sea level rise and flooding into its civil plan. As part of the design effort, building finished floor elevations will be proposed to meet City of Menlo Park code and to accommodate a future rise in sea levels: • Raise the building sites through grading activities to a minimum grade elevation of 13 ft NAVD, a minimum of 2 feet above the Base Flood Elevation of 11 ft NAVD. • Proposed buildings will have a minimum finished floor elevation of at least 14 ft NAVD88 and are set high enough such that it is likely site adaptations would not be necessary for even the highest estimates of sea level rise for the useful life of the buildings. • • The entire project storm drain system is designed to drain to the City storm drain main in willow, which in turn drains to the Ravenswood Pump Station (operated by CalTrans) located northeast of the Project site along Bayfront Expressway. The storm drain system is not hydraulically connected to the Bay and will not be impacted by sea level rise.
		Provide means-based financial support to retrofit existing residential buildings	**Not applicable.** This action is not directly applicable to the proposed Project as it does not include retrofit of any existing buildings.
		Fund energy upgrades to enable carbon neutrality in all existing commercial and public buildings	**Not applicable.** The Project is new construction and would not convert any existing buildings; however, the proposed Project would be entirely electrically powered with the exception of commercial culinary uses, with a commitment to purchase 100% carbon free power, where

			possible. The Project also would replace old less efficient buildings with new efficient buildings.
	Expand Access to Parks and Open Space	Maintain urban growth boundaries	**Consistent**. The proposed Project would be constructed within an incorporated city on a site currently developed with urban uses.
		Protect and manage high-value conservation lands	**Not applicable.** This action is not directly applicable to the proposed Project as the Project would re-develop aging buildings and is not located in high-value conservation lands.
		Modernize and expand parks, trails and recreation facilities	**Consistent**. The proposed Project would include a publicly accessible park, a dog park, an elevated park, and a town square to provide green space to the residents, employees, visitors, and community members. Streetscapes would also be lined with vegetation. The Project would also provide a connection for the Bay Trail, which is across Bayfront Expressway.
	Reduce Climate Emissions	Expand commute trip reduction programs at major employers	**Consistent**. The proposed Project would implement trip reduction programs as part of the TDM programs that may include, but is not limited to, carpool and vanpool programs, tram service, and commuter shuttles.
		Expand clean vehicle initiatives	**Consistent.** The proposed Project would install EV charging capabilities consistent with the City of Menlo Park Code, expanding access to EV chargers.
		Expand transportation demand management initiatives	**Consistent**. The proposed Project would implement TDM programs that may include, but is not limited to, the following measures: • Improve biking/walking network • Provide bicycle amenities • Improve public transit service • Car share program • Tram service • Commuter shuttles • Parking management • Emergency ride-home program • Carpool and vanpool programs • Commute assistance center • On-site housing

Consistency with Advanced Clean Cars Initiative and the State's Zero-Emission Vehicles Mandate

The Project is consistent with State goals for zero-emission vehicles (ZEVs) as expressed in the Advanced Clean Cars Initiative and the ZEV goal established by Executive Order B-16-12, which sets a target of reaching 1.5 million ZEVs (meaning battery electric vehicles and fuel cell electric vehicles) and plug-in hybrid electric vehicles on California's roadways by 2025. The Project is also consistent with State goals established by Executive Order N-79-20, which sets a target that 100 percent of in-state sales of new passenger cars and trucks will be zero-emission by 2035.

The Project supports these ZEV goals by installing EV charging capabilities consistent with the City of Menlo Park Code. The Project would also have a comprehensive EV charging program in its Campus District, which would incentivize the further penetration of EVs into the fleet. EV chargers would also be installed with the Project in Mixed Use land uses, including residential areas, contributing to emissions reductions due to increased eVMT charged by the Project chargers. Therefore, the Project does not conflict with the implementation of this initiative.

Consistency with 2017 Scoping Plan Update

As directed by SB 32, CARB's 2017 Scoping Plan Update describes how the State plans to achieve the 2030 GHG emission reduction goal for California of 40 percent below 1990 levels by 2030. The 2017 Scoping Plan Update's strategy for meeting the State's 2030 GHG target incorporates the full range of legislative actions and state-developed plans that have relevance to the year 2030, including the LCFS, SB 350, the 2016 Mobile Source Strategy, the Sustainable Freight Action Plan, SB 1383, and the State's Cap-and-Trade Program (AB 398). The 2017 Scoping Plan Update does not regulate local land use projects. The 2017 Scoping Plan Update regulates the emissions associated with such projects (i.e., electricity, fuel, etc.), but not the projects themselves.

The Project would be consistent with key State plans and regulatory requirements referenced in the 2017 Scoping Plan Update designed to reduce statewide emissions. According to the 2017 Scoping Plan Update, reductions needed to achieve the 2030 target are expected to be achieved by increasing the RPS to 50 percent of the State's electricity by 2030, greatly increasing the fuel economy of vehicles and the number of zero-emission or hybrid vehicles, reducing the rate of growth in VMT, supporting high speed rail and other alternative transportation options, and increasing the use of high efficiency appliances, water heaters, and HVAC systems. The Project would support and would not impede implementation of these potential reduction strategies identified by CARB, and it would benefit from statewide and utility-provider efforts towards increasing the portion of electricity provided from renewable resources.[3] The Project would also benefit from statewide efforts towards increasing the fuel economy standards of vehicles and reducing the carbon content of fuels. The Project would utilize energy efficiency appliances and equipment, as required by Title 24, and it would provide EV charging stations to support the future use of electric and hybrid-electric vehicles by employees and visitors traveling to and from the site. The Project would install EV charging capabilities consistent with the City of Menlo Park Code. The electricity for EV charging at the Project would be supplied with 100% renewable and/or carbon free energy. For these reasons, the Project would be consistent with the objectives of the 2017 Scoping Plan Update.

[3] As discussed previously, with the passage of SB 100, California's RPS has been increased over what is prescribed by the 2017 Scoping Plan Update, requiring retail sellers and local publicly-owned electric utilities to procure eligible renewable electricity for 44 percent of retail sales by the end of 2024, 52 percent by the end of 2027, and 60 percent by the end of 2030; and requires that CARB should plan for 100 percent eligible renewable energy resources and zero-carbon resources by the end of 2045.

The Project will be much more efficient on average than existing development in the City and far more efficient than what the Scoping Plan assumes for new development throughout the state.

In addition, the Project is consistent with the 2017 Scoping Plan Update's guidance on mitigation measures: "To the degree a project relies on GHG mitigation measures, CARB recommends that lead agencies prioritize on-site design features that reduce emissions, especially from VMT, and direct investments in GHG reductions within the project's region that contribute potential air quality, health, and economic co-benefits locally. For example, on-site design features to be considered at the planning stage include land use and community design options that reduce VMT, promote transit-oriented development, promote street design policies that prioritize transit, biking, and walking, and increase low carbon mobility choices, including improved access to viable and affordable public transportation, and active transportation opportunities." (CARB, 2017). The Project's design reduces VMT because it provides a mix of land uses and includes pedestrian features to promote walking. The Project would include multiuse pathways to promote bicycle and pedestrian connectivity both within and through the main Project Site. The Project would also provide retail land uses in a retail desert, placing a grocery and pharmacy in close proximity to the adjacent Belle Haven neighborhood. In addition, the Project's TDM Plan include features to reduce VMT.

For the reasons described above, the Project does not conflict with the implementation of the 2017 Scoping Plan Update.

APPENDIX C
DATA RECEIVED

Instructions: Please fill in all cells highlighted in yellow. Please confirm or update cells highlighted in orange

Daily Trips Rates and VMT

Land Use	Fleet Type / Land Use	Daily Project Trip Rates (Weekday)				Daily Project VMT (Weekday) (including reductions for passby and diverted trips)				EV Percentage of Fleet[1]
		End of Phase 1a	End of Phase 1b	End of Phase 2	TOTAL (trips/1,000 sf)	End of Phase 1a	End of Phase 1b	End of Phase 2	TOTAL	
Faceook Office - Existing 2019	Cars (per 1,000 s.f.)				9.19				110,860	--
	Trucks (per 1,000 s.f.)				0.22				2,640	N/A
	Shuttles (per 1,000 s.f.)				0.66				21,088	0%
	On-Demand (per 1,000 s.f.)				0.66				7,919	38%
Facebook Office	Cars (per 1,000 s.f.)	9.16	10.05	10.05		53,996	178,766	178,766		--
	Trucks (per 1,000 s.f.)	0.23	0.23	0.23		1,344	4,056	4,056		N/A
	Shuttles (per 1,000 s.f.)	1.32	0.44	0.44		21,088	21,088	21,088		0%
	On-Demand (per 1,000 s.f.)	0.68	0.68	0.68		4,031	12,168	12,168		38%
Mixed Use	Residential (per d.u.)	4.35	4.35	4.35		30,841	43,077	71,524		EMFAC2021 Default
	Retail[3] (per 1,000 s.f.)	25.07	25.07	25.07		25,195	33,587	33,594		EMFAC2021 Default
	Park (per acre)	42.80	42.80	42.80		860	860	1,147		EMFAC2021 Default
	Hotel (per room)	--	6.69	6.69		--	14,814	14,814		EMFAC2021 Default

Notes:

1. Dashes indicate EV percentage will be calculated elsewhere based on charger usage data provided by Facebook.
   Trucks are marked N/A as none of the vehicle categories within the fleet are electric (as shown in the upper table).
   Assume EV percentage of On-Demand remains the same between existing conditions and full buildout. Existing EV Percentage previously provided by Facebook.
   The default EMFAC2021 electrification for San Mateo county will be assumed for vehicles operating in the Mixed Use district.
2. Estimate of trip rate reductions due to implementation of Transportation Demand Management measures.
3. All non-Facebook office space is classified as Retail.

Instructions

Please provide <u>background</u> traffic volumes for any roadway with over 10,000 vehicles per day in the vicinity of the project.

Roadway	Segment Limit		Vehicles Per Day

SIGNATURE DEVELOPMENT GROUP

MEMORANDUM

To: Kyle Perata, City of Menlo Park

From: Faye Brandin, Signature Development Group

Subject: Emergency Backup Generator Memorandum

Date: October 20, 2020 (REVISED December 21, 2021, revisions in red)

Dear Kyle:

This is a memorandum following up the email you sent on July 24th, requesting an update to previously submitted documents on June 5th.

Staff comment:

On June 5th you provided two generator supplemental forms that are slightly different. Can you take a look and let me know why two different forms were submitted? Is one of the forms for the grocery store generator and one for the Office Campus generators?

In addition to the forms, the submittal also included a narrative response that included the detailed specifications for two different generators. I also attached that document for reference.

Would you please review the attached documents and provide me with clarification on the number of generators, general size/specs for the generators, and a site plan showing the anticipated locations of the generators.

In addition to the generator supplemental form, the City also requires submittal of its hazardous materials information form (HMIF), and a chemical inventory (inventory would identify the approximate amount of diesel fuel for each generator) for review of applications involving hazardous materials.

Response:

The information has been updated to include a total of twelve emergency backup generators across Willow Village, four in the Campus District, one in the Town Square District, six for the Residential/Shopping District, and one at the Willow Hamilton North Parcel.

The following items are provided are part of this response:

- Site Plan with anticipated locations of the emergency backup generators (updated)
- Campus District emergency backup generator supplements with the following:
    - Two emergency backup generators to service Meeting, Collaboration, and Conference Space, located inside the north garage, sizes: 103”(W)x201”(L)x119”(H) each;
    - Two emergency backup generators servicing Office Buildings 1, 2, 3, 4, 5, and 6, sizes: 110”(W)x270”(L)x164”(H) each;

- Town Square District: one emergency backup generator to service the Hotel, located inside the basement level of the hotel, size: 77”(W)x167”(L)x78”(H).
- For the Residential/Shopping District, refer to the Preliminary Mixed-Use Emergency Backup Generator Summary and Generator Supplements:
    - Each of the six residential/mixed-use buildings will have their own emergency backup generator
    - Sizes included in the summary from PAE Engineers
- Cut sheet for one generator at the Willow Hamilton North Parcel.

If hazardous materials are associated with emergency backup generator use, we propose submitting the hazardous materials form (HMIF) at the time we submit permits to commence construction on all buildings, but prior to any hazardous materials incidental to all uses, being stored and used on site.

Please do not hesitate to contact me with any questions. I can be reached at (510) 862-5629.

Sincerely,

Faye Brandin

APPLICATIONS INVOLVING HAZARDOUS MATERIALS – GENERATOR SUPPLEMENT

The following information is required for hazardous materials applications that include generators.

GENERATOR PURPOSE (for example, whether it is an emergency generator dedicated to life safety egress lighting and other life safety devices, or a standby generator to allow continued operations in the event of a power outage)

Generator(s) will be used for life safety egress lighting, accessible egress elevator loads and other misc. standby loads.

FUEL TANK SIZE (in gallons) **AND FUEL TYPE** Estimated Diesel tank capacity is 4,000 Gallons	**NOISE RATING** 85 dBA
SIZE (output in both kW (kilowatt) and hp (horsepower) measurements) Estimated generator size (2) @ 750kW	**ENCLOSURE COLOR** Generators located interior of parking garage
ROUTE FOR FUELING HOSE ACCESS Remote fuel station located on exterior of the building	**PARKING LOCATION OF FUELING TRUCK** Exterior, drive up to remote fill station
FREQUENCY OF REFUELING Two times per year	**HOURS OF SERVICE ON A FULL TANK** 24 hours at 100% generator capacity

PROPOSED TESTING SCHEDULE (including frequency, days of week, and time of day)

Monthly, Sunday AM

ALARMS AND/OR AUTOMATIC SHUTOFFS (for leaks during use and/or spills/over-filling during fueling, if applicable)

Double-wall fuel tank with leak detection and remote fuel fill station with automatic shut off and alarms

OTHER APPLICATION SUBMITTAL REQUIREMENTS (please attach)

- Section showing the height of the pad, the isolation base (if there is one), the height of the generator with the appropriate belly (fuel storage tank) and exhaust stack
- Status of required Bay Area Air Qualify Management District (BAAQMD) permit, including confirmation of parental notification for any proposals within 1,000 feet of a school

Memo

Date:	September 23, 2020
Project:	Willow Village Mixed-Use Development
Project Number:	18-1489
To:	Faye Brandin (SDG)
From:	Scott Bevan, PE
Subject:	Mixed-Use Generator Summary (Preliminary)
Distribution:	PAE Team

The purpose of this memo is to provide preliminary on-site emergency power system description and sizing for the mixed-use buildings of the Willow Village Mixed-Use District in Menlo Park, CA.

EMERGENCY POWER SYSTEM SUMMARY

Based on preliminary information, PAE assumes that each mixed-use building will require certain loads to be backed up by generator power due to building codes, operational requirements and owner preference. A dedicated standby generator power system will be provided at each mixed-use building.

Specific loads and tenant requirements are unknown at this time, but it is assumed each generator system will include capacity for (1) fire pump, (1-2) elevator(s), and a provision for non-emergency backup power to Optional Standby tenant loads as determined by tenant. The table below summarizes the load types assumed to require generator backup.

Table 1: Generator Load Types

Classification	System Description	Notes
Life Safety / Emergency (EM)	Emergency Lighting	
	Fire Alarm Panels	
	Fire Pump	Assumed to be required for all buildings.
Legally Required Standby (LRS)	Elevator(s)	All buildings assumed to be five stories or greater.
Optional Standby (OS)	Optional Standby Provision	
	Grocery Tenant (RS2 only)	

Fire pumps are required to have a reliable source of power per CEC 695.3 and NFPA 20. The determination of whether the PG&E service is a reliable source of power is an issue for the AHJ. If the service is deemed to be unreliable, then an alternate source is required, and typically this is a standby diesel generator. Given all the PG&E issues lately, PAE currently assumes that if fire pump is needed at a building, then a generator will be required.

Each standby generator is anticipated to be diesel-engine driven with integral base fuel tank, located within a dedicated indoor equipment room or within an exterior custom acoustic enclosure, constructed in compliance with NFPA 110 requirements. The desired run-time of the generator is unknown at this time but can be approximated to be 8 hours or less.

The generator equipment will be provided with custom acoustic enclosure and/or treatment systems to maintain nighttime and daytime acoustic thresholds at the property line as determined by City of Menlo Park zoning and noise ordinances.

The generator system will operate during utility power interruption in order to maintain critical building operation, or on a monthly basis for testing purposes. The generator system will be selected to meet Tier 2 emission standards and have engine exhaust to the exterior meeting all local city ordinance and code requirements.

Refer to the attached standby generator equipment cutsheets for information on fuel tank volume, acoustic enclosure dimensions, sound data, and weights. These cutsheets are meant to be representative of this equipment. Actual manufacturer equipment shown, and specific equipment attributes are used for preliminary coordination purposes only.

EMERGENCY POWER SYSTEM LOAD SUMMARY

The preliminary generator load summary and recommended generator sizes are shown in the table below. Refer to the appendix for more information. These loads will be refined as the design progresses.

Table 2: Generator Load Summary

BUILDING ID	GENERATOR LOAD (KW)	RECOMMENDED GENERATOR SIZE (KW)
RS2	741	1,000
RS3	571	750
RS4	407	500
RS5	361	500
RS6	199	250
RS7	125	150

End of memo.

APPLICATIONS INVOLVING HAZARDOUS MATERIALS – GENERATOR SUPPLEMENT

The following information is required for hazardous materials applications that include generators.

GENERATOR PURPOSE (for example, whether it is an emergency generator dedicated to life safety egress lighting and other life safety devices, or a standby generator to allow continued operations in the event of a power outage)

Generator is intended to provide backup power to Emergency, Legally Required and Optional Standby loads to support continued facility operations in the event of a utility power outage.

FUEL TANK SIZE (in gallons) **AND FUEL TYPE** Fuel tank size: 660 gallons (approx) Fuel type: diesel	**NOISE RATING** 75.3db(A) @ 7meters
SIZE (output in both kW (kilowatt) and hp (horsepower) measurements) Power output: 1000 kW (approx) Engine output: 1490 hp	**ENCLOSURE COLOR** Green or gray
ROUTE FOR FUELING HOSE ACCESS 75ft max distance, direct from fueling truck to generator fuel tank	**PARKING LOCATION OF FUELING TRUCK** Building exterior at drivable surface
FREQUENCY OF REFUELING 2 times / year	**HOURS OF SERVICE ON A FULL TANK** 9 hours at generator fully rated load

PROPOSED TESTING SCHEDULE (including frequency, days of week, and time of day)

Monthly, Sunday, AM

ALARMS AND/OR AUTOMATIC SHUTOFFS (for leaks during use and/or spills/over-filling during fueling, if applicable)

Fuel system alarms and/or shutdowns: overfill, low fuel, fuel-in-rupture basin alarm.
Engine alarms and/or shutdowns: overspeed, fail start, low oil pressure, high coolant temp, etc.

OTHER APPLICATION SUBMITTAL REQUIREMENTS (please attach)

- Section showing the height of the pad, the isolation base (if there is one), the height of the generator with the appropriate belly (fuel storage tank) and exhaust stack
- Status of required Bay Area Air Qualify Management District (BAAQMD) permit, including confirmation of parental notification for any proposals within 1,000 feet of a school

1000KW GENERATOR

Specification sheet

Diesel generator set QST30 series engine

680 kW - 1000 kW 60 Hz

Description

Cummins® commercial generator sets are fully integrated power generation systems providing optimum performance, reliability and versatility for stationary Standby and Prime power applications.

Features

Cummins heavy-duty engine - Rugged 4-cycle, industrial diesel delivers reliable power, low emissions and fast response to load changes.

Alternator - Several alternator sizes offer selectable motor starting capability with low reactance 2/3 pitch windings, low waveform distortion with non-linear loads and fault clearing short-circuit capability.

Permanent Magnet Generator (PMG) - Offers enhanced motor starting and fault clearing short circuit capability.

Circuit breakers - Option for manually-and/or electrically-operated circuit breakers.

Control system - The PowerCommand® electronic control is standard equipment and provides total generator set system integration including automatic remote starting/stopping, precise frequency and voltage regulation, alarm and status message display, AmpSentry™ protection, output metering, auto-shutdown at fault detection and NFPA 110 Level 1 compliance.

Masterless Paralleling - An optional electrically operated circuit breaker can be added for a simple masterless paralleling solution.

Cooling system - Standard integral set-mounted radiator system, designed and tested for rated ambient temperatures, simplifies facility design requirements for rejected heat.

NFPA - The generator set accepts full rated load in a single step in accordance with NFPA 110 for Level 1 systems.

Warranty and service - Backed by a comprehensive warranty and worldwide distributor network.

	Standby rating	Prime rating	Continuous rating	Data sheets
Model	60 Hz kW (kVA)	60 Hz kW (kVA)	60 Hz kW (kVA)	60 Hz
DQFAA	750 (938)	680 (850)		D-3329
DQFAB	800 (1000)	725 (907)		D-3330
DQFAC	900 (1125)	818 (1023)		D-3331
DQFAD	1000 (1250)	900 (1125)		D-3332

Generator set specifications

Governor regulation class	ISO 8528 Part 1 Class G3
Voltage regulation, no load to full load	± 0.5%
Random voltage variation	± 0.5%
Frequency regulation	Isochronous
Random frequency variation	± 0.25%
Radio frequency emissions compliance	IEC 61000-4-2: Level 4 Electrostatic discharge IEC 61000-4-3: Level 3 Radiated susceptibility

Engine specifications

Bore	140 mm (5.51 in.)
Stroke	165.0 mm (6.5 in.)
Displacement	30.5 L (1860 in^3)
Cylinder block	Cast iron, V 12 cylinder
Battery capacity	1800 amps minimum at ambient temperature of -18 °C to 0 °C (0 °F to 32 °F)
Battery charging alternator	35 amps
Starting voltage	24 volt, negative ground
Fuel system	Direct injection: number 2 diesel fuel, fuel filter, automatic electric fuel shutoff
Fuel filter	Triple element, 10 micron filtration, spin-on fuel filters with water separator
Air cleaner type	Dry replaceable element
Lube oil filter type(s)	Four spin-on, combination full flow filter and bypass filters
Standard cooling system	High ambient radiator

Alternator specifications

Design	Brushless, 4 pole, drip-proof, revolving field
Stator	2/3 pitch
Rotor	Single bearing flexible discs
Insulation system	Class H on low and medium voltage, Class F on high voltage
Standard temperature rise	150 °C Standby at 40 °C ambient
Exciter type	PMG (Permanent Magnet Generator)
Phase rotation	A (U), B (V), C (W)
Alternator cooling	Direct drive centrifugal blower fan
AC waveform Total Harmonic Distortion (THDV)	< 5% no load to full linear load, < 3% for any single harmonic
Telephone Influence Factor (TIF)	< 50 per NEMA MG1-22.43
Telephone Harmonic Factor (THF)	< 3

Available voltages

60 Hz Line – Neutral/Line - Line

• 120/208	• 220/380	• 240/416	• 347/600
• 139/240	• 230/400	• 277/480	

Note: Consult factory for other voltages.

Generator set options

Engine

- 208/240/480 V coolant heater for ambient above 4.5 °C (40 °F)
- 208/240/480 V coolant heater for ambient below 4.5 °C (40 °F)

Control panel

- PowerCommand 3.3 with Masterless Load Demand (MLD)
- Run relay package
- Ground fault indication
- Paralleling configuration
- Remote fault signal package
- Exhaust gas temperature sensor
- 120/240 V 100 W control anti-condensation heater

Alternator

- 80 °C rise
- 105 °C rise
- 150 °C rise
- 120/240 V 300 W anti-condensation heater
- Temperature sensor - RTDs, 2-phase
- Temperature sensor – alternator bearing RTD
- Differential current transformers

Exhaust system

- Critical grade exhaust silencer
- Exhaust packages
- Industrial grade exhaust silencer
- Residential grade exhaust silencer

Cooling system

- High ambient 50 °C radiator

Generator set

- AC entrance box
- Battery
- Battery rack with hold-down - floor standing
- Circuit breaker - set mounted
- Disconnect switch - set mounted
- PowerCommand network
- Remote annunciator panel
- Spring isolators
- 2 year warranty
- 5 year warranty
- 10 year major components warranty

Note: Some options may not be available on all models - consult factory for availability.

PowerCommand 3.3 Control System

An integrated microprocessor based generator set control system providing voltage regulation, engine protection, alternator protection, operator interface and isochronous governing. Refer to document S-1570 for more detailed information on the control.

AmpSentry – Includes integral AmpSentry protection, which provides a full range of alternator protection functions that are matched to the alternator provided.

Power management – Control function provides battery monitoring and testing features and smart starting control system.

Advanced control methodology – Three phase sensing, full wave rectified voltage regulation, with a PWM output for stable operation with all load types.

Communications interface – Control comes standard with PCCNet and Modbus® interface.

Regulation compliant – Prototype tested: UL, CSA and CE compliant.

Service - InPower™ PC-based service tool available for detailed diagnostics, setup, data logging and fault simulation.

Easily upgradeable – PowerCommand controls are designed with common control interfaces.

Reliable design – The control system is designed for reliable operation in harsh environment.

Multi-language support

Operator panel features

Operator/display functions

- Displays paralleling breaker status
- Provides direct control of the paralleling breaker
- 320 x 240 pixels graphic LED backlight LCD
- Auto, manual, start, stop, fault reset and lamp test/panel lamp switches
- Alpha-numeric display with pushbuttons
- LED lamps indicating generator set running, remote start, not in auto, common shutdown, common warning, manual run mode, auto mode and stop

Paralleling control functions

- First Start Sensor System selects first generator set to close to bus
- Phase Lock Loop Synchronizer with voltage matching
- Sync check relay
- Isochronous kW and kVar load sharing
- Load govern control for utility paralleling
- Extended Paralleling (Base Load/Peak Shave) Mode
- Digital power transfer control, for use with a breaker pair to provide open transition, closed transition, ramping closed transition, peaking and base load functions,
- Alternator data
- Line-to-Neutral and Line-to-Line AC volts
- 3-phase AC current
- Frequency
- kW, kVar, power factor kVA (three phase and total)
- Engine data
- DC voltage
- Engine speed
- Lube oil pressure and temperature
- Coolant temperature
- Comprehensive FAE data (where applicable)
- Other data
- Genset model data
- Start attempts, starts, running hours, kW hours
- Load profile (operating hours at % load in 5% increments)
- Fault history
- Data logging and fault simulation (requires InPower)

Standard control functions

Digital governing

- Integrated digital electronic isochronous governor
- Temperature dynamic governing

Digital voltage regulation

- Integrated digital electronic voltage regulator
- 3-phase, 4-wire Line-to-Line sensing
- Configurable torque matching

AmpSentry AC protection

- AmpSentry protective relay
- Over current and short circuit shutdown
- Over current warning
- Single and three phase fault regulation
- Over and under voltage shutdown
- Over and under frequency shutdown
- Overload warning with alarm contact
- Reverse power and reverse Var shutdown
- Field overload shutdown

Engine protection

- Battery voltage monitoring, protection and testing
- Overspeed shutdown
- Low oil pressure warning and shutdown
- High coolant temperature warning and shutdown
- Low coolant level warning or shutdown
- Low coolant temperature warning
- Fail to start (overcrank) shutdown
- Fail to crank shutdown
- Cranking lockout
- Sensor failure indication
- Low fuel level warning or shutdown
- Fuel-in-rupture-basin warning or shutdown
- Full authority electronic engine protection

Control functions

- Time delay start and cool down
- Real time clock for fault and event time stamping
- Exerciser clock and time of day start/stop
- Data logging
- Cycle cranking
- Load shed
- Configurable inputs and outputs (4)
- Remote emergency stop

Options

- Auxiliary output relays (2)

Ratings definitions

Emergency Standby Power (ESP):
Applicable for supplying power to varying electrical load for the duration of power interruption of a reliable utility source. Emergency Standby Power (ESP) is in accordance with ISO 8528. Fuel Stop power in accordance with ISO 3046, AS 2789, DIN 6271 and BS 5514.

Limited-Time Running Power (LTP):
Applicable for supplying power to a constant electrical load for limited hours. Limited-Time running Power (LTP) is in accordance with ISO 8528.

Prime Power (PRP):
Applicable for supplying power to varying electrical load for unlimited hours. Prime Power (PRP) is in accordance with ISO 8528. Ten percent overload capability is available in accordance with ISO 3046, AS 2789, DIN 6271 and BS 5514.

Base Load (Continuous) Power (COP):
Applicable for supplying power continuously to a constant electrical load for unlimited hours. Continuous Power (COP) in accordance with ISO 8528, ISO 3046, AS 2789, DIN 6271 and BS 5514.

Codes and standards

Codes or standards compliance may not be available with all model configurations – consult factory for availability.

	This generator set is designed in facilities certified to ISO 9001 and manufactured in facilities certified to ISO 9001 or ISO 9002.		The generator set is available listed to UL 2200, Stationary Engine Generator Assemblies for all 60 Hz low voltage models. The PowerCommand control is Listed to UL 508 - Category NITW7 for U.S. and Canadian usage. Circuit breaker assemblies are UL 489 Listed for 100% Continuous operation and also UL 869A Listed Service Equipment.
	The Prototype Test Support (PTS) program verifies the performance integrity of the generator set design. Cummins products bearing the PTS symbol meet the prototype test requirements of NFPA 110 for Level 1 systems.	**U.S. EPA**	Engine certified to Stationary Emergency U.S. EPA New Source Performance Standards, 40 CFR 60 subpart IIII Tier 2 exhaust emission levels. U.S. applications must be applied per this EPA regulation.
	All low voltage models are CSA certified to product class 4215-01.	**International Building Code**	The generator set package is available certified for seismic application in accordance with the following International Building Code: IBC2000, IBC2003, IBC2006, IBC2009 and IBC2012.

Warning: Back feed to a utility system can cause electrocution and/or property damage. Do not connect to any building's electrical system except through an approved device or after building main switch is open.

347/600	3-phase	125/105	S/P		3866	1021	ADS-311	B300
347/600	3-phase	105/80	S/P		4234	1024	ADS-312	B301
347/600	3-phase	80	S		4602	1004	ADS-330	B604

Notes:

[1] Limited single phase capability is available from some three phase rated configurations. To obtain single phase rating, multiply the three phase kW rating by the Single Phase Factor[3]. All single phase ratings are at unity power factor.

[2] Standby (S), Prime (P) and Continuous ratings (C).

[3] Factor for the *Single phase output from Three phase alternator* formula listed below.

[4] Maximum rated starting kVA that results in a minimum of 90% of rated sustained voltage during starting.

Formulas for calculating full load currents:

Three phase output

$$\frac{\text{kW} \times 1000}{\text{Voltage} \times 1.73 \times 0.8}$$

Single phase output

$$\frac{\text{kW} \times \text{SinglePhaseFactor} \times 1000}{\text{Voltage}}$$

Warning: Back feed to a utility system can cause electrocution and/or property damage. Do not connect to any building's electrical system except through an approved device or after building main switch is open.

750KW GENERATOR

Specification sheet

Diesel generator set QSK23 series engine

600 kW - 800 kW 60 Hz

Standby

Description

Cummins® commercial generator sets are fully integrated power generation systems providing optimum performance, reliability and versatility for stationary Standby and Prime Power applications.

Features

Cummins heavy-duty engine - Rugged 4-cycle, industrial diesel delivers reliable power, low emissions and fast response to load changes.

Alternator - Several alternator sizes offer selectable motor starting capability with low reactance 2/3 pitch windings, low waveform distortion with non-linear loads and fault clearing short-circuit capability.

Permanent Magnet Generator (PMG) - Offers enhanced motor starting and fault clearing short circuit capability.

Circuit breakers - Option for manually-and/or electrically-operated circuit breakers.

Control system - The PowerCommand® electronic control is standard equipment and provides total genset system integration including automatic remote starting/stopping, precise frequency, and voltage regulation, alarm and status message display, AmpSentry™ protection, output metering, auto-shutdown at fault detection and NFPA 110 Level 1 compliance.

Peer-to-peer paralleling - For applications where two or more generators with PowerCommand 3.3 control can be combined with an electrically operated circuit breaker and a combination of transfer switch(s).

Cooling system - Standard integral set-mounted radiator system, designed and tested for rated ambient temperatures, simplifies facility design requirements for rejected heat.

Enclosures - Optional weather protective and sound attenuated enclosures are available.

NFPA - The genset accepts full rated load in a single step in accordance with NFPA 110 for Level 1 systems.

Warranty and service - Backed by a comprehensive warranty and worldwide distributor network.

	Standby rating	Prime rating	Continuous rating	Data sheets
Model	60 Hz kW (kVA)	60 Hz kW (kVA)	60 Hz kW (kVA)	60 Hz
DQCA	600 (750)	545 (681)		D-3352
DQCB	750 (938)	680 (850)		D-3353
DQCC	800 (1000)	725 (906)		D-3354

Generator set specifications

Governor regulation class	ISO8528 Part 1 Class G3
Voltage regulation, no load to full load	± 0.5%
Random voltage variation	± 0.5%
Frequency regulation	Isochronous
Random frequency variation	± 0.25%
Radio frequency emissions compliance	IEC 61000-4-2: Level 4 electrostatic discharge IEC 61000-4-3: Level 3 radiated susceptibility

Engine specifications

Bore	169.9 mm (6.69 in)
Stroke	169.9 mm (6.69 in)
Displacement	23.15 liters (1413 in^3)
Configuration	Cast iron, in line 6 cylinder
Battery capacity	1400 amps minimum at ambient temperature of 0 °C to 10 °C (32 °F to 50 °F)
Battery charging alternator	35 amps
Starting voltage	24 volt, negative ground
Fuel system	Direct injection: number 2 diesel fuel, fuel filter, automatic electric fuel shutoff
Fuel filter	Spin-on fuel filters with water separator
Air cleaner type	Dry replaceable element with restriction indicator
Lube oil filter type(s)	Fleet guard dual venturi spin-on, combination full flow and bypass filters
Standard cooling system	High ambient radiator

Alternator specifications

Design	Brushless, 4 pole, drip proof, revolving field
Stator	2/3 pitch
Rotor	Single bearing flexible disc
Insulation system	Class H
Standard temperature rise	125 ºC Standby at 40 °C ambient
Exciter type	Permanent Magnet Generator (PMG)
Phase rotation	A (U), B (V), C (W)
Alternator cooling	Direct drive centrifugal blower fan
AC waveform Total Harmonic Distortion (THDV)	< 5% no load to full linear load, < 3% for any single harmonic
Telephone Influence Factor (TIF)	< 50 per NEMA MG1-22.43
Telephone Harmonic Factor (THF)	< 3%

Available voltages

60 Hz Line-Neutral/Line-Line

- 110/190
- 115/200
- 120/208
- 127/220
- 139/240
- 220/380
- 230/380
- 240/416
- 255/440
- 277/480
- 347/600

Note: Consult factory for other voltages.

Generator set options and accessories

Engine

- 208/240/480 V coolant heater for ambient above 4.5 ºC (40 ºF)
- Fuel/water separator
- Heavy duty air cleaner

Alternator

- 80 °C rise
- 105 °C rise
- 125 °C rise
- 120/240 V anti-condensation heater
- Temperature sensor - alternator bearing RTD

Control panel

- PC3.3
- PC3.3 with MLD
- 120/240 V 100 W control anti-condensation heater
- Ground fault indication
- Remote fault signal package
- Run relay package
- Run time display

Cooling system

- 50 °C ambient

Generator set options and accessories (continued)

Exhaust system

- Industrial grade exhaust silencer (12 to 18 dBA)
- Residential grade exhaust silencer (18 to 25 dBA)
- Critical grade exhaust silencer (25 to 35 dBA)
- Super critical exhaust silencer (35 to 45 dBA)

Generator set

- AC entrance box
- Battery
- Battery rack with hold-down
- Circuit breaker - set mounted
- Remote annunciator panel
- Spring isolators

- 2 year warranty
- 5 year warranty
- 10 year major components warranty

Note: Some options may not be available on all models - consult factory for availability.

PowerCommand 2.3 – control system

PowerCommand 2.3 control - An integrated generator set control system providing voltage regulation, engine protection, generator protection, operator interface, and isochronous governing (optional).

Control - Provides battery monitoring and testing features and smart-starting control system.

InPower™ - PC based service tool available for detailed diagnostics.

PCCNet RS485 - Network interface (standard) to devices such as remote annunciator for NFPA 110 applications.

Control boards - Potted for environmental protection.

Ambient operation - Suitable for operation in ambient temperatures from -40 °C to +70 °C and altitudes to 13,000 feet (5000 meters).

Prototype tested - UL, CSA, and CE compliant.

AC protection

- AmpSentry protective relay
- Over current warning and shutdown
- Over and under voltage shutdown
- Over and under frequency shutdown
- Over excitation (loss of sensing) fault
- Field overload
- Overload warning
- Reverse kW shutdown
- Reverse Var shutdown
- Short circuit protection

Engine protection

- Overspeed shutdown
- Low oil pressure warning and shutdown
- High coolant temperature warning and shutdown
- Low coolant level warning or shutdown
- Low coolant temperature warning
- High, low and weak battery voltage warning
- Fail to start (over crank) shutdown
- Fail to crank shutdown
- Redundant start disconnect
- Cranking lockout
- Sensor failure indication
- Low fuel level warning or shutdown
- Fuel-in-rupture-basin warning or shutdown

Operator/display panel

- Manual off switch
- 128 x 128 alpha-numeric display with push button access for viewing engine and alternator data and providing setup, controls and adjustments (English or international symbols)
- LED lamps indicating generator set running, not in auto, common warning, common shutdown, manual run mode and remote start
- Suitable for operation in ambient temperatures from -20 ºC to +70 ºC

Alternator data

- Line-to-Neutral AC volts
- Line-to-Line AC volts
- 3-phase AC current
- Frequency
- kVA, kW, power factor

Engine data

- DC voltage
- Lube oil pressure
- Coolant temperature

Other data

- Generator set model data
- Start attempts, starts, running hours
- Fault history
- RS485 Modbus® interface
- Data logging and fault simulation (requires InPower service tool)
- Total kilowatt hours
- Load profile

Digital governing (optional)

- Integrated digital electronic isochronous governor
- Temperature dynamic governing

Digital voltage regulation

- Integrated digital electronic voltage regulator
- 3-phase Line-to-Line sensing
- Configurable torque matching
- Fault current regulation under single or three phase fault conditions

Control functions

- Time delay start and cool down
- Glow plug control (some models)
- Cycle cranking
- PCCNet interface
- (4) Configurable inputs
- (4) Configurable outputs
- Remote emergency stop
- Battle short mode
- Load shed
- Real time clock with exerciser
- Derate

Options

- Auxiliary output relays (2)
- 120/240 V, 100 W anti-condensation heater
- Remote annunciator with (3) configurable inputs and (4) configurable outputs
- PMG alternator excitation
- PowerCommand for Windows® remote monitoring software (direct connect)
- AC output analogue meters
- PowerCommand 2.3 and 3.3 control with AmpSentry protection

For further detail on PC 2.3, see document S-1569.
For further detail on PC 3.3, see document S-1570.

Ratings definitions

Emergency Standby Power (ESP):

Applicable for supplying power to varying electrical loads for the duration of power interruption of a reliable utility source. Emergency Standby Power (ESP) is in accordance with ISO 8528. Fuel Stop power in accordance with ISO 3046, AS 2789, DIN 6271 and BS 5514.

Limited-Time Running Power (LTP):

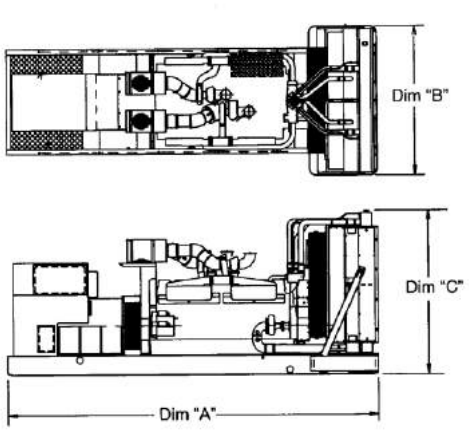
Applicable for supplying power to a constant electrical load for limited hours. Limited-Time Running Power (LTP) is in accordance with ISO 8528.

Prime Power (PRP):

Applicable for supplying power to varying electrical loads for unlimited hours. Prime Power (PRP) is in accordance with ISO 8528. Ten percent overload capability is available in accordance with ISO 3046, AS 2789, DIN 6271 and BS 5514.

Base Load (Continuous) Power (COP):

Applicable for supplying power continuously to a constant electrical load for unlimited hours. Continuous Power (COP) in accordance with ISO 8528, ISO 3046, AS 2789, DIN 6271 and BS 5514.



This outline drawing is for reference only. See respective model data sheet for specific model outline drawing number.

Codes and standards

Codes or standards compliance may not be available with all model configurations – consult factory for availability.

	This generator set is designed in facilities certified to ISO 9001 and manufactured in facilities certified to ISO 9001 or ISO 9002.		The generator set is available listed to UL 2200 for all 60 Hz low voltage models, Stationary Engine Generator Assemblies. The PowerCommand control is Listed to UL 508 - Category NITW7 for U.S. and Canadian usage. Circuit breaker assemblies are UL 489 Listed for 100% continuous operation and also UL 869A Listed Service Equipment.
	The Prototype Test Support (PTS) program verifies the performance integrity of the generator set design. Cummins products bearing the PTS symbol meet the prototype test requirements of NFPA 110 for Level 1 systems.	**U.S. EPA**	Engine certified to Stationary Emergency U.S. EPA New Source Performance Standards, 40 CFR 60 subpart IIII Tier 2 exhaust emission levels. U.S. applications must be applied per this EPA regulation.
	All low voltage models are CSA certified to product class 4215-01.	**International Building Code**	The generator set package is available certified for seismic application in accordance with the following International Building Code: IBC2000, IBC2003, IBC2006, IBC2009, and IBC2012.

Warning: Back feed to a utility system can cause electrocution and/or property damage. Do not connect to any building's electrical system except through an approved device or after building main switch is open.

Engine

	Standby Rating	Prime Rating	Continuous Rating
Engine manufacturer	Cummins Inc.		
Engine model	QSK23-G7 NR2		
Configuration	Cast Iron, in line, 6 cylinder		
Aspiration	Turbocharged and low temperature after-cooled		
Gross engine power output, kWm (bhp)	910 (1220)	808 (1085)	
BMEP at set rated load, kPa (psi)	2435 (353)	2214 (321)	
Bore, mm (in.)	170 (6.69)		
Stroke, mm (in.)	170 (6.69)		
Rated speed, rpm	1800		
Piston speed, m/s (ft/min)	10.21 (2010)		
Compression ratio	16:1		
Lube oil capacity, L (qt)	102 (108)		
Overspeed limit, rpm	2100		
Regenerative power, kW	93		

Fuel Flow

Maximum fuel flow, L/hr (US gph)	685 (181)	
Maximum fuel inlet restriction, kPa (in Hg)	13.44 (4)	
Maximum fuel inlet temperature, °C (°F)	71 (160)	

Air	Standby Rating	Prime Rating	Continuous Rating
Combustion air, m^3/min (scfm)	64 (2242)	62 (2189)	
Maximum air cleaner restriction, kPa (in H_2O)	6.2 (25)		
Alternator cooling air, m^3/min (cfm)	117 (4156)		

Exhaust

Exhaust flow at set rated load, m^3/min (cfm)	152 (5358)	146 (5147)	
Exhaust temperature, °C (°F)	476 (888)	458 (856)	
Maximum back pressure, kPa (in H_2O)	10.1 (40.8)		

Standard Set-Mounted Radiator Cooling (Non-Seismic)

Ambient design, °C (°F)	50 (122)		
Fan load, kW_m (HP)	24 (32)		
Coolant capacity (with radiator), L (US gal)	109.5 (29)		
Cooling system air flow, m^3/min (scfm)	1069.8 (37779.6)		
Total heat rejection, MJ/min (Btu/min)	32.3 (30655)	29.6 (28065)	
Maximum cooling air flow static restriction, kPa (in H_2O)	0.12 (0.5)		
Maximum fuel return line restriction kPa (in Hg)	30.47 (9)		

Optional Set-Mounted Radiator Cooling (with Seismic Feature Codes L228-2 (IBC) and/or L225-2 (OSHPD))

Ambient design, °C (°F)	50 (122)		
Fan load, kW_m (HP)	27 (36)		
Coolant capacity (with radiator), L (US gal)	89 (23.5)		
Cooling system air flow, m^3/min (scfm)	1252 (44183)		
Total heat rejection, MJ/min (Btu/min)	32.3 (30655)	29.6 (28065)	
Maximum cooling air flow static restriction, kPa (in H_2O)	0.12 (0.5)		
Maximum fuel return line restriction, kPa (in Hg)	30.47 (9)		

Optional Heat Exchanger Cooling

Set coolant capacity, L (US gal)			
Heat rejected, jacket water circuit, MJ/min (Btu/min)			
Heat rejected, aftercooler circuit, MJ/min (Btu/min)			
Heat rejected, fuel circuit, MJ/min (Btu/min)			
Total heat radiated to room, MJ/min (Btu/min)			
Maximum raw water pressure, jacket water circuit, kPa (psi)			
Maximum raw water pressure, aftercooler circuit, kPa (psi)			
Maximum raw water pressure, fuel circuit, kPa (psi)			
Maximum raw water flow, jacket water circuit, L/min (US gal/min)			
Maximum raw water flow, aftercooler circuit, L/min (US gal/min)			
Maximum raw water flow, fuel circuit, L/min (US gal/min)			
Minimum raw water flow at 27 °C (80 °F) inlet temp, jacket water circuit, L/min (US gal/min)			
Minimum raw water flow at 27 °C (80 °F) inlet temp, aftercooler circuit, L/min (US gal/min)			
Minimum raw water flow at 27 °C (80 °F) inlet temp, fuel circuit, L/min (US gal/min)			
Raw water delta P at min flow, jacket water circuit, kPa (psi)			

	Standby rating	Prime rating	Continuous rating
Raw water delta P at min flow, aftercooler circuit, kPa (psi)			
Raw water delta P at min flow, fuel circuit, kPa (psi)			
Maximum jacket water outlet temp, ℃ (℉)			
Maximum aftercooler inlet temp, ℃ (℉)			
Maximum aftercooler inlet temp at 25 ℃ (77 ℉) ambient, ℃ (℉)			
Maximum fuel return line restriction, kPa (in Hg)			

Optional Remote Radiator Cooling[1]

Set coolant capacity, L (US gal)			
Max flow rate at max friction head, jacket water circuit, L/min (US gal/min)			
Max flow rate at max friction head, aftercooler circuit, L/min (US gal/min)			
Heat rejected, jacket water circuit, MJ/min (Btu/min)			
Heat rejected, aftercooler circuit, MJ/min (Btu/min)			
Heat rejected, fuel circuit, MJ/min (Btu/min)			
Total heat radiated to room, MJ/min (Btu/min)			
Maximum friction head, jacket water circuit, kPa (psi)			
Maximum friction head, aftercooler circuit, kPa (psi)			
Maximum static head, jacket water circuit, m (ft)			
Maximum static head, aftercooler circuit, m (ft)			
Maximum jacket water outlet temp, ℃ (℉)			
Maximum aftercooler inlet temp at 25 ℃ (77 ℉) ambient, ℃ (℉)			
Maximum aftercooler inlet temp, ℃ (℉)			
Maximum fuel flow, L/hr (US gph)			
Maximum fuel return line restriction, kPa (in Hg)			

Weights[2]

Unit dry weight kgs (lbs)	6075 (13395)
Unit wet weight kgs (lbs)	6337 (13973)

Notes:

[1] For non-standard remote installations contact your local Cummins representative.

[2] Weights represent a set with standard features. See outline drawing for weights of other configurations.

Derating Factors

Standby	Engine power available up to 1371 m (4497 ft) at ambient temperatures up to 40 ℃ (104 ℉). Above these elevations, derate at 4.4% per 305 m (1000 ft). Above 40 ℃ (104 ℉), derate 10% per 10 ℃ (18 ℉).
Prime	Engine power available up to 1084 m (3555 ft) at ambient temperatures up to 40 ℃ (104 ℉). Above these elevations, derate at 4.5% per 305 m (1000 ft). Above 40 ℃ (104 ℉), derate 20.9% per 10 ℃ (18 ℉).
Continuous

Notes:

[1] Limited single phase capability is available from some three phase rated configurations. To obtain single phase rating, multiply the three phase kW rating by the Single Phase Factor[3]. All single phase ratings are at unity power factor.

[2] Standby (S), Prime (P) and Continuous ratings (C).

[3] Factor for the *Single phase output from Three phase alternator* formula listed below.

[4] Maximum rated starting kVA that results in a minimum of 90% of rated sustained voltage during starting.

Formulas for Calculating Full Load Currents:

Three phase output

$$\frac{\text{kW} \times 1000}{\text{Voltage} \times 1.73 \times 0.8}$$

Single phase output

$$\frac{\text{kW} \times \text{SinglePhaseFactor} \times 1000}{\text{Voltage}}$$

Warning: Back feed to a utility system can cause electrocution and/or property damage. Do not connect to any building's electrical system except through an approved device or after building main switch is open.

500KW GENERATOR

Specification sheet

Diesel generator set QSX15 series engine

450 kW – 500 kW Standby

Description

Cummins® commercial generator sets are fully integrated power generation systems providing optimum performance, reliability and versatility for stationary standby and prime power applications.

Features

Cummins heavy-duty engine - Rugged 4-cycle, industrial diesel delivers reliable power, low emissions and fast response to load changes.

Alternator - Several alternator sizes offer selectable motor starting capability with low reactance 2/3 pitch windings, low waveform distortion with non-linear loads and fault clearing short-circuit capability.

Permanent Magnet Generator (PMG) - Offers enhanced motor starting and fault clearing short-circuit capability.

Control system - The PowerCommand® electronic control is standard equipment and provides total genset system integration including automatic remote starting/stopping, precise frequency and voltage regulation, alarm and status message display, AmpSentry™ protection, output metering, auto-shutdown at fault detection and NFPA 110 Level 1 compliance.

Cooling system - Standard integral set-mounted radiator system, designed and tested for rated ambient temperatures, simplifies facility design requirements for rejected heat.

Enclosures - Optional weather protective and sound attenuated enclosures are available.

Fuel tanks - Dual wall sub-base fuel tanks are also available.

NFPA - The genset accepts full rated load in a single step in accordance with NFPA 110 for Level 1 systems.

Warranty and service - Backed by a comprehensive warranty and worldwide distributor network.

	Standby rating	Prime rating	Continuous rating	Data sheets
Model	60 Hz kW (kVA)	60 Hz kW (kVA)	60 Hz kW (kVA)	60 Hz
DFEJ	450 (563)	410 (513)		D-3400
DFEK	500 (625)	455 (569)		D-3401

Generator set specifications

Governor regulation class	ISO 8528 part 1 Class G3
Voltage regulation, no load to full load	± 0.5%
Random voltage variation	± 0.5%
Frequency regulation	Isochronous
Random frequency variation	± 0.25%
EMS compatibility	IEC 61000-4-2: Level 4 Electrostatic discharge IEC 61000-4-3: Level 3 Radiated susceptibility

Engine specifications

Design	Turbocharged with air-to-air charge air-cooling
Bore	136.9 mm (5.39 in.)
Stroke	168.9 mm (6.65 in.)
Displacement	14.9 L (912.0 in^3)
Cylinder block	Cast iron with replaceable wet liners, in-line 6 cylinder
Battery capacity	1400 Amps minimum at ambient temperature 0 ℃ (32 ℉)
Battery charging alternator	35 Amps
Starting voltage	24 volt, negative ground
Fuel system	Full authority electronic (FAE) Cummins HPI-TP
Fuel filter	
Air cleaner type	
Lube oil filter type(s)	Single spin-on combination full flow and bypass filters
Standard cooling system	40 ºC (104 ºF) ambient radiator

Alternator specifications

Design	Brushless, 4 pole, drip-proof revolving field
Stator	2/3 pitch
Rotor	Single bearing, flexible discs
Insulation system	Class H
Standard temperature rise	125 ℃ standby at 40 ℃ ambient
Exciter type	PMG (Permanent Magnet Generator)
Phase rotation	A (U), B (V), C (W)
Alternator cooling	Direct drive centrifugal blower fan
AC waveform total harmonic distortion (THDV)	< 5% no load to full linear load, < 3% for any single harmonic
Telephone influence factor (TIF)	< 50% per NEMA MG1-22.43
Telephone harmonic factor (THF)	< 3%

Available voltages

60 Hz Line – Neutral/Line - Line

- 110/190
- 110/220
- 115/200
- 115/230
- 120/208
- 127/220
- 139/240
- 220/380
- 230/400
- 240/416
- 255/440
- 277/480
- 347/600

Note: Consult factory for other voltages.

Generator set options

Engine

- 208/240/480 V thermostatically controlled coolant heater for ambient above 4.5 ℃ (40℉)
- 208/240/480 V thermostatically controlled coolant heater for ambient below 4.5 ℃ (40℉)
- 120 V 300 W lube oil heater
- Heavy duty air cleaner with safety element

Alternator

- 80 ℃ rise
- 105 ℃ rise
- 150 ℃ rise
- 120/240 V 200 W anti-condensation heater

Exhaust system

- Critical grade exhaust silencer
- Exhaust packages
- Industrial grade exhaust silencer
- Residential grade exhaust silencer

Fuel system

- 1022 L (270 gal) sub-base tank
- 1136 L (300 gal) sub-base tank
- 1514 L (400 gal) sub-base tank
- 1893 L (500 gal) sub-base tank
- 2271 L (600 gal) sub-base tank
- 2498 L (660 gal) sub-base tank
- 3218 L (850 gal) sub-base tank
- 6435 L (1700 gal) sub-base tank
- 9558 L (2525 gal) sub-base tank

Cooling system

- High ambient 50 ℃ radiator

Control panel

- PC 3.3
- PC 3.3 with MLD
- 120/240 V 100 W control anti-condensation heater
- Ground fault indication
- Remote fault signal package
- Run relay package

Generator set

- AC entrance box
- Battery
- Battery charger
- Export box packaging
- UL 2200 Listed
- Main line circuit breaker
- Paralleling accessories
- Remote annunciator panel
- Spring isolators
- Enclosure: aluminium, steel, weather protective or sound attenuated
- 2 year standby power warranty
- 2 year prime power warranty
- 5 year basic power warranty
- 10 year major components warranty

*Note: Some options may not be available on all models - consult factory for availability.

Control system 2.3

The PowerCommand 2.3 control system - An integrated generator set control system providing voltage regulation, engine protection, generator protection, operator interface and isochronous governing (optional).

Control – Provides battery monitoring and testing features and smart-starting control system.

InPower™ – PC-based service tool available for detailed diagnostics.

PCCNet RS485 – Network interface (standard) to devices such as remote annunciator for NFPA 110 applications.

Control boards – Potted for environmental protection.

Ambient operation – Suitable for operation in ambient temperatures from -40 ℃ to +70 ℃ and altitudes to 13,000 feet (5000 meters). Prototype tested - UL, CSA and CE compliant.

AC protection

- AmpSentry protective relay
- Over current warning and shutdown
- Over and under voltage shutdown
- Over and under frequency shutdown
- Over excitation (loss of sensing) fault
- Field overload
- Overload warning
- Reverse kW shutdown
- Reverse Var shutdown
- Short circuit protection

Engine protection

- Overspeed shutdown
- Low oil pressure warning and shutdown
- High coolant temperature warning and shutdown
- Low coolant level warning or shutdown
- Low coolant temperature warning
- High, low and weak battery voltage warning
- Fail to start (overcrank) shutdown
- Fail to crank shutdown
- Redundant start disconnect
- Cranking lockout
- Sensor failure indication
- Low fuel level warning or shutdown
- Fuel-in-rupture-basin warning or shutdown

Operator/display panel

- Manual off switch
- 128 x 128 Alpha-numeric display with push button access for viewing engine and alternator data and providing setup, controls and adjustments (English or international symbols)
- LED lamps indicating genset running, not in auto, common warning, common shutdown, manual run mode and remote start
- Suitable for operation in ambient temperatures from -20 ºC to +70 ºC

Alternator data

- Line-to-Neutral AC volts
- Line-to-Line AC volts
- 3-phase AC current
- Frequency
- kVA, kW, power factor

Engine data

- DC voltage
- Lube oil pressure
- Coolant temperature

Control functions

- Time delay start and cool down
- Glow plug control (some models)
- Cycle cranking
- PCCNet interface
- (4) Configurable inputs
- (4) Configurable outputs
- Remote emergency stop
- Battle short mode
- Load shed
- Real time clock with exerciser
- Derate

Digital governing (optional)

- Integrated digital electronic isochronous governor
- Temperature dynamic governing

Digital voltage regulation

- Integrated digital electronic voltage regulator
- 3-phase Line-to-Line sensing
- Configurable torque matching
- Fault current regulation under single or three phase fault conditions

Other data

- Genset model data
- Start attempts, starts, running hours
- Fault history
- RS485 Modbus® interface
- Data logging and fault simulation (requires InPower service tool)
- Total kilowatt hours
- Load profile

Options

- Auxiliary output relays (2)
- 120/240 V, 100 W anti-condensation heater
- Remote annunciator with (3) configurable inputs and (4) configurable outputs
- PMG alternator excitation
- PowerCommand for Windows® remote monitoring software (direct connect)
- AC output analogue meters
- PowerCommand 2.3 and 3.3 control with AmpSentry protection

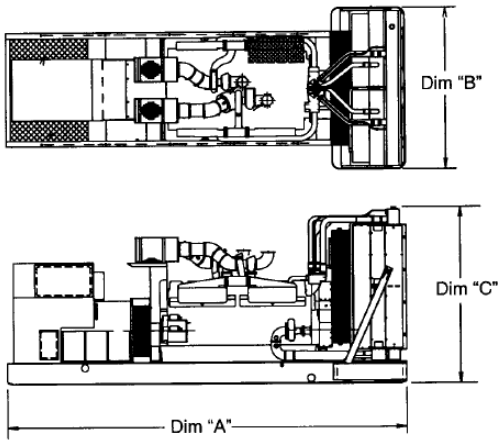
For further detail on PC 2.3 see document S-1569.
For further detail on PC 3.3 see document S-1570.

Emergency Standby Power (ESP):
Applicable for supplying power to varying electrical load for the duration of power interruption of a reliable utility source. Emergency Standby Power (ESP) is in accordance with ISO 8528. Fuel Stop power in accordance with ISO 3046, AS 2789, DIN 6271 and BS 5514.

Limited-Time running Power (LTP):
Applicable for supplying power to a constant electrical load for limited hours. Limited Time Running Power (LTP) is in accordance with ISO 8528.

Prime Power (PRP):
Applicable for supplying power to varying electrical load for unlimited hours. Prime Power (PRP) is in accordance with ISO 8528. Ten percent overload capability is available in accordance with ISO 3046, AS 2789, DIN 6271 and BS 5514.

Base Load (Continuous) Power (COP):
Applicable for supplying power continuously to a constant electrical load for unlimited hours. Continuous Power (COP) in accordance with ISO 8528, ISO 3046, AS 2789, DIN 6271 and BS 5514.



This outline drawing if for reference only. See respective model data sheet for specific model outline drawing number.

Do not use for installation design

*Weights represent a set with standard features. See outline drawings for weights of other configurations.

Codes and standards

Codes or standards compliance may not be available with all model configurations – consult factory for availability.

	This generator set is designed in facilities certified to ISO 9001 and manufactured in facilities certified to ISO 9001 or ISO 9002.		The generator set is available listed to UL 2200, Stationary Engine Generator Assemblies for all 60 Hz low voltage models. The PowerCommand control is Listed to UL 508 - Category NITW7 for U.S. and Canadian usage. Circuit breaker assemblies are UL 489 Listed for 100% continuous operation and also UL 869A Listed Service Equipment.
	The Prototype Test Support (PTS) program verifies the performance integrity of the generator set design. Cummins products bearing the PTS symbol meet the prototype test requirements of NFPA 110 for Level 1 systems.	**U.S EPA**	Engine certified to Stationary Emergency U.S. EPA New Source Performance Standards, 40 CFR 60 subpart IIII Tier 2 exhaust emission levels. U.S. applications must be applied per this EPA regulation.
	All low voltage models are CSA certified to product class 4215-01.	**International Building Code**	The generator set package is available certified for seismic application in accordance with the following International Building Code: IBC2000, IBC2003, IBC2006, IBC2009 and IBC2012.

Warning: Back feed to a utility system can cause electrocution and/or property damage. Do not connect to any building's electrical system except through an approved device or after building main switch is open.

Total heat rejection, MJ/min (Btu/min)	19.6 (18485.0)	17.7 (16680.0)	
Maximum cooling air flow static restriction, kPa (in H_2O)	0.12 (0.5)		

Optional heat exchanger cooling

Set coolant capacity, L (US Gal.)			
Heat rejected, jacket water circuit, MJ/min (Btu/min)			
Heat rejected, aftercooler circuit, MJ/min (Btu/min)			
Heat rejected, fuel circuit, MJ/min (Btu/min)			
Total heat radiated to room, MJ/min (Btu/min)			
Maximum raw water pressure, jacket water circuit, kPa (psi)			
Maximum raw water pressure, aftercooler circuit, kPa (psi)			
Maximum raw water pressure, fuel circuit, kPa (psi)			
Maximum raw water flow, jacket water circuit, L/min (US Gal/min)			
Maximum raw water flow, aftercooler circuit, L/min (US Gal/min)			
Maximum raw water flow, fuel circuit, L/min (US Gal/min)			
Minimum raw water flow at 27 °C (80 °F) inlet temp, jacket water circuit, L/min (US Gal/min)			
Minimum raw water flow at 27 °C (80 °F) inlet temp, aftercooler circuit, L/min (US Gal/min)			
Minimum raw water flow at 27 °C (80 °F) inlet temp, fuel circuit, L/min (US Gal/min)			
Raw water delta P at min flow, jacket water circuit, kPa (psi)			
Raw water delta P at min flow, aftercooler circuit, kPa (psi)			
Raw water delta P at min flow, fuel circuit, kPa (psi)			
Maximum jacket water outlet temp, °C (°F)			
Maximum aftercooler inlet temp, °C (°F)			
Maximum aftercooler inlet temp at 25 °C (77 °F) ambient, °C (°F)			

Optional remote radiator cooling[1]	Standby rating	Prime rating	Continuous rating
Set coolant capacity, L (US gal)			
Max flow rate at max friction head, jacket water circuit, L/min (US gal/min)			
Max flow rate at max friction head, aftercooler circuit, L/min (US gal/min)			
Heat rejected, jacket water circuit, MJ/min (Btu/min)			
Heat rejected, aftercooler circuit, MJ/min (Btu/min)			
Heat rejected, fuel circuit, MJ/min (Btu/min)			
Total heat radiated to room, MJ/min (Btu/min)			
Maximum friction head, jacket water circuit, kPa (psi)			
Maximum friction head, aftercooler circuit, kPa (psi)			
Maximum static head, jacket water circuit, m (ft)			
Maximum static head, aftercooler circuit, m (ft)			
Maximum jacket water outlet temp, °C (°F)			
Maximum aftercooler inlet temp at 25 °C (77 °F) ambient, °C (°F)			
Maximum aftercooler inlet temp, °C (°F)			
Maximum fuel flow, L/hr (US gph)			
Maximum fuel return line restriction, kPa (in Hg)			

Weights[2]

Unit dry weight kgs (lbs)	4325 (9535)
Unit wet weight kgs (lbs)	4461 (9835)

Notes:
[1] For non-standard remote installations contact your local Cummins Power Generation representative.
[2] Weights represent a set with standard features. See outline drawing for weights of other configurations.

Derating factors

Standby	Genset may be operated up to 640 m (2100 ft) and 40 °C (104 °F) without power deration. For sustained operation above these conditions up to 1150 m (3770 ft), derate by 3.8% per 305 m (1000 ft), and 6.1% per 10 °C (3.4% per 10 °F). Above 1150 m (3770 ft) up to 1680 m (5510 ft), derate 6.3% total for 1150 m (3770 ft) plus 1.6% per 305 m (1000 ft) over 1150 m (3770 ft) and 3.8% per 10 °C (2.2% per 10 °F). Above 1680 m (5510 ft), up to 3000 m (9840 ft), derate 9.0% total for 1680 m (5510 ft) plus 3.7% per 305 m (1000 ft) and 5.7% per 10 °C (3.2% per 10 °F). Above 3000 m (9840 ft), derate 24.8% total for 3000 m (9840 ft) plus 1.8% per 305 m (1000 ft) above 3000 m (9840 ft) and 10% per 10 °C (5.6% per 10 °F).
Prime	Genset may be operated up to 640 m (2100 ft) and 40 °C (104 °F) without power deration. For sustained operation above these conditions up to 1150 m (3770 ft), derate by 3.8% per 305 m (1000 ft), and 6.1% per 10 °C (3.4% per 10 °F). Above 1150 m (3770 ft) up to 1680 m (5510 ft), derate 6.3% total for 1150 m (3770 ft) plus 1.6% per 305 m (1000 ft) over 1150 m (3770 ft) and 3.8% per 10 °C (2.2% per 10 °F). Above 1680 m (5510 ft), up to 3000 m (9840 ft), derate 9.0% total for 1680 m (5510 ft) plus 3.7% per 305 m (1000 ft) and 5.7% per 10 °C (3.2% per 10 °F). Above 3000 m (9840 ft), derate 24.8% total for 3000 m (9840 ft) plus 1.8% per 305 m (1000 ft) above 3000 m (9840 ft) and 10% per 10 °C (5.6% per 10 °F).

250KW GENERATOR

Specification Sheet

Diesel Generator Set QSL9-G7 Series Engine

250 kW - 300 kW Standby

Description

Cummins® commercial generator sets are fully integrated power generation systems providing optimum performance, reliability and versatility for stationary Standby and Prime Power applications.

Features

Cummins heavy-duty engine - Rugged 4-cycle, industrial diesel delivers reliable power, low emissions and fast response to load changes.

Alternator - Several alternator sizes offer selectable motor starting capability with low reactance 2/3 pitch windings, low waveform distortion with non-linear loads and fault clearing short-circuit capability.

Control system - The PowerCommand® electronic control is standard equipment and provides total genset system integration including automatic remote starting/stopping, precise frequency and voltage regulation, alarm and status message display, AmpSentry™ protection, output metering, auto-shutdown at fault detection and NFPA 110 Level 1 compliance.

Cooling system - Standard cooling package provides reliable running at the rated power level.

Enclosures - Optional weather protective and sound attenuated enclosures are available.

Fuel tanks - Dual wall sub-base fuel tanks are also available.

NFPA - The genset accepts full rated load in a single step in accordance with NFPA 110 for Level 1 systems.

Warranty and service - Backed by a comprehensive warranty and worldwide distributor network.

Generator Set Specifications

Governor regulation class	ISO 8528 Part 1 Class G3
Voltage regulation, no load to full load	± 0.5%
Random voltage variation	± 0.5%
Frequency regulation	Isochronous
Random frequency variation	± 0.5%
Radio frequency emissions compliance	IEC 801.2 through IEC 801.5; MIL-STD-461C, Part 9

Engine Specifications

Bore	114.0 mm (4.49 in)
Stroke	145 mm (5.69 in)
Displacement	8.9 L (543 in^3)
Configuration	Cast iron, in-line 6 cylinder
Battery capacity	750 amps minimum at ambient temperature of -18 ºC (-0.4 ºF) and above
Battery charging alternator	70 amps
Starting voltage	24 volt, negative ground
Fuel system	Direct injection: number 2 diesel fuel, fuel filter, automatic electric fuel shutoff
Fuel filter	Dual element with water separator
Air cleaner type	Normal duty
Lube oil filter type(s)	Single spin-on, combination full flow and bypass filters
Standard cooling system	High ambient radiator

Alternator Specifications

Design	Brushless, 4 pole, drip proof revolving field
Stator	2/3 pitch
Rotor	Single bearing, flexible discs
Insulation system	Class H
Standard temperature rise	125 ºC Standby, 105 ºC Prime
Exciter type	Permanent Magnet Generator (PMG)
Phase rotation	A (U), B (V), C (W)
Alternator cooling	Direct drive centrifugal blower
AC waveform Total Harmonic Distortion (THDV)	< 5% no load to full linear load, < 3% for any single harmonic
Telephone Influence Factor (TIF)	< 50 per NEMA MG1-22.43
Telephone Harmonic Factor (THF)	< 3

Available Voltages

60 Hz 3-phase			**50 Hz** 3-phase	
Reconnectable		Non-Reconnectable	Reconnectable	Non-Reconnectable

Note: Consult factory for other voltages.

Generator Set Options and Accessories

Engine

- 120/240 V 1500 W coolant heater
- 120/240 V 150 W lube oil heater
- Heavy duty air cleaner
- Engine oil temperature

Control panel

- 120/240 V 100 W control anti-condensation heater
- Exhaust pyrometer
- Ground fault indication
- Remote fault signal package
- Run relay package
- Paralleling configuration

Alternator

- 105 ℃ rise
- 125 ℃ rise
- 120/240 V 100 W anti-condensation heater
- PMG excitation
- Single phase

Exhaust system

- Genset mounted muffler
- Heavy duty exhaust elbow
- Slip on exhaust connection
- NPT exhaust connection

Fuel system

- 1022 L (270 gal) sub-base tank
- 1136 L (300 gal) sub-base tank
- 1514 L (400 gal) sub-base tank
- 1893 L (500 gal) sub-base tank
- 2271 L (600 gal) sub-base tank
- 2498 L (660 gal) sub-base tank
- 2725 L (720 gal) sub-base tank
- 5565 L (1470 gal) sub-base tank

Generator set

- AC entrance box
- Battery
- Battery charger
- Export box packaging
- UL 2200 Listed
- Main line circuit breaker
- PowerCommand network
- Communications Module (NCM)
- Remote annunciator panel
- Spring isolators
- Enclosure: aluminum, steel, weather protective or sound attenuated
- 2 year Standby power warranty
- 2 year Prime power warranty
- 5 year Basic power warranty
- 10 year major components warranty

Note: Some options may not be available on all models - consult factory for availability.

Control System PCC 2100

PowerCommand control is an integrated generator set control system providing governing, voltage regulation, engine protection and operator interface functions. Major features include:

- Integral AmpSentry™ protective relay providing a full range of alternator protection functions that are matched to the alternator provided.
- Battery monitoring and testing features and smart starting control system.
- Three phase sensing, full wave rectified voltage regulation system, with a PWM output for stable operation with all load types.
- Standard PCCNet™ and optional Echelon® LonWorks® network interface.
- Control suitable for operation in ambient temperatures from -40 °C to +70 °C (-40 °F to +158 °F) and altitudes to 5000 meters (13,000 feet).
- Prototype tested; UL, CSA, and CE compliant.
- InPower™ PC-based service tool available for detailed diagnostics.

Operator/display panel

- Off/manual/auto mode switch
- Manual run/stop switch
- Panel lamp test switch
- Emergency stop switch
- Alpha-numeric display with pushbutton access for viewing engine and alternator data and providing setup, controls and adjustments
- LED lamps indicating genset running, not in auto, common warning, common shutdown
- Configurable LED lamps (5)
- Configurable for local language

Engine protection

- Overspeed shut down
- Low oil pressure warning and shut down
- High coolant temperature warning and shut down
- High oil temperature warning (some models)
- Low coolant level warning or shut down
- Low coolant temperature warning
- High and low battery voltage warning
- Weak battery warning
- Dead battery shut down
- Fail to start (overcrank) shut down
- Fail to crank shut down
- Redundant -start disconnect
- Cranking lockout
- Sensor failure indication

Engine data

- DC voltage
- Lube oil pressure
- Coolant temperature
- Lube oil temperature (some models)
- Engine speed

AmpSentry AC protection

- Over current and short-circuit shut down
- Over current warning
- Single and three phase fault regulation
- Over and under voltage shut down
- Over and under frequency shut down
- Overload warning with alarm contact
- Reverse power and reverse Var shut down
- Excitation fault

Alternator data

- Line-to-Line and Line-to-Neutral AC volts
- Three phase AC current
- Frequency
- Total and individual phase power factor, kW and kVA

Other data

- Genset model data
- Start attempts, starts, running hours
- kW hours (total and since reset)
- Fault history
- Load profile (hours less than 30% and hours more than 90% load)
- System data display (optional with network and other PowerCommand gensets or transfer switches)

Governing

- Digital electronic isochronous governor
- Temperature dynamic governing
- Smart idle speed mode
- Glow plug control (some models)

Voltage regulation

- Digital PWM electronic voltage regulation
- Three phase Line-to-Neutral sensing
- Suitable for PMG or shunt excitation
- Single and three phase fault regulation
- Configurable torque matching

Control functions

- Data logging on faults
- Fault simulation (requires InPower)
- Time delay start and cooldown
- Cycle cranking
- PCCNet interface
- Configurable customer inputs (4)
- Configurable customer outputs (4)
- Configurable network inputs (8) and outputs (16) (with optional network)
- Remote emergency stop

Options

- LED bargraph AC data display
- Thermostatically controlled space heater
- Key-type mode switch
- Ground fault module
- Auxiliary relays (3)
- Echelon LONWORKS interface
- Modlon Gateway to convert to Modbus (loose)
- PowerCommand iWatch web server for remote monitoring and alarm notification (loose)
- Digital input and output module(s) (loose)
- Remote annunciator (loose)

For further detail see document S-1409.

Ratings Definitions

Emergency Standby Power (ESP):

Applicable for supplying power to varying electrical load for the duration of power interruption of a reliable utility source. Emergency Standby Power (ESP) is in accordance with ISO 8528. Fuel Stop power in accordance with ISO 3046, AS 2789, DIN 6271 and BS 5514.

Limited-Time Running Power (LTP):

Applicable for supplying power to a constant electrical load for limited hours. Limited Time Running Power (LTP) is in accordance with ISO 8528.

Prime Power (PRP):

Applicable for supplying power to varying electrical load for unlimited hours. Prime Power (PRP) is in accordance with ISO 8528. Ten percent overload capability is available in accordance with ISO 3046, AS 2789, DIN 6271 and BS 5514.

Base Load (Continuous) Power (COP):

Applicable for supplying power continuously to a constant electrical load for unlimited hours. Continuous Power (COP) in accordance with ISO 8528, ISO 3046, AS 2789, DIN 6271 and BS 5514.

Codes and Standards

Codes or standards compliance may not be available with all model configurations – consult factory for availability.

	This generator set is designed in facilities certified to ISO 9001 and manufactured in facilities certified to ISO 9001 or ISO 9002.		The PowerCommand control is Listed to UL 508 - Category NITW7 for U.S. and Canadian usage.
	The Prototype Test Support (PTS) program verifies the performance integrity of the generator set design. Cummins products bearing the PTS symbol meet the prototype test requirements of NFPA 110 for Level 1 systems.	U.S. EPA	Engine certified to Stationary Emergency U.S. EPA New Source Performance Standards,40 CFR 60 subpart IIII Tier 3 exhaust emission levels. U.S. applications must be applied per this EPA regulation.
	All low voltage models are CSA certified to product class 4215-01.	International Building Code	The generator set package is available certified for seismic application in accordance with the following International Building Code: IBC2000, IBC2003, IBC2006, IBC2009 and IBC2012.

Warning: Back feed to a utility system can cause electrocution and/or property damage. Do not connect to any building's electrical system except through an approved device or after building main switch is open.

Engine

	Standby rating	Prime rating	Continuous rating
Engine manufacturer	Cummins Inc.		
Engine model	QSL9-G7		
Configuration	Cast iron, in-line 6 cylinder		
Aspiration	Turbocharged and after-cooled		
Gross engine power output, kW_m (bhp)	346 (464)	312 (419)	
BMEP at set rated load, kPa (psi)	2606 (378)	2351 (341)	
Bore, mm (in.)	114.0 (4.49)		
Stroke, mm (in.)	145 (5.69)		
Rated speed, rpm	1800		
Piston speed, m/s (ft/min)	8.7 (1707.0)		
Compression ratio	16.1:1		
Lube oil capacity, L (qt)	30.0 (31.7)		
Overspeed limit, rpm	2070 ± 50		
Regenerative power, kW	35.00		

Fuel flow

Maximum fuel flow, L/hr (US gph)	138.1 (36.5)	
Maximum fuel inlet restriction, mm Hg (in Hg)	152.4 (6.0)	
Maximum return restriction, mm Hg (in Hg)	254.0 (10.0)	

Air	Standby rating	Prime rating	Continuous rating
Combustion air, m^3/min (scfm)	22.3 (787)	20.8 (733)	
Maximum air cleaner restriction, kPa (in H_2O)	6.2 (25.0)		
Alternator cooling air, m^3/min (cfm)	59.4 (2100.0)		

Exhaust

Exhaust flow at set rated load, m^3/min (cfm)	54.6 (1927)	50.8 (1796)	
Exhaust temperature, °C (°F)	525 (977)	495 (923)	
Maximum back pressure, kPa (in H_2O)	10.2 (41.0)		

Standard set-mounted radiator cooling (non-seismic)

Ambient design, °C (°F)	50 (122)		
Fan load, kW_m (HP)	26.09 (35)		
Coolant capacity (with radiator), L (US gal)	34.29 (9.06)		
Cooling system air flow, m^3/min (scfm)	427.58 (15100)		
Total heat rejection, MJ/min (Btu/min)	8.93 (8467.0)	8.55 (8104.0)	
Maximum cooling air flow static restriction, kPa (in H_2O)	0.12 (0.5)		

Optional set-mounted radiator cooling (with seismic feature codes L228-2 (IBC) and/or L225-2 (OSHPD)

Ambient design, °C (°F)	50 (122)		
Fan load, kW_m (HP)	27.8 (37.2)		
Coolant capacity (with radiator), L (US gal)	30.3 (8.0)		
Cooling system air flow, m^3/min (scfm)	568.1 (20075.0)		
Total heat rejection, MJ/min (Btu/min)	8.93 (8467.0)	8.55 (8104.0)	
Maximum cooling air flow static restriction, kPa (in H_2O)	0.12 (0.5)		

Optional heat exchanger cooling	Standby rating	Prime rating	Continuous rating
Set coolant capacity, L (US gal)			
Heat rejected, jacket water circuit, MJ/min (Btu/min)			
Heat rejected, aftercooler circuit, MJ/min (Btu/min)			
Heat rejected, fuel circuit, MJ/min (Btu/min)			
Total heat radiated to room, MJ/min (Btu/min)			
Maximum raw water pressure, jacket water circuit, kPa (psi)			
Maximum raw water pressure, aftercooler circuit, kPa (psi)			
Maximum raw water pressure, fuel circuit, kPa (psi)			
Maximum raw water flow, jacket water circuit, L/min (US gal/min)			
Maximum raw water flow, aftercooler circuit, L/min (US gal/min)			
Maximum raw water flow, fuel circuit, L/min (US gal/min)			
Minimum raw water flow at 27 °C (80 °F) inlet temp, jacket water circuit, L/min (US gal/min)			
Minimum raw water flow at 27 °C (80 °F) inlet temp, aftercooler circuit, L/min (US gal/min)			
Minimum raw water flow at 27 °C (80 °F) inlet temp, fuel circuit, L/min (US gal/min)			
Raw water delta P at min flow, jacket water circuit, kPa (psi)			
Raw water delta P at min flow, aftercooler circuit, kPa (psi)			
Raw water delta P at min flow, fuel circuit, kPa (psi)			
Maximum jacket water outlet temp, °C (°F)			
Maximum aftercooler inlet temp, °C (°F)			
Maximum aftercooler inlet temp at 25 °C (77 °F) ambient, °C (°F)			

Optional remote radiator cooling[1]			
Set coolant capacity, L (US gal)			
Max flow rate at max friction head, jacket water circuit, L/min (US gal/min)			
Max flow rate at max friction head, aftercooler circuit, L/min (US gal/min)			
Heat rejected, jacket water circuit, MJ/min (Btu/min)			
Heat rejected, aftercooler circuit, MJ/min (Btu/min)			
Heat rejected, fuel circuit, MJ/min (Btu/min)			
Total heat radiated to room, MJ/min (Btu/min)			
Maximum friction head, jacket water circuit, kPa (psi)			
Maximum friction head, aftercooler circuit, kPa (psi)			
Maximum static head, jacket water circuit, m (ft)			
Maximum static head, aftercooler circuit, m (ft)			
Maximum jacket water outlet temp, °C (°F)			
Maximum aftercooler inlet temp at 25 °C (77 °F) ambient, °C (°F)			
Maximum aftercooler inlet temp, °C (°F)			
Maximum fuel flow, L/hr (US gph)			
Maximum fuel return line restriction, kPa (in Hg)			

Weights[2]

Unit dry weight kgs (lbs)	2184 (4814)
Unit wet weight kgs (lbs)	2234 (4926)

Notes:
[1] For non-standard remote installations contact your local Cummins representative.
[2] Weights represent a set with standard features. See outline drawing for weights of other configurations.

Derating factors

Standby	Engine power available up to 1494 m (4900 ft) at ambient temperature up to 40 °C (104 °F). Above these elevations, derate at 7% per 400m (1312 ft). Above 40 °C (104 °F) derate 5.5% per 10 °C (18 °F). Derates must be combined when both altitude of 1494 m (4900 ft) and temperature of 40 °C (104 °F) are exceeded.
Prime	Engine power available up to 1452 m (4764 ft) at ambient temperature up to 40 °C (104 °F). Above these elevations, derate at 7% per 400m (1312 ft). Above 40 °C (104 °F) derate 5.5% per 10 °C (18 °F). Derates must be combined when both altitude of 1452 m (4764 ft) and temperature of 40 °C (104 °F) are exceeded.
Continuous	

Ratings definitions

Emergency Standby Power (ESP):	**Limited-Time Running Power (LTP):**	**Prime Power (PRP):**	**Base Load (Continuous) Power (COP):**
Applicable for supplying power to varying electrical load for the duration of power interruption of a reliable utility source. Emergency Standby Power (ESP) is in accordance with ISO 8528. Fuel stop power in accordance with ISO 3046, AS 2789, DIN 6271 and BS 5514.	Applicable for supplying power to a constant electrical load for limited hours. Limited-Time Running Power (LTP) is in accordance with ISO 8528.	Applicable for supplying power to varying electrical load for unlimited hours. Prime Power (PRP) is in accordance with ISO 8528. Ten percent overload capability is available in accordance with ISO 3046, AS 2789, DIN 6271 and BS 5514.	Applicable for supplying power continuously to a constant electrical load for unlimited hours. Continuous Power (COP) is in accordance with ISO 8528, ISO 3046, AS 2789, DIN 6271 and BS 5514.

Specification Sheet

Enclosures and Tanks

250-1000 kW Gensets

Enclosure Standard Features

- 14-gauge steel construction (panels)
- Stainless steel hardware
- Zinc phosphate pretreatment, e-coat primer and super durable powder topcoat paint minimize corrosion and color fade
- Package listed to UL 2200
- Designed to satisfy national electrical code installation requirements
- Fuel and electrical stub-up area within enclosure perimeter
- Fixed louvers
- Cambered roof prevents water accumulation
- Recessed, lockable doors in two sides
- Retainers hold doors open for easy access
- Enclosed exhaust silencer ensures safety and protects against rust
- Rain cap
- Exterior oil and coolant drains with interior valves for ease of service
- Rodent barriers on inlet
- Non-hydroscopic sound attenuating material
- Side mounted controls and circuit breakers
- Easy access lifting points for spreader bars
- Dual vibration isolation system (250-500 kW)
- Spring vibration isolation system (600-1000 kW)
- Enclosure mounts to lifting base or fuel tank (250-500 kW)
- Enclosure mounts to lifting base (600-1000 kW)
- Factory pre-assembled package
- Designed for outdoor use only
- Externally mounted emergency stop button for operator safety (optional on 250-500 kW)
- Horizontal air discharge to prevent leaf and snow accumulation (600-1000 kW)

Options

- Three levels of sound attenuation
- Motorized louvers to protect from ice and snow accumulation (available on air inlet for all models and on air outlet on level II, 250-500 kW enclosures only)
- Horizontal air discharge, sound level 2 only (250-500 kW)
- Aluminium construction with roll-coated polymer paint
- Wind rated to 150 mph
- Neutral sandstone paint color
- Factory mounted battery charger
- External 120 VAC service outlet
- Rain hoods for air inlet (250-500 kW)
- Lifting base in lieu of a sub-base tank (250-500 kW)
  - Pre-wired AC distribution package
  - 100 amp (250-500 kW) or 150 amp (600-1000 kW) main circuit breaker; connected to 120 VAC Line-Neutral and 208 or 240 VAC Line-Line, spare breaker positions and capacity for future upgrades (600-1000 kW)
  - GFCI protected internal 120 VAC service receptacle
  - GFCI protected weather proof external 120 volt service receptacle
  - All factory installed AC powered features pre-wired into load center
- Interior lights – 120 volt (600-1000 kW)
- Rain hoods for air inlet (250-500 kW)
- Seismic isolators available (600-1000 kW)

Fuel Tanks

Standard sub-base tank features

- UL 142 Listed
- ULC-S601-07 Listed
- NFPA37 compliant
- Dual walled, steel construction
- Emergency tank and rupture basin vents
- Tank mounted mechanical fuel gauge
- Fuel supply and return tubes
- Top mounted leak detection float switch
- Low and high level fuel switches
- Mounting brackets for optional pump and control (250-500 kW)
- Integral lifting points

Sub-base tank options

- Pre-wired fuel pump and control
- Fuel overfill alarm – internal or external
- Overflow and tank fill plugs
- Five gallon spill fill box – internal or external
- Fill pipe extender
- Local code approvals available

- This weight does not include the generator set. Consult your local Cummins distributor or the appropriate generator specification sheet.
- Width is 86” lifting eye to lifting eye (250-500 kW), 102” lifting eye to lifting eye (600-1000 kW).
- Height - Florida, Michigan, and Suffolk add 6.4” (250-500 kW) or 2” (600-1000 kW) for bottom space.
- Maximum length emergency vent removed.

CSA	CSA - The generator set is CSA certified to product class 4215-01.
UL	UL - The generator set is available listed to UL 2200, stationary engine generator assemblies. The PowerCommand® control is listed to UL 508 - Category NITW7 for U.S. and Canadian usage.

S-1443 (11/18)

150KW GENERATOR

Specification sheet

Diesel generator set

QSB7 series engine
125-200 kW @ 60 Hz
EPA Tier 3 emissions

Description

Cummins® generator sets are fully integrated power generation systems providing optimum performance, reliability and versatility for stationary Standby applications.

Features

Heavy duty engine - Rugged 4-cycle industrial diesel delivers reliable power and fast response to load changes.

Alternator - Several alternator sizes offer selectable motor starting capability with low reactance 2/3 pitch windings, low waveform distortion with non-linear loads and fault clearing short-circuit capability.

Control system - The PowerCommand® 1.1 electronic control is standard equipment and provides total generator set system integration including automatic remote starting/stopping, precise frequency and voltage regulation, alarm and status message display, output metering, auto-shutdown at fault detection and NFPA 110 Level 1 compliance.

Cooling system - Standard cooling package provides reliable running at up to 50 ℃ (122 ℉) ambient temperature.

Enclosures - The aesthetically appealing enclosure incorporates special designs that deliver one of the quietest generators of its kind. Aluminium material plus durable powder coat paint provides the best anti-corrosion performance. The generator set enclosure has been evaluated to withstand 180 MPH wind loads in accordance with ASCE7 -10. The design has hinged doors to provide easy access for service and maintenance.

Fuel tanks - Dual wall sub-base fuel tanks are offered as optional features, providing economical and flexible solutions to meet extensive code requirements on diesel fuel tanks.

NFPA - The generator set accepts full rated load in a single step in accordance with NFPA 110 for Level 1 systems.

Warranty and service - Backed by a comprehensive warranty and worldwide distributor network.

Generator set specifications

Governor regulation class	ISO8528 Part 1 Class G3
Voltage regulation, no load to full load	± 1.0%
Random voltage variation	± 1.0%
Frequency regulation	Isochronous
Random frequency variation	± 0.50%
Radio frequency emissions compliance	FCC code title 47 part 15 class A and B

Engine specifications

Design	Turbocharged and charge air cooled
Bore	107 mm (4.21 in.)
Stroke	124 mm (4.88 in.)
Displacement	6.7 L (408 in^3)
Cylinder block	Cast iron, in-line 6 cylinder
Battery capacity	2 x 850 amps per battery at ambient temperature of 0 ℃ (32 ℉)
Battery charging alternator	100 amps
Starting voltage	2 x 12 volt in parallel, negative ground
Lube oil filter type(s)	Spin-on with relief valve
Standard cooling system	High ambient radiator
Rated speed	1800 rpm

Alternator specifications

Design	Brushless, 4 pole, drip proof, revolving field
Stator	2/3 pitch
Rotor	Direct coupled, flexible disc
Insulation system	Class H per NEMA MG1-1.65
Standard temperature rise	120 ºC (248 ℉) Standby
Exciter type	Torque match (shunt) with PMG as option
Alternator cooling	Direct drive centrifugal blower
AC waveform Total Harmonic Distortion (THDV)	< 5% no load to full linear load, < 3% for any single harmonic
Telephone Influence Factor (TIF)	< 50 per NEMA MG1-22.43
Telephone Harmonic Factor (THF)	< 3%

Available voltages

1-phase	3-phase				
• 120/240	• 120/208	• 120/240	• 277/480	• 347/600	• 127/220

Generator set options

Fuel system
- Basic fuel tanks
- Regional fuel tanks

Engine
- Engine air cleaner – normal or heavy duty
- Shut down – low oil pressure
- Extension – oil drain
- Engine oil heater

Alternator
- 120 ℃ temperature rise alternator
- 105 ℃ temperature rise alternator
- PMG excitation
- Alternator heater, 120 V
- Reconnectable full 1 phase output alternator upto 175 kWe

Control
- AC output analog meters
- Stop switch – emergency
- Auxiliary output relays (2)
- Auxiliary configurable signal inputs (8) and relay outputs (8)

Electrical
- One, two or three circuit breaker configurations
- 80% rated circuit breakers
- 80% or 100% rated LSI circuit breakers
- Battery charger

Enclosure
- Aluminium enclosure Sound Level 1 or Level 2, green color
- Aluminium weather protective enclosure with muffler installed, green color

Cooling system
- Shutdown – low coolant level
- Warning – low coolant level
- Extension – coolant drain
- Coolant heater options:
  - <4 ℃ (40 ℉) – cold weather
  - <-18 ℃ (0 ℉) – extreme cold

Exhaust system
- Exhaust connector NPT
- Exhaust muffler mounted

Generator set application
- Base barrier – elevated genset
- Radiator outlet duct adapter

Warranty
- Base warranty – 2 year/1000 hours, Standby
- Base warranty – 1 year/unlimited hours, Prime
- 3 & 5 year Standby warranty options

Our energy working for you.™

Generator set accessories

- Coolant heater
- Battery heater kit
- Engine oil heater
- Remote control displays
- Auxiliary output relays (2)
- Auxiliary configurable signal inputs (8) and relay outputs (8)
- Annunciator – RS485
- Audible alarm
- Remote monitoring device – PowerCommand 500/550
- Battery charger – stand-alone, 12 V
- Circuit breakers
- Enclosure Sound Level 1 to Sound Level 2 upgrade kit
- Base barrier – elevated generator set
- Mufflers – industrial, residential or critical
- Alternator PMG excitation
- Alternator heater
- Improved PC1.1 display readability
- Top conduit entry access

Control system PowerCommand 1.1

PowerCommand control is an integrated generator set control system providing voltage regulation, engine protection, operator interface and isochronous governing (optional). Major features include:

- Battery monitoring and testing features and smart starting control system.
- Standard PCCNet interface to devices such as remote annunciator for NFPA 110 applications.
- Control boards potted for environmental protection.
- Control suitable for operation in ambient temperatures from -40 ℃ to +70 ℃ (-40 ℉ to +158 ℉) and altitudes to 5000 meters (13,000 feet).
- Prototype tested; UL, CSA, and CE compliant.
- InPower™ PC-based service tool available for detailed diagnostics.

Operator/display panel

- Manual off switch
- Alpha-numeric display with pushbutton access for viewing engine and alternator data and providing setup, controls and adjustments (English or international symbols)
- LED lamps indicating generator set running, not in auto, common warning, common shutdown, manual run mode and remote start
- Suitable for operation in ambient temperatures from -40 ℃ to +70 ℃
- Bargraph display (optional)

AC protection

- Over current warning and shutdown
- Over and under voltage shutdown
- Over and under frequency shutdown
- Over excitation (loss of sensing) fault
- Field overload

Engine protection

- Overspeed shutdown
- Low oil pressure warning and shutdown
- High coolant temperature warning and shutdown
- Low coolant level warning or shutdown
- Low coolant temperature warning
- High, low and weak battery voltage warning
- Fail to start (overcrank) shutdown
- Fail to crank shutdown
- Redundant start disconnect
- Cranking lockout
- Sensor failure indication
- Low fuel level warning or shutdown

Alternator data

- Line-to-Line and Line-to-neutral AC volts
- 3-phase AC current
- Frequency
- Total kVa

Engine data

- DC voltage
- Lube oil pressure
- Coolant temperature
- Engine speed

Other data

- Generator set model data
- Start attempts, starts, running hours
- Fault history
- RS485 Modbus® interface
- Data logging and fault simulation (requires InPower service tool)

Digital governing (optional)

- Integrated digital electronic isochronous governor
- Temperature dynamic governing

Digital voltage regulation

- Integrated digital electronic voltage regulator
- 2-phase Line-to-Line sensing
- Configurable torque matching

Control functions

- Time delay start and cooldown
- Cycle cranking
- PCCNet interface
- (2) Configurable inputs
- (2) Configurable outputs
- Remote emergency stop
- Automatic Transfer Switch (ATS) control
- Generator set exercise, field adjustable

Options

- Auxiliary output relays (2)
- Remote annunciator with (3) configurable inputs and (4) configurable outputs
- PMG alternator excitation
- PowerCommand 500/550 for remote monitoring and alarm notification (accessory)
- Auxiliary, configurable signal inputs (8) and configurable relay outputs (8)
- AC output analog meters (bargraph)
  - Color-coded graphical display of:
    - 3-phase AC voltage
    - 3-phase current
    - Frequency
    - kVa
- Remote operator panel
- PowerCommand 2.3 control with AmpSentry protection

Ratings definitions

Emergency Standby Power (ESP):

Applicable for supplying power to varying electrical load for the duration of power interruption of a reliable utility source. Emergency Standby Power (ESP) is in accordance with ISO 8528. Fuel Stop power in accordance with ISO 3046, AS 2789, DIN 6271 and BS 5514.

Limited-Time Running Power (LTP):

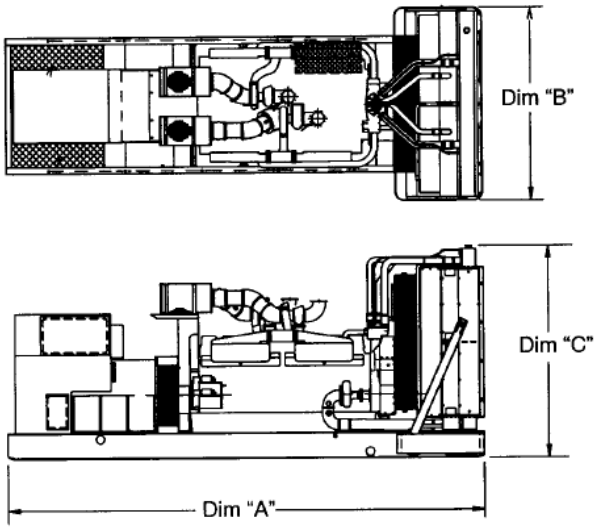
Applicable for supplying power to a constant electrical load for limited hours. Limited Time Running Power (LTP) is in accordance with ISO 8528.

Prime Power (PRP):

Applicable for supplying power to varying electrical load for unlimited hours. Prime Power (PRP) is in accordance with ISO 8528. Ten percent overload capability is available in accordance with ISO 3046, AS 2789, DIN 6271 and BS 5514.

Base Load (Continuous) Power (COP):

Applicable for supplying power continuously to a constant electrical load for unlimited hours. Continuous Power (COP) in accordance with ISO 8528, ISO 3046, AS 2789, DIN 6271 and BS 5514.



This outline drawing is for reference only. See respective model data sheet for specific model outline drawing number.

Codes and standards

Codes or standards compliance may not be available with all model configurations – consult factory for availability.

	This generator set is designed in facilities certified to ISO 9001 and manufactured in facilities certified to ISO 9001 or ISO 9002.		The generator set is available Listed to UL 2200, Stationary Engine Generator Assemblies.
	The Prototype Test Support (PTS) program verifies the performance integrity of the generator set design. Cummins products bearing the PTS symbol meet the prototype test requirements of NFPA 110 for Level 1 systems.	**U.S. EPA**	Engine certified to U.S. EPA SI Stationary Emission Regulation 40 CFR, Part 60.
	All low voltage models are CSA certified to product class 4215-01.	**International Building Code**	The generator set is certified to International Building Code (IBC) 2012.

Warning: Back feed to a utility system can cause electrocution and/or property damage. Do not connect to any building's electrical system except through an approved device or after building main switch is open.

Global Notes:

1. Sound pressure levels at 1 meter are measured per the requirements of ISO 3744, ISO 8528-10, and European Communities Directive 2000/14/EC as applicable. The microphone measurement locations are 1 meter from a reference parallelepiped just enclosing the generator set (enclosed or unenclosed).

2. Seven-meter measurement location 1 is 7 meters (23 feet) from the generator (alternator) end of the generator set, and the locations proceed counterclockwise around the generator set at 45° angles at a height of 1.2 meters (48 inches) above the ground surface.

3. Sound Power Levels are calculated according to ISO 3744, ISO 8528-10, and/or CE (European Union) requirements.

4. Exhaust Sound Levels are measured and calculated per ISO 6798, Annex A.

5. Reference Sound Pressure Level is 20 µPa

6. Reference Sound Power Level is 1 pW (10^{-12} Watt)

7. Sound data for remote-cooled generator sets are based on rated load without cooling fan noise.

8. Sound data for the generator set with infinite exhaust do not include the exhaust noise contribution

9. Published sound levels are measured at CE certified test site and are subject to instrumentation measurement, installation, and manufacturing variability.

10. Unhoused/Open configuration generator sets refers to generator sets with no sound enclosures of any kind.

11. Housed/Enclosed/Closed/Canopy configuration generator sets refer to generator sets that have noise reduction sound enclosure installed over the generator set and usually integrally attached to the skid base/base frame/fuel container base of the generator set.

12. Published sound levels meet the requirements India's Central Pollution Control Board (Ministry of Environment & Forests), vide GSR 371 (E), which states the A-weighted sound level at 1 meter from any diesel generator set up to a power output rating of 1000kVA shall not exceed 75 dB(A).

13. For updated noise pollution information for India see website: http://www.envfor.nic.in/legis/legis.html

14. Sound levels must meet India's Ambient Air Noise Quality Standards detailed for Daytime/Nighttime operation in Noise Pollution (Regulation and Control) Rules, 2000

Specification sheet

Dual wall sub-base diesel fuel tanks -

10-200 kW generator sets

Description

Cummins® offers two series of fuel tanks (basic series and regional series) for the 10~125 kW diesel generator sets. The “basic” series of fuel tanks provide economical solutions for areas with no or minimal local/regional code requirements on diesel fuel tanks. The footprint of “basic” tanks matches the generator set’s footprint. The “regional” series of fuel tanks provide flexible and upgradable solutions for areas with extensive local/regional code requirements on diesel fuel tanks. The footprint of the “regional” series of fuel tanks extends beyond the generator set to allow room for installation of optional features at factory or accessories in the field for meeting local/regional code requirements or customer specification on diesel fuel tanks. All fuel tanks and optional features are compatible with factory installed enclosures.

These tanks are constructed of heavy gauge steel and include an internally reinforced baffle structure for supporting the generator set. The fuel tank design features fewer seams and welds for better corrosion resistance performance.

These tanks are pre-treated with a conversion coating and then finished with a textured powder paint. The paint has superior UV and chemical resistance with best-in-class adhesion, flexibility, and durability to resist chipping and substrate corrosion. Both interior compartments are treated with a rust preventative for extended corrosion protection.

These tanks are UL and ULC Listed as secondary containment generator base tanks. Inner and outer containments are leak checked per UL and ULC testing procedures to ensure their integrity.

These fuel tanks are offered in various sizes to satisfy different fuel capacities requirements.

Basic fuel tanks

Standard features:

UL 142 and ULC-S601 listed - Minimum 110% secondary containment capacity.

NFPA and IFC - Capable of meeting NFPA 30 and NFPA 110 codes with available factory installed optional features.

Emergency pressure relief vents - Ensure adequate ventilation of the primary and secondary tank compartments under extreme temperature and emergency conditions.

Normal atmospheric vent - “Mushroom” style vent ensures adequate venting of the primary tank during fill, generator set running and temperature variations. Raised above fuel fill.

Raised fuel fill - includes lockable sealed fuel cap.

Lifting eyes - Allow lifting of fuel tank with generator set installed.

Optional features:

Secondary containment basin switch (rupture switch) - Activates a warning in the event of a primary tank leak. Side mounted.

Low fuel level switch - Activates a warning when 40% of the fuel is left in the tank.

Fuel level gauge - Provides direct reading of fuel level. Top mounted.

Electric fuel level sender with gauge - Allows remote electrical monitoring of fuel tank level. Flying leads for customer connection.

Tank to foundation clearance - 2-inch bolt-thru risers allow visual inspection under tank including rodent barrier.

Note: No OFPV is offered on basic fuel tanks.

* All weights are approximate.

Regional fuel tanks

Standard features:

UL 142 and ULC-S601 listed - Minimum 110% secondary IBC 2012 and 2015 certified - All optional features are seismically certified with this range of tanks and generator sets. Requires factory-installed 2 ft vent extensions or higher.

UL 142 & ULC-S601 listed - Minimum 125% secondary containment capacity.

NFPA & IFC - Capable of meeting NFPA 30, NFPA 110, and IFC codes with available factory-installed optional features.

Emergency pressure relief vents - Ensure adequate ventilation of the primary and secondary tank compartments under extreme temperature and emergency conditions.

Normal atmospheric vent - "Mushroom" style vent ensures adequate venting of the primary tank during fill, generator set running, and temperature variations. Raised above fuel fill.

Raised fuel fill - Includes lockable sealed fuel cap.

Lifting eyes - Allow lifting of fuel tank with generator set installed.

Optional features:

Secondary containment basin switch (rupture switch) - Activates a warning in the event of a primary tank leak. Side Mounted.

Low fuel level switch - Activates a warning when 40% of the fuel is left in the tank.

Fuel level gauge - Provides direct reading of fuel level. Top mounted.

Electric fuel level sender with gauge - Allows remote electrical monitoring of fuel tank level. Flying leads for customer connection.

Tank to foundation clearance - 2-inch bolt-thru risers allow visual inspection under tank including rodent barrier.

Spill containment box for fuel fill - 5 gallon capacity with integral drain (to tank). Lockable lid.

Overfill prevention valve - Shuts off fuel flow during filling at approximately 95% full*. Includes fill down tube, as needed, to terminate within 6" of the bottom of the fuel tank. Uses a 2 inch type "F" cam lock adapter for filling.

High fuel switch - Activates at 90% of full fuel level. Flying leads for customer connection.

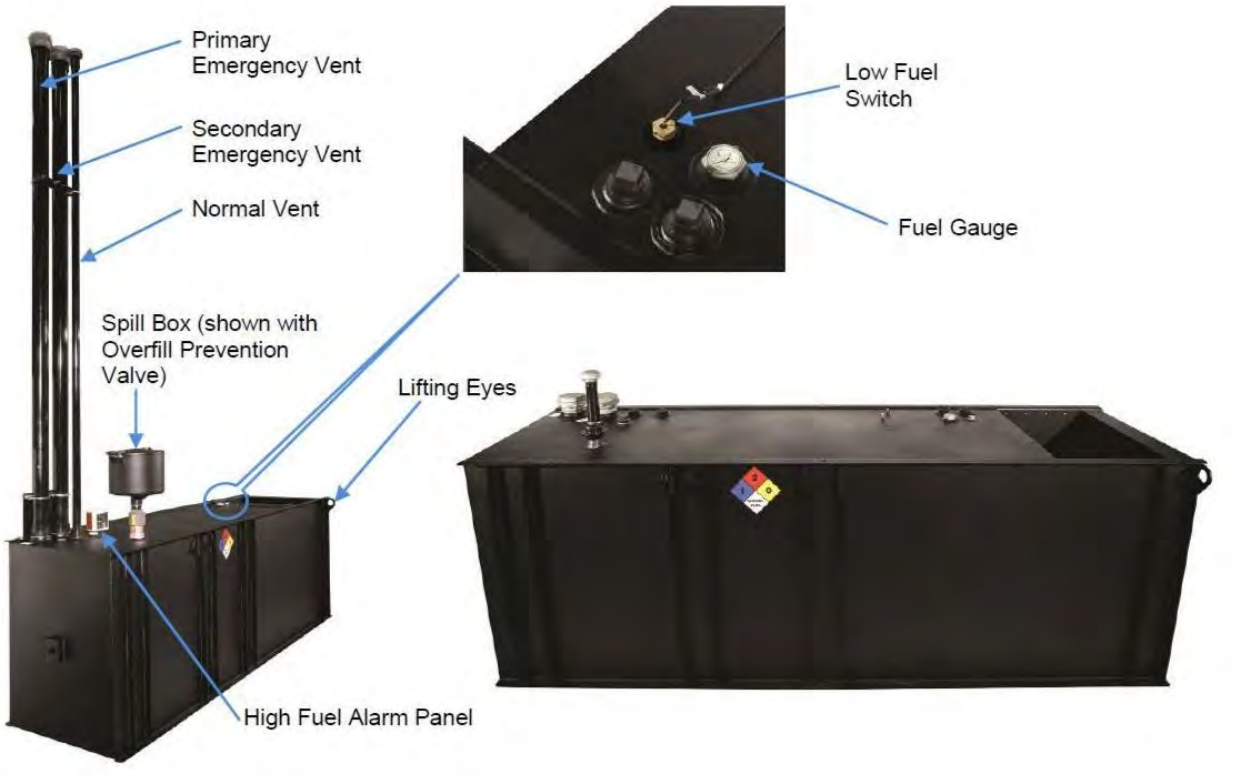
High fuel alarm panel - Provides audible & visual alarm when fuel level reaches 90% of full fuel level.

Fill drop tube - Terminates fuel fill location within 6" of the bottom of the fuel tank.

Vent extensions - Terminate normal and emergency vents (both primary and secondary) a minimum of 12 ft above the bottom of tank.

Seismic vent extensions - 2 ft normal and emergency (both primary & secondary) extensions to meet IBC/OSHPD seismic requirements.

* The OFPV inherently shuts off fuel at approximately 2" below the top of the fuel tank. Some tanks will shut off below this 95% fill level.



*Picture is for reference only. See outline drawing for tank specific information by model.

Certifications/standards/codes

UL 142 Listed - Cummins dual wall sub-base tanks are UL Listed and constructed in accordance with Underwriters Laboratories Standard UL 142 “steel aboveground tanks for flammable and combustible liquids,” as a “secondary containment generator base tank”

NFPA - Cummins tanks are built in accordance with all applicable NFPA codes:

- NFPA 30 - Flammable and Combustible Liquids code
- NFPA 37 - Standard for Installation and use of Stationary Combustible Engine and Gas Turbines
- NFPA 110 - Standard for Emergency and Standby Power Systems

ISO9001 - This product was designed and manufactured in facilities certified to ISO9001.

ULC - Cummins tanks are built in accordance with all applicable ULC codes

APPLICATIONS INVOLVING HAZARDOUS MATERIALS – GENERATOR SUPPLEMENT

The following information is required for hazardous materials applications that include generators.

GENERATOR PURPOSE (for example, whether it is an emergency generator dedicated to life safety egress lighting and other life safety devices, or a standby generator to allow continued operations in the event of a power outage)

Generator is intended to provide backup power to Emergency, Legally Required and Optional Standby loads to support continued facility operations in the event of a utility power outage.

FUEL TANK SIZE (in gallons) **AND FUEL TYPE** Fuel tank size: 270 gallons (approx) Fuel type: diesel	**NOISE RATING** 72db(A) @ 7meters
SIZE (output in both kW (kilowatt) and hp (horsepower) measurements) Power output: 150 kW (approx) Engine output: 324 hp	**ENCLOSURE COLOR** Green or gray
ROUTE FOR FUELING HOSE ACCESS 75ft max distance, direct from fueling truck to generator fuel tank	**PARKING LOCATION OF FUELING TRUCK** Building exterior at drivable surface
FREQUENCY OF REFUELING 2 times / year	**HOURS OF SERVICE ON A FULL TANK** 24 hours at generator fully rated load

PROPOSED TESTING SCHEDULE (including frequency, days of week, and time of day)

Monthly, Sunday, AM

ALARMS AND/OR AUTOMATIC SHUTOFFS (for leaks during use and/or spills/over-filling during fueling, if applicable)

Fuel system alarms and/or shutdowns: overfill, low fuel, fuel-in-rupture basin alarm.
Engine alarms and/or shutdowns: overspeed, fail start, low oil pressure, high coolant temp, etc.

OTHER APPLICATION SUBMITTAL REQUIREMENTS (please attach)

- Section showing the height of the pad, the isolation base (if there is one), the height of the generator with the appropriate belly (fuel storage tank) and exhaust stack
- Status of required Bay Area Air Qualify Management District (BAAQMD) permit, including confirmation of parental notification for any proposals within 1,000 feet of a school

GENERATOR SIZE (kW)	DIMENSION 'A' (")	DIMENSION 'B' (")
1000	315	137
750	315	137
500	222	106
250	222	106

Specification sheet

Diesel generator set

QSB7 series engine
125-200 kW @ 60 Hz
EPA Tier 3 emissions

Description

Cummins® generator sets are fully integrated power generation systems providing optimum performance, reliability and versatility for stationary Standby applications.

Features

Heavy duty engine - Rugged 4-cycle industrial diesel delivers reliable power and fast response to load changes.

Alternator - Several alternator sizes offer selectable motor starting capability with low reactance 2/3 pitch windings, low waveform distortion with non-linear loads and fault clearing short-circuit capability.

Control system - The PowerCommand® 1.1 electronic control is standard equipment and provides total generator set system integration including automatic remote starting/stopping, precise frequency and voltage regulation, alarm and status message display, output metering, auto-shutdown at fault detection and NFPA 110 Level 1 compliance.

Cooling system - Standard cooling package provides reliable running at up to 50 ℃ (122 ℉) ambient temperature.

Enclosures - The aesthetically appealing enclosure incorporates special designs that deliver one of the quietest generators of its kind. Aluminium material plus durable powder coat paint provides the best anti-corrosion performance. The generator set enclosure has been evaluated to withstand 180 MPH wind loads in accordance with ASCE7 -10. The design has hinged doors to provide easy access for service and maintenance.

Fuel tanks - Dual wall sub-base fuel tanks are offered as optional features, providing economical and flexible solutions to meet extensive code requirements on diesel fuel tanks.

NFPA - The generator set accepts full rated load in a single step in accordance with NFPA 110 for Level 1 systems.

Warranty and service - Backed by a comprehensive warranty and worldwide distributor network.

Generator set specifications

Governor regulation class	ISO8528 Part 1 Class G3
Voltage regulation, no load to full load	± 1.0%
Random voltage variation	± 1.0%
Frequency regulation	Isochronous
Random frequency variation	± 0.50%
Radio frequency emissions compliance	FCC code title 47 part 15 class A and B

Engine specifications

Design	Turbocharged and charge air cooled
Bore	107 mm (4.21 in.)
Stroke	124 mm (4.88 in.)
Displacement	6.7 L (408 in^3)
Cylinder block	Cast iron, in-line 6 cylinder
Battery capacity	2 x 850 amps per battery at ambient temperature of 0 ℃ (32 ℉)
Battery charging alternator	100 amps
Starting voltage	2 x 12 volt in parallel, negative ground
Lube oil filter type(s)	Spin-on with relief valve
Standard cooling system	High ambient radiator
Rated speed	1800 rpm

Alternator specifications

Design	Brushless, 4 pole, drip proof, revolving field
Stator	2/3 pitch
Rotor	Direct coupled, flexible disc
Insulation system	Class H per NEMA MG1-1.65
Standard temperature rise	120 ºC (248 ℉) Standby
Exciter type	Torque match (shunt) with PMG as option
Alternator cooling	Direct drive centrifugal blower
AC waveform Total Harmonic Distortion (THDV)	< 5% no load to full linear load, < 3% for any single harmonic
Telephone Influence Factor (TIF)	< 50 per NEMA MG1-22.43
Telephone Harmonic Factor (THF)	< 3%

Available voltages

1-phase	3-phase				
• 120/240	• 120/208	• 120/240	• 277/480	• 347/600	• 127/220

Generator set options

Fuel system
- Basic fuel tanks
- Regional fuel tanks

Engine
- Engine air cleaner – normal or heavy duty
- Shut down – low oil pressure
- Extension – oil drain
- Engine oil heater

Alternator
- 120 ℃ temperature rise alternator
- 105 ℃ temperature rise alternator
- PMG excitation
- Alternator heater, 120 V
- Reconnectable full 1 phase output alternator upto 175 kWe

Control
- AC output analog meters
- Stop switch – emergency
- Auxiliary output relays (2)
- Auxiliary configurable signal inputs (8) and relay outputs (8)

Electrical
- One, two or three circuit breaker configurations
- 80% rated circuit breakers
- 80% or 100% rated LSI circuit breakers
- Battery charger

Enclosure
- Aluminium enclosure Sound Level 1 or Level 2, green color
- Aluminium weather protective enclosure with muffler installed, green color

Cooling system
- Shutdown – low coolant level
- Warning – low coolant level
- Extension – coolant drain
- Coolant heater options:
  - <4 ℃ (40 ℉) – cold weather
  - <-18 ℃ (0 ℉) – extreme cold

Exhaust system
- Exhaust connector NPT
- Exhaust muffler mounted

Generator set application
- Base barrier – elevated genset
- Radiator outlet duct adapter

Warranty
- Base warranty – 2 year/1000 hours, Standby
- Base warranty – 1 year/unlimited hours, Prime
- 3 & 5 year Standby warranty options

Our energy working for you.™

Generator set accessories

- Coolant heater
- Battery heater kit
- Engine oil heater
- Remote control displays
- Auxiliary output relays (2)
- Auxiliary configurable signal inputs (8) and relay outputs (8)
- Annunciator – RS485
- Audible alarm
- Remote monitoring device – PowerCommand 500/550
- Battery charger – stand-alone, 12 V
- Circuit breakers
- Enclosure Sound Level 1 to Sound Level 2 upgrade kit
- Base barrier – elevated generator set
- Mufflers – industrial, residential or critical
- Alternator PMG excitation
- Alternator heater
- Improved PC1.1 display readability
- Top conduit entry access

Control system PowerCommand 1.1

PowerCommand control is an integrated generator set control system providing voltage regulation, engine protection, operator interface and isochronous governing (optional). Major features include:

- Battery monitoring and testing features and smart starting control system.
- Standard PCCNet interface to devices such as remote annunciator for NFPA 110 applications.
- Control boards potted for environmental protection.
- Control suitable for operation in ambient temperatures from -40 ℃ to +70 ℃ (-40 ℉ to +158 ℉) and altitudes to 5000 meters (13,000 feet).
- Prototype tested; UL, CSA, and CE compliant.
- InPower™ PC-based service tool available for detailed diagnostics.

Operator/display panel

- Manual off switch
- Alpha-numeric display with pushbutton access for viewing engine and alternator data and providing setup, controls and adjustments (English or international symbols)
- LED lamps indicating generator set running, not in auto, common warning, common shutdown, manual run mode and remote start
- Suitable for operation in ambient temperatures from -40 ℃ to +70 ℃
- Bargraph display (optional)

AC protection

- Over current warning and shutdown
- Over and under voltage shutdown
- Over and under frequency shutdown
- Over excitation (loss of sensing) fault
- Field overload

Engine protection

- Overspeed shutdown
- Low oil pressure warning and shutdown
- High coolant temperature warning and shutdown
- Low coolant level warning or shutdown
- Low coolant temperature warning
- High, low and weak battery voltage warning
- Fail to start (overcrank) shutdown
- Fail to crank shutdown
- Redundant start disconnect
- Cranking lockout
- Sensor failure indication
- Low fuel level warning or shutdown

Alternator data

- Line-to-Line and Line-to-neutral AC volts
- 3-phase AC current
- Frequency
- Total kVa

Engine data

- DC voltage
- Lube oil pressure
- Coolant temperature
- Engine speed

Other data

- Generator set model data
- Start attempts, starts, running hours
- Fault history
- RS485 Modbus® interface
- Data logging and fault simulation (requires InPower service tool)

Digital governing (optional)

- Integrated digital electronic isochronous governor
- Temperature dynamic governing

Digital voltage regulation

- Integrated digital electronic voltage regulator
- 2-phase Line-to-Line sensing
- Configurable torque matching

Control functions

- Time delay start and cooldown
- Cycle cranking
- PCCNet interface
- (2) Configurable inputs
- (2) Configurable outputs
- Remote emergency stop
- Automatic Transfer Switch (ATS) control
- Generator set exercise, field adjustable

Options

- Auxiliary output relays (2)
- Remote annunciator with (3) configurable inputs and (4) configurable outputs
- PMG alternator excitation
- PowerCommand 500/550 for remote monitoring and alarm notification (accessory)
- Auxiliary, configurable signal inputs (8) and configurable relay outputs (8)
- AC output analog meters (bargraph)
  - Color-coded graphical display of:
    - 3-phase AC voltage
    - 3-phase current
    - Frequency
    - kVa
- Remote operator panel
- PowerCommand 2.3 control with AmpSentry protection

Ratings definitions

Emergency Standby Power (ESP):

Applicable for supplying power to varying electrical load for the duration of power interruption of a reliable utility source. Emergency Standby Power (ESP) is in accordance with ISO 8528. Fuel Stop power in accordance with ISO 3046, AS 2789, DIN 6271 and BS 5514.

Limited-Time Running Power (LTP):

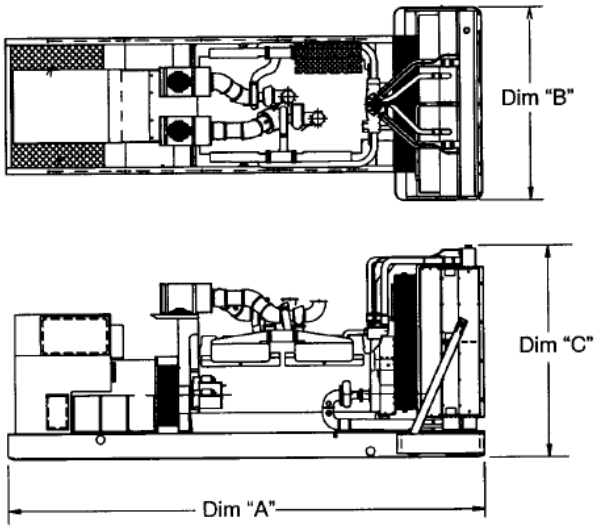
Applicable for supplying power to a constant electrical load for limited hours. Limited Time Running Power (LTP) is in accordance with ISO 8528.

Prime Power (PRP):

Applicable for supplying power to varying electrical load for unlimited hours. Prime Power (PRP) is in accordance with ISO 8528. Ten percent overload capability is available in accordance with ISO 3046, AS 2789, DIN 6271 and BS 5514.

Base Load (Continuous) Power (COP):

Applicable for supplying power continuously to a constant electrical load for unlimited hours. Continuous Power (COP) in accordance with ISO 8528, ISO 3046, AS 2789, DIN 6271 and BS 5514.



This outline drawing is for reference only. See respective model data sheet for specific model outline drawing number.

Codes and standards

Codes or standards compliance may not be available with all model configurations – consult factory for availability.

	This generator set is designed in facilities certified to ISO 9001 and manufactured in facilities certified to ISO 9001 or ISO 9002.		The generator set is available Listed to UL 2200, Stationary Engine Generator Assemblies.
	The Prototype Test Support (PTS) program verifies the performance integrity of the generator set design. Cummins products bearing the PTS symbol meet the prototype test requirements of NFPA 110 for Level 1 systems.	**U.S. EPA**	Engine certified to U.S. EPA SI Stationary Emission Regulation 40 CFR, Part 60.
	All low voltage models are CSA certified to product class 4215-01.	**International Building Code**	The generator set is certified to International Building Code (IBC) 2012.

Warning: Back feed to a utility system can cause electrocution and/or property damage. Do not connect to any building's electrical system except through an approved device or after building main switch is open.

Global Notes:

1. Sound pressure levels at 1 meter are measured per the requirements of ISO 3744, ISO 8528-10, and European Communities Directive 2000/14/EC as applicable. The microphone measurement locations are 1 meter from a reference parallelepiped just enclosing the generator set (enclosed or unenclosed).

2. Seven-meter measurement location 1 is 7 meters (23 feet) from the generator (alternator) end of the generator set, and the locations proceed counterclockwise around the generator set at 45° angles at a height of 1.2 meters (48 inches) above the ground surface.

3. Sound Power Levels are calculated according to ISO 3744, ISO 8528-10, and/or CE (European Union) requirements.

4. Exhaust Sound Levels are measured and calculated per ISO 6798, Annex A.

5. Reference Sound Pressure Level is 20 µPa

6. Reference Sound Power Level is 1 pW (10^{-12} Watt)

7. Sound data for remote-cooled generator sets are based on rated load without cooling fan noise.

8. Sound data for the generator set with infinite exhaust do not include the exhaust noise contribution

9. Published sound levels are measured at CE certified test site and are subject to instrumentation measurement, installation, and manufacturing variability.

10. Unhoused/Open configuration generator sets refers to generator sets with no sound enclosures of any kind.

11. Housed/Enclosed/Closed/Canopy configuration generator sets refer to generator sets that have noise reduction sound enclosure installed over the generator set and usually integrally attached to the skid base/base frame/fuel container base of the generator set.

12. Published sound levels meet the requirements India's Central Pollution Control Board (Ministry of Environment & Forests), vide GSR 371 (E), which states the A-weighted sound level at 1 meter from any diesel generator set up to a power output rating of 1000kVA shall not exceed 75 dB(A).

13. For updated noise pollution information for India see website: http://www.envfor.nic.in/legis/legis.html

14. Sound levels must meet India's Ambient Air Noise Quality Standards detailed for Daytime/Nighttime operation in Noise Pollution (Regulation and Control) Rules, 2000

Specification sheet

Dual wall sub-base diesel fuel tanks -

10-200 kW generator sets

Description

Cummins® offers two series of fuel tanks (basic series and regional series) for the 10~125 kW diesel generator sets. The “basic” series of fuel tanks provide economical solutions for areas with no or minimal local/regional code requirements on diesel fuel tanks. The footprint of “basic” tanks matches the generator set’s footprint. The “regional” series of fuel tanks provide flexible and upgradable solutions for areas with extensive local/regional code requirements on diesel fuel tanks. The footprint of the “regional” series of fuel tanks extends beyond the generator set to allow room for installation of optional features at factory or accessories in the field for meeting local/regional code requirements or customer specification on diesel fuel tanks. All fuel tanks and optional features are compatible with factory installed enclosures.

These tanks are constructed of heavy gauge steel and include an internally reinforced baffle structure for supporting the generator set. The fuel tank design features fewer seams and welds for better corrosion resistance performance.

These tanks are pre-treated with a conversion coating and then finished with a textured powder paint. The paint has superior UV and chemical resistance with best-in-class adhesion, flexibility, and durability to resist chipping and substrate corrosion. Both interior compartments are treated with a rust preventative for extended corrosion protection.

These tanks are UL and ULC Listed as secondary containment generator base tanks. Inner and outer containments are leak checked per UL and ULC testing procedures to ensure their integrity.

These fuel tanks are offered in various sizes to satisfy different fuel capacities requirements.

Compatible generator set model

Basic fuel tanks

Standard features:

UL 142 and ULC-S601 listed - Minimum 110% secondary containment capacity.

NFPA and IFC - Capable of meeting NFPA 30 and NFPA 110 codes with available factory installed optional features.

Emergency pressure relief vents - Ensure adequate ventilation of the primary and secondary tank compartments under extreme temperature and emergency conditions.

Normal atmospheric vent - “Mushroom” style vent ensures adequate venting of the primary tank during fill, generator set running and temperature variations. Raised above fuel fill.

Raised fuel fill - includes lockable sealed fuel cap.

Lifting eyes - Allow lifting of fuel tank with generator set installed.

Optional features:

Secondary containment basin switch (rupture switch) - Activates a warning in the event of a primary tank leak. Side mounted.

Low fuel level switch - Activates a warning when 40% of the fuel is left in the tank.

Fuel level gauge - Provides direct reading of fuel level. Top mounted.

Electric fuel level sender with gauge - Allows remote electrical monitoring of fuel tank level. Flying leads for customer connection.

Tank to foundation clearance - 2-inch bolt-thru risers allow visual inspection under tank including rodent barrier.

Note: No OFPV is offered on basic fuel tanks.

* All weights are approximate.

Regional fuel tanks

Standard features:

UL 142 and ULC-S601 listed - Minimum 110% secondary IBC 2012 and 2015 certified - All optional features are seismically certified with this range of tanks and generator sets. Requires factory-installed 2 ft vent extensions or higher.

UL 142 & ULC-S601 listed - Minimum 125% secondary containment capacity.

NFPA & IFC - Capable of meeting NFPA 30, NFPA 110, and IFC codes with available factory-installed optional features.

Emergency pressure relief vents - Ensure adequate ventilation of the primary and secondary tank compartments under extreme temperature and emergency conditions.

Normal atmospheric vent - "Mushroom" style vent ensures adequate venting of the primary tank during fill, generator set running, and temperature variations. Raised above fuel fill.

Raised fuel fill - Includes lockable sealed fuel cap.

Lifting eyes - Allow lifting of fuel tank with generator set installed.

Optional features:

Secondary containment basin switch (rupture switch) - Activates a warning in the event of a primary tank leak. Side Mounted.

Low fuel level switch - Activates a warning when 40% of the fuel is left in the tank.

Fuel level gauge - Provides direct reading of fuel level. Top mounted.

Electric fuel level sender with gauge - Allows remote electrical monitoring of fuel tank level. Flying leads for customer connection.

Tank to foundation clearance - 2-inch bolt-thru risers allow visual inspection under tank including rodent barrier.

Spill containment box for fuel fill - 5 gallon capacity with integral drain (to tank). Lockable lid.

Overfill prevention valve - Shuts off fuel flow during filling at approximately 95% full*. Includes fill down tube, as needed, to terminate within 6" of the bottom of the fuel tank. Uses a 2 inch type "F" cam lock adapter for filling.

High fuel switch - Activates at 90% of full fuel level. Flying leads for customer connection.

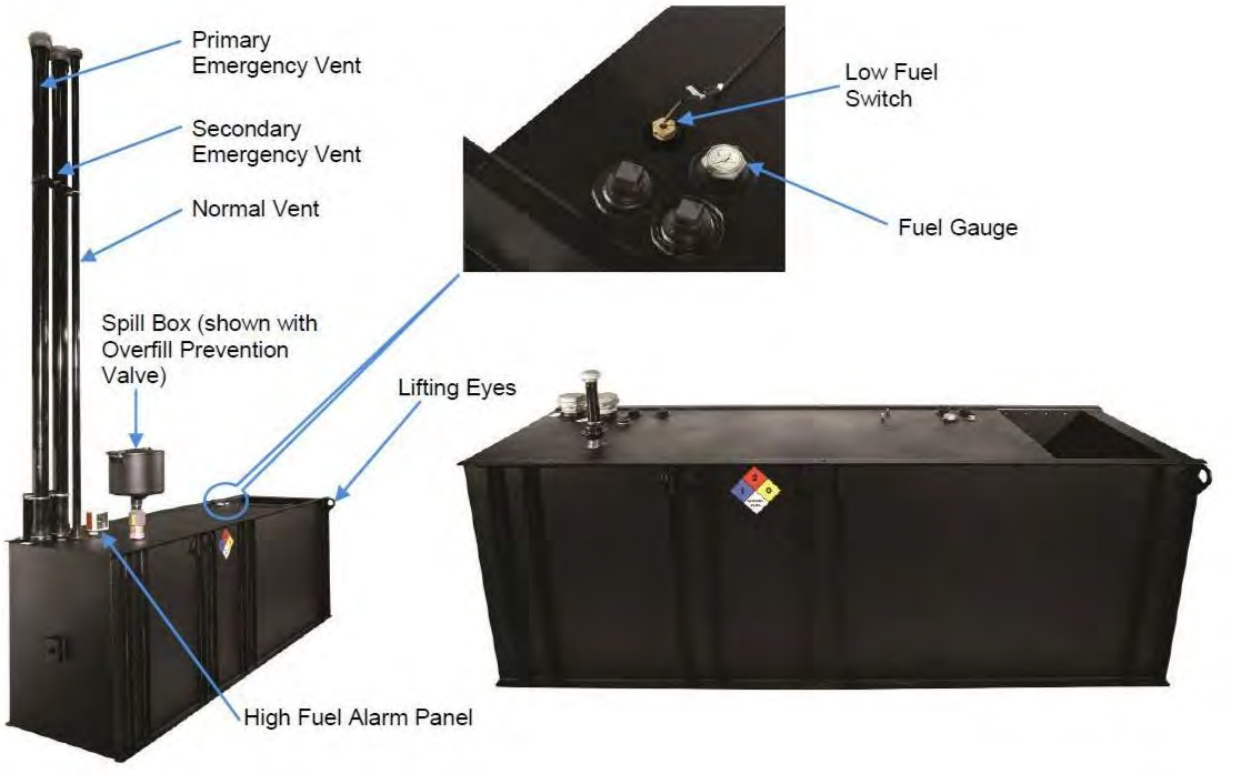
High fuel alarm panel - Provides audible & visual alarm when fuel level reaches 90% of full fuel level.

Fill drop tube - Terminates fuel fill location within 6" of the bottom of the fuel tank.

Vent extensions - Terminate normal and emergency vents (both primary and secondary) a minimum of 12 ft above the bottom of tank.

Seismic vent extensions - 2 ft normal and emergency (both primary & secondary) extensions to meet IBC/OSHPD seismic requirements.

* The OFPV inherently shuts off fuel at approximately 2" below the top of the fuel tank. Some tanks will shut off below this 95% fill level.



*Picture is for reference only. See outline drawing for tank specific information by model.

Certifications/standards/codes

UL 142 Listed - Cummins dual wall sub-base tanks are UL Listed and constructed in accordance with Underwriters Laboratories Standard UL 142 “steel aboveground tanks for flammable and combustible liquids,” as a “secondary containment generator base tank”

NFPA - Cummins tanks are built in accordance with all applicable NFPA codes:

- NFPA 30 - Flammable and Combustible Liquids code
- NFPA 37 - Standard for Installation and use of Stationary Combustible Engine and Gas Turbines
- NFPA 110 - Standard for Emergency and Standby Power Systems

ISO9001 - This product was designed and manufactured in facilities certified to ISO9001.

ULC - Cummins tanks are built in accordance with all applicable ULC codes

Powering Ahead

For over 50 years, Generac has provided innovative design and superior manufacturing.

Generac ensures superior quality by designing and manufacturing most of its generator components, including alternators, enclosures and base tanks, control systems and communications software.

Generac gensets utilize a wide variety of options, configurations and arrangements, allowing us to meet the standby power needs of practically every application.

Generac searched globally to ensure the most reliable engines power our generators. We choose only engines that have already been proven in heavy-duty industrial applications under adverse conditions.

Generac is committed to ensuring our customers' service support continues after their generator purchase.

ENGINE SYSTEM

- Oil Drain Extension
- Heavy Duty Air Cleaner
- Fan Guard
- Stainless Steel Flexible Exhaust Connection
- Critical Silencer (Enclosed Units Only)
- Factory Filled Oil and Coolant
- Radiator Duct Adapter (Open Set Only)

Fuel System

- Primary Fuel Filter

Cooling System

- Closed Coolant Recovery System
- UV/Ozone Resistant Hoses
- Factory-Installed Radiator
- 50/50 Ethylene Glycol Antifreeze
- Radiator Drain Extension

Electrical System

- Battery Charging Alternator
- Battery Cables
- Battery Tray
- Rubber-Booted Engine Electrical Connections
- Solenoid Activated Starter Motor

ALTERNATOR SYSTEM

- UL2200 GENprotect™
- Class H Insulation Material
- Vented Rotor
- 2/3 Pitch
- Skewed Stator
- Amortisseur Winding
- Permanent Magnet Excitation
- Sealed Bearing
- Full Load Capacity Alternator
- Protective Thermal Switch

GENERATOR SET

- Internal Genset Vibration Isolation
- Separation of Circuits - High/Low Voltage
- Separation of Circuits - Multiple Breakers
- Wrapped Exhaust Piping (Enclosed Units Only)
- Standard Factory Testing
- 2 Year Limited Warranty (Standby Rated Units)
- 1 Year Limited Warranty (Prime Rated Units)
- Silencer Mounted in the Discharge Hood (Enclosed Units Only)

ENCLOSURE (If Selected)

- Rust-Proof Fasteners with Nylon Washers to Protect Finish
- High Performance Sound-Absorbing Material (Sound Attenuated Enclosures)
- Gasketed Doors
- Stamped Air-Intake Louvers
- Upward Facing Discharge Hoods (Radiator and Exhaust)
- Stainless Steel Lift Off Door Hinges
- Stainless Steel Lockable Handles
- RhinoCoat™ - Textured Polyester Powder Coat Paint

FUEL TANKS (If Selected)

- UL 142/ULC S-601
- Double Wall
- Vents
- Sloped Top
- Sloped Bottom
- Factory Pressure Tested (2 psi)
- Rupture Basin Alarm
- Fuel Level
- Check Valve in Supply and Return Lines
- RhinoCoat™ - Textured Polyester Powder Coat Paint
- Stainless Hardware

CONTROL SYSTEM

Digital H Control Panel- Dual 4x20 Display

Program Functions

- Programmable Crank Limiter
- 7-Day Programmable Exerciser
- Special Applications Programmable Logic Controller
- RS-232/485 Communications
- All Phase Sensing Digital Voltage Regulator
- 2-Wire Start Capability
- Date/Time Fault History (Event Log)
- Isochronous Governor Control
- Waterproof/Sealed Connectors
- Audible Alarms and Shutdowns
- Not in Auto (Flashing Light)
- Auto/Off/Manual Switch
- E-Stop (Red Mushroom-Type)
- NFPA110 Level I and II (Programmable)
- Customizable Alarms, Warnings, and Events
- Modbus® protocol
- Predictive Maintenance Algorithm
- Sealed Boards
- Password Parameter Adjustment Protection
- Single Point Ground
- 16 Channel Remote Trending
- 0.2 msec High Speed Remote Trending
- Alarm Information Automatically Annunciated on the Display

Full System Status Display

- Power Output (kW)
- Power Factor
- kW Hours, Total and Last Run
- Real/Reactive/Apparent Power
- All Phase AC Voltage
- All Phase Currents
- Oil Pressure
- Coolant Temperature
- Coolant Level
- Engine Speed
- Battery Voltage
- Frequency

Alarms and Warnings

- Oil Pressure
- Coolant Temperature
- Coolant Level
- Low Fuel Pressure
- Engine Overspeed
- Battery Voltage
- Alarms and Warnings Time and Date Stamped
- Snap Shots of Key Operation Parameters During Alarms and Warnings
- Alarms and Warnings Spelled Out (No Alarm Codes)

INDUSTRIAL DIESEL GENERATOR SET

EPA Certified Stationary Emergency

GENERAC | INDUSTRIAL POWER

CONFIGURABLE OPTIONS

ENGINE SYSTEM

- ○ Engine Coolant Heater
- ○ Oil Heater
- ○ Level 1 Fan and Belt Guards (Open Set Only)
- ○ Radiator Stone Guard (Open Set Only)

FUEL SYSTEM

- ○ NPT Flexible Fuel Line

ELECTRICAL SYSTEM

- ○ 10A UL Listed Battery Charger
- ○ Battery Warmer

ALTERNATOR SYSTEM

- ○ Alternator Upsizing
- ○ Anti-Condensation Heater

CIRCUIT BREAKER OPTIONS

- ○ Main Line Circuit Breaker
- ○ 2nd Main Line Circuit Breaker
- ○ Shunt Trip and Auxiliary Contact
- ○ Electronic Trip Breakers

GENERATOR SET

- ○ 12 Position Load Center
- ○ Extended Factory Testing

ENCLOSURE

- ○ Weather Protected Enclosure
- ○ Level 1 Sound Attenuated
- ○ Level 2 Sound Attenuated
- ○ Level 2 Sound Attenuated with Motorized Dampers
- ○ Steel Enclosure
- ○ Aluminum Enclosure
- ○ IBC Seismic Certification/OSHPD Preapproval
- ○ Up to 200 MPH Wind Load Rating (Contact Factory for Availability)
- ○ AC/DC Enclosure Lighting Kit
- ○ Enclosure Heater

FUEL TANKS (Size On Last Page)

- ○ 8 in Fill Extension
- ○ 13 in Fill Extension
- ○ 19 in Fill Extension

CONTROL SYSTEM

- ○ NFPA 110 Compliant 21-Light Remote Annunciator
- ○ Remote Relay Assembly (8 or 16)
- ○ Oil Temperature Indication and Alarm
- ○ Ground Fault Annunciator
- ○ 10A Engine Run Relay
- ○ 120V GFCI and 240V Outlets
- ○ Remote E-Stop (Break Glass-Type, Surface Mount)
- ○ Remote E-Stop (Red Mushroom-Type, Surface Mount)
- ○ Remote E-Stop (Red Mushroom-Type, Flush Mount)
- ○ Damper Alarm Contacts (Motorized Dampers Only)
- ○ 100dB Alarm Horn

WARRANTY (Standby Gensets Only)

- ○ 2 Year Extended Limited Warranty
- ○ 5 Year Limited Warranty
- ○ 5 Year Extended Limited Warranty
- ○ 7 Year Extended Limited Warranty
- ○ 10 Year Extended Limited Warranty

ENGINEERED OPTIONS

ENGINE SYSTEM

- ○ Fluid Containment Pan
- ○ Coolant Heater Ball Valves

ALTERNATOR SYSTEM

- ○ 3rd Breaker Systems

CONTROL SYSTEM

- ○ Spare Inputs (x4) / Outputs (x4)
- ○ Battery Disconnect Switch

GENERATOR SET

- ○ Special Testing
- ○ Battery Box

ENCLOSURE

- ○ Door Open Alarm Switch

TANKS

- ○ Overfill Protection Valve
- ○ UL 2085 Tank
- ○ Stainless Steel Tank
- ○ Special Fuel Tanks
- ○ Vent Extensions
- ○ 5 Gallon Spill Containment Box
- ○ Dealer Supplied AHJ Requirements

INDUSTRIAL DIESEL GENERATOR SET

EPA Certified Stationary Emergency

GENERAC | INDUSTRIAL POWER

APPLICATION AND ENGINEERING DATA

ENGINE SPECIFICATIONS

General

Make	Perkins
EPA Emissions Compliance	Stationary Emergency
EPA Emission Reference	See Emission Data Sheet
Cylinder #	6
Type	In-Line
Displacement - in^3 (L)	927.56 (15.2)
Bore - in (mm)	5.39 (137)
Stroke - in (mm)	6.73 (171)
Compression Ratio	16.0:1
Intake Air Method	Turbocharged/Aftercooled
Cylinder Head Type	4-Valve
Piston Type	Aluminum
Crankshaft Type	I-Beam Section

Engine Governing

Governor	Electronic Isochronous
Frequency Regulation (Steady State)	±0.25%

Lubrication System

Oil Pump Type	Gear
Oil Filter Type	Full-Flow
Crankcase Capacity - qt (L)	47.55 (45)

Cooling System

Cooling System Type	Closed Recovery
Water Pump Type	Centrifugal Type, Belt-Driven
Fan Type	Pusher
Fan Speed - RPM	1,658
Fan Diameter - in (mm)	36.5 (927)

Fuel System

Fuel Type	Ultra Low Sulfur Diesel #2
Carburetor	ASTM
Fuel Filtering (Microns)	Primary 10 - Secondary 2
Fuel Inject Pump Make	Electronic
Injector Type	MEUI
Engine Type	Pre-Combustion
Fuel Supply Line - in (mm)	0.5 (12.7) NPT
Fuel Return Line - in (mm)	0.5 (12.7) NPT

Engine Electrical System

System Voltage	24 VDC
Battery Charger Alternator	Standard
Battery Size	See Battery Index 0161970SBY
Battery Voltage	(2)-12 VDC
Ground Polarity	Negative

ALTERNATOR SPECIFICATIONS

Standard Model	K0500124Y23
Poles	4
Field Type	Revolving
Insulation Class - Rotor	H
Insulation Class - Stator	H
Total Harmonic Distortion	<3% (3-Phase)
Telephone Interference Factor (TIF)	<50

Standard Excitation	Permanent Magnet
Bearings	Single Sealed Cartridge
Coupling	Direct via Flexible Disc
Prototype Short Circuit Test	Yes
Voltage Regulator Type	Digital
Number of Sensed Phases	All
Regulation Accuracy (Steady State)	±0.25%

Subject: RE: Backup Generator for Pump Station

Hi Sarah,

Here is a crude map of where the pump station generator is located. It is at the southwestern corner of the public park. Do you need something more formal?

Faye Brandin

Subject: RE: Backup Generator for Pump Station

Hi Faye,

Thank you for sending along the information. Can you provide a map of where the generator would be? All we need is a dot on the site plan.

Thanks!

Memo

Date:	December 1, 2021
Project:	Willow Village Mixed-Use Development
Project Number:	18-1489
To:	Faye Brandin (Signature Development Group)
From:	Ian Seagren, PE Forest Tanier-Gesner, PE
Subject:	Concept Level Energy Use and Production Summary
Distribution:	Eric Harrison (SDG), PAE Team

The purpose of this memo is to summarize a preliminary estimate of energy consumption by programming and fuel type, to summarize a preliminary estimate of photovoltaic (PV) energy production and to summarize the key assumptions of the preliminary analysis for the Willow Village Mixed-Use Development.

ENERGY CONSUMPTION SUMMARY BY PROGRAM AND FUEL

The preliminary energy use estimates by land-use category and fuel type for the mixed-use portion of Willow Village are summarized below.

Table 1| Concept Level Consumption Estimates

Land Use	Estimated Annual Electricity Usage (kWh/yr)	Estimated Annual Natural Gas Usage (Therms/yr)
Residential	16,855,000	0
Supermarket	1,562,000	3,000
Retail	269,000	0
Dining	1,150,000	18,500
Parking Infrastructure	1,280,000	0
Total	21,116,000	21,500

ENERGY PRODUCTION OPPORTUNITY SUMMARY BY BUILDING

The preliminary production for the on-site solar photovoltaic (PV) has been estimated by building as summarized below. PV systems are sized to comply with the Solar PV requirements described under Title 24 and Menlo Park Municipal code ordinances.

Table 2| Concept Level Production Estimates

BUILDING ID	SOLAR PV SYSTEM (kW)	ESTIMATED ENERGY PRODUCTION[i] (kWh/yr)
RS2	62	100,000
RS3	57	92,000
RS4	64	103,000
RS5	34	55,000
RS6	35	56,000
RS7	13	21,000
Total		427,000

SUMMARY OF ANALYSIS AND KEY ASSUMPTIONS

Land Use

Land use gross area estimates are based on the programming estimates provided on Jan 5, 2021, as summarized in Table 3 below.

Table 3| Land Use Gross Area Estimates

Land Use	Proposed Area (GSF)	Note
Residential	1,695,976	1730 Units Total
Supermarket	40,000	
Retail	30,000	60,000 GSF Retail allocation assumed to be 50% Dining
Dining	30,000	
Parking Infrastructure	617,715	1,883 residential spaces and 502 commercial spaces @ 259 SF/Space (308 EV Charging Stations)

Energy Data Sources

The estimates provided in Tables 1 utilize prototypical energy models for ASHRAE 90.1[ii] and Title 24[iii] along with supplemental existing building stock data[iv] and Title 24 exterior lighting power[v] allowances. Key characteristics of these data sources are:

- The prototype models utilize regional climate data (SFO or Oakland).
- Averaged estimates were taken from both ASHRAE 90.1-2016 prototypes and T-24 – 2016 prototypes when available. (Midrise Apartment; Restaurant; Retail)
- The Supermarket reference is an average of the DOE reference model and regional existing building stock data, due to a lack of cooking/baking energy in the reference model.
- The exterior lighting calculations only account for the General Hardscape allowance of 0.04 W/SF and does not include any "Special Security Lighting for Retail Parking and Pedestrian Hardscape" allowance.
- Electrification impacts are based on conservative heat pump space heating (2.5 COP) and electric tank water heating (0.93 EF). No efficiency credit estimated for conversion from gas cooking appliances to electric.
- Gas use in Supermarket and Dining is for commercial cooking equipment only. Smaller supermarkets may include minimal or no in-house food prep.
- Residential prototype includes in-unit air conditioning.

---

Subject: Willow Village - Consolidated Data Request

Hi Sarah,

There have been a number of data requests related to Willow Village recently, and I wanted to consolidate a summary of our projected energy use and solar capabilities here in one place.

First, here are the estimates provided by our electrical engineering team. This is predominantly going off the 100% SD set – some of it based off modeled information, some off educated guesses and EV charging is still an evolving field:

	Estimated KWH/YR*
Office Buildings (6)	23,828,000
North Garage	397,120
NG EV Charging	17,100,000
South Garage	268,098
SG EV Charging	10,885,500
Town Square Garage	268,181
TS EV Charging	1,984,500
Retail	1,450,000
Hotel (w/no garage)	2,528,400
Town Square Plaza	38,000

**note that the office buildings, N&S garages and hotel will have solar PV installed. The hotel will also have solar hot water generation. This onsite renewable energy generation will have an impact on the KWH numbers listed above.*

EV – connected loads and consumption based on the following assumptions:

- North Garage: 30% of the parking stalls (had 20% in the SD set but increased to 30% in case more are desired)
- South Garage: 30% of the parking stalls (had 20% in the SD set but increased to 30% in case more are desired)
- TS Garage: 20% of the parking stalls (remains as per SD set)

Second, assuming usage of 21,500 therms/year for both the Mixed-Use (including the supermarket) and public-facing retail on the office campus (the owner-occupied campus will be all-electric), the question was asked if "all natural gas usage in the commercial cooking areas be offset by on-site solar capabilities to be in compliance with the Municipal Code?" The answer is below:

Yes, currently the office campus (6 offices + 2 garages) is on track to have enough solar PV to offset this gas usage. We are estimating producing approx. 3.5M kWh/year from solar PV.

Please let me know if there is anything else you need.

Regards,

Jeff

Notes:

1. Hamilton Avenue Parcels North and South were provided separately and added to the retail land use totals.
2. Trip counts and VMTs by land use type were broken out by year using a scaling factor representing the percent of each fleet that is operational in a given year leading up to full buildout. This percent was determined based on the square footage of the land use associated with each fleet that is operational in a given year relative to that land use's full buildout square footage. See Table 16 for more details on scaling. See Table 18 for Project Trip Rates and VMT.
3. Criteria air pollutants are calculated by year using emission factors for the associated year and fleet from EMFAC2021. Electric vehicles are not included in the emission factors for Campus District fleets (all fleet types except San Mateo Fleet), as reductions associated with EVs are considered separately. Project emission factors are shown in Table 20.
4. Full buildout emissions are conservatively calculated using 2026 emission factors.

Abbreviations:

EV - electric vehicle
lb - pound
NO_x - nitrogen oxides
VMT- vehicle miles traveled
PM_{10} - particulate matter less than 10 microns in diameter
$PM_{2.5}$ - particulate matter less than 2.5 microns in diameter
ROG - reactive organic gases

Existing Conditions Charging Energy Usage[6]	kWh/year	534,955
Full Buildout Charging Energy Usage[7]	kWh/year	2,925,608

eVMTs from Project Chargers at the proposed Campus District

Year	Land Use Category[8]	Project Increase in Annual eVMTs[9]
		eVMT/year
Existing Conditions	Campus District	1,783,182
Partial Buildout - Year 4		298,927
Partial Buildout - Year 5		5,701,922
Partial Buildout - Year 6		9,259,481
Full Buildout		9,752,026

Notes:

1. An average EV fuel economy of 0.30 kWh per mile was used. The fuel economy is based on electric fleet data from fueleconomy.gov. Available at: https://www.fueleconomy.gov/.
2. Meta provided energy usage and areas for EV charging at their existing campuses: Classic, Bayfront, Chilco, Willow, Gateway. The provided data was used to evaluate an average ratio of EV charging energy usage per campus area.
3. The percent eVMT for existing conditions is calculated by dividing the eVMT in existing conditions by the annual VMT from the 'Car' and 'On-Demand' vehicle types in existing conditions. For existing conditions VMT, see Table 18.
4. ARB is currently preparing its 2020 Mobile Source Strategy (MSS) update to the ARB VISION Model (version 2.1) estimating future fleet characteristics. The Mobile Source Strategy projects eVMTs reflecting the aspirational target identified in EO N-79-20, assuming 100% of passenger vehicle sales in California are ZEV or PHEV, and GHG emissions assumed to have reduced by 2.0% per year from 2026 to 2035. The increase in annual eVMTs charged by the Campus District is scaled from the increase in fleet eVMT from existing conditions to full buildout.
5. A 10% Loss Factor was applied to the annual project energy uses to account for expected losses. Source available at: https://www.fueleconomy.gov/

Table 22
EV Assumptions for Campus District
Willow Village
Menlo Park, California

6. The EV charging energy consumption for existing conditions was based on existing charger energy usage data for Willow Village for 2019 provided by the Project applicant. The total energy usage was reduced assuming a 10% loss factor.
7. The EV charging energy consumption for the Project at full buildout was determined using an average ratio of existing charging sites kWh/sqf and multiplying it by the Campus District land use area at full buildout (1.6 million sqf). This number was scaled by the increase in fleet eVMT from existing conditions to full buildout based on the MSS scenario of the VISION model. A 10% loss factor was applied to the total energy usage per year. All relevant data sources were provided by the Project applicant.
8. Meta offers an EV charging program to its workers. Charging on campus is free and valets move cars into chargers to maximize charging time. Therefore, the EV charging annual electricity for the Campus District was provided based on studies from Meta's existing campuses in the area. The electricity for EV charging at the Project would be supplied with 100% renewable energy.
9. For years where the Campus District is only operational a proportion of the year, the annual kWh is multiplied by a scaling fraction for the Campus District land use, found in Table 16.

Abbreviations:

EV - Electric vehicle (includes battery electric or plug-in hybrid technology)
eVMT- Electric vehicle miles traveled
kWh - Kilowatt hour
sqf- Square foot
MSS - Mobile Source Strategy

Notes:

1. Expected eVMT and trips charged by the Project chargers in Town Square and the Residential/Shopping District land uses are calculated based on the San Mateo Fleet, charger usage assumptions, ARB's Vision Model, and traffic data provided by the Transportation Engineer. For calculation details, see Table 23.
2. Emissions reductions from EV charging represent the decrease in emissions from increases in electric vehicle use due to the installation of EV chargers throughout the site. For Town Square and the Residential/Shopping District land uses, the eVMT and trips from additional Project chargers is calculated based on the difference between the MSS scenario and the baseline scenario, representing the additional eVMT due to the installation of additional chargers.
3. Emissions reductions use emission factors developed in EMFAC2021 that represent passenger vehicles (LDA, LDT1, LDT2, MCY). The eVMTs determined for Town Square and the Residential/Shopping District are based on ARB's VISION Model, which includes expected electric vehicle fleet % for passenger vehicles only (LDA, LDT1, LDT2, MCY).
4. EVs emit particulate matter brake wear and tire wear, therefore those emissions are not considered in the reductions.
6. Expected eVMT charged by additional Project chargers is measured based on anticipated charging energy usage provided by the Project Applicant. For calculation details see Table 22.
7. Trip counts from Project chargers were calculated by dividing the increased eVMTs from project chargers by the average VMTs per trip for the passenger vehicles (Cars) in a given year, based on traffic data provided by the Transportation Engineer.

Abbreviations:

eVMT - electric vehicle miles traveled
lb - pound
MT - metric ton
EV - electric vehicle
ROG - reactive organic gases
NOx - nitrogen oxides
PM_{10} - particulate matter less than 10 microns in diameter
$PM_{2.5}$ - particulate matter less than 2.5 microns in diameter

Notes:

1. The miles charged per hour charged is representative of a typical charge rate for an EV of 6.25 kWh per hour and a fuel economy of 0.30 kWh per mile. The charge rate is based on capability of existing battery-electric vehicles and Level 2 charging stations. Reference: Chargepoint. 2017. Level Up Your EV Charging Knowledge. Available at: https://www.chargepoint.com/blog/level-your-ev-charging-knowledge/. The fuel economy is based on electric fleet data from fueleconomy.gov. Available at: https://www.fueleconomy.gov/.
2. The two scenarios analyzed are the Reference and the Mobile Source Strategy scenarios. ARB is currently preparing its 2020 Mobile Source Strategy (MSS) update to the ARB VISION Model (version 2.1). The 2020 MSS uses "scenario planning to take an integrated approach to identifying the technology trajectories and programmatic concepts" to model projected years of electric vehicle miles for assessed scenarios. The Mobile Source Strategy projects eVMTs reflecting the aspirational target identified in EO N-79-20, assuming 100% of passenger vehicle sales in California are ZEV or PHEV, and GHG emissions assumed to have reduced by 2.0% per year from 2026 to 2035. The 2020 update only considers passenger vehicles (LDA, LDT1, LDT2, and MDV). To determine the eVMT percent of the passenger vehicle fleets, the 2020 MSS update was downloaded in July 13, 2021. The increase in annual eVMTs charged by the Project from the Reference Scenario to the MSS Scenario is used to determine the eVMTs the Project can take credit for based on providing additional charging infrastructure for the state to reach aspirational EV fleet penetration.
3. The number of chargers in the Town Square and the Residential/Shopping District was provided by the Project Applicant in the Willow Village Mixed Use Development Concept Level Energy Use Summary, dated June 14, 2021, detailing chargers available for all mixed-use traffic. 249 EV Charging Stations are available to serve the 1,694 residential spaces and 500 commercial spaces.
4. Meta offers a valet service to charge EVs from 7am to 7pm, average daily hours of availability for charging per charger is conservatively assumed to be 10 hours per day. When demand is met, the full 10 hours will be used for charging, with each vehicle cycling out of the charging spot before or as the car reaches full charge. The number of chargers are available for all Town Square and the Residential/Shopping District land uses, and it is expected that there will be 10 hours a day of active charging taking place due to the frequency of turnover associated with retail, restaurant, hotel, and park land uses. Town Square and the Residential/Shopping District land uses are assumed to operate 365 days per year. Any charging inefficiencies associated with cars remaining plugged in after reaching full charge is assumed to balance out due the likelihood of more than 10 hours of activity a day associated with Town Square and the Residential/Shopping District activity.
5. Town Square and the Residential/Shopping District Total VMT and trips includes all proposed Project residential, retail, park, and hotel land uses, consistent with Table 18. Retail land uses include Hamilton Parcels North and South and are added to total VMT and trips.
6. EV Annual Trips and EV Annual VMT are determined based on Project trips and VMTs and the VISION Reference Scenario percent of Electric Fleet. These eVMTs (electric vehicle miles traveled) represents the number of project VMTs that are driven by electric vehicles.
7. 249 EV Charging Stations are proposed for the full buildout. To reflect the EV charging stations that will come online during construction in the partial years leading up to full buildout, a scaling factor was applied based on the ratio of square feet of the parking land use that is built out in a given year to the total square feet that will be built. The scaling factor for a given year was applied to the 249 chargers at full buildout. To see scaling factors used, refer to the parking land use from Table 16.
8. Total annual charge hours available from the project are determined by multiplying the average daily hours of charging per charger (10 hours) by the annual days of charger activity (365 days). The annual charge hours available from the project are then multiplied by 25 miles charged per charge hour to determine the number of eVMT available from the project.
9. The Project EV chargers for Town Square and the Residential/Shopping District land uses are determined to be at capacity, meaning used fully for all available charge hours per day, when the electric vehicle miles associated with the Project are in excess of the maximum electric vehicle miles the Project chargers can charge. If there is a surplus of chargers relative to EVs coming to the site, then the Project chargers are under-capacity, and only a fraction of chargers will be used as the number of EVs coming to the site are fewer than the total number of charger capacity. If there is a surplus of EVs coming to the site relative to the chargers at the site, all chargers will be used and the site will be at capacity. In the scenario when the chargers are at capacity, the full capacity of VMTs the site can charge are assumed to be charged.

Abbreviations:

EV - electric vehicle (includes battery electric or plug-in hybrid technology)
Hr - hour
TDM - Transportation Demand Management
VMT - vehicle miles travelled
eVMT - electric vehicle mile traveled

Table 19
Summary of Fleet Mix Categories
Willow Village
Menlo Park, California

Land Use	Fleet Type	EMFAC2007 Category[1]	Fuel[1,2]
Town Square and the Residential/Shopping District[3]	San Mateo County Mix	All	Mix of Gasoline, Diesel, Electric, and Natural Gas
Campus District[4]	Cars	LDA, LDT1, LDT2, MCY Mix	Mix of Gasoline and Diesel
	On-Demand	LDA	Gasoline
	Shuttles	Motor Coach, All Other Buses Mix	Diesel
	Trams	LDT1, LDT2	Mix of Gasoline and Diesel
	Trucks	HHDT, LHDT1, LHDT2, MHDT Mix	Mix of Gasoline, Diesel, and Natural Gas

Notes:

1. EMFAC2007 categories and fuel types were chosen to match vehicle type descriptions provided by Meta Transportation Operations Team.
2. Electric vehicles were not considered in the emission factors of the Campus District fleets because Campus District-specific emissions reductions are applied later.
3. Land uses other than the Campus District were assumed to have the same distribution of vehicle types as San Mateo County, per EMFAC2021. Hamilton Avenue Parcels North and South were combined with the retail land uses having the EMFAC2021 fleet for San Mateo County.
4. Default split between EMFAC categories assumed for all fleets associated with the Office (Existing and Full Buildout).

Abbreviations:

HHDT - heavy-heavy duty trucks
LDA - light duty auto (passenger cars)
LDT- light duty trucks
LHDT - light-heavy duty trucks
LHDT - light-heavy duty trucks
MHDT - medium-heavy duty trucks
MCY - motorcycles

Table 8
Fugitive Road Dust Emission Factors
Willow Village
Menlo Park, California

Road Dust Equation[1]

E [lb/VMT] = k*(sL)^0.91 * (W)^1.02 * (1-P/4N)

Parameter	Value
k = particle size multiplier for PM_{10} [lb/VMT]	0.0022
sL = roadway silt loading [grams per square meter - g/m^2]	0.032
W = average weight of vehicles traveling the road [tons]	2.4
P = number of "wet" days in county with at least 0.01 in of precipitation during the annual averaging period	74
N = number of days in the averaging period	365
PM_{10} speciation profile fraction	0.46
$PM_{2.5}$ speciation profile fraction	0.069
E = Fugitive PM_{10} Emission Factor [g/VMT]	0.10
E = Fugitive $PM_{2.5}$ Emission Factor [g/VMT][2]	0.015
E = Fugitive PM_{10} Emission Factor with Street Sweeping Reduction [g/VMT][3]	0.075
E = Fugitive $PM_{2.5}$ Emission Factor with Street Sweeping Reduction [g/VMT][3]	0.011

Notes:

1. Road dust equation is based on the U.S. EPA AP-42 Chapter 13.2.1: Paved Roads. Parameter values were obtained from the 2021 California ARB Miscellaneous Process Methodology using major roadways silt loading, annual San Mateo county "wet" days, and statewide average vehicle fleet weight.
2. $PM_{2.5}$ emission factor was scaled from the PM_{10} value based on the ARB's guidance.
3. A 26% reduction in the PM_{10} emission factor was taken for street sweeping of arterial/collector streets, based on SCAQMD's Fugitive Dust Table XI-C. The $PM_{2.5}$ emissions factor was scaled from the PM_{10} value based on the ARB's guidance.

Abbreviations:

ARB - Air Resource Board
lb - pounds
g - grams
m^2 - square meters
PM - particulate matter
$PM_{2.5}$ - particulate matter less than 2.5 microns in diameter
PM_{10} - particulate matter less than 10 microns in diameter
SCAQMD - South Coast Air Quality Management District
USEPA - United States Environmental Protection Agency
VMT - vehicle miles traveled

Retail		208	ksf	207,690
Residential		1,730	DU	1,695,976
Hotel		193	Rooms	172,000
Parking		1,869	ksf	1,869,240
Park		404	ksf	403,837

Notes:

1. Land uses analyzed based on information provided by the Project Applicant, as found in the Project Description. "Office" land use mapped to General Office Building and Research and Development; "Office/Lab" mapped to General Office Building, Research and Development, Health Club, and Manufacturing; "Warehouse" mapped to Unrefrigerated Warehouse-No Rail and General Light Industry, and "Warehouse/Office" mapped to Unrefrigerated Warehouse-No Rail and Research and Development CalEEMod land use types on a building-by-building basis.

2. The Project Applicant provided Project land uses in units of square footage, hotel rooms, and dwelling units. For the existing parking land use, each parking space is assumed to be 400 sqft. This assumption is based on CalEEMod defaults.

3. Partial buildout for Year 4, Year 5, and Year 6 were calculated based on the portion of building area for each land use type that becomes operational each year, based on the construction schedule, as shown in Table 2.

4. For Hamilton Avenue Parcels North and South, only net new square footage was included in the analysis. This is under the conservative assumption that the existing retail area and the retail land use that will replace it have similar operational emissions.

Abbreviations:

DU - dwelling unit
sqft - square foot
ksf - 1,000 square feet

Table 25
Summary of Mobile Emissions
Willow Village
Menlo Park, California

Total Emissions Before Reductions:[1]

Year	CAP Emissions without Reductions (ton/year)			
	ROG	NO_x	PM_{10}[2]	$PM_{2.5}$[2]
Total Emissions by Year				
Existing Conditions[3]	4.985	8.007	4.022	0.836
Year 4	0.61	0.67	0.46	0.092
Year 5	5.8	6.3	5.1	1.0
Year 6	10	11	9.4	1.9
Full Buildout	12	13	11	2.1
Net Emissions by Year				
Year 4	-4.4	-7.3	-3.6	-0.74
Year 5	0.8	-1.7	1.0	0.17
Year 6	5.3	3.1	5.4	1.0
Full Buildout	**6.8**	**4.7**	**6.7**	**1.3**

Total Emissions with Reductions:[4]

Year	CAP Emissions with Reductions (ton/year)			
	ROG	NO_x	PM_{10}[2]	$PM_{2.5}$[2]
Total Emissions by Year				
Existing Conditions[3]	5.0	8.0	4.0	0.84
Year 4	0.56	0.64	0.46	0.091
Year 5	5.0	5.9	5.1	1.0
Year 6	8.8	10	9.4	1.8
Full Buildout	**10**	**12**	**11**	**2.1**
Net Emissions by Year				
Year 4	-4.4	-7.4	-3.6	-0.74
Year 5	0.0	-2.2	1.0	0.16
Year 6	3.9	2.3	5.3	1.0
Full Buildout	**5.0**	**3.7**	**6.6**	**1.3**

Notes:

1. Calculations of emissions before reductions are shown in detail in Table 21. Net emissions subtract the emissions from the existing conditions in 2019.
2. PM10 and PM2.5 emissions include exhaust, tire wear, brake wear, and fugitive dust. Fugitive dust emissions factors are calculated in Table 8.
3. The Existing Conditions includes EV reductions associated with existing Project Site chargers.
4. Emissions after reductions account for the reductions associated with EVs as shown in Table 24. The emissions reductions are subtracted from the total Project emissions.

Abbreviations:

lb - pound
MT - metric ton
EV - electric vehicle
ROG - reactive organic gases
NOx - nitrogen oxides
PM_{10} - particulate matter less than 10 microns in diameter
$PM_{2.5}$ - particulate matter less than 2.5 microns in diameter

Notes:

1. Construction area/subphasing information and full buildout square footage by building provided by Project Applicant.
2. The percentage of year that each building is operational is calculated using the last day of construction for each building. For each partial year of construction, the building is assumed to be operational during the fraction of the year between the last day of construction and the end of that year. The building is assumed to be 0% operational for each full year of construction and 100% operational for each year full year after the end of construction.
3. Partial buildout for Year 4, Year 5, and Year 6 were calculated based on the portion of building area that becomes operational each year over the total building area for each land use type.

Abbreviations:

% - percent

Copied from operational workbook, used for scaling land usage by year

Building or Parcel[1]		Percent Breakdown of Land Use Type by Building						Percent of Year Building is Operational[2]		
		Office	Retail	Residential	Hotel	Parking	Park	Year 4	Year 5	Year 6
Partial Buildout by Year and Land Use Type[3]	Year 4	3.1%	10%	0%	0%	53%	86%			
	Year 5	58%	59%	16%	41%	75%	94%			
	Year 6	95%	98%	64%	100%	96%	100%			

Notes:

1. Construction area/subphasing information and full buildout square footage by building provided by Project Applicant.
2. The percentage of year that each building is operational is calculated using the last day of construction for each building. For each partial year of construction, the building is assumed to be operational during the fraction of the year between the last day of construction and the end of that year. The building is assumed to be 0% operational for each full year of construction and 100% operational for each year full year after the end of construction.
3. Partial buildout for Year 4, Year 5, and Year 6 were calculated based on the portion of building area that becomes operational each year over the total building area for each land use type.
