C. This concentration is an outdoor concentration that assumes someone is exposed to construction emissions for a full year. However, in reality, the patient will not be at the center for more than a few days a week for a few hours per day and the Dialysis Center is only expected to be onsite for six to nine months. Furthermore, the patient will be indoors where windows likely would not be open in the middle of a construction site. This concentration also assumes the construction is co-located with the receptor, which drastically over-estimates impact. The maximum $PM_{2.5}$ concentration reported in the Technical Report was 0.18 $\mu g/m^3$, which is the same as the maximum concentration for the overly conservative analysis for the Dialysis Center. An additional note, the maximum $PM_{2.5}$ concentration reported in the Technical Report was driven by operational traffic. The maximum construction only mitigated $PM_{2.5}$ concentration for non-dialysis center receptors is 0.12 $\mu g/m^3$. This was not reported in the Technical Report because this location was not the overall maximum concentration for all sources (construction + operational generators and traffic). If the $PM_{2.5}$ concentration for the Dialysis Center at the existing location was reduced to only consider six to nine months of actual exposure, the concentration would be 0.09 $\mu g/m^3$ to 0.12 $\mu g/m^3$. Therefore, this overly conservative assessment of $PM_{2.5}$ concentration for the Dialysis Center results in similar concentration to the maximum $PM_{2.5}$ concentration from construction for non-dialysis receptors.

TABLE 1

Table 1
Exposure Parameters
Willow Village
Menlo Park, California

Receptor Type	Receptor Age Group[1]	Exposure Parameters					
		Breathing Rate (DBR)[2]	Exposure Duration (ED)[3]	Exposure Frequency (EF)[4]	Averaging Time (AT)	Intake Factor, Inhalation (If_{inh})	Age Sensitivity Factor (ASF)[5]
		(L/kg-per 8hrs)	(years)	(days/year)	(days)	(m^3/kg-day)	(unitless)
Dialysis	Age 16-30 Years	40	2	156	25,550	0.00049	1

Notes:

1. Receptor age group 16-30 is used for the Dialysis Center patients. The breathing rate is the same as the 16-70 age group.
2. Daily breathing rates for residents reflect default breathing rates from Cal/EPA 2015 as follows:
   95th percentile 8-hour breathing rate for age 16-30 years for passive and sedentary activities.
3. Exposure was assumed for the first 13 months of construction. The first month was a fraction of a month. However, in the calculation of cancer risk, an exposure duration of 2 was used since the concentration is averaged over the entire year and exposure is over two modeled years.
4. Exposure frequency was determined assuming visits 3 days a week reflective of the typical treatement schedule, which is Monday, Wednesday, Friday or Tuesday, Thursday, Saturday (Satellite 2022).
5. Age sensitivity factors account for an "anticipated special sensitivity to carcinogens" of infants and children as recommended in the OEHHA Technical Support Document (Cal/EPA 2009) and current OEHHA guidance (Cal/EPA 2015). An age sensitivity factor of 1 was used to account for adult patients.

Abbreviations:

AT - averaging time
Cal/EPA - California Environmental Protection Agency
DBR - daily breathing rate
EF - exposure frequency

As you know, at the request of Peninsula Innovation Partners (Peninsula), Ramboll US Consulting, Inc. (Ramboll) has been conducting air quality monitoring at four locations in the Belle Haven Community in Menlo Park since October 8, 2020. Initially, the monitoring was proposed for a period of three months, but it was extended and has continued to the current date. This memorandum summarizes the monitoring work that will continue in the Belle Haven Community commencing on October 26, 2021.

We propose to remove two of the monitoring stations (Child Development Center and MPK64) and keep the Kelly Park and Willow Road stations for six more months. More discussion on background and reasons for continuing monitoring at these stations is provided below.

Background

In October 2020, Ramboll started conducting air monitoring at four locations in the Belle Haven Community to better understand the community's localized air quality ("The Menlo Park Air Monitoring Program"). The Belle Haven Community is uniquely placed between the high traffic corridors of Highway 101, Bayfront Expressway and Willow Road. In depth air monitoring had not been performed in this area before and the nearest Bay Area Air Quality Management District (BAAQMD) air monitoring station is approximately 2 miles away in Redwood City. The goal of this monitoring effort was to gather data on the background air quality in the Belle Haven community for possible inclusion in the Willow Village Draft EIR and to compare that data to current and historical data from the BAAQMD Redwood City monitoring station to put the existing air quality in the neighborhood into perspective.

The Menlo Park Air Monitoring Program originally consisted of four monitoring stations each with an identical array of air monitoring equipment: Child Development Center, Kelly Park, MPK64, and Willow Road located at 410 Ivy Drive, 100 Terminal Avenue, 135 Commonwealth Drive, and 1283 Willow Road, respectively. The Menlo Park Air Monitoring Program measured continuous particulate matter less than 2.5 micrometers in diameter ($PM_{2.5}$) concentrations for 1 year along with filter-based PM_{10}/metals concentrations and canister-based volatile organic compound (VOC) concentrations for 6 months. The filter-based

PM10/metals samples and canister-based VOC samples were stopped on April 10, 2021 after 6 months of sampling.

The Menlo Park Air Monitoring Program utilized US Environmental Protection Agency (EPA) and California Air Resources Board (CARB) approved monitoring and sampling methodologies to gather data on the existing air quality in the Belle Haven Community. The particulate matter monitors used in this monitoring program are EPA-approved monitors that were awarded Federal Equivalency Method (FEM) or Federal Reference Method (FRM) designations.

We understand SMC Labs has also been monitoring particulate matter at various locations in Belle Haven using Clarity monitors. Clarity monitors provide estimates of particulate matter concentrations and are available at a lower cost than the monitors used in Ramboll's monitoring program. However, they are not approved by the EPA for regulatory compliance and do not provide the same data quality as the monitoring equipment used at the BAAQMD stations. The Menlo Park Air Monitoring Program uses equipment that matches the caliber of the BAAQMD monitoring stations, which are EPA approved, designated as FRM or FEM, and meet rigorous quality assurance and accuracy requirements. Because the program uses monitoring equipment equivalent to the equipment used by BAAQMD, the results of the program can be compared to the readings from the BAAQMD air monitoring station.

Proposed Program Modification

Ramboll is proposing to remove two of the monitoring stations, Child Development Center and MPK64, and keep the Kelly Park and Willow Road stations based on the following factors: data consistency with BAAQMD monitor, minimal difference in concentrations between stations, proximity to Willow Road, and co-location with the Clarity monitors. For reference, **Figure 1** below shows the current location of the four Ramboll monitors, the nearby Clarity monitors, and the BAAQMD Redwood City monitor.

Figure 1: Ramboll, BAAQMD, and Clarity Monitor Locations

Data Consistency with BAAQMD Monitor

The data collected during the Menlo Park Air Monitoring Program will be discussed in the forthcoming Air Quality and Meteorological Monitoring Data Summary Report. These data show that the concentrations measured at the BAAQMD Redwood City monitor were, on average, higher than those in the Belle Haven Community, and followed the same trends. Based on this finding, BAAQMD's monitor at Redwood City is representative of $PM_{2.5}$ concentrations in the Belle Haven Community, though the concentrations from Redwood City are likely an overestimate for the Belle Haven Community. Because the BAAQMD Redwood City monitor is representative of the Belle Have Community, Ramboll is proposing to reduce the number of stations in the Menlo Park Air Monitoring Program.

Difference Between Belle Haven Monitors

The data collected during the Menlo Park Air Monitoring Program shows that concentrations in the Belle Haven area were similar at each of the monitoring stations and result in a similar conclusion when comparing to the BAAQMD Redwood City monitoring station. The average 24-hour concentration was 5.8, 5.6, 5.9, and 5.6 $\mu g/m^3$ at the Child Development Center, Kelly Park, MPK64, and Willow

Road, respectively, compared to a value of 6.9 µg/m^3 at the BAAQMD station.[1] Because the difference between the monitors in Menlo Park is so minor compared to the differences between the BAAQMD Redwood City monitor and the Menlo Park monitors, having four stations is redundant.

Traffic on Willow Road

The Willow Road station is adjacent to Willow Road, which is a primary route to the Facebook campuses as well as a major roadway for traffic moving through the community. As more people return to work due to easing of pandemic restrictions, the traffic along Willow Road is expected to increase. Ramboll is proposing to keep the Willow Road monitoring station to make sure this potential increase in traffic is analyzed. The MPK64 station is adjacent to Highway 101, which is also a major roadway in the area. However, the Willow Road station is closer to the Belle Haven Community than the MPK64 station.

Co-Location with Clarity Monitors

Figure 1 above shows the location of the nearby Clarity monitors, the BAAQMD monitor, and Ramboll's monitors. As mentioned in the Background section of this memo and discussed in detail in the forthcoming Air Quality and Meteorological Monitoring Data Summary Report, Clarity monitors are low-cost sensors that are not approved by the EPA for regulatory compliance and do not provide the same data quality as the monitoring equipment used at the BAAQMD/Ramboll stations. These monitors tend to overestimate $PM_{2.5}$ concentrations during higher ambient concentrations when compared to the FEM BAM monitors.

While the low-cost sensors are helpful to understand hyperlocal trends, the concentrations from low-cost sensors should not be used in a direct comparison to those from BAAQMD's monitor in Redwood City. Ramboll is proposing to keep the two stations that are closest to the Clarity monitors in order to allow for a comparison of the concentrations between the low-cost Clarity monitors and the FEM/FRM monitors in the Menlo Park Air Monitoring Program.

Conclusion

Based on the rationale laid out above, Ramboll is proposing to reduce the number of monitoring stations from four to two. Ramboll is proposing to remove the monitoring stations at the MPK64 and Child Development Center locations and continue to monitor $PM_{2.5}$ concentrations using the continuous monitors at the Kelly Park and Willow Road stations. The filter-based PM_{10}/metals samples and canister-based VOC samples were stopped at all stations on April 10, 2021 after 6 months of sampling.

[1] Average includes data from October 8, 2020 to September 26, 2021 for all sites except Willow Road. The average for the Willow Road station includes data from February 24, 2021 to September 26, 2021.

Appendix 3.5.1

Assessment of Energy Use and Impacts
Willow Village Project

RAMBOLL

DRAFT

ENVIRONMENT & HEALTH

MEMORANDUM

Date: February 18, 2022

To: Eric Harrison, Signature Development Group

From: Michael Keinath, PE

Ramboll conducted an assessment of energy use for the construction and operation of the proposed mixed-use development at Willow Village in Menlo Park, California (referred to hereafter as the “Proposed Project” or “Project”) for Peninsula Innovation Partners, LLC. The scope and methods used in this assessment are consistent with recommended analyses for projects requiring review under California Environmental Quality Act (CEQA). The analysis in this report will be independently reviewed by the City of Menlo Park, California (referred to as the "City") and peer reviewed by ICF Incorporated, LLC., the City's environmental consultant for possible incorporation into the Environmental Impact Report (EIR) for the Project. Assumptions used herein are consistent with assumptions used in our Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Report for Willow Village.

1. METHODOLOGY FOR DEVELOPMENT OF ENERGY PROJECTIONS

Table 1 lists the sources for which energy use estimates from the Project are quantified.

1.1 Project Construction Energy Use

This analysis assumes that construction of buildings will overlap, that the complete build out would occur in roughly five years and that the buildings constructed would be occupied and fully operational as soon as construction of each building is completed. This is conservative because occupancy and operation of each building would likely ramp up over time, rather than occur immediately upon completion of construction. The analysis also assumes that operational energy use from completed buildings would overlap with construction energy use from buildings that are still being constructed.

The construction program would commence after all existing uses have vacated.[1,2] The preliminary construction schedule assumes that construction would begin after project entitlements and would last for roughly five years. See the **Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Report** for a summary of the expected construction phasing timeline, provided by the Project Applicant.

Initial construction activities affecting the full site area include demolition of the existing buildings and parking lots, followed by grading and utilities. Construction activities related to the proposed Project (including constructing the Town Square District, Residential/Shopping District, and Campus District) include foundations, core and shell, tenant improvements, and landscaping.

Energy use calculations associated with off-road construction equipment are based on the construction schedule, type and quantity of equipment and hours of operation for each piece of equipment based on Project-specific information provided by the Project Applicant for demolition, grading and site preparation, building construction, architectural coating, and paving. Sources of energy use from construction are shown in **Table 1**. Fuel use from off-road construction equipment is estimated using consistent with Environmental Protection Agency (EPA) AP-42 diesel fuel. All off-road equipment is either diesel-fueled or electric based on Project-specific information. **Table 2** shows the anticipated fuel and electricity usage from off-road equipment for Campus and Town Square District construction equipment and **Table 3** shows Residential/Shopping District, Hamilton Avenue Parcels North and South, Tunnel, Substation Upgrade, Feeder Line, and Intersection Improvements construction equipment.

Passenger vehicles for construction workers are assumed to use gasoline. On-road construction vehicles such as vendors and trucks for demolition material, soil, and other material hauling are assumed to use diesel fuel. These fuel uses are calculated based on the number of trips and vehicle miles travelled (VMT) along with fuel efficiency from EMFAC2021. Trip counts were provided by the Project Applicant for hauling, worker and vendor trips, and California Emissions Estimator Model (CalEEMod®) defaults are used for worker trip lengths. The vendor and haul trip lengths were provided by the Project Applicant. **Table 4** shows the fuel efficiency derivations for the on-road vehicle types, while **Table 5** shows the anticipated fuel consumption from on-road construction vehicles.

Construction water trucks use indirect electricity to supply, treat, and distribute the water. **Table 6** shows the electricity required for construction water usage.

Total construction energy use is summarized in **Table 7**.

1.2 Existing Conditions Operational Energy Use

Detailed calculations of Existing Conditions operational energy uses are further explained below. These are calculated to estimate the net energy use of the Project (Project energy use minus Existing Conditions energy use).

[1] The existing dialysis center may remain open for a few months after demolition commences. If this were to occur, changes to the analysis would be negligible. The dialysis center would not be considered a sensitive receptor based on BAAQMD guidance, so the impacts of construction on the dialysis center do not need to be analyzed. The existing operational emissions associated with the dialysis center remaining and the shifting of emissions from the demolition of the dialysis center would not change conclusions as these are would minor changes.

[2] The analysis only considers net new retail in the Hamilton Avenue Parcels North and South, so does not consider the existing retail in this area to be vacated.

1.2.1 Building Energy Use

Natural gas and electricity provide building energy for residential and commercial use. The **Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Report** shows the annual electricity and natural gas use for the existing land uses.

Energy use for the Existing Conditions was based on 2019 historical data provided by the Project Applicant. Additional information and tables regarding building electricity and natural gas usage estimates can be found in the **Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Report**.

1.2.2 Water Energy Use

Electricity is used to supply, treat, and distribute potable water and treat the resulting wastewater. Water consumption and wastewater generation were quantified as shown in the **Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Report**. This electricity from water use is summarized in **Table 8**.

1.2.3 Mobile Energy Use

Fuel usage was estimated from on-road VMT by employees and visitors. Trip generation rates and total VMT for each land use for the existing conditions were provided by Hexagon, as shown in the **Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Report**. Fuel usage was estimated using an average mpg obtained from EMFAC2021 for the fleet mix corresponding to the vehicle category and fuel type (gasoline, diesel, compressed natural gas, or electricity).

Table 9 shows detailed mobile fuel consumption estimates for Existing Conditions.

1.2.4 Stationary Source Energy Use

Diesel fuel usage is from diesel combustion resulting from their operation for testing and maintenance and for emergency operation. Under Existing Conditions, there is currently one emergency generator installed.

Operation for routine maintenance and testing is conservatively assumed to be 50 hours per year, consistent with the maximum allowed testing time from the Airborne Toxic Control Measures (ATCM) for Stationary Compression Ignition Engines (17 CCR 93115).

Fuel usage was estimated based on the fuel consumption rate based on generator size, provided by the Project Applicant. **Table 11** provides details on fuel usage estimates from emergency generators. Additional details on fuel consumption rate and hours of operation can be found in the **Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Report**.

1.2.5 Summary of Existing Conditions Energy Consumption

Table 12 shows the total energy use for the Existing Conditions, including electricity, natural gas, diesel fuel, and gasoline.

1.3 Project Operational Energy Use

Detailed calculations of Project operational energy uses are further explained below.

1.3.1 Building Energy Use

Natural gas and electricity provide building energy for residential and commercial use. **Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Report** shows the annual electricity and natural gas use for the Project buildings.

In an effort to reduce greenhouse gas (GHG) emissions, the Project would be entirely electrically powered with the exception of commercial culinary uses. The residential buildings would be entirely electrically powered. Therefore, energy use totals for the Project are based on Project-specific electricity and natural gas usage studies, as provided by the Project Applicant.

Additional information and tables regarding building electricity and natural gas usage estimates can be found in the **Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Report**.

1.3.2 Water Energy Use

Electricity is used to supply, treat, and distribute potable water and treat the resulting wastewater. Water consumption and wastewater generation were quantified as shown in the **Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Report**. This electricity from water use is summarized in **Table 8**.

1.3.3 Mobile Energy Use

Fuel usage was estimated from on-road VMT by residents, employees, and visitors. Trip generation rates and total VMT for each land use were provided by Hexagon, as shown in the **Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Report**. Fuel usage was estimated using an average miles-per-gallon (mpg) obtained from EMFAC2021 for the fleet mix corresponding to the vehicle category and fuel type (gasoline, diesel, compressed natural gas, or electricity).

Table 9 shows detailed vehicle fuel usage estimates for the Project, including implementation of the Transportation Demand Management (TDM) Plan measures.

This is discussed further in the **Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Report**.

1.3.4 Electric Vehicle Charging Energy Use

Electricity used to charge additional electric vehicles beyond the projected fleet-average due to the Project's commitment to including electric vehicle (EV) charging stations onsite is included in building energy use estimates. Battery electric vehicles use electricity to drive their motors rather than that combustion of gasoline or diesel fuel. The gasoline and diesel displaced by the additional electric vehicles is calculated in **Table 10**. The detailed derivation of the electricity usage VMT displacement estimates are shown in the **Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Report**.

1.3.5 Stationary Source Energy Use

Diesel fuel usage from diesel combustion resulting from generator operation for testing and maintenance is included in this analysis. For the Full Buildout Project, 13 emergency generators are anticipated to be installed. Operation for routine maintenance and testing is

conservatively assumed to be 50 hours per year, consistent with the maximum allowed testing time from the ATCM for Stationary Compression Ignition Engines (17 CCR 93115).

Fuel usage was estimated based on the fuel consumption rate based on generator size, provided by the Project Applicant. **Table 11** provides details on fuel usage estimates from emergency generators. Additional details on fuel consumption rate and hours of operation can be found in the **Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Report**.

1.3.6 Summary of Net Project Operational Energy Consumption

The table below summarizes the change in operational energy use with the project. More detail can be found in **Table 12**, which summarizes Existing Conditions and Full Project Buildout operational energy use by source and the change in energy use between the Existing Conditions and Full Project Buildout.

	Electricity (MWh/yr)	Natural Gas (MMBtu/yr)	Gasoline (gallons)	Diesel (gallons)
Existing Conditions	13,484	30,274	1,201,685	543,432
Project	81,336	3,806	2,923,540	748,392
Net Change	67,851	-26,468	1,721,855	204,960

2. IMPACT ASSESSMENT AND MITIGATION MEASURES

2.1 Standards of Significance

CEQA Guidelines Appendix G (as amended December 28, 2018) includes two significance thresholds related to Energy as follows:

Would the project:

A. Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?

B. Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?

In addition, Part I of Appendix F of the CEQA Guidelines states as follows:

“The goal of conserving energy implies the wise and efficient use of energy. The means of achieving this goal include:

1. decreasing overall per capita energy consumption,
2. decreasing reliance on natural gas and oil, and
3. increasing reliance on renewable energy resources.”

Appendix F states that an EIR should discuss the general energy impacts of a project, with particular emphasis on avoiding or reducing inefficient, wasteful, and unnecessary consumption of energy. The avoidance of inefficient, wasteful, and unnecessary consumption of energy will be the standard of significance used for this Project.

For purposes of this analysis, impacts to Energy Resources will be considered to be significant if the Project would result in the wasteful, inefficient or unnecessary consumption of energy resources, and conversely if the project would conflict with or obstruct a state or local plan for renewable energy or energy efficiency.

2.2 Methodology

The methodology used to evaluate the significance of the Project's energy-related impacts is explained in the context of each impact, as discussed below.

2.3 Environmental Analysis

Impact ER-1: The Project Would Not Result in the Wasteful, Inefficient or Unnecessary Consumption of Fuel or Energy, and Conversely the Project Would Not Conflict With or Obstruct a State or Local Plan for Renewable Energy or Energy Efficiency (Less Than Significant)

2.3.1 Overview

The Project will be constructed in compliance with California's Building Energy Efficiency Standards; California's Green Building Standards; Leadership in Energy and Environmental Design (LEED) Gold Standards for buildings over 10,000 square feet; City of Menlo Park Municipal and Reach Codes additional requirements; and will implement transportation demand management strategies to reduce vehicle miles traveled and mobile fuel use. Overall, these programs will ensure that the Project reduces wasteful consumption of energy and does not obstruct any plans for renewable energy or energy efficiency.

2.3.2 Analysis of Factors Identified in CEQA Guidelines Appendix F

To determine whether a project would result in the wasteful, inefficient or unnecessary consumption of fuel or energy, and conversely whether the project would fail to incorporate renewable energy or energy efficiency measures into building design, equipment use, transportation or other project features, Appendix F of the CEQA Guidelines identifies six categories of potential energy-related environmental impacts, and five categories of potential mitigation measures that may be incorporated into the project. Each impact and mitigation category identified in Appendix F is addressed below.

Based on the analysis of each of these factors, the potential for the Project to result in wasteful, inefficient or unnecessary consumption of fuel or energy, and conversely to fail to incorporate renewable energy or energy efficiency measures into building design, equipment use, transportation or other project features is **Less Than Significant.**

2.3.2.1 Appendix F.II.C.1 Energy Requirements and Energy Use Efficiencies

In section II.C.1, CEQA Guidelines Appendix F states that environmental impacts may include:

The project's energy requirements and its energy use efficiencies by amount and fuel type for each stage of the project including construction, operation, maintenance and/or removal. If appropriate the energy intensiveness of materials may be discussed.

The inventories prepared for this evaluation include energy and fuel used for construction and operation of the Project. Energy intensiveness of materials is not addressed because the California Governor's Office of Planning and Research (OPR) has stated that lifecycle analyses

are not required under CEQA,[3] and in December 2009 the California Natural Resources Agency (CNRA) issued energy conservation guidelines for EIRs that make no reference to lifecycle emissions.[4] The CNRA explained that: (1) There exists no standard regulatory definition for lifecycle emissions, and (2) Even if a standard definition for 'lifecycle' existed, the term might be interpreted to refer to emissions "beyond those that could be considered 'indirect effects'" as defined by CEQA Guidelines, and therefore, beyond what an EIR is required to estimate and mitigate.[5] This reasoning was reaffirmed in the November 2018 CEQA Guidelines Update.[6]

The Project requires energy in the forms of electricity, natural gas, and gasoline and diesel fuel. These energy use requirements are summarized in **Table 12** for operational activities and **Table 7** for construction activities.

Construction-related energy consumption would be limited to the construction period. As shown in the tables noted above, construction would require the use of electricity, diesel and gasoline. **Table 7** shows the fuel use for construction over the length of the construction period. **Table 12** shows the annual fuel use of operation. The construction gasoline and diesel fuel use over the length of construction would be less than the associated gasoline and diesel fuel use if the Existing Conditions remained over the length of construction. Electricity would be used to reduce other impacts of construction, such as the electricity associated with providing watering for fugitive dust control and the electricity to power construction equipment to reduce fossil fuel use. Therefore, construction energy consumption is not wasteful, inefficient, or unnecessary.

As shown in the tables noted above, operational electricity, diesel, and gasoline requirements are projected to increase from the Existing Conditions to the Project due to the increase in density associated with the Project and the addition of new land uses, such as residences. However, the mobile fuel requirements will not increase as much as they would in the absence of the Project's TDM programs, electric vehicle initiatives, and increasing fuel efficiencies of vehicles. The electricity may be further reduced due to the Project's commitment to achieve LEED Gold building design for all buildings with more than 10,000 square feet, which has not been fully incorporated quantitatively into this assessment. Furthermore, the electricity usage assumes a conservative estimate of EV charging that is more than the associated reduction in gasoline and fuel usage, which overestimates energy use.

Accessed December 16, 2021.

[6] CNRA, 2018. Final Statement of Reasons For Regulatory Action
Amendments to the State CEQA Guidelines. Available at:
http://resources.ca.gov/ceqa/docs/2018_CEQA_Final_Statement_of%20Reasons_111218.pdf, pg 41. Accessed December 16, 2021.

In addition, the Project's commitment to encourage the use of EVs increases overall energy efficiency of the Project. EVs convert more electrical energy from the grid to power vehicles than conventional gasoline vehicles.[7]

Natural gas consumption is reduced with the Project compared to the Existing Conditions.

Due to its energy-efficient design and focus on reducing mobile fuel use, the resulting energy use from Project implementation is not wasteful or unnecessary.

2.3.2.2 Appendix F.II.C.2 Local and Regional Energy Supplies

In section II.C.2, CEQA Guidelines Appendix F states that environmental impacts may include:

The effects of the project on local and regional energy supplies and on requirements for additional capacity.

The Project will not have a substantial impact on the local or regional energy supplies or require additional capacity to be constructed. Through use of renewable energy, energy efficiency standards, and electric vehicle charging infrastructure, the Project will minimize impacts on the local and regional energy supply. The transition toward electric fuels for on-site vehicles and 100 percent electric building will result in an increase in calculated total electricity usage that will not significantly impact overall electricity infrastructure. This small increase may be offset by gains in energy efficiency at the Project that are not quantitatively addressed in the energy usage calculations as noted above.

As discussed in **Section 1.3** above, the Project relies on electricity, natural gas, and gasoline and diesel consumption associated with mobile operations, emergency generator operations, and construction operations. Total energy use requirements for Existing Conditions, Construction, and Project Full Buildout years are summarized in **Tables 7** and **12**.

The Project site is supplied electricity from Peninsula Clean Energy (PCE) and natural gas through Pacific Gas and Electric (PG&E). PCE and PG&E have established contracts to ensure there is adequate electricity generation capacity to meet its current and future loads. In addition, the Project would include solar photovoltaics that would generate renewable electricity and further reduce the burden on regional energy supplies. This extensive generation of new renewable energy would reduce the strain on electricity production by reducing the demand for electricity generation from the grid resources, particularly during peak times when energy demand is the highest and solar energy potential is also the highest. The Project would use minimal amounts of natural gas as only commercial culinary uses would be supplied with natural gas.

To put the Project's energy use in context, in 2020 Californians consumed 279,510 gigawatt hour (GWh) of electricity, of which San Mateo County consumed 4,167 GWh.[8] California Energy Commission (CEC) estimates that state-wide energy demand will increase to 320,375 GWh in 2025, an average annual growth rate of 1.32%.[9] The Project's anticipated increase in

[9] California Energy Commission. 2018. California Energy Demand 2018-2030 Revised Forecast. Available online at: https://efiling.energy.ca.gov/getdocument.aspx?tn=223244. Accessed January 3, 2020.

electricity usage from 13,484 megawatt-hours (MWh) for Existing Conditions to 81,336 MWh by Full Buildout reflects an increase of 67,851 MWh in electricity usage. This increase represents approximately 0.024% of the total 2020 state-wide electricity usage and 1.63% of San Mateo County 2020 electricity usage. The electricity use associated with the Project incorporates a large demand for charging electric vehicles in 2026. This trend for increased demand for electric vehicles is likely to increase the state-wide and county electricity usage regardless of the Project. Therefore, these percentages would likely be much smaller compared to 2026 state-wide and county usage. Therefore, the Project will not require additional generation capacity or cause the need for more additionally generation capacity beyond more general state-wide expansion.

The Project's annual natural gas consumption is estimated to decrease by 26,468 Million British Thermal Unit (MMBtu) from 30,274 MMBtu for Existing Conditions to 3,806 MMBtu at Full Buildout. California's natural gas demand in 2020 was 1,232,858,633.8 MMBtu, and San Mateo County's natural gas demand in 2020 was approximately 20,025,518 MMBtu.[10] The Project's decrease in natural gas consumption accounts for just 0.0021% of the projected statewide annual consumption and 0.13% of the projected countywide consumption.

Although natural gas is the most common source for the generation of electricity in California, 90% of the state's natural gas is imported from the Rocky Mountain region, the Southwest, and Canadian basins.[11] The United States produces 20 trillion standard cubic feet per year (scf/yr) and had 340 trillion scf of proven reserves in 2014.[12] The Project's natural gas consumption is not substantial in comparison to the national natural gas reserves and comprises a tiny portion of annual national natural gas production.

Gasoline and diesel are provided by California's transportation fuels supplier network, as the majority of gasoline and diesel fuels are used for transportation to and from the Project.

Based on the very small increases in overall energy demand, the Project will not have a substantial impact on the local or regional energy supplies or require additional capacity to be constructed.

2.3.2.3 Appendix F.II.C.3 Peak and Base Period Demands

In section II.C.3, CEQA Guidelines Appendix F states that environmental impacts may include:

The effects of the project on peak and base period demands for electricity and other forms of energy.

The Project will not have a substantial impact on the peak and base period demands for electricity or other forms of energy. The Project's base energy consumption compared to regional and statewide energy consumption is discussed above in Section 2.3.2.2. Further details and reasoning on the peak demand are described below.

[12]California Energy Commission. 2019. Draft Staff Report: 2019 Natural Gas Market Trends and Outlook. Available online at: https://efiling.energy.ca.gov/getdocument.aspx?tn=233214#:~:text=The%20U.S.%20Energy%20Information%20Administration,or%20energy%20source%20in%20California. Accessed December 13, 2021.

In 2016, California's peak grid demand was 46,193 megawatts (MW). On the same day, PG&E reached a maximum demand of 23,752 MW.[13] In 2018, California's peak grid demand increased to 46,427 MW.[14] In comparison, the Project's maximum demand is expected to be 37.1 MW. This also conservatively excludes all the benefits of LEED Gold design and improvements in demand response due to the Title 24 energy standards, which would further reduce peak demand. Therefore, the Project peak demand represents less than 0.16 percent of PG&E's peak demand. This is a conservative estimate because the Project's peak may not occur at the same time as the utility or statewide peak. Therefore, the Project would have a relatively negligible effect on state-wide peak demands.

2.3.2.4 Appendix F.II.C.4 Existing Energy Standards

In section II.C.4, CEQA Guidelines Appendix F states that environmental impacts may include:

The degree to which the project complies with existing energy standards.

The Project complies with existing energy standards. During implementation of the Project, the Project will continue to adhere to State standards designed to minimize use of fuel in construction vehicles, ensure that buildings employ strict energy efficiency techniques, and operate comprehensive transportation demand management programs, as described further below.

Construction Vehicles and Electricity Usage

Project construction requires use of on-road trucks for soil hauling and deliveries, and off-road equipment such as excavators, cranes, forklifts, and pavers. The Project would comply with state and local requirements designed to minimize idling and associated emissions, which also minimizes use of fuel. Specifically, idling of commercial vehicles and off-road equipment would be limited to five minutes in accordance with the Commercial Motor Vehicle Idling Regulation and the Off-Road Regulation, and the trucks used would be compliant with the requirements of the Tractor-Trailer Greenhouse Gas Regulation.

Building Efficiency

The Project's anticipated electricity and natural gas use in buildings is shown in the sections above. New building construction is subject to California's Title 24. California's Title 24 reduces energy use in residential and commercial buildings through progressive updates to both the Green Building Standards Code (Title 24, Part 11) and the Energy Efficiency Standards (Title 24, Part 6). Provisions added over the years include consideration and possible incorporation of new energy efficiency technologies and methods for building features such as space conditioning, water heating, lighting, and whole envelope, as well as construction waste diversion goals. Additionally, some standards focus on larger energy saving concepts such as reducing loads at peak periods and seasons, improving the quality of energy-saving installations, and performing energy system inspections. Past updates to the Title 24 standards have proven very effective in reducing building energy use. The 2019 standards have reduced residential and non-residential electricity consumption further. Non-residential

[13] California ISO. 2021. 2020-2021 Transmission Plan. Available online at: http://www.caiso.com/planning/Pages/TransmissionPlanning/2020-2021TransmissionPlanningProcess.aspx. Accessed December 13, 2021.

[14] California ISO. 2021. California ISO Peak Load History 1998 through 2020. Available online at: https://www.caiso.com/documents/californiaisopeakloadhistory.pdf. Accessed December 13, 2021.

buildings built according to the 2019 code are expected to use 30% less energy than those built per 2016 code, mainly due to lighting upgrades.[15] . The draft 2022 Building Energy Efficiency Standards have been published and are scheduled to be approved in December 2021. If approved, the 2022 standards will go into effect on January 1, 2023. The 2022 standards improve upon the 2019 standards and focus on four key areas in new residential and nonresidential construction: (1) encouraging electric heat pump technology and use, (2) establishing electric-ready requirements when natural gas is installed, (3) expanding solar photovoltaic system and battery storage standards, and (4) strengthening ventilation standards to improve indoor air quality.[16] Future updates, which occur every 3 years, are expected to further reduce high-rise residential and non-residential electricity consumption.

As the Project schedule anticipates build out between 2024 and 2027, further reductions can be anticipated from future Title 24 code updates. Additionally, the Project will go beyond Title 24 requirements in construction and operation of new buildings by achieving the LEED Gold standard for all buildings with more than 10,000 square feet. This energy benefit of this commitment has conservatively not been quantified.

The buildings on the main Project Site also must comply with applicable Menlo Park Municipal Code energy efficiency requirements, which are more stringent than Title 24. These requirements state:

> *For all new construction, a project will meet 100 percent of energy demand (electricity and natural gas) through any combination of the following measures:*
>
> *(i) Onsite energy generation,*
>
> *(ii) Purchase of 100 percent renewable electricity through Peninsula Clean Energy or Pacific Gas and Electric Company (PG&E) in an amount equal to the annual energy demand of the project,*
>
> *(iii) Purchase of local renewable energy generation in Menlo Park in an amount equal to the annual energy demand of the project, and*
>
> *(iv) Purchase of certified renewable energy credits and/or certified renewable energy offsets annually in an amount equal to the annual energy demand of the project.*

The Campus District would meet this code requirement by eliminating the use of natural gas, except for culinary purposes, and committing to purchasing 100 percent carbon free electricity from PCE.

Portions of the Town Square, Campus, and/or the Residential/Shopping District would include natural gas for cooking in the retail area. To meet this code requirement, the on-site solar would offset any emissions from the natural gas combustion for cooking and any electricity that may not be carbon free.

[15] Stok. 2020. 2019 Title 24 Energy Code Update: What Project Teams Should Know. Available online at: https://stok.com/insights/2019-title-24-energy-code-update-what-project-teams-should-know/

[16] CEC. 2021. 2022 Building Energy Efficiency Standards. Available online at: https://www.energy.ca.gov/programs-and-topics/programs/building-energy-efficiency-standards/2022-building-energy-efficiency

The compliance method is discussed further in the memorandum from Signature Development Group to the City of Menlo Park dated December 2, 2021 regarding Willow Village 100% Renewable Energy Memo.

Transportation

Vehicle use at the Project has been reduced through TDM programs. VMT has a direct correlation to fuel usage. Many regulatory requirements reduce mobile fuel use and VMT, and the Project will comply with or exceed all requirements. For example, SB 743 requires projects to evaluate VMT relative to existing regional averages rather than evaluating Level of Service (LOS) for CEQA significance and allows streamlining for projects in high quality transit areas. SB 375, the Sustainable Communities & Climate Protection Program, requires Metropolitan Planning Organizations MPOs to develop Sustainable Community Strategies (SCS) to reduce per capita VMT. The California Air Resources Board (ARB) has prepared a white paper that identifies how VMT reductions consistent with SB 743 and SB 375 relate to statewide climate goals.[17] The Project focuses housing and job growth within existing urbanized areas, reducing VMT below regional averages and thus fulfills one of the key aspects of the SCS.[18] The Project also helps fulfill the Governor's Zero Emission Vehicle Action Plan (Executive Order B-48-18) by promoting the adoption of electric vehicles. The vehicles that travel to and from the Project will be registered at the Department of Motor Vehicles consistent with the overall regional fleet and therefore will comply with vehicle efficiency standards.

2.3.2.5 Appendix F.II.C.5 Energy Resources

In section II.C.5, CEQA Guidelines Appendix F states that environmental impacts may include:

The effects of the project on energy resources.

The Project's use of energy will not have a substantial effect on statewide or regional energy resources. The Project's energy use is discussed above, including electricity, natural gas, and gasoline and diesel consumption associated with mobile operations, emergency generator operations, and construction operations. The change in energy use requirements from the Existing Conditions to Full Buildout Project years is summarized in **Table 12**. Programs and measures relevant to energy resources are discussed in detail in **Sections 2.3.2.2** and **2.3.2.3**.

2.3.2.6 Appendix F.II.C.6 Transportation Energy Use

In section II.C.6, CEQA Guidelines Appendix F states that environmental impacts may include:

The project's projected transportation energy use requirements and its overall use of efficient transportation alternatives.

The Project uses efficient transportation alternatives to reduce its transportation energy use requirements, as described further below.

[17]ARB. 2019. CARB 2017 Scoping Plan-Identified VMT Reductions and Relationship to State Climate Goals. Available at: https://ww2.arb.ca.gov/resources/documents/carb-2017-scoping-plan-identified-vmt-reductions-and-relationship-state-climate. Accessed December 16, 2021.

[18]ARB. 2019. What are Sustainable Communities Strategies. Available at: https://ww2.arb.ca.gov/our-workprogramssustainable-communities-program/what-are-sustainable-communities-strategies. Accessed December 16, 2021.

The Project's transportation energy use is discussed above and gasoline and diesel quantities for all inventory scenarios, including the Existing Conditions and Project are presented in **Tables 7** and **12**. The quantification of VMT associated with Project operations, which feeds into total transportation energy use quantified, is discussed in detail in the **Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Report**.

The Project includes reductions in VMT from TDM Plan measures, which result in a reduction in gasoline, diesel, natural gas, and electricity usage at Full Buildout. Additional displacement of gasoline or diesel fuel will occur due to the Project's commitment to installing additional EV charging stations.

The Project's EV charging stations will reduce fuel use and GHG emissions by assisting Californians in the shift from fossil-fueled vehicles to electric vehicles, while the fossil fuels needed to produce electricity for charging continues to decrease. As shown in the **Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Report**, by 2026 a conventional passenger vehicle is expected to emit 289 grams of Carbon Dioxide Equivalent (CO_2e) per mile, while the indirect electricity emissions for an EV charged with carbon-free electricity is 0. Therefore, for every mile that is driven in an EV rather than in a gasoline or diesel car, GHG emissions are reduced by 289 grams, and corresponding fuel use decreases.

2.3.2.7 Appendix F.II.D.1 Energy Reduction Measures

In section II.D.1, CEQA Guidelines Appendix F states that mitigation measures (including those already incorporated into the project) may include:

Potential measures to reduce wasteful, inefficient and unnecessary consumption of energy during construction, operation, maintenance and/or removal. The discussion should explain why certain measures were incorporated in the project and why other measures were dismissed.

As discussed above, construction energy consumption is not wasteful, inefficient, or unnecessary. As discussed in the **Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Report**, the project has proposed to implement the Bay Area Air Quality Management District (BAAQMD) Basic Construction Mitigation Measures. These measures would result in reduced fuel consumption during construction.

The Project implements a number of programs to reduce the consumption of energy, as discussed above. Buildings with more than 10,000 square feet will achieve LEED Gold standards, will comply with increasingly stringent Title 24 Building Energy Efficiency and Green Building standards, and will comply with City of Menlo Park's Municipal and Reach Codes. Mobile fuel use is reduced through an extensive TDM program. Mobile fuel is also displaced through use of EV charging stations. Solid waste energy use is reduced through diversion, recycling, and composting programs. The Project also incorporates on-site solar generation, and water and waste reduction measures, including low-water landscaping, low-flow toilets, and low-flow faucets. These measures have not all been completely quantitatively incorporated in the Project to be conservative. However, the Project is committed to enough onsite renewable electricity generation to offset non-carbon free energy use in buildings.

2.3.2.8 Appendix F.II.D.2 Siting, Orientation, and Design

In section II.D.2, CEQA Guidelines Appendix F states that mitigation measures (including those already incorporated into the project) may include:

The potential of siting, orientation, and design to minimize energy consumption, including transportation energy, increase water conservation and reduce solid waste.

A number of Project initiatives and programs, as well as general features of the location itself, utilize siting, orientation, or design elements to minimize energy consumption, as discussed further below.

Transportation (Siting)

The Project is an infill development positioned within existing residential and industrial land uses. The Project brings amenities, such as a grocery store and pharmacy, to an area devoid of such amenities, thereby reducing existing trip lengths for residents of the neighboring community and reducing demand for transportation fuels. The Project is a mixed-use development placing residents near office and retail areas, reducing the need for trips outside the development.

Building Energy Efficiency (Siting, Orientation)

The Project's high-performance design and construction of new buildings to achieve LEED Gold for buildings over 10,000 square feet, stringent Title 24 building energy requirements, and compliance with City of Menlo Park Municipal code will allow for increased energy efficiency and opportunities for on-site renewables generation. Title 24 performance-based compliance requires building energy modeling through computer software that calculates energy use and reductions by incorporating building orientation and climate data; it penalizes buildings that are oriented in a way that will increase energy consumption, as such buildings would be required to achieve additional energy efficiency features to reach the target energy design ratings. Therefore, the Project is incentivized to site and orient its buildings in a way that maximizes energy efficiency or will implement additional energy efficiency to reduce demand.

Furthermore, the Project would incorporate potable water conservation, utilize recycled water for non-potable uses and implement an aggressive solid waste reduction program at the Campus District that exceeds the goals of the City's waste goals.

2.3.2.9 Appendix F.II.D.3 Reducing Peak Energy Demand

In section II.D.3, CEQA Guidelines Appendix F states that mitigation measures (including those already incorporated into the project) may include:

The potential for reducing peak energy demand.

The Project's energy mitigation measures and project features will help reduce peak energy demand throughout the Project life. LEED Gold and Title 24 Building Energy Efficiency Standards include measures that encourage load-shifting and demand-response. In addition, rooftop solar should reduce grid demand, particularly during peak times when energy demand is the highest and solar energy potential is also the highest. Title 24 energy use performance standards are based on the time dependent valuation (TDV) of energy, which uses the value of the electricity or natural gas used at every hour of the year to incentivize load shifting off of the peak. In addition, the mixed-use nature of the Project site naturally allows for a balanced energy load, as not all uses will be occupied at the same time of day.

2.3.2.10 Appendix F.II.D.4 Alternative Fuels

In section II.D.4, CEQA Guidelines Appendix F states that mitigation measures (including those already incorporated into the project) may include:

Alternative fuels (particularly renewable ones) or energy systems.

The Project has pursued the use of alternative fuels or energy systems for heating, cooling, electricity, and transportation, as discussed below.

The Project has committed to providing on-site EV charging stations to support the expanded use of electric vehicles. The Project's EV charging stations will reduce fuel use and GHG emissions by assisting Californians in the shift from fossil-fueled vehicles to electric vehicles, while the fossil fuels needed to produce electricity for charging continues to decrease. Additional details regarding the number and type of EV chargers to be installed by the Project are shown in the **Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Report**.

2.3.2.11 Appendix F.II.D.5 Recycling Efforts

In section II.D.5, CEQA Guidelines Appendix F states that mitigation measures (including those already incorporated into the project) may include:

Energy conservation which could result from recycling efforts.

California has a statewide goal of 75% waste diversion by 2020, while the City of Menlo Park Zero Waste goal reduces emissions from waste by 90 percent between 2005 and 2035.[19] The City of Menlo Park administers recycling and solid waste services. For multifamily homes, this includes recycling for residential solid waste and organics. Recology provides recycling services for residential as well as commercial establishments.[20] The Project will comply with these goals by implementing waste diversion policies and infrastructure. At the Campus District, the Project will implement an aggressive solid waste reduction program that exceeds the goals of the City's waste goals.

2.3.2.12 Summary

In summary, based on the analysis of each of the factors identified in CEQA Guidelines Appendix F, the potential for the Project to result in wasteful, inefficient or unnecessary consumption of fuel or energy, and conversely to fail to incorporate renewable energy or energy efficiency measures into building design, equipment use, transportation or other project features is **Less Than Significant.**

Notes:

1. Information on Project equipment list, horsepower, quantity, and hours per equipment per year were provided by the Project Applicant. Cumulative hours per building represents the sum of hours per equipment across all years. All off-road equipment is assumed to have diesel engines except aerial lifts and cranes which were assumed to be electric, as designated by Project Applicant.
2. Fuel usage is calculated by taking the horsepower-hours for each piece of equipment (calculated as horsepower * usage hours * load factor) and multiplying it by the gallons of diesel consumption per horsepower-hour consistent with USEPA AP-42 diesel fuel data in Table 3.4.1, which cites an average brake-specific fuel consumption (BSFC) of 7,000 BTU/hp-hr, a heating value of 19,300 BTU/lb, and density of 7.1 lb/gal.

Notes:

1. Information on Project equipment list, horsepower, quantity, and utilization factor were provided by the Project Applicant. All off-road equipment is assumed to have diesel engines except aerial lifts which were assumed to be electric, as designated by Project Applicant. Utilizations for duration represent the usage percentage during the indicated equipment date range. Utilization percentage is multiplied by the number of hours per day in the calculation of off-road emissions.

2. Fuel usage is calculated by taking the horsepower-hours for each piece of equipment (calculated as horsepower * usage hours * load factor) and multiplying it by the gallons of diesel consumption per horsepower-hour consistent with USEPA AP-42 diesel fuel data in Table 3.4.1, which cites an average brake-specific fuel consumption (BSFC) of 7,000 BTU/hp-hr, a heating value of 19,300 BTU/lb, and density of 7.1 lb/gal.

Abbreviations:

CalEEMod - CALifornia Emissions Estimator MODel

Notes:

1. Fuel consumption and VMT from EMFAC2021 online database for San Mateo County. HHDT and MHDT are assumed to be diesel. LDA, LDT1 and LDT2 are assumed to be gasoline.
2. Fuel efficiency calculated based off of EMFAC data: [Fuel Consumption]/ [VMT]
3. Consistent with CalEEMod, Hauling assumes 100% HHDT, Vendor assumes 50% HHDT and 50% MHDT, and Worker assumes 50% LDA, 25% LDT1, and 25% LDT2 vehicles.

Abbreviations:

CalEEMod - California Emissions Estimator Model
EMFAC2021 - California Air Resources Board EMission FACtor model
LDA - light duty auto
LDT - light duty truck
MHDT - medium-heavy duty truck
HHDT - heavy-heavy duty truck
VMT - vehicle miles traveled

								Total Fuel Consumption:	**809,457**	**205,895**	**274,744**

Notes

1. Total miles based on trip generation provided by Project sponsor and CalEEMod default trip distance by trip type.
2. Fuel usage based on VMT data and fuel efficiency values calculated in Table 4. It is assumed that worker vehicles use gasoline while vendor and hauling vehicles use diesel.
3. Onroad fuel usage does not vary between the unmitigated and mitigated scenario.

Abbreviations:

CalEEMod - California Emissions Estimator Model
mi - mile
yr - year
VMT - vehicle miles traveled

						Total[3]	**27**

Notes:

1. Information on Project water use was provided by the Project Applicant.
2. Energy usage is calculated by applying the electric intensity factor for outdoor water to total water usage. An electric intensity factor of 3,500 kWh/million gallons was taken from Table 9.2 in Appendix D of the CalEEMod User's Guide as the sum of supply water, treat water and distribute water electric intensity factors. Since the water use reported here is only for construction fugitive dust control, operational indoor water use-related emissions and wastewater treatment-related emissions are not estimated here.
3. Water usage does not vary between the unmitigated and mitigated scenario.

Abbreviations:

gal - Gallons
kWh - kilowatt-hours
MWh - megawatt-hours

References:

CalEEMod User's Guide (Available online at: http://www.aqmd.gov/caleemod/user's-guide)
PG&E, Pacific Gas and Electric - Gas and power company for California (https://www.pge.com/)

Table 7
Summary of Project Construction Energy Use
Willow Village
Menlo Park, California

Source		Units	Project Construction Usage[1]
Electricity	Water Consumption[2]	kWh	26,689
	Off-Road Construction Equipment[3]	kWh	56,309
	Electricity Total	**kWh**	**82,998**
Diesel	On-Road Construction Trips[4]	gallons	480,639
	Off-Road Construction Equipment[3]	gallons	2,389,804
	Diesel Total	**gallons**	**2,870,443**
Gasoline	On-Road Construction Trips[4]	gallons	809,457
	Gasoline Total	**gallons**	**809,457**

Notes:

1. The energy usage for the unmitigated and mitigated scenarios is the same.
2. Construction water use based on project-specific estimate provided by Project sponsor. See Table 6 for more details on the methodology.
3. Off-road equipment electricity use based on hours of operation for electric equipment. Off-road diesel fuel usage based on a fuel usage rate of 0.051 gallons of diesel per horsepower (hp)-hour, consistent with diesel conversion factors given in USEPA AP-42 Table 3.4.1. See Tables 2 and 3 for more details on the methodology.
4. On-road mobile source fuel use based on vehicle miles traveled (VMT) for all years of construction and fleet-average fuel consumption in gallons per mile from EMFAC2021 for CY 2021 through 2026 in San Mateo County. See Table 4 for more details on the methodology.

Abbreviations:

CY - calendar year

EMFAC2021 - California Air Resources Board EMission FACtor model

hp - horsepower

kWh - kilowatt-hour

USEPA - United States Environmental Protection Agency

VMT - vehicle miles traveled

Table 8
Water Energy Use
Willow Village
Menlo Park, California

Scenario	Water Usage[1]		Electricity Usage[2]		
	Indoor	Outdoor	Indoor	Outdoor	Total
	(million gallons/year)		(kWh/year)		
Existing Conditions	247	28	1,335,508	98,953	1,434,462
Full Buildout	114	35	617,173	122,546	739,719

Notes:

1. Water usage rates consistent with Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Report.
2. Energy Usage is based on the water usage rates and the default water electricity intensity found in Tables 9.2 of Appendix D of the CalEEMod user guide. Indoor water electricity usage assumes electricity is used to supply, treat and distribute water and treat wastewater. Outdoor water electricity usage does not include treating wastewater.

Abbreviations:

CalEEMod - California Emissions Estimator Model
kWh - kilowatt hour
yr - year

											Full Buildout Fuel Consumption:	**3,421,733**	**728,814**	**11,726**	**647,090**

Notes:

1. The VMT and fleet mixes are based on data provided by The Transportation Engineer, for detailed VMT calculations see Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Report.
2. The percent of each fuel type for a given fleet and the fuel efficiency (miles per gallon, diesel miles per gallon, natural gas miles per DEG) were calculated based on EMFAC2021 for San Mateo County.
3. An average EV fuel economy of 0.30 kWh per mile was used. The fuel economy is based on electric fleet data from fueleconomy.gov. Available at: https://www.fueleconomy.gov/.
4. Fuel consumption is calculated by multiplying the VMT by the fuel efficiency and percent of vehicles for each fuel type.

Abbreviations:

VMT - Vehicle miles traveled
DEG - Diesel equivalent gallon
CNG- Compressed natural gas

References:

California Air Resources Board. EMFAC2021. Available at: https://arb.ca.gov/emfac/

Table 10
Fuel Reduction from Electric Vehicles
Willow Village
Menlo Park, California

Year	Land Use	Annual Electric VMT (mi/yr)[1]	Percent Replacing Gasoline Vehicle Miles[2]	Percent Replacing Diesel Vehicle Miles[2]	Replaced Vehicle Miles		Miles per Gallon		Fuel Reduction	
					Gasoline	Diesel	Gasoline	Diesel	(gallons of gasoline)	(gallons of diesel)
2019	Campus District	1,783,182	99.7%	0.3%	1,777,261	5,921	26	37	68,134	160
2027	Town Square and the Residential/Shopping District	4,404,570	90.8%	4.3%	3,999,357	187,472	25	10	158,225	18,649
	Campus District	9,752,026	99.7%	0.3%	9,726,961	25,065	29	38	339,969	667
								Total Fuel Reduction:	**430,060**	**19,156**

Notes:

1. The electric VMT and fleet mixes are based on the expected increase in eVMT that the project will contribute. For detailed EV calculations see Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Report.
2. The percent of each fuel type for a given fleet were calculated based on EMFAC2021 for San Mateo County.
3. Replaced vehicles miles is found by multiplying the fleet percentage by fuel type by the expected eVMT due to the project.
4. Fuel reduction is calculated by dividing the replaced VMT by the fleet fuel efficiency derived from EMFAC2021.

Abbreviations:

VMT - Vehicle miles traveled
mi/yr - Miles per year

References:

California Air Resources Board. EMFAC2021. Available at: https://arb.ca.gov/emfac/

Table 11
Project Generator Fuel Consumption
Willow Village
Menlo Park, California

Project Generators

Scenario[1]	Generator Hours of Operation [2] (hrs)	Average Horsepower (hp)	Fuel Consumption[3] (gallons of diesel)
Existing Conditions	50	324	828
Project Full Buildout	650	1,171	38,893

Notes:

1. The table shows generator fuel consumption for an annual operation of 50 hours/year, the maximum allowable by the Airborne Toxics Control Measure (ATCM) for Stationary Compression Ignition Engines (17 CCR 93115).

2. Total annual hours of operation and average horsepower from Air Quality Technical Report Table 27.

3. Consistent with USEPA AP-42 diesel fuel data in Table 3.4.1, which cites an average brake-specific fuel consumption (BSFC) of 7,000 BTU/hp-hr, a heating value of 19,300 BTU/lb, and density of 7.1 lb/gal.

Abbreviations:

BTU - British Thermal Units
gal - gallon
hp - horsepower
hrs - hours
lb - pound

References:

California Air Resources Board. Airborne Toxic Control Measures (ATCM), 17 CCR § 93115. Available online at: https://ww2.arb.ca.gov/sites/default/files/classic/diesel/documents/finalreg2011.pdf

Table 12
Summary of Operational Energy Use
Willow Village
Menlo Park, California

Field Pictures

Noise Monitoring Site LT-1.
Location: 1439 Kavanaugh Drive

On Kavanaugh Drive looking East, ~130 feet West of the Kavanaugh Drive/Gertrude Court intersection.

On Kavanaugh Drive, looking North towards 1439 Kavanaugh Drive.

On Kavanaugh Drive looking West, ~180 feet East of the Kavanaugh Drive/Clarence Court intersection.

On Kavanaugh Drive, looking Northwest towards 1439 Kavanaugh Drive.

Noise Monitoring Site LT-2.
Location: 1360 Willow Road

West of 1360 Willow Road, looking North towards the Willow Road/Hamilton Avenue intersection.

~110 feet Northwest of 1360 Willow Road, looking West.

Looking Southwest towards Willow Road.

Looking South along Willow Road.

Noise Monitoring Site LT-3.
Location: 1125 Alberni Avenue

Looking West along Alberni Avenue.

Looking Southwest along Alberni Avenue.

Looking East towards along Alberni Avenue. The Alberni Avenue/Poplar Avenue intersection is ~25 feet to the Southeast.

Looking South on the Northeast corner of Orizaba Avenue and Broad Street.

Noise Monitoring Site LT-4.
Location: 1396 Carlton Avenue

On Carlton Avenue, looking South.

On Carlton Avenue, looking East towards 1396 Carlton Avenue.

Looking North on Carlton Avenue, ~170 feet South of Hamilton Avenue.

Looking Northwest on Carlton Avenue, South of Hamilton Avenue.

Noise Monitoring Site ST-1.
Location: 1380 Willow Road

Looking West towards Willow Road.

Looking Northwest towards Willow Road.

Looking East, ~60 feet West from 1380 Willow Road.

Looking Southwest towards Willow Road.

Noise Monitoring Site ST-2.
Location: 1350 Willow Road

~40 feet from Willow Road, looking West.

Looking South towards Mid-Peninsula High School. Sound level meter is ~70 feet from the school.

Looking East, with 1350 Willow Road to the Northeast (left) and Mid-Peninsula High School to the Southeast (right).

On Willow Road, looking Northeast towards 1350 Willow Road.

Noise Monitoring Site ST-3.
Location: Open Mind School (1215 O'Brien Drive)

Looking North, the Northwest corner of Open Mind School is behind the camera.

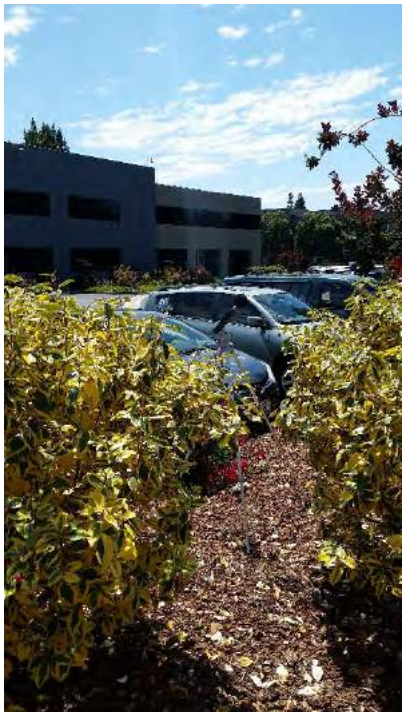
Looking South towards Open Mind School.

Looking East, ~220 feet from O’Brien Drive.

Noise Monitoring Site ST-4.
Location: 1530 O’Brien Drive

Looking Northeast towards the O’Brien Drive/University Avenue intersection.

Looking North, ~30 feet from O’Brien Drive.



Looking Southwest towards 1530 O’Brien Drive.

Looking South at 1530 O’Brien, ~100 feet from the sound level meter.

Noise Monitoring Site ST-5.
Location: 1221 Willow Road

Looking Southwest towards 1221 Willow Road (~40 feet away).

Looking East, towards Willow Road.

Looking Northeast, ~80 feet from Willow Road.

Looking West, at 1221 Willow Road.

Table 1. Construction Noise

Source Data:	Maximum Sound Level (dBA)	Utilization Factor	Leq Sound Level (dBA)
Construction Condition: Phase 1 Demolition			
Source 1: Excavator - Sound level (dBA) at 50 feet =	81	40%	77.0
Source 2: Front end loader - Sound level (dBA) at 50 feet =	79	40%	75.0
Source 3: Generator - Sound level (dBA) at 50 feet =	81	50%	78.0
Calculated Data:			
All Sources Combined - Lmax sound level (dBA) at 50 feet =			85
All Sources Combined - Leq sound level (dBA) at 50 feet =			82

Distance Between Source and Receiver (ft.)	Geometric Attenuation (dB)	Ground Effect Attenuation (dB)	Calculated Lmax Sound Level (dBA)	Calculated Leq Sound Level (dBA)
25	6	0.0	91	88
50	0	0.0	85	82
100	-6	0.0	79	76
150	-10	0.0	76	72
200	-12	0.0	73	70
250	-14	0.0	71	68
300	-16	0.0	70	66
400	-18	0.0	67	64
500	-20	0.0	65	62
600	-22	0.0	64	60
700	-23	0.0	62	59

Geometric attenuation based on 6 dB per doubling of distance.
Note: This calculation does not include the effects, if any, of local shielding from walls, topography or other barriers which may reduce sound levels further.

Table 2. Construction Noise

Source Data:	Maximum Sound Level (dBA)	Utilization Factor	Leq Sound Level (dBA)
Construction Condition: Phase 1 Grading & Utilities			
Source 1: Grader - Sound level (dBA) at 50 feet =	85	40%	81.0
Source 2: Scraper - Sound level (dBA) at 50 feet =	84	40%	80.0
Source 3: Gradall - Sound level (dBA) at 50 feet =	83	40%	79.0
Calculated Data:			
All Sources Combined - Lmax sound level (dBA) at 50 feet =			89
All Sources Combined - Leq sound level (dBA) at 50 feet =			85

Distance Between Source and Receiver (ft.)	Geometric Attenuation (dB)	Ground Effect Attenuation (dB)	Calculated Lmax Sound Level (dBA)	Calculated Leq Sound Level (dBA)
10	14	0.0	103	99
25	6	0.0	95	91
50	0	0.0	89	85
60	-2	0.0	87	83
100	-6	0.0	83	79
150	-10	0.0	79	75
300	-16	0.0	73	69
400	-18	0.0	71	67
500	-20	0.0	69	65
600	-22	0.0	67	63
700	-23	0.0	66	62

Geometric attenuation based on 6 dB per doubling of distance.
Note: This calculation does not include the effects, if any, of local shielding from walls, topography or other barriers which may reduce sound levels further.

Table 3. Construction Noise

Source Data:	Maximum Sound Level (dBA)	Utilization Factor	Leq Sound Level (dBA)
Construction Condition: Phase 1 Office - North Garage 2022			
Source 1: Pile Driver - Sound level (dBA) at 50 feet =	101	20%	94.0
Source 2: Generator - Sound level (dBA) at 50 feet =	81	50%	78.0
Source 3: Trencher - Sound level (dBA) at 50 feet =	80	50%	77.0
Calculated Data:			
All Sources Combined - Lmax sound level (dBA) at 50 feet =			101
All Sources Combined - Leq sound level (dBA) at 50 feet =			94

Distance Between Source and Receiver (ft.)	Geometric Attenuation (dB)	Ground Effect Attenuation (dB)	Calculated Lmax Sound Level (dBA)	Calculated Leq Sound Level (dBA)
10	14	0.0	115	108
25	6	0.0	107	100
50	0	0.0	101	94
100	-6	0.0	95	88
170	-11	0.0	90	84
190	-12	0.0	89	83
290	-15	0.0	86	79

Note: This calculation does not include the effects, if any, of local shielding from walls, topography or other barriers which may reduce sound levels further.

Table 19. Construction Noise

Source Data:	**Maximum Sound Level (dBA)**	**Utilization Factor**	**Leq Sound Level (dBA)**
Construction Condition: Phase 1 Mixed Use - Parcel 2 Core and Shell			
Source 1: Crane - Sound level (dBA) at 50 feet =	81	16%	73.0
Source 2: Generator - Sound level (dBA) at 50 feet =	81	50%	78.0
Source 3: Gradall - Sound level (dBA) at 50 feet =	83	40%	79.0
Calculated Data:			
All Sources Combined - Lmax sound level (dBA) at 50 feet =			87
All Sources Combined - Leq sound level (dBA) at 50 feet =			82

Distance Between Source and Receiver (ft.)	Geometric Attenuation (dB)	Ground Effect Attenuation (dB)	Calculated Lmax Sound Level (dBA)	Calculated Leq Sound Level (dBA)
25	6	0.0	93	88
50	0	0.0	87	82
100	-6	0.0	81	76
150	-10	0.0	77	73
200	-12	0.0	75	70
250	-14	0.0	73	68
300	-16	0.0	71	67
400	-18	0.0	68	64
500	-20	0.0	67	62
600	-22	0.0	65	61
700	-23	0.0	64	59

Geometric attenuation based on 6 dB per doubling of distance.
Note: This calculation does not include the effects, if any, of local shielding from walls, topography or other barriers which may reduce sound levels further.

Table 20. Construction Noise

Source Data:	Maximum Sound Level (dBA)	Utilization Factor	Leq Sound Level (dBA)
Construction Condition: Phase 1 Mixed Use - Parcel 2 Tenant Improvements			
Source 1: Dump truck - Sound level (dBA) at 50 feet =	76	40%	72.0
Source 2: Generator - Sound level (dBA) at 50 feet =	81	50%	78.0
Source 3: Gradall - Sound level (dBA) at 50 feet =	83	40%	79.0
Calculated Data:			
All Sources Combined - Lmax sound level (dBA) at 50 feet =			86
All Sources Combined - Leq sound level (dBA) at 50 feet =			82

Distance Between Source and Receiver (ft.)	Geometric Attenuation (dB)	Ground Effect Attenuation (dB)	Calculated Lmax Sound Level (dBA)	Calculated Leq Sound Level (dBA)
25	6	0.0	92	88
50	0	0.0	86	82
100	-6	0.0	80	76
150	-10	0.0	76	72
200	-12	0.0	74	70
250	-14	0.0	72	68
300	-16	0.0	70	66
400	-18	0.0	68	64
500	-20	0.0	66	62
600	-22	0.0	64	60
700	-23	0.0	63	59

Geometric attenuation based on 6 dB per doubling of distance.
Note: This calculation does not include the effects, if any, of local shielding from walls, topography or other barriers which may reduce sound levels further.

Table 21. Construction Noise

Source Data:	Maximum Sound Level (dBA)	Utilization Factor	Leq Sound Level (dBA)
Construction Condition: Phase 1 Mixed Use - Parcel 2 Landscaping			
Source 1: Excavator - Sound level (dBA) at 50 feet =	81	40%	77.0
Source 2: Backhoe - Sound level (dBA) at 50 feet =	78	40%	74.0
Source 3: Front end loader - Sound level (dBA) at 50 feet =	79	40%	75.0
Calculated Data:			
All Sources Combined - Lmax sound level (dBA) at 50 feet =			84
All Sources Combined - Leq sound level (dBA) at 50 feet =			80

Distance Between Source and Receiver (ft.)	Geometric Attenuation (dB)	Ground Effect Attenuation (dB)	Calculated Lmax Sound Level (dBA)	Calculated Leq Sound Level (dBA)
10	14	0.0	98	94
25	6	0.0	90	86
50	0	0.0	84	80
100	-6	0.0	78	74
170	-11	0.0	74	70
250	-14	0.0	70	66
300	-16	0.0	69	65
400	-18	0.0	66	62
500	-20	0.0	64	60
600	-22	0.0	63	59
700	-23	0.0	61	57

Geometric attenuation based on 6 dB per doubling of distance.

Note: This calculation does not include the effects, if any, of local shielding from walls, topography or other barriers which may reduce sound levels further.

Table 22. Construction Noise

Source Data:	Maximum Sound Level (dBA)	Utilization Factor	Leq Sound Level (dBA)
Construction Condition: Phase 1 Mixed Use - Parcel 3 Foundations			
Source 1: Excavator - Sound level (dBA) at 50 feet =	81	40%	77.0
Source 2: Generator - Sound level (dBA) at 50 feet =	81	50%	78.0
Source 3: Gradall - Sound level (dBA) at 50 feet =	83	40%	79.0
Calculated Data:			
All Sources Combined - Lmax sound level (dBA) at 50 feet =			87
All Sources Combined - Leq sound level (dBA) at 50 feet =			83

Distance Between Source and Receiver (ft.)	Geometric Attenuation (dB)	Ground Effect Attenuation (dB)	Calculated Lmax Sound Level (dBA)	Calculated Leq Sound Level (dBA)
25	6	0.0	93	89
50	0	0.0	87	83
100	-6	0.0	81	77
150	-10	0.0	77	73
200	-12	0.0	75	71
250	-14	0.0	73	69
300	-16	0.0	71	67
400	-18	0.0	68	65
500	-20	0.0	67	63
600	-22	0.0	65	61
700	-23	0.0	64	60

Geometric attenuation based on 6 dB per doubling of distance.
Note: This calculation does not include the effects, if any, of local shielding from walls, topography or other barriers which may reduce sound levels further.

Table 23. Construction Noise

Source Data:	Maximum Sound Level (dBA)	Utilization Factor	Leq Sound Level (dBA)
Construction Condition: Phase 1 Mixed Use - Parcel 3 Core and Shell			
Source 1: Crane - Sound level (dBA) at 50 feet =	81	16%	73.0
Source 2: Generator - Sound level (dBA) at 50 feet =	81	50%	78.0
Source 3: Gradall - Sound level (dBA) at 50 feet =	83	40%	79.0
Calculated Data:			
All Sources Combined - Lmax sound level (dBA) at 50 feet =			87
All Sources Combined - Leq sound level (dBA) at 50 feet =			82

Distance Between Source and Receiver (ft.)	Geometric Attenuation (dB)	Ground Effect Attenuation (dB)	Calculated Lmax Sound Level (dBA)	Calculated Leq Sound Level (dBA)
25	6	0.0	93	88
50	0	0.0	87	82

Table 35. Construction Noise

Source Data:	Maximum Sound Level (dBA)	Utilization Factor	Leq Sound Level (dBA)
Construction Condition: Phase 1 Office - Office Building 2 2023			
Source 1: Compactor (ground) - Sound level (dBA) at 50 feet =	83	20%	76.0
Source 2: Pile Driver - Sound level (dBA) at 50 feet =	101	20%	94.0
Source 3: Gradall - Sound level (dBA) at 50 feet =	83	40%	79.0
Calculated Data:			
All Sources Combined - Lmax sound level (dBA) at 50 feet =			101
All Sources Combined - Leq sound level (dBA) at 50 feet =			94

Distance Between Source and Receiver (ft.)	Geometric Attenuation (dB)	Ground Effect Attenuation (dB)	Calculated Lmax Sound Level (dBA)	Calculated Leq Sound Level (dBA)
25	6	0.0	107	100
50	0	0.0	101	94
100	-6	0.0	95	88
150	-10	0.0	92	85
200	-12	0.0	89	82
250	-14	0.0	87	80
300	-16	0.0	86	79
400	-18	0.0	83	76
500	-20	0.0	81	74
600	-22	0.0	80	73
700	-23	0.0	78	71

Geometric attenuation based on 6 dB per doubling of distance.
Note: This calculation does not include the effects, if any, of local shielding from walls, topography or other barriers which may reduce sound levels further.

Table 36. Construction Noise

Source Data:	Maximum Sound Level (dBA)	Utilization Factor	Leq Sound Level (dBA)
Construction Condition: Phase 1 Office - Office Building 2 2024			
Source 1: Concrete mixer truck - Sound level (dBA) at 50 feet =	79	40%	75.0
Source 2: Concrete pump truck - Sound level (dBA) at 50 feet =	81	20%	74.0
Source 3: Gradall - Sound level (dBA) at 50 feet =	83	40%	79.0
Calculated Data:			
All Sources Combined - Lmax sound level (dBA) at 50 feet =			86
All Sources Combined - Leq sound level (dBA) at 50 feet =			81

Distance Between Source and Receiver (ft.)	Geometric Attenuation (dB)	Ground Effect Attenuation (dB)	Calculated Lmax Sound Level (dBA)	Calculated Leq Sound Level (dBA)
25	6	0.0	92	87
50	0	0.0	86	81
100	-6	0.0	80	75
150	-10	0.0	77	72
200	-12	0.0	74	69
250	-14	0.0	72	67
300	-16	0.0	71	66
400	-18	0.0	68	63
500	-20	0.0	66	61
600	-22	0.0	64	60
700	-23	0.0	63	58

Geometric attenuation based on 6 dB per doubling of distance.
Note: This calculation does not include the effects, if any, of local shielding from walls, topography or other barriers which may reduce sound levels further.

Table 37. Construction Noise

Source Data:	Maximum Sound Level (dBA)	Utilization Factor	Leq Sound Level (dBA)
Construction Condition: Phase 1 Office - Office Building 2 2025			
Source 1: Dump truck - Sound level (dBA) at 50 feet =	76	40%	72.0
Source 2: Pickup Truck - Sound level (dBA) at 50 feet =	75	40%	71.0
Source 3: Gradall - Sound level (dBA) at 50 feet =	83	40%	79.0
Calculated Data:			
All Sources Combined - Lmax sound level (dBA) at 50 feet =			84
All Sources Combined - Leq sound level (dBA) at 50 feet =			80

Distance Between Source and Receiver (ft.)	Geometric Attenuation (dB)	Ground Effect Attenuation (dB)	Calculated Lmax Sound Level (dBA)	Calculated Leq Sound Level (dBA)
25	6	0.0	90	86
50	0	0.0	84	80
100	-6	0.0	78	74
150	-10	0.0	75	71

Note: This calculation does not include the effects, if any, of local shielding from walls, topography or other barriers which may reduce sound levels further.

Table 51. Construction Noise

Source Data:	Maximum Sound Level (dBA)	Utilization Factor	Leq Sound Level (dBA)
Construction Condition: Phase 1 Mixed Use - Parcel 6 Landscaping			
Source 1: Excavator - Sound level (dBA) at 50 feet =	81	40%	77.0
Source 2: Backhoe - Sound level (dBA) at 50 feet =	78	40%	74.0
Source 3: Front end loader - Sound level (dBA) at 50 feet =	79	40%	75.0
Calculated Data:			
All Sources Combined - Lmax sound level (dBA) at 50 feet =			84
All Sources Combined - Leq sound level (dBA) at 50 feet =			80

Distance Between Source and Receiver (ft.)	Geometric Attenuation (dB)	Ground Effect Attenuation (dB)	Calculated Lmax Sound Level (dBA)	Calculated Leq Sound Level (dBA)
25	6	0.0	90	86
35	3	0.0	87	83
50	0	0.0	84	80
85	-5	0.0	80	76
90	-5	0.0	79	75
100	-6	0.0	78	74
150	-10	0.0	75	71
200	-12	0.0	72	68
400	-18	0.0	66	62
600	-22	0.0	63	59
800	-24	0.0	60	56

Geometric attenuation based on 6 dB per doubling of distance.
Note: This calculation does not include the effects, if any, of local shielding from walls, topography or other barriers which may reduce sound levels further.

Table 52. Construction Noise

Source Data:	Maximum Sound Level (dBA)	Utilization Factor	Leq Sound Level (dBA)
Construction Condition: Phase 2 Mixed Use - Grading and Utilities			
Source 1: Grader - Sound level (dBA) at 50 feet =	85	40%	81.0
Source 2: Gradall - Sound level (dBA) at 50 feet =	83	40%	79.0
Source 3: Scraper - Sound level (dBA) at 50 feet =	84	40%	80.0
Calculated Data:			
All Sources Combined - Lmax sound level (dBA) at 50 feet =			89
All Sources Combined - Leq sound level (dBA) at 50 feet =			85

Distance Between Source and Receiver (ft.)	Geometric Attenuation (dB)	Ground Effect Attenuation (dB)	Calculated Lmax Sound Level (dBA)	Calculated Leq Sound Level (dBA)
25	6	0.0	95	91
50	0	0.0	89	85
100	-6	0.0	83	79
150	-10	0.0	79	75
200	-12	0.0	77	73
250	-14	0.0	75	71
300	-16	0.0	73	69

Table 1. Construction Noise

Intersections - Marsh & Bayfront

Source Data:	Maximum Sound Level (dBA)	Utilization Factor	Leq Sound Level (dBA)
Construction Condition: Intersections - Marsh & Bayfront			
Source 1: Pick-Ups - Sound level (dBA) at 50 feet =	75	40%	71.0
Source 2: Striping Truck - Sound level (dBA) at 50 feet =	74	40%	70.0
Source 3: Traffic Control Truck - Sound level (dBA) at 50 fee	74	40%	70.0
Calculated Data:			
All Sources Combined - Lmax sound level (dBA) at 50 feet =			79
All Sources Combined - Leq sound level (dBA) at 50 feet =			75

Distance Between Source and Receiver (ft.)	Geometric Attenuation (dB)	Ground Effect Attenuation (dB)	Calculated Lmax Sound Level (dBA)	Calculated Leq Sound Level (dBA)
15	10	0.0	90	86
40	2	0.0	81	77
75	-4	0.0	76	72
100	-6	0.0	73	69
125	-8	0.0	71	67
150	-10	0.0	70	66
170	-11	0.0	69	65
230	-13	0.0	66	62
290	-15	0.0	64	60
300	-16	0.0	64	60
400	-18	0.0	61	57
550	-21	0.0	58	54
600	-22	0.0	58	54
750	-24	0.0	56	52
830	-24	0.0	55	51
900	-25	0.0	54	50
1000	-26	0.0	53	49

Geometric attenuation based on 6 dB per doubling of distance.

Note: This calculation does not include the effects, if any, of local shielding from walls, topography or other barriers which may reduce sound levels further.

Table 2. Construction Noise

Intersections - Chilco & Hamilton

Source Data:	Maximum Sound Level (dBA)	Utilization Factor	Leq Sound Level (dBA)
Construction Condition: Intersections - Chilco & Hamilton			
Source 1: Truck Mounted Crane - Sound level (dBA) at 50 fe	81	16%	73.0
Source 2: Truck Mounted Auger - Sound level (dBA) at 50 fe	79	20%	72.0
Source 3: Pick-Ups - Sound level (dBA) at 50 feet =	75	40%	71.0
Calculated Data:			
All Sources Combined - Lmax sound level (dBA) at 50 feet =			84
All Sources Combined - Leq sound level (dBA) at 50 feet =			77

Distance Between Source and Receiver (ft.)	Geometric Attenuation (dB)	Ground Effect Attenuation (dB)	Calculated Lmax Sound Level (dBA)	Calculated Leq Sound Level (dBA)
15	10	0.0	94	87
40	2	0.0	86	79
75	-4	0.0	80	73
100	-6	0.0	78	71
125	-8	0.0	76	69

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

This form records the Menlo Science & Technology Park complex, an administrative and light-industrial park located in Menlo Park, San Mateo County (**Photograph 1**). Menlo Science & Technology Park is accessed via a primary entrance drive located on the east side of Willow Road, between U.S. Highway 101 and State Route 84. The complex is comprised of six historic-era buildings (50 years of age or older) and 14 modern structures located on 18 legal parcels (see **Table 1** and **Site Map** on Continuation Sheet). The historic-period facilities, which were constructed between 1956 and 1962, are centered near the western boundary of the complex. These buildings are immediately adjacent to Willow Road and share a similar International-style appearance and common materials, such as concrete and aluminum. The buildings set back from Willow Road are more utilitarian in their design with subtle International-style details. The site landscaping largely consists of paved parking and planting strips adjacent to buildings and around the complex perimeter (see Continuation Sheets).

(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity.)

The buildings at Menlo Science & Technology Park property do not meet the criteria individually or collectively for listing in the National Register of Historic Places (NRHP) or the California Register of Historical Resources (CRHR), nor are they historical resources for the purposes of CEQA. A resource must possess historical significance and retain historic integrity to convey that significance to be eligible for listing in the NRHP or CRHR. While three of the buildings on the property possess historical significance for their associations during the Cold War with the covert Corona satellite surveillance program, the individual buildings and the property as a whole have undergone substantial alterations such that the buildings no longer retain the historic integrity necessary to convey any significance and thus do not meet the eligibility requirements for listing in either the NRHP or CRHR. This property has been evaluated in accordance with Section 15064.5(a)(2)-(3) of the CEQA Guidelines, using the criteria outlined in Section 5024.1 of the California Public Resources Code, and National Register Bulletin, "How to Apply the National Register Criteria for Evaluation." An explanation of the NRHP and CRHR eligibility significance and integrity requirements, and a detailed eligibility evaluation for the buildings on this property are provided on the Continuation Sheets.

Year built established using sources cited herein, see section B6 and P10 (footnotes), unless otherwise noted.
* Year built provided by City of Menlo Park.

1390 Willow Road (MPK 50)

The building at 1390 Willow Road was constructed in 1956 for the Hiller Aircraft Corporation. The facility is comprised of an office with a windowless warehouse and secondary office wing arranged in a U-shape plan on a concrete foundation. A courtyard is located at the center of the building; however, for security reasons, it was not accessible at the time of the recordation. The main office wing is a single-story building constructed of concrete with incised concrete panel walls on the primary, northwest facade. The roof is flat, extending slightly over the windows and main entrance and this eave and the roof-wall juncture is accented with horizontally grooved wood panels. The roof covering is a rolled composite material. The building is entered along the northwest-facing façade via a concrete walkway that leads to a glazed vestibule with a glass and metal door that projects from the north corner (**Photograph 2**).

The entrance is sheltered by the roof extension and stub walls that flank the entrance. The vestibule windows are recessed between vertical concrete panels. To the south of the door is a flat concrete surface that once bore the insignia of its former occupant. The southern half of the façade is fenestrated with narrow rectangular windows with reinforced glass. The window frames appear to be painted metal. The fenestration on the northeast side of the building, which includes a secondary entrance, consists of a ribbon of rectangular fixed-frame modern windows and a modern glass and metal door set beneath the roof extension (**Photograph 3**).

The warehouse wing is located on the east end of the building and is constructed of concrete panels and features a flat roof clad in a rolled composite material. An entrance vestibule with metal double doors is located on the south side of the building. There is no visible fenestration (**Photograph 4**).

The single-story secondary office wing forming the south end of the building, part of which was a later addition, is constructed of concrete and features a flat roof with a boxed overhang that extends on the northeast courtyard-facing side to shelter the entrance. Fenestration, also located on the northeast side of the wing, consists of a ribbon of modern rectangular windows with fixed aluminum frames.

1370 Willow Road (MPK 54)

The one- and two-story office located at 1370 Willow Road, located south of 1390 Willow Road and the modern building at 1380 Willow Road, was constructed in 1962. The building has a generally L-shaped plan with an oversized two-story entrance projection on the primary, northwest-facing façade and a walled courtyard located on the rear, southeast side. The flat roof features a moderate, boxed overhang with metal coping at the rim of the parapet. The roof is covered with a rolled composite material. The walls are sheathed in replacement stucco superimposed onto concrete panels. The stucco is scored to give the appearance of long horizontal tiles.

The projecting oversized entrance and vestibule is accessed by a concrete walkway and is located near the north end of the northwest façade (**Photograph 5**). The projection is fenestrated by large, vertically-oriented windows set in fixed aluminum frames. Groups of windows are segmented by narrow square columns that extend the height of the structure. A set of glass double doors open to the first story of the building. On both sides of the entrance vestibule, the second story slightly overhangs the first story. The first story is defined by a smooth stucco wall surface and evenly spaced square windows with aluminum frames. The stucco replaced an original stone veneer at an unknown date. The second story features full-length ribbon of single-pane windows. The aluminum frames or mullions, are elongated from the edge of the second-story overhang to the eaves, adding to the geometric aesthetic of the façade.

The sparsely ornamented northeast and southwest sides of the building are similar in their materials and types of fenestration. The northeast side has seven window openings and a plain metal door (**Photograph 6**). All of the windows are set in fixed aluminum frames. Likewise, the southwest side end of the building is punctuated by two horizontally-oriented windows with fixed aluminum frames (**Photograph 7**).

The rear, southeast-facing side of the building is separated into two sections. The single-story north half extends outward towards the southeast. This section has two openings, occupied by an overhead garage door and an adjacent metal door with a single window, but otherwise lacks fenestration (**Photograph 8**). The south half bears a form and fenestration pattern that resembles the front façade, consisting and overhanging second story with a band of windows with fixed aluminum frames. The recessed first story also has aluminum frame windows, with a set of aluminum-framed glass doors near the center. The rear concrete-slab courtyard features a stand-alone, wood-frame shade structure and is partially enclosed by decorative cinderblock privacy walls (**Photograph 9**).

1374 - 1376 Willow Road (MPK 55)

The light-industrial and office building at 1374 and 1376 Willow Road, located southeast of 1370 Willow Road, was constructed in two phases in 1959 and 1962. The adjoining rectangular-plan buildings form a roughly square footprint. Their roofs are a combination of hipped and flat elements surrounded by a short parapet that outlines the two buildings. The roofs are clad in asphalt shingles and dotted with several vents. The exterior walls are concrete panels covered in replacement stucco with vertical score marks. All sides of the building are windowless except for the main, northwest façade.

The main façade is characterized by rows of evenly-placed, aluminum-frame, fixed windows at the first and second-story levels. These windows are all modern replacements of original steel-frame windows. The windows are separated by raised concrete panels and pilasters. The façade includes two metal and glass entrance doors, located on the north and south ends (**Photograph 10**). The southwest and northeast sides of the building are far less elaborate. The southwest side characterized by plain stucco wall surface with vertical incisions. An overhead garage door, plain metal door, and glass door are offset to the west (**Photograph 11**). The northeast side, which is segmented into several bays by concrete pilasters, has no openings except for four plain metal doors (**Photograph 12**). The locations of former openings are evidenced by breaks in the siding

near the east corner. The rear, southeast side of the building serves as a loading zone and is punctuated by five overhead garage doors. The two southern-most garage doors have been resized and two former garage openings near the north end have been enclosed. The southeast side also has two metal entrance doors located near the center, one of which is sheltered by a canvas awning (**Photograph 13**)

940 Hamilton Court (aka 1392 Hamilton Court; MPK 51)

Located northeast of 1390 Willow Road, the two-story building at 940 Hamilton Court, built in 1961, is nearly rectangular in plan and is constructed of concrete. Raised concrete panels extend the height of the wall and separate the windows. The roof features a hipped element in the center and a flat element that extends out from the hipped portion to a small parapet. The hipped element is clad in composition shingles and numerous vents dot both the hipped and flat elements of the roof. The entrance, located on the northeast façade, is accessed by a metal and glass modern enclosure with a bowed wall of aluminum frame windows that extends to the roofline (**Photograph 14**). The glass enclosure was constructed in 2007. Fenestration on the northeast and northwest sides consists of paired windows with fixed aluminum frames, also added in 2007. Two metal roll-up freight doors and two secondary entrance doors are located on the southeast side of the building (**Photograph 15**). Both the southeast and southwest sides of the building are void of fenestration. A large, two-story addition, also added in 2007, is located on the building's southwest side and features corrugated metal siding.

960 Hamilton Court (MPK 53)

The rectangular plan, two-story building at 960 Hamilton Court, immediately south of 940 Hamilton Court, was built in 1961. The building is constructed of concrete panels. The roof features a centered hipped element with a wide flat element that extends from the base of the hipped element to a small parapet. The hipped element is clad in composition shingles and numerous vents dot both the hipped and flat elements of the roof. The entrance, located on the northwest side of the building, is accessed by a short concrete walkway leading to a glass and metal door that is sheltered by an aluminum and canvas awning (**Photograph 16**). Fenestration on this elevation consists of modern fixed aluminum-frame windows on both the first and second stories. Overhead freight doors are located on the southeast side of the building and there are no openings on the southwest or northeast sides of the building (**Photograph 17** and **Photograph 18**).

980 Hamilton Avenue (MPK 56)

The two-story building located at 980 Hamilton Avenue, southeast of 1374 and 1376 Willow Road, was constructed in 1962. The rectangular plan building sits on concrete foundation and is topped a roof clad in composition shingles. The roof is a combination of a central hipped element and a flat element that extends out from the hipped portion to a small parapet. Numerous vents dot both the hipped and flat elements of the roof. The exterior walls of the building are constructed of concrete panels clad in replacement stucco with vertical score marks. The building's northwest façade is the only side that features fenestration.

A set of glass and metal double doors sheltered beneath a metal awning on the west half of the southwest-facing façade serves as the building's primary entrance. This entrance is located in a former freight opening. The remainder of the wall surface has no openings (**Photograph 19**). The northwest and southeast ends of the building each feature additional entrances. The northwest side has three metal doors. The upper portion is fenestrated by a row of ten square windows with fixed aluminum frames, all of which appear to be modern replacements (**Photograph 20**). The southeast side, which has no windows, is punctuated by a set of metal double doors at the center and a single metal door at the south corner. The location of three former garage doors is evidenced by horizontal breaks in the in the three central wall panels (**Photograph 21**). The northeast side, which was partially obscured at the time of recordation by busses and trucks, has no openings except for a set of metal doors at the center, two metal louvered vents, and two openings occupied by exterior air conditioning units. Whereas the other sides of the building feature vertical score marks to demarcate separate bays, the northeast side includes concrete pilasters that divide the wall surface (**Photograph 22**).

Modern Buildings

The complex also contains 14 modern buildings, constructed between 1981 and 1996, most on the eastern two-thirds of the site. They exhibit a variety architectural styles and forms and are visually distinct from the discussed historic-era buildings. See typical examples shown in **Photographs 1, 23,** and **24**, and for a list of the modern buildings, see **Table 1**.

B6. Construction History (continued):

Table 2. Construction History for Evaluated Buildings at Menlo Science & Technology Park

Address / Bldg No.	Construction History
1390 Willow Road / MPK 50	Built 1956; southeast wing addition, built 1960; alteration dates unknown: roof parapet addition; windows and doors replaced; Hiller Aircraft signage removed
1370 Willow Road / MPK 54	Built 1962; alteration dates unknown: replacement doors; replacement windows (mostly on first floor); first-floor northwest entrance enclosed with fixed windows; modern stucco siding application.
1374-76 Willow Road / MPK 55	Built 1959; Addition, 1376 Willow Road built 1962; alteration dates unknown: replacement aluminum-frame windows and aluminum-frame glass doors; enclosed and reduced freight door openings on southeast side; altered walls on northeast side.
940 Hamilton Court (1392 Hamilton Court, MPK 51)	Built 1961; major remodel in 2007 included two-story projecting main entrance addition, replacement windows, replacement doors, window additions, two-story full-length southwest-side addition, and siding alterations, including adding raised wall panels.
960 Hamilton Court / MPK 53	Built 1961; alteration dates unknown: multiple enclosed freight openings; replacement aluminum-frame windows; replacement main entrance door; prefabricated buildings on northeast side added 1962 and demolished dates unknown.
980 Hamilton Avenue / MPK 56	Built 1962; alteration dates unknown: replacement aluminum windows and doors; added windows and doors, including on southwest and northwest sides; remove freight doors on southeast side.

The construction histories for the individual buildings are based on Building Permits on file at City of Menlo Park Building Division; Assessor Property Records on file at San Mateo County Assessor Office; historical and aerials photographs; and field survey conducted for this document. The buildings also underwent many interior alterations throughout their histories that are not enumerated here.

B10. Significance (continued):

Historic Context

The buildings at Menlo Science & Technology Park were initially developed in 1956 in north Menlo Park, a city along the San Francisco Bay in southeast San Mateo County. Since that time, the buildings served a variety of purposes, including the design and testing of Hiller Aircraft helicopters, the covert development of spy satellites for the CIA, and, more recently, offices and warehouses for tech-related businesses.

Menlo Park History

The Menlo Science & Technology Park property is located within the former 35,200-acre *Rancho de las Pulgas*, which was granted to Luis Arguello—the first Mexican governor of California—in 1835. Settlement of the area was slow through the mid nineteenth century, led in large part by its proximity to the shipping port at Ravenswood Slough (see **Location Map**). The port and its townsite were established in 1849 with the intent of becoming the premier shipping wharf for southern San Mateo County's burgeoning lumber industry, but ultimately that mantle was taken up by Redwood City, a bayfront town a few miles to the northwest. As the importance of Ravenswood waned in the 1860s, Lester Cooley began acquiring property in the area, using the land for a successful agricultural business. Other early settlers included Maurice Dooley, who used wealth he earned from an express delivery company to invest in real estate in Ravenswood and Menlo Park, and Charles Kavanaugh, who arrived in the area in the 1850s, purchasing 150 acres of land which he used for a profitable grain farming operation.[1]

Most of the Ravenswood area remained rural and undeveloped until the mid-twentieth century, when the City of East Palo Alto and the City of Menlo Park incorporated, following an unsuccessful attempt to found a City of Ravenswood. The City of

[1] Alan Hynding, *From Frontier to Suburb: The Story of the San Mateo Peninsula* (Belmont, Calif.: Star Publishing, 1982), 30, 36, 37, 133-134; B.F. Alley, *History of San Mateo County, California* (San Francisco: B.F. Alley, 1883), 211.

Menlo Park first incorporated in 1874, but landowners fearful of high local taxes led a campaign to disincorporate two years later, which remained the formal status of Menlo Park until the 1920s. Through the end of the nineteenth century, Menlo Park's commercial core located on the Southern Pacific Railroad (about two miles west of the subject property), remained the local hub of activity in this part of San Mateo County, while the area surrounding town was farmland. Samuel Carnduff settled the land on which the subject property is located and farmed there until his death in the 1880s (**Figure 1**). The land remained in the Carnduff family through the first half of the twentieth century.[2]

Figure 1. Menlo Park and Ravenswood in 1894, with the subject property in circle.[3]

The area around the subject property during the early twentieth century was held in large tracts of agricultural land until several major changes helped to transform the Ravenswood and Menlo Park areas. In 1910, Ravenswood was bisected by the Southern Pacific Railroad's Dumbarton Cutoff, which branched from the main line connecting San Francisco and San Jose near Redwood City. The Dumbarton Cutoff followed an easterly route through Ravenswood and then across the San Francisco Bay on a newly constructed bridge, and connected the Peninsula with the East Bay. To the south, in Menlo Park, the St. Patrick's Seminary & University was founded just before the turn of the twentieth century north of Middlefield Road, and would continue as one of the city's largest landowners through the twentieth century. During World War I, the military used land south of downtown Menlo Park to train nearly 30,000 soldiers at Camp Fremont, which helped drive infrastructural improvements in town. In association with Camp Fremont, the Army built a hospital north of the seminary and after the war it was transferred first to the Public Health Service, which oversaw the medical needs of veterans returning from war, then to the newly created Veterans Bureau (precursor to the Veterans Administration and, later, Department of Veterans Affairs), established to oversee the federal government's wide array of veteran benefits, including health care. The increasing density of this development and throughout the Peninsula and San Mateo County led to expansion of state and local roads, including construction of the Dumbarton Bridge and Bayshore Highway in the late 1920s and early 1930s.[4]

Newman, *Official Map of San Mateo County*, 1909; Davenport Bromfield, *Map of the County of San Mateo, California* (San Francisco: D. Bromfield, 1910).

Despite these substantial changes to Menlo Park and its surroundings, the army closed Camp Fremont after World War I and the local population receded and growth returned to a more gradual pace until the post-World War II period. The end of the Second World War brought rapid suburban expansion to the Peninsula, as it did to the rest of the country, along with Cold War-related development and the introduction of the high-tech industry. Menlo Park's population grew tenfold between 1930 and 1970 as suburban tracts spread in the areas around downtown. The city quickly annexed many of these new residential areas, expanding north and east into the Ravenswood district. In 1949, the neighborhoods of Belle Haven and Suburban Park, west of Willow Road and north of Bay Road, were incorporated into Menlo Park. By the late 1950s, a fight erupted over the remaining unincorporated portions of the Ravenswood district as the City of Menlo Park sought to annex much of the land but faced opposition. A proposal to incorporate a separate City of Ravenswood was put forward, but after its incorporation failed, Menlo Park annexed a large swath of land generally north and east of the Belle Haven and Suburban Park neighborhoods, an area that included the subject property.[5]

In the post-war era, the rise of technology companies drove the growth of Menlo Park and the surrounding area, which in many ways was closely linked to research and development undertaken by the federal government's intelligence and military departments. It was in the early years of the post-war period that Silicon Valley, a tech-heavy region of the south San Francisco Bay, was born. Major electronics companies were attracted to the area by cheap land, improved transportation facilities, willing local governments, and the availability of professional talent coming out of University of California, Berkeley, and Stanford University. The establishment of the Stanford Research Institute, founded in 1946 and eventually located on Ravenswood Avenue in Menlo Park, was an early foray in the relationship between high-tech innovations, university resources, and government research. During its first years, Stanford Research Institute helped the Air Force study the potential for expansion in the aircraft industry, hosted the first national symposium on air pollution, and over time was an important stepping stone for engineers coming out of college before entering private industry.[6]

As the high-tech industry grew throughout the region, several local governments promoted the development of professional office buildings and relatively clean industrial plants. The City of Menlo Park prepared a land use-focused master plan to manage the boom of the late 1940s and early 1950s through regulated professionally-administrative zoning and it was adopted by the City Council in 1953. The new zoning districts were established outside of the city center, often where agriculture had historically dominated, and were strictly limited to industrial uses by "smokeless" companies. This spurred the development of new light-industrial parks in northeast Menlo Park, including the 200-acre Bohannon Industrial Park by noted Bay Area developer David Bohannon that included several pharmaceutical and electronic companies on a site about a mile west of the subject property. The Kavanaugh family, descendants of early Ravenswood settler Charles Kavanaugh, who still owned a vast acreage of farmland including an area south of the Menlo Science & Technology Park, decided cash out on their holdings that had appreciated in value to $1,000 per acre, turning "barley into buildings." The Kavanaugh Industrial Park quickly attracted noteworthy tenants, such as Signal Oil and *Sunset Magazine*.[7]

Hiller Aircraft

The Menlo Science & Technology Park property was developed starting in the 1940s by Stanley Hiller, who used the property for nearly 20 years to design, test, and manufacture helicopters by his company Hiller Aircraft.[8] During this period, part of the property was used by Lockheed Corporation for a secret CIA-sponsored program to design and build surveillance satellites. Like other local properties turned into industrial parks during the mid-twentieth century, the Hiller Aircraft site had previously been used as farmland. The Carnduff family, who were descendants of long-term Ravenswood farmers, owned the land. When Hiller developed the site in 1947, he constructed his plant in open fields at the southeast corner of the former Carnduff property and initially retained the agriculture-related buildings that were sited on the north end of the property, adjacent the railroad tracks.[9]

Stanley Hiller's story started when he was still a teenager building toy race cars in a barn behind his parents' house. He was only 19 in 1944 when he launched his first successful flight of a helicopter he designed and built. This project formed the basis of Hiller Aircraft, a company that would compete with the leading aircraft manufacturers around the country, developing a wide range of helicopters for both civilian and military uses. By 1948, Hiller Aircraft had won multiple military contracts, briefly teamed up with Henry Kaiser, and eventually purchased the old Carnduff farmland for construction of a new research and production plant (**Figure 2**).[10]

Figure 2. Hiller Helicopters' first plant at the site, a large building at the southwest corner that was demolished in the 1980s as the property was transformed into offices.[11]

Stanley Hiller's initial success was driven in part by his design for a coaxial rotor helicopter, which placed two rotors spinning in opposite directions in a vertical position above the cockpit. This design eliminated the need for a long tail with counterbalancing rotor and made the helicopter more compact. However, the design was less stable and in an accident that was nearly catastrophic for Hiller, he was convinced to abandon the coaxial rotor. What Hiller and his team came up with was a single rotor with a tail rotor and innovative stabilization features that made it easier to use. While he was initially among a limited number of helicopter makers using the coaxial rotor design, the single rotor design he turned to was typical of helicopters of that era. The company turned this new design into the Hiller 360, a reliable, consumer-oriented helicopter that

[8] Throughout its history, the company went by several names, including Hiller Industries, United Helicopters, Hiller Helicopters, and Hiller Aircraft Corporation. For the purposes of this form, the name Hiller Aircraft is used to identify the company before it is acquired by Fairchild Stratos Corporation in the 1960s, after which it is referred to as Fairchild Hiller.

[9] Several former Carnduff buildings, which included both agriculture-related structures and the family's residential area, remained on the property until about the 1970s. Over time Hiller added a few more buildings and structures, but all have since been demolished. Hiller used this area of the property for experimental research and testing.

Kneese, *Official Map of San Mateo County, California* ([Redwood City, CA]: San Mateo County, 1927; John Straubel, *One Way Up* (Palo Alto, CA: Hiller Aircraft Co., 1964), 5-7; "Genius Declares His Vertical Flying Craft Lands in Small Area," *Oakland Tribune*, 30 August 1944, 8; Rosa Jenson, "The Hiller-Hornet," *Skyline*, December 1951: 39-41; "Helicopter Plant for South County," *San Mateo Times*, 9 December 1946.

[11] Jenson, "The Hiller-Hornet," 39.

was relatively affordable. Hiller gained attention for his helicopter with creative marketing—he flew the Hiller 360 across the country, stopping in more than 400 cities along the way, before ultimately creating a spectacle in downtown Manhattan.[12]

Despite Hiller's concerted efforts to market his helicopters to civilian buyers, sales sputtered. The cost of the helicopter was simply out of reach for many civilians and while Hiller demonstrated the benefits—for example, as a crop duster or commute vehicle—the civilian market never emerged. Undeterred, Hiller Aircraft turned back to the military, which began ramping up its war effort in the late 1940s as Post-World War II divisions on the Korean Peninsula turned to armed conflict between the US-backed South Koreans and the Chinese and Soviet Union-backed North Koreans in 1950. The United States immediately invested in new military equipment, including aircraft like helicopters. Hiller Aircraft immediately set about converting its Hiller 360s to meet military standards, developing what was renamed the Hiller Raven. The revamped helicopter received military approval in 1950 and by the end of the year Hiller Aircraft was working under a $3.5 million contract with the Army and Navy. In Korea, the Ravens were employed in medical evacuations, spotting gunfire, and guarding planes and other aircraft. The Ravens proved successful despite the complications of using what was essentially a casual civilian aircraft for precise and demanding military requirements. Still, Hiller Aircraft faced competition with other emerging helicopter companies, like Hughes Aircraft and Bell Aircraft, and only a few hundred of the Hiller Ravens were ever deployed during the Korean War.[13]

After the Korean War, Hiller Aircraft won smaller military contracts and focused less on the production of aircrafts and more on research and development. The company turned its efforts from rapid manufacturing of the Raven to more deliberate research of unique and innovative technology, much of which was still funded by the U.S. military. In the early 1950s, the increased demand for Hiller Ravens had led Hiller to build an addition onto the main plant, nearly doubling its square footage, and construct three engineering and manufacturing buildings to the south and east.[14] But as the company turned its attention toward research and development, Hiller Aircraft initiated plans to develop a new research facility on the property in 1955. The Advanced Research Division facility (**Figure 3**) was designed by Vincent G. Raney, a San Francisco architect, and erected in 1956. This building remains on the property at 1390 Willow Road (MPK 50) (**Photographs** 2-4). Raney, who earned an architectural engineering degree in 1929 and worked for other architectural firms through the early 1930s, founded his own firm in 1935 designing a variety of building types. He became proficient in designs of churches, schools, shopping centers, and gas stations, but was best known for his unique dome design for Century Theatres, which were built to showcase new widescreen film technology.[15]

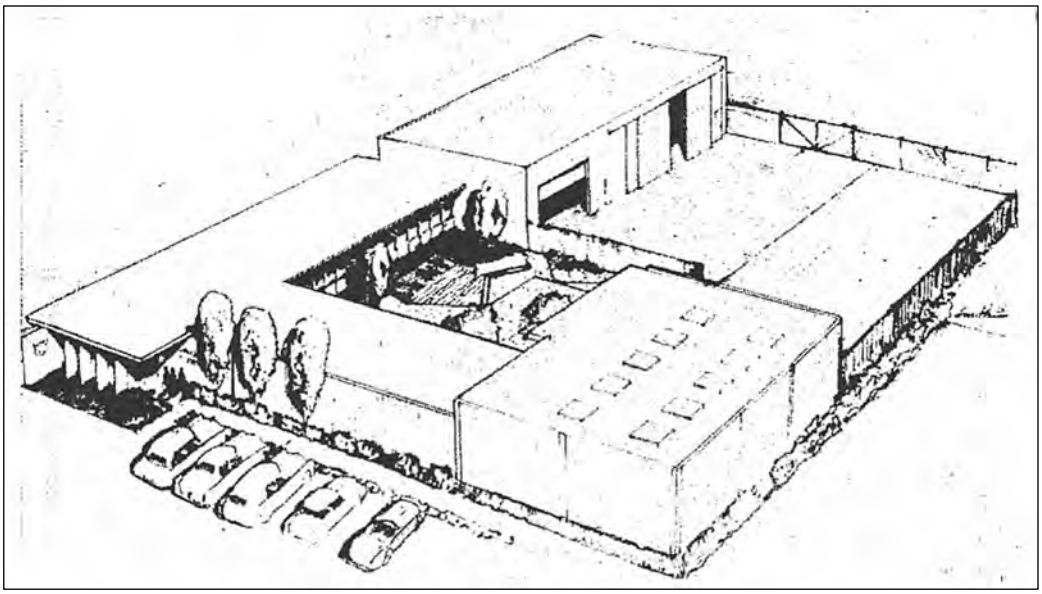

Figure 3. Architect's drawing of Hiller Aircraft's Advanced Research Division Facility.[16]

Military contracts continued to support Hiller Aircraft during the late 1950s and early 1960s. The company designed several new aircraft, but most proved to be duds. A helicopter powered by small jets on the tips of the rotor blades helped to reduce the overall weight of the aircraft, but was too loud and visible for military uses. Hiller designed multiple platform-style aircrafts, but because of the complications in the engineering, proved more of a novelty than a realistic craft. Hiller also entered the competition to design a vertical takeoff and landing aircraft, designing an airplane with two coaxial propellers attached to a wing that rotated in the vertical position for helicopter-like function and in the horizontal position for airplane-like function. The complications associated with what Hiller called the Propelloplane also proved too difficult to turn into reality. Still, the military contracts funded this research and development helped support continued expansion at the Hiller Aircraft site during the late 1950s and early 1960s (**Figure 4, Figure 5**, and **Table 1**). In 1958, Hiller constructed a new 10,260-square-foot warehouse and shipping building (the building currently at 1374 Willow Road, MPK 55) (**Photographs 10-13**), some of which was used for production of military and civilian helicopter components. Hiller Aircraft continued to obtain Defense Department contacts, and through a series of acquisitions and mergers with related companies, expanded its workforce and planned a $2 million expansion starting in 1961. The expansion included four new buildings to provide offices for a marketing division (1370 Willow Road, MPK 54, **Photographs 5-9**), and two for engineering and manufacturing (1376 Willow Road, MPK 55, **Photographs 10-13**, and 980 Hamilton Avenue, MPK 56, **Photographs 16-18**). It was during this period that the former Advanced Research Division was occupied by Lockheed Corporation for their work on the Corona satellite (see discussion of the Corona satellite program, below).[17]

[19] Cartwright Aerial Surveys, Alameda, Contra Costa, Marin, Napa, Sacramento, San Francisco, San Mateo, Solano, Sonoma Counties Aerial Photography, CAS-65-130, prepared for California Division of Highways, 1965, on file at Santa Barbara Davidson Library.

By the mid 1960s, the helicopter industry began to suffer the reality of being closely tied to the military. Commercial uses of helicopters were never realized in the manner Hiller and others imagined. The technology also proved too expensive and too complicated for casual use. Ultimately, it required the investment of time and money that only the military was willing to provide, and this cause many helicopter companies to begin to consolidate. Hiller had already agreed to a merger deal with Ohio-based Electric Autolite Company. Under the arrangement Hiller remained a semi-autonomous subsidiary assisted by Electric Autolite's Research Division in further research and development. It continued to build newer versions of its Raven helicopter, which the military began deploying to Vietnam, but Hiller Aircraft struggled to develop new, profitable models. In 1964, Fairchild Stratos Corporation purchased Hiller from Electric Autolite in a move that marked a much more significant change for Hiller. Fairchild wanted to win an upcoming military helicopter contract that Hiller was competing for, but also sought to diversify its aircraft holdings. The merged company was renamed Fairchild Hiller Corporation and Stanley Hiller was named executive vice president. Fairchild Hiller ultimately lost the contract to Hughes.[20]

After another failed attempt to gain a lucrative military contract—this time with an airplane designed to compete with what would become the highly successful F-4 Phantom—Fairchild Hiller refocused its energies on aerospace. As the company began to downsize, it announced plans in 1965 to move most of the Menlo Park operations to the company's headquarters in Maryland. The primary elements of the Menlo Park plant were relocated, including management, marketing, and personnel, as well as the teams manufacturing of the company's FH-1100 helicopter. The company retained a pared-down operation in Menlo Park, which now included only spare parts distribution, overhaul, and some research facilities. Disillusioned, Stanley Hiller left not only Fairchild Hiller but the industry to start a business that helped turn around failing companies.[21]

By the late 1960s, Fairchild began leasing out parts of the Menlo Park property after Fairchild Hiller scaled back and Lockheed ceased operations at the site (see the Corona Satellite Program, below). Listed as the Fairchild Hiller Industrial Park, the property had several tenants, including US Geological Survey and engineering and manufacturing companies. It appears many of the companies that occupied the buildings through the 1970s were associated with research and development of aeronautic electrical engineer equipment. Granger Associates, an aeronautic electrical research and manufacturing company started by John Granger, used the properties at 1360 Willow Road through 1977. By 1973, the US Geological Survey opened offices at 1380 Willow Road and remained there through at least 1978. The building at 1390 Willow Road was used in 1973 by a company working on scientific instrumentation, Radiation Systems, Incorporated, and subsequently companies associated with aeronautic engineering. In 1979, Fairchild sold the property to Lincoln Properties, a development company that began expanding and redeveloping the buildings. All buildings have undergone some level of alterations since then and several new buildings were added to the site in the 1980s, often resulting in changes to street numbers (**Figure 6**).[22]

Figure 6. In the early 1980s, Lincoln Properties had begun to make substantial changes to the property by adding new buildings, developing a new road system, and paving parking lots. In this 1982 aerial, the original Hiller plant and its adjacent buildings remained but within a few years they would be demolished and replaced with new office buildings.[23]

CONONA Satellite Program

The Lockheed Corporation used part of the Hiller Aircraft property between 1958 and 1969 as a secret facility for the development of the CIA's Corona surveillance satellite. The satellite was developed as part of the United States' effort to improve surveillance during heightening tensions with the Soviet Union, reflecting various aspects of the Cold War contest, in the space race, nuclear arms, espionage, and intelligence gathering. During the 1950s, both the United States and the Soviet Union rushed to achieve strategic military advantage by developing increasingly more powerful nuclear weapons, rockets, and airplanes to deliver weapons and a variety of systems to monitor each other's progress. The Soviet Union's successful 1957 launch of Sputnik, the first satellite to orbit Earth and evidence that the Soviets had progressed significantly in developing an intercontinental ballistic missile, and the risks of reconnaissance flights using aircraft like the U-2, created urgency in better understanding the Soviet Union's capabilities. For the United States, the solution was the Corona surveillance satellite.[24]

Agencies of the US government had been researching the possibility of sending surveillance satellites to space since just after World War II. The nature of nuclear warfare necessitated knowing as much as possible, as soon as possible about an opponent's capabilities. This became accepted wisdom within the US government at the same time that researchers were exploring the possibility of space travel and installing satellites in Earth's orbit. By the early 1950s, the Air Force was working with private contractors to study a reconnaissance satellite, but it was not until Sputnik launched that plans were fast-tracked. The Corona program was initiated under the cover of deep secrecy and only a select number of government officials and contractors of its existence. The primary contract to design and build the Corona was awarded to Lockheed Corporation under the direction Lockheed engineer James Plummer, who was working at the company's Palo Alto research facility. In March 1958, Plummer presented his preliminary designs to the Air Force, CIA, and others, and received approval to proceed with development. On

Steury, "A Tribute to the People of the Air Force Satellite Control Facility; the National Security Impact of Its Corona Satellites," History Section, Center for the Study of National Reconnaissance, Business Plans and Operations, National Reconnaissance Office, Chantilly, Virginia, April 2007, 1-2.

April 1, 1958, Lockheed signed a lease with Hiller Aircraft to use the helicopter company's then vacant Advanced Research Division facility (**Figure 7**).[25]

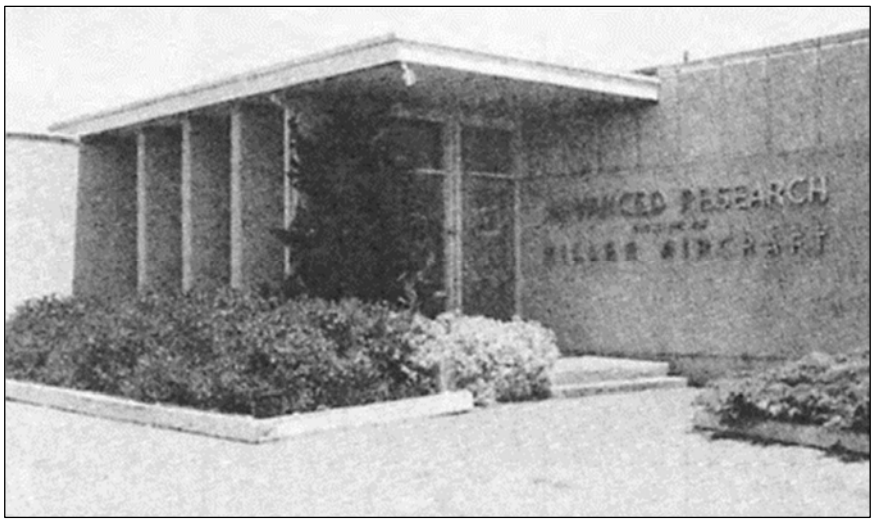

Figure 7. From 1958 to 1969, the Hiller Aircraft Advanced Research Division building was used by Lockheed Corporation to develop the Corona surveillance satellites. As a highly guarded secret, the program did not change the appearance of the building, which retained the Hiller Aircraft signage, as seen in this photograph. The signage has since been removed.[26]

Work developing the satellite started immediately after Lockheed took over the facilities at the Hiller Aircraft property. One of the critical elements of working at the site was ensuring secrecy of the program. Lockheed took great measures to restrict access to the site while maintaining the cover that the building remained part of the Hiller Aircraft operation. Within a couple years, two large research and manufacturing buildings were constructed, and fences went up around the site, separating it from Hiller Aircraft operations to the south (**Figure 8**). These three buildings remained on the property at 1390 Willow Road, 940 Hamilton Court, and 960 Hamilton Court (**Photographs 2-4 and 14-18**), but were substantially altered after 1970. Though Lockheed retained the Hiller Aircraft signage (which has since been removed) and dressed security guards in Hiller attire, Hiller employees were instructed never to enter the facility. Plummer and the other Lockheed engineers drove a different route to the facility each day to make sure they were not followed. This secrecy was important for ensuring the Soviets would be kept in the dark. If successful, the satellite could be launched into orbit about 100 miles above Earth, capture high-resolution stereo-image photography of secret sites throughout the Soviet Union, and be retrieved, all without revealing its surveillance purpose and thus giving the United States an upper hand. However, achieving these goals was difficult. It took the work of several contractors, each of which worked on different aspects of the satellites. It was Lockheed's job to receive all the parts at the Hiller Aircraft facility, assemble them into launch-ready satellites, and conduct testing. Eastman Kodak made the film. Itek Corporation engineered the cameras. General Electric created the reentry capsule that was ejected from the satellite after photographs were taken.[27]

Figure 8. These three buildings at the Hiller Aircraft property were used by Lockheed from 1958 until 1969 for testing and development of the Corona satellites. Note that these buildings were separated from the rest of the facility to the south by fencing.[28]

It took only nine months for the Corona team to develop a test satellite ready for launch, but that proved to be only the first step in a multi-year effort to build a reliable system. The first test launch on January 21, 1959, failed. The second one a month later did too. In fact, it was not until August 10, 1960, that the first Corona satellite was successfully launched into space, placed in orbit, and returned with photographs of Earth, making the first of its kind. Despite this achievement, the Corona satellite program struggled for several years because its success rate was spotty, as problems arose with nearly every aspect of the system, from blurred or foggy film to failed rocket launches. Nonetheless, engineering improved and by the mid-1960s Corona launches were succeeding more than they were failing. And the images captured helped fortify the United States' understanding of the strength and capabilities of the Soviet Union and its influence around the world. As the 1960s progressed, a new generation of surveillance satellites emerged and the Corona program was scaled down. In 1969, Lockheed moved its Corona program to its in Sunnyvale facility, near Moffett Field, where it continued the work until 1971 when the final Corona satellite was launched.[29]

NRHP and CRHR Eligibility Criteria

The criteria for listing properties in the NRHP and CRHR are essentially the same. The criteria for NRHP eligibility are codified in 36 CFR 60 and expanded upon in numerous guidelines published by the National Park Service. The eligibility criteria for listing a property in the CRHR closely parallel those of the NRHP and are codified in PRC 5024.1(c)(1)-(4). Eligibility rests on twin factors of significance and integrity. A property must have *both* significance and integrity to be considered eligible for listing in either the CRHR or NRHP. If a property possesses significance, it must be able to convey that significance through the integrity of the defining physical and architectural characteristics from the period of its significance. Loss of integrity from its significant period will remove a property's ability to convey its historical significance

[28] Cartwright Aerial Surveys, Alameda, Contra Costa, Marin, Napa, Sacramento, San Francisco, San Mateo, Solano, Sonoma Counties Aerial Photography, CAS-65-130, prepared for California Division of Highways, 1965, on filed at Santa Barbara Davidson Library.
[29] Peebles, *The Corona Project*, 62-66, 80-83, 156, 173-174; Day, "The Development and Improvement of the CORONA Satellite,"51-52, 59-60, 83-85.

and render it ineligible. Likewise, a resource can have complete integrity, but if it lacks significance, it does not meet the eligibility requirements for listing in either the NRHP or CRHR and must also be considered ineligible.

Historic significance is judged by applying the NRHP criteria, identified as Criteria A through D. The NRHP guidelines state that a historic resource's significance must be determined by meeting at least one of the four main criteria. The NRHP criteria are:

NRHP Criterion A: Are associated with events that have made a significant contribution to the broad patterns of our history;

NRHP Criterion B: Are associated with the lives of persons significant in our past;

NRHP Criterion C: Embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values;

NRHP Criterion D: Have yielded, or may be likely to yield, information important to history or prehistory.[30]

The criteria for the CRHR are nearly identical to NRHP criteria, but have some differences. The CRHR criteria are identified as Criteria 1 through 4 and are:

CRHR Criterion 1: Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;

CRHR Criterion 2: Is associated with the lives of persons important in our past;

CRHR Criterion 3: Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values;

CRHR Criterion 4: Has yielded, or may be likely to yield, information important in prehistory or history.[31]

Integrity is determined by regarding the property's retention of its location, design, setting, workmanship, materials, feeling, and association to its period of significance. These seven aspects of integrity can be roughly grouped into three types of integrity considerations. Location and setting relate to the relationship between the property and its environment. Design, materials, and workmanship, as they apply to historic buildings, relate to construction methods and architectural details. Feeling and association are the least objective of the seven criteria and pertain to the overall ability of the property to convey a sense of the historical time and place in which it was constructed, or the historic events or people associated with the property. Feeling is a property's expression of the aesthetic or historic sense of a particular period of time. It results from the presence of physical features that, taken together, convey the property's historic character. Association is the direct link between an important historic event or person and a historic property. A property retains association if it is the place where the event or activity occurred and is sufficiently intact to convey that relationship to an observer. Because feeling and association depend on individual perceptions, their retention alone is insufficient to support eligibility of a property for the NRHP or CRHR.

[31] PRC 5024.1(c)(1)-(4).

Evaluation: Significance

Six of the Buildings at the Menlo Science & Technology Park have important associations with significant historic events, patterns, or trends of development under NRHP Criterion A or CRHR Criterion 1; however, the individual buildings and the property as a whole have lost historic integrity and no longer convey the significance of the property (see integrity discussion below). Three of the buildings, 1390 Willow Road, 940 Hamilton Court, and 960 Hamilton Court (MPK 50, MPK 51, and MPK 53), are directly and importantly associated with the significant research and development the created the Corona surveillance satellite, the first spy satellite sent into space to capture aerial photography of sites around the world, including in the Soviet Union. The Corona satellite program proved pivotal in intelligence collection and national security, as well as future surveillance programs. While highly guarded information at the time, it has since been revealed that the Lockheed Corporation used these three buildings as the primary location for the research and development of the satellites between 1958 and 1969. As such, the buildings possess significance under Criteria A and 1 for their association with the pioneering period of the United States Cold War space-based surveillance programs. The period of significance for these buildings is 1958 to 1969. The characteristics that defined the buildings included the general architectural designs as well as the specific materials—such as windows, siding, and doors, arrangement of windows and doors—and the layout and spatial relationship of the buildings. These features included the International-style architecture for the building at 1390 Willow Road with original windows, signage, doors, stucco siding materials, and roof forms. The buildings at 940 Hamilton Court (aka 1392 Hamilton Court, MPK 51) and 960 Hamilton Court (MPK 53) featured mostly utilitarian designs with unadorned concrete walls, small square windows on the west side, steel personnel doors, and large rollup freight doors. Among the most important characteristics of the buildings were their relative isolation within the larger property, and the security features that helped secure the highly classified activities being undertaken inside, such as fencing that surrounded the buildings to separate them from the other buildings on the property, and each also included their own parking lot, which further segregated them from each other. Some features that characterized the buildings were present when Lockheed moved in, such as its original association with the Hiller Aircraft and the signage on the front of 1390 Willow Road (MPK 50) for Hiller Aircraft, both of which served as covers for the Lockheed operations. Additionally, the site location itself was generally secluded, at the far north end of Menlo Park's built environment and surrounded to the north and east by open fields. Since 1969, however, the buildings and the site as a whole have undergone considerable changes that have substantially diminished the historic integrity of the buildings and site and the ability of the property to convey its association with the historic Corona satellite program. The changes to the individual buildings—such as the major alterations to the entrance and the rear addition on 940 Hamilton Court (MPK 51), the removal of the original Hiller Aircraft signage, replacement doors and windows on 1390 Willow Road (MPK 50), and replacement windows on 960 Hamilton Court (MPK 53)—change the physical appearance and important characteristics of the buildings. Additionally, the changes to the site as a whole, particularly the addition of several office buildings and much larger warehouses to the north and east of the original buildings, removal of internal fencing, and integration of parking lots, substantially alter the original character of the individual buildings and the complex. See the discussion in the Integrity section below for additional information on the changes and the historic integrity of the buildings.

The three remaining historic-period buildings were developed for use by Hiller Aircraft to research, test, and manufacture helicopters and other aircraft. Most of the projects were conducted under contract with the United States Army or Navy, but only a few of the company's helicopter models were put into full production. While significant money, time, and effort were spent designing and building helicopters at this site, Hiller Aircraft did not prove to be an important company in the development of helicopters during the decades after World War II. The company frequently competed for military contracts to develop production-ready aircrafts, but repeatedly did not meet the military's requirements. It did succeed in earning research and development contracts, which proved lucrative for short periods, but usually never materialized into military aircrafts. One of its only successful helicopter models was the light observation type helicopter known as the Raven. It was first used in relatively small numbers during the Korean War and later used more extensively during the Vietnam War. Its success, however, did not translate into significance within the helicopter manufacturing industry. Many of the company's competitors, such as Bell Helicopters and Hughes Helicopters, developed a greater number of frequently more successful helicopter models and, unlike Hiller Aircraft, were able to transition into civilian markets. The buildings at this property associated with Hiller Aircraft do not possess significance within the helicopter industry that meet the eligibility requirements for listing in the NRHP and CRHR under these criteria. Even if the buildings possessed significance for their association with

Hiller Aircraft, the buildings and the property as a whole have undergone substantial changes since they were used by Hiller Aircraft and these changes have diminished their historic integrity. See the discussion in the Integrity section below for additional information on the changes and the historic integrity of the buildings.

While the six historic-period buildings are also associated with the post-World War II rise of technology companies in the Silicon Valley, they are not significant within that association. Relative to other important projects throughout the area, such as the Stanford Research Institute, the Hiller Aircraft operation and the use of the buildings for development of the Corona satellites did not play a major or important role in the regional growth of technology companies. Despite having success, Hiller Aircraft was not among the most important technology-related companies in the area nor was it instrumental in the growth of additional tech-related companies. Lockheed's use of the buildings for the Corona project was highly insular and secretive. Although it was important for its association with the federal government's Cold War space-based surveillance programs, it did not play a significant role in the local technology industry. In any event, the buildings and the property as a whole have undergone major changes since the early history of the property such that the property no longer conveys its association with the growth of the technology industry.

The Menlo Science & Technology Park—individual buildings and as a whole—are also not eligible under NRHP Criterion B and CRHR Criterion 2, because they do not have direct, significant association with persons important to history. The property in general is most closely linked to Stanley Hiller, who started Hiller Aircraft and directed the development of the historic-period buildings on the property. Hiller proved to be a relatively successful innovator in helicopter technology. However, his innovations did not prove significant within the industry. His chief innovations, such as the coaxial rotor, stabilizing elements in his "Rotormatic" system, platform helicopters, ramjet powered helicopters, and tiltwing vertical takeoff and landing helicopter, were either derivatives of previous designs developed by others or failed to translate into successful, production-level aircrafts. While Hiller's business was successful for a time, especially during the early years, and his Raven helicopter contributed to the United States effort in the Korean and Vietnam wars, these were comparatively minor accomplishments compared to leaders of the field. As such, for the purposes of NRHP Criterion B and CRHR Criterion 2, Stanley Hiller is not considered a person whose contributions in his field of helicopter development rose to the level of significance. Moreover, the buildings are no longer associated with Stanley Hiller and have undergone significant changes since he was directly connected with the site. Thus, the buildings do not possess the historic integrity to convey their association with Hiller.

The historic-period buildings at Menlo Science & Technology Park are not significant as important examples of a type, period, or method of construction, they are not important examples of master architects or engineers, and they do not represent high artistic value. Therefore, the buildings—individually and as a collection—are not eligible for listing in the NRHP or CRHR under Criterion C or Criterion 3. Some of the buildings represent modest examples of International-style architecture, while most are mostly utilitarian in design. The buildings at 1370 Willow Road (MPK 54) and 1390 Willow Road (MPK 50) contain some elements of the International style, such as contrasting horizontal and vertical elements, rectilinear asymmetric designs, and lack of architectural ornament, but these are decidedly typical and basic elements of the style. The buildings lack the level of architectural detail and quality of design and materials to be considered important examples of International style. The building at 1390 Willow Road was designed by Vincent Raney, who was a successful architect in the San Francisco Bay Area who became known for is designs of the Century dome movie theaters. Despite gaining moderate success in the field, Raney was not generally recognized as one of the distinguished architects of his time. Some of his buildings, such as the domed theaters, may be considered significant for their designs, but his overall body of work in the field does not rise to the level of greatness. As such, the building at 1390 Willow Road is not an important example of a master architect. The remaining buildings represent very modest utilitarian designs. They were built as large warehouses and feature minimal windows, large freight doors, and tilt-up concrete panels. The buildings were designed to meet the basic functions of their occupants with little effort paid to aesthetic and architectural qualities. While the architects of these buildings are not known, they do not represent an important work of an unidentified craftsman. As such, none of the buildings at Menlo Science & Technology Park meet the requirements for eligibility under NRHP Criterion C or CRHR Criterion 3.

Under NRHP Criterion D and CRHR Criterion 4, this property and its buildings are not significant or likely sources of important information about historic construction materials or technologies that otherwise would not be available through documentary evidence. The buildings represent standard construction techniques of their historical period that are well

recorded by documentary evidence. The buildings mostly feature concrete tilt-up or wood-frame construction, both of which are very common and well understood methods. It is unlikely that any information revealed would add historically significant information to the common understanding of these type of structures.

Evaluation: Integrity

The property and the individual buildings have lost historic integrity to the historic period, including during the years when the building was associated with the historically significant Corona satellite program (1958-1969). All of the buildings have undergone some changes, and some of the buildings have undergone significant alterations. The buildings alterations are detailed in Sections P3a Description and in **Table 2** of B6 Construction History above, and can be seen illustrated in the photographs on the following pages. As detailed in the Significance section above, the features that characterize the three buildings directly associated with the important Corona satellite program—1390 Willow Road, 940 Hamilton Court, and 960 Hamilton Court (MPK 50, MPK 51, and MPK 53)—include their overall architectural designs, materials, layout, and spatial relationships within the complex. Since their significant period, the buildings have undergone several changes, including the replacement of windows, doors, and siding, and construction of roof parapets. The building at 1390 Willow Road has replacement siding and the original Hiller Aircraft signage on the front of the building has been removed. The buildings at 940 Hamilton Court and 960 Hamilton Court have replacement windows, personnel doors, and freight doors. In addition, the building at 940 Hamilton Court has substantial additions on the north and south sides. Elements of the overall property were also important to the character of these buildings. The relative isolation of the site and the security features for the three buildings associated with the Corona program were important character-defining elements. After their association with the Corona program, the security features have been removed and several new buildings have been constructed in the surrounding areas. The buildings are no longer directly associated with their historical uses. The three buildings directly connected with the development of the Corona satellites (1390 Willow Road, 940 Hamilton Court, and 960 Hamilton Court; MPK 50, MPK 51, and MPK 53) lost this association after the program was moved to facilities in Sunnyvale in 1969. These changes have substantially diminished the integrity of design, materials, workmanship, feeling, and association of the buildings at 1390 Willow Road, 940 Hamilton Court, and 960 Hamilton Court. The integrity of setting is also diminished because of modern construction in the immediate vicinity. The buildings retain their integrity of location because they have not been moved, but these three buildings do not retain overall historic integrity.

The remaining buildings on the property do not meet the NRHP or CRHR significance criteria. They have also undergone a variety of alterations that have diminished their historic integrity, including: additions, replacement of original windows and doors, enclosing freight doors, personnel doors, and other openings, creation of new openings, and changes to siding. It appears very few original windows or doors remain at any of the buildings. More substantial changes include additions and major alterations to entrances, such as at 960 Hamilton Court, where a two-story glass-wall entrance was built. These changes substantially diminish the integrity of materials, design, workmanship, and feeling of the historic-period buildings.

In addition to the changes to the individual buildings, the site as a whole underwent a major overhaul during the 1970s and 1980s. The original Hiller Aircraft plant and three adjacent buildings constructed in the 1950s (and seen in **Figures 2**, **4**, **5**, and **6** above) were demolished. In the largely open space that was used for testing aircraft from the late 1940s to the mid 1960s, several new buildings were constructed, including some that dwarf the square footage of the historic-period buildings. In fact, as stated above, a critical element to the history of the site includes the large open space that characterized and helped protect the privacy of the Corona satellite program. Overall, 14 new buildings were constructed at the site, new roads were added, and paved parking lots fill most of the space between the buildings. These changes substantially diminish the integrity setting, association, feeling, and design of the property as a whole, as well as the individual buildings.

Like the buildings formerly associated with the Corona program, the other buildings on the property are no longer directly associated with their historical uses. The associations with the Hiller companies were lost during the 1960s when most of the operations were moved to the East Coast. Since then, the buildings have been used for a variety of office and industrial purposes. Ultimately, even though some of the buildings once possessed significance for association with the Corona satellite program, none of the buildings on the property, nor the site as a whole, meet the criteria for listing in the NRHP or CRHR because of the loss of integrity of materials, design, workmanship, feeling, setting, and association to the individual buildings, and the loss of design, feeling, setting, and association to the overall site.

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

This form records an apartment building located on the west side of Willow Road south of Hamilton Avenue in the Belle Haven neighborhood of the city of Menlo Park. It is the northernmost apartment building on a 2.969-acre parcel that spans most of the block between Hamilton Avenue and Ivy Drive, containing the northern half of the multi-unit Gateway Garden Apartments complex, see **Sketch Map**, and **Figures 1 and 3**. Gateway Garden Apartments consists of numerous single- and two-story apartment buildings. The current study evaluates the northernmost one, which is a single-story, Ranch-style, four-unit building at 1385 Willow Road. The subject building has a rectilinear footprint, stucco cladding, and a low-pitched side-gable roof with composition shingles, open overhanging eaves, wood fascia, and rectangular louvered vents in the gable peaks (**Photograph 1**). The building has a symmetrical, south-facing main façade, with entries to the four residential evenly distributed living units that feature replacement wood panel doors—one with a metal security door (Unit C)—and replacement vinyl, horizontal-sliding windows. The units open out to a courtyard shared with the adjacent, virtually identical, north-facing, single-story, four-unit apartment building at 1381 Willow Road (**Photograph 2**). (See Continuation Sheet.)

The apartment building at 1385 Willow Road does not meet the criteria for listing in the National Register of Historic Places (NRHP) or the California Register of Historical Resources (CRHR) because it is not historically significant. This property was also evaluated in accordance with Section 15064.5(a)(2)-(3) of the CEQA Guidelines, using the criteria outlined in Section 5024.1 of the California Public Resources Code and it is not an historical resource for the purposes of the California Environmental Quality Act (CEQA). (See Continuation Sheet.)

P3a. Description (continued):

In addition to the courtyard framed at the east end by a wood fence and pergola, the two apartment buildings (1381 and 1385 Willow Road) also share two asphalt-paved parking areas—comprising a former frontage road to the east and an alley to the west—as well as a metal-frame shade structure to the south.

B10. Significance (continued):

Historic Context

The apartment building recorded on this form was constructed in 1953 in north Menlo Park, a city along the San Francisco Bay in southeast San Mateo County. Since its initial construction, the building has continued to function as a multi-family residential property. The parcel is located on land once within the former 35,200-acre *Rancho de las Pulgas*, which was granted to Luis Arguello—the first Mexican governor of California—in 1835. Settlement of the area was slow through the mid nineteenth century, and most of the acreage was devoted to agricultural uses. Landowners and their tenant farmers used the nearby port at Ravenswood Slough (established in 1849) to ship products to market. As the importance of the Ravenswood port and its surrounding settlement waned in the 1860s, the rancho was divided and sold to various investors and agriculturalists, including Robert E. Doyle and Charles C. Bowman. Doyle and Bowman acquired many former rancho parcels, including Tract No. 1 that stretched along the bay between what is now Marsh Road and Willow Road. This more than 1,770-acre tract included the study area near Hamilton Avenue and Willow Road. Doyle held the tract for several more years, but gradually further subdivided and sold portions of it.[1]

James P. Rynder, a banker based in Eureka, California, acquired some of Doyle's acreage in the 1870s, and by 1894 had amassed a 400-acre portion that was bounded by the salt marshes on the north, Bay Road on the south, and Willow Road on the east. Rynder never occupied this land and most likely rented it for grain and forage farming. His son and one of his two daughters, George and Ida, inherited the tract when their father died in 1910. George Y. Henderson and Ida Henderson Sevier appear to have continued renting it as farmland for about 15 years before subdividing much of the eastern half of the parcel to create Newbridge Park—the location of the subject property—and selling the new residential tract to a real estate sales company (**Figure 1**). The subdivision offered small lots on a grid of streets located south of the Dumbarton Cutoff rail line and straddling Willow Road, a layout designed to take advantage of the new bay crossing for vehicles, the Dumbarton Bridge.[2] Sales were very slow despite repeated efforts to market the lots throughout the greater San Francisco Bay Area. Although the first buildings at the southwest corner of Willow Road and Hamilton Avenue (just north of the property) appeared not long after the subdivision map was filed, Newbridge Park and the surrounding lands remained rural and agricultural through the 1940s, even though the residential streets were laid out. Very few lots sold during the great depression, and it was not until after World War II that most of the area—including the row of apartment buildings containing the subject property—was densely developed.[3]

The end of the Second World War brought rapid suburban expansion to the San Francisco Peninsula, as it did to the rest of the country, along with Cold War-related development and the introduction of the high-tech industry. Menlo Park's population grew tenfold between 1930 and 1970 as suburban tracts spread in the areas around downtown. The city quickly annexed many of these new residential areas, expanding north and east into the Ravenswood district. In 1949, the neighborhoods of Belle

Haven and Newbridge Park, west of Willow Road and north of Bay Road, were incorporated into Menlo Park, including the lot for the subject property.[4]

The parcels on the west side of Willow Road were developed in the mid twentieth century and tended to be commercial or residential in nature.[5] After the first commercial buildings appeared at the southwest corner of Willow Road and Hamilton Avenue, the other Newbridge Park parcels started to be developed as well, and by the late 1940s and early 1950s a few small residences and a few roadside commercial buildings appear in aerial photographs. Early in 1956, real estate agents Hare, Brewer & Kelly advertised property for sale in Menlo Park, including a "drive-in commercial corner opposite Hiller Helicopter plant, Willow Road, can be used for industry."[6]

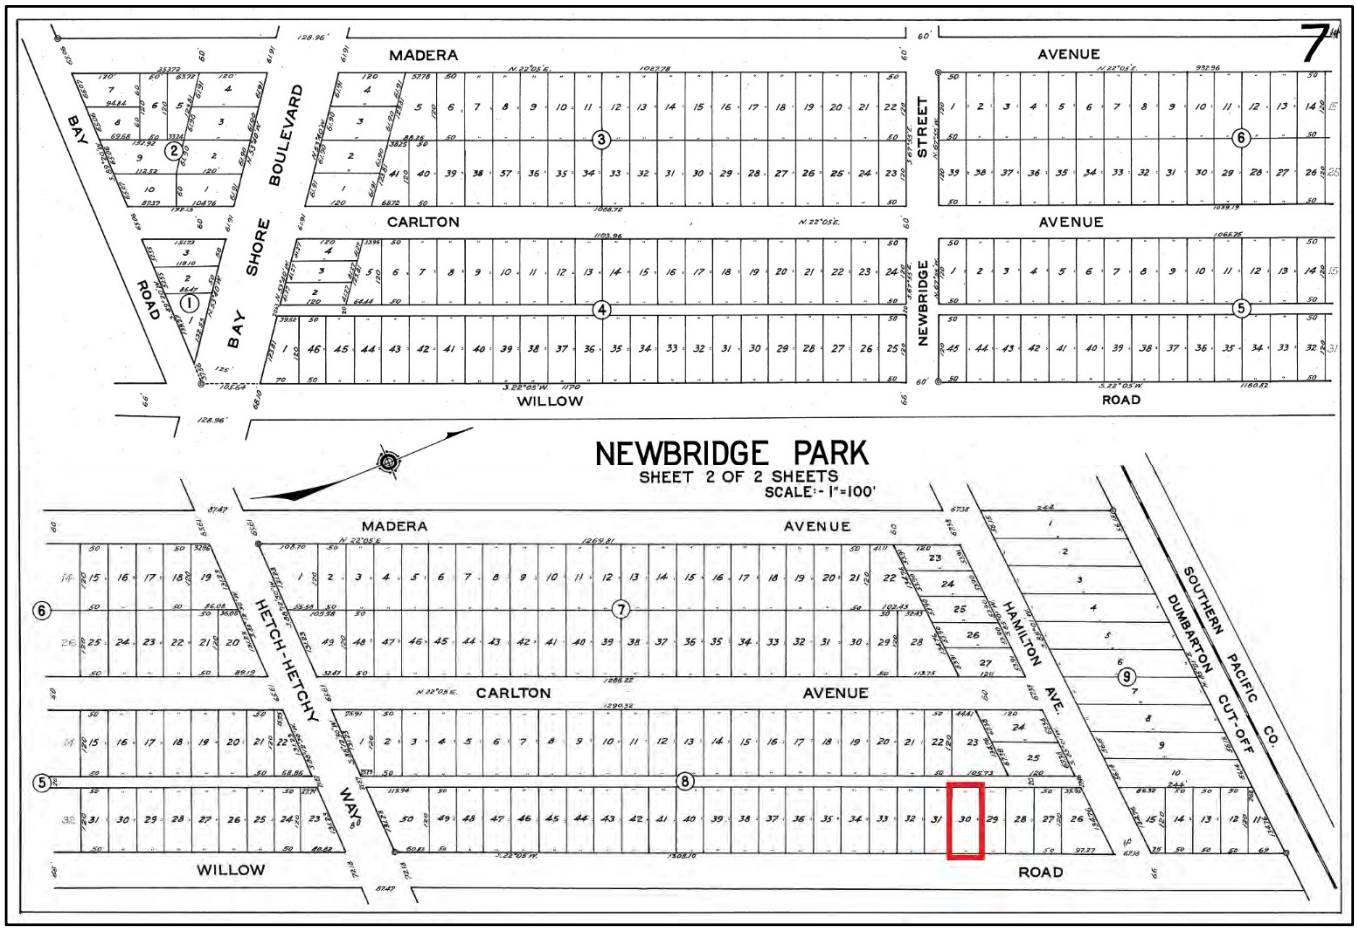

Figure 1. 1926 Newbridge Park subdivision map, with approximate location of subject property outlined in red.[7]

Commercial and multi-family residential buildings dominated the development of the west side of Willow Road area through the rest of the twentieth century, including the first row of apartment buildings containing the subject property on, which were built in the early 1950s. In addition to a market, restaurant, and bakery, a contractor's yard was among the businesses located

on Willow Road near Hamilton Avenue in the 1960s and 1970s (**Figure 2**). Single-family homes faced Hamilton Avenue or Carlton Avenue, the street running parallel to Willow Road one block west, and a youth center and a church appeared north of Hamilton Avenue in the 1970s as well.[8]

Figure 2. Excerpt of 1964 aerial photograph, with subject property circled in red. Annotation by JRP.[9]

By the late 1980s, the Community Development Agency (CDA) of Menlo Park began to focus its efforts in the area when it submitted a re-subdivision map for the row of apartment buildings on the west side of Willow Road (**Figure 3**). The CDA also resurveyed the parcels within the study area, and it appears that the parcels at the southwest corner of Hamilton and Willow Road were cleared of buildings not long after. The site, just north of the apartment building at 1385 Willow Road, remained vacant for about a decade until the CDA filed a new resurvey of all the parcels at both the northwest and southwest corners of the intersection. This resurvey was called Belle Haven Retail Center and eventually led to the construction of the current buildings at the site by 2002.[10]

The Redwood Terrace Company built the property recorded and evaluated on this form in 1953 (1385 Willow Road) as one of many independently developed apartment buildings along the west side of Willow Road between Hamilton Avenue and the Bayshore Freeway (US Highway 101) in the 1950s and 1960s. The Redwood Terrace Company was a residential development firm active throughout the San Francisco Peninsula in the late 1940s through the 1950s. By the early 1960s, the company relocated to Citrus Heights in Sacramento County. Multiple development companies constructed the various multi-family residential complexes ad hoc in this area, and it appears that the Redwood Terrace Company developed the subject building in tandem with three virtually identical buildings: the extant apartment building at 1381 Willow Road, which contains the odd-numbered units as counterpart to the subject property's even numbers; and two buildings with identical footprints originally sited to the immediate south and demolished sometime after 1981. By 1963, Castle Realty, a San Francisco Peninsula-based real estate firm, had acquired ownership of the apartment building, with Bob Olden listed as the owner in 1976. The four-unit apartment building experienced a high rate of turnover during the pre-1971 period, with tenants employed in such professions as: maintenance and construction workers, general laborers, machinists, a nurse, and a security guard at the adjacent Hiller Aircraft compound. Since 1987, the non-profit housing organization, MidPen Housing, has owned and managed the Gateway Garden Apartments (1221-1385 Willow Road), which includes the apartment building recorded on this form.[11]

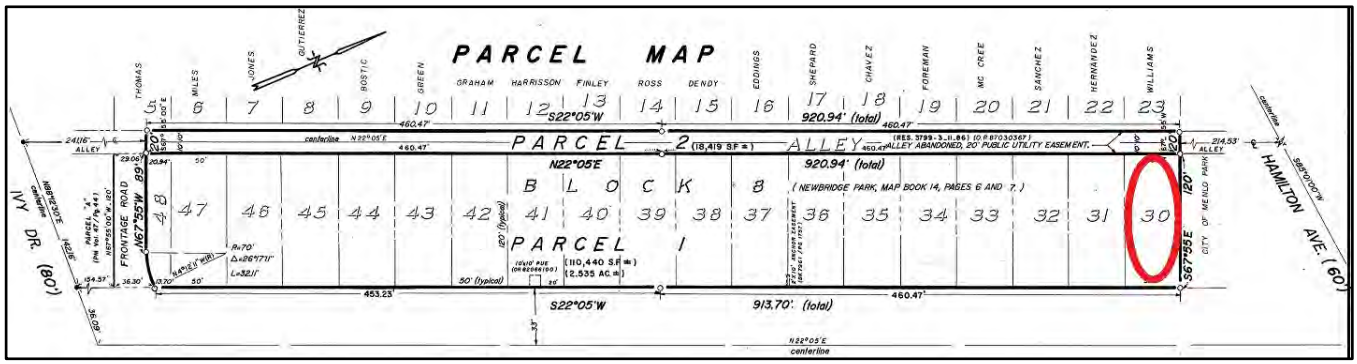

Figure 3. Excerpt of 1987 parcel map, with approximate location of subject property circled in red. Annotation by JRP.[12]

Evaluation

This property does not have important associations with significant historic events, patterns, or trends of development (NRHP Criterion A / CRHR Criterion 1). This multi-family residential property was developed in 1953 during a period of general expansion for the city of Menlo Park and while generally associated with this trend, 1385 Willow Road did not play a demonstrably important role in the post-World War II growth of the city. Additionally, the building does not have important associations with any other known local historic contexts or themes explored within this document, or any state or national historic contexts. Therefore, the property does not meet NRHP Criterion A / CRHR Criterion 1.

[12] "Parcel Map," Book 59, page 17, filed 29 Jan 1987, San Mateo County Assessor.

The building at 1385 Willow Road is not significant for an association with the lives of persons important to history (NRHP Criterion B/CRHR Criterion 2). It does not appear that any individual associated with this muli-unit residence made demonstrably important contributions to history at the local, state, or national level.

Under NRHP Criterion C / CRHR Criterion 3, this apartment building is not significant as an important example of a type, period, or method of construction. The building is a modest example of the Ranch style that grew in popularity from the 1940s through the 1960s. The style is characterized by a single-story, sprawling rectilinear plan with a wide façade, and a broad, low- to medium-pitched roof. Other common elements include sliding windows and stucco cladding.[13] The building on the study parcel is an unremarkable example of the style and does not embody enough of the distinctive characteristics of the type necessary for significance under these criteria. The apartment building also lacks high artistic value and is not the important work of a master architect or builder.

Under NRHP Criterion D / CRHR Criterion 4, this property is not a significant or likely source of important information about historic construction materials or technologies that otherwise would not be available through documentary evidence.

Aside from the installation of replacement vinyl window, the subject property retains overall historic integrity; however, it lacks historical significance and does not meet the criteria necessary for eligibility for listing in either the NRHP or CRHR.

This form records a 0.206-acre parcel located on the east side of Carlton Avenue south of Hamilton Avenue in the Belle Haven neighborhood of the city of Menlo Park. The parcel contains a 960-square-foot, single-story Ranch Bungalow with attached garage, an approximately 230-square-foot rear utility shed, a metal-frame shade shelter, and minimal landscape / hardscape features. This residence has a generally rectangular footprint, stucco cladding, and a medium-pitched, side-gable roof with composition shingles, narrow closed eaves along the front (west) façade, and flush eaves in the north- and southside gable peaks (**Photograph 1**). A stucco-clad chimney rises through the roof the south end of the main (west) slope. The main (west) entrance is located within an inset porch with a horizontal wood railing or balustrade and gate. The entry features a replacement wood panel door with a fanlight in the top panel and narrow vertical sidelight (**Photograph 2**). At the south end of the house is the attached single-car garage with a replacement metal roll-up door. Fenestration consists of replacement, sliding, vinyl windows with false muntins. P3a. Description (continued):

Sited to the rear (east) and side (north) of the residence are a modern outbuilding and modern shade structure, respectively. They are not visible from the public right-of-way on Carlton Avenue, but are evident in aerial satellite imaging.

The parcel is framed by concrete-block and horizontal and vertical wood fencing. The front features a semicircular grass lawn framed by a concrete driveway and brick walkway (**Photograph 3**). The rear yard is divided between a rectangular grass lawn and a concrete patio.

B10. Significance (continued):

Historic Context

The residence recorded on this form was constructed in 1952 in north Menlo Park, a city along the San Francisco Bay in southeast San Mateo County. Since its initial construction, the building has continued to function as a single-family residential property. The parcel is located on land once within the former 35,200-acre *Rancho de las Pulgas*, which was granted to Luis Arguello—the first Mexican governor of California—in 1835. Settlement of the area was slow through the mid nineteenth century, and most of the acreage was devoted to agricultural uses. Landowners and their tenant farmers used the nearby port at Ravenswood Slough (established in 1849) to ship products to market. As the importance of the Ravenswood port and its surrounding settlement waned in the 1860s, the rancho was divided and sold to various investors and agriculturalists, including Robert E. Doyle and Charles C. Bowman. Doyle and Bowman acquired many former rancho parcels, including Tract No. 1 that stretched along the bay between what is now Marsh Road and Willow Road. This more than 1,770-acre tract included the study area near Hamilton Avenue and Willow Road. Doyle held the tract for several more years, but gradually further subdivided and sold portions of it.[1]

James P. Rynder, a banker based in Eureka, California, acquired some of Doyle's acreage in the 1870s, and by 1894 had amassed a 400-acre portion that was bounded by the salt marshes on the north, Bay Road on the south, and Willow Road on the east. Rynder never occupied this land and most likely rented it for grain and forage farming. His son and one of his two daughters, George and Ida, inherited the tract when their father died in 1910. George Y. Henderson and Ida Henderson Sevier appear to have continued renting it as farmland for about 15 years before subdividing much of the eastern half of the parcel to create Newbridge Park—the location of the subject property—and selling the new residential tract to a real estate sales company (**Figure 1**). The subdivision offered small lots on a grid of streets located south of the Dumbarton Cutoff rail line and straddling Willow Road a layout designed to take advantage of the new bay crossing for vehicles, the Dumbarton Bridge.[2] Sales were very slow despite repeated efforts to market the lots throughout the greater San Francisco Bay Area. Although the first buildings at the southwest corner of Willow Road and Hamilton Avenue (just north of the subject property) appeared not long after the subdivision map was filed, Newbridge Park and the surrounding lands remained rural and agricultural through the 1940s, even though the residential streets were laid out. Very few lots sold during the great depression, and it was not until after World War II that most of the area—including that residential block containing the subject property—was densely developed.[3]

The end of the Second World War brought rapid suburban expansion to the San Francisco Peninsula, as it did to the rest of the country, along with Cold War-related development and the introduction of the high-tech industry. Menlo Park's population grew tenfold between 1930 and 1970 as suburban tracts spread in the areas around downtown. The city quickly annexed many

of these new residential areas, expanding north and east into the Ravenswood district. In 1949, the neighborhoods of Belle Haven and Newbridge Park, west of Willow Road and north of Bay Road, were incorporated into Menlo Park, including the lot for the subject property.[4]

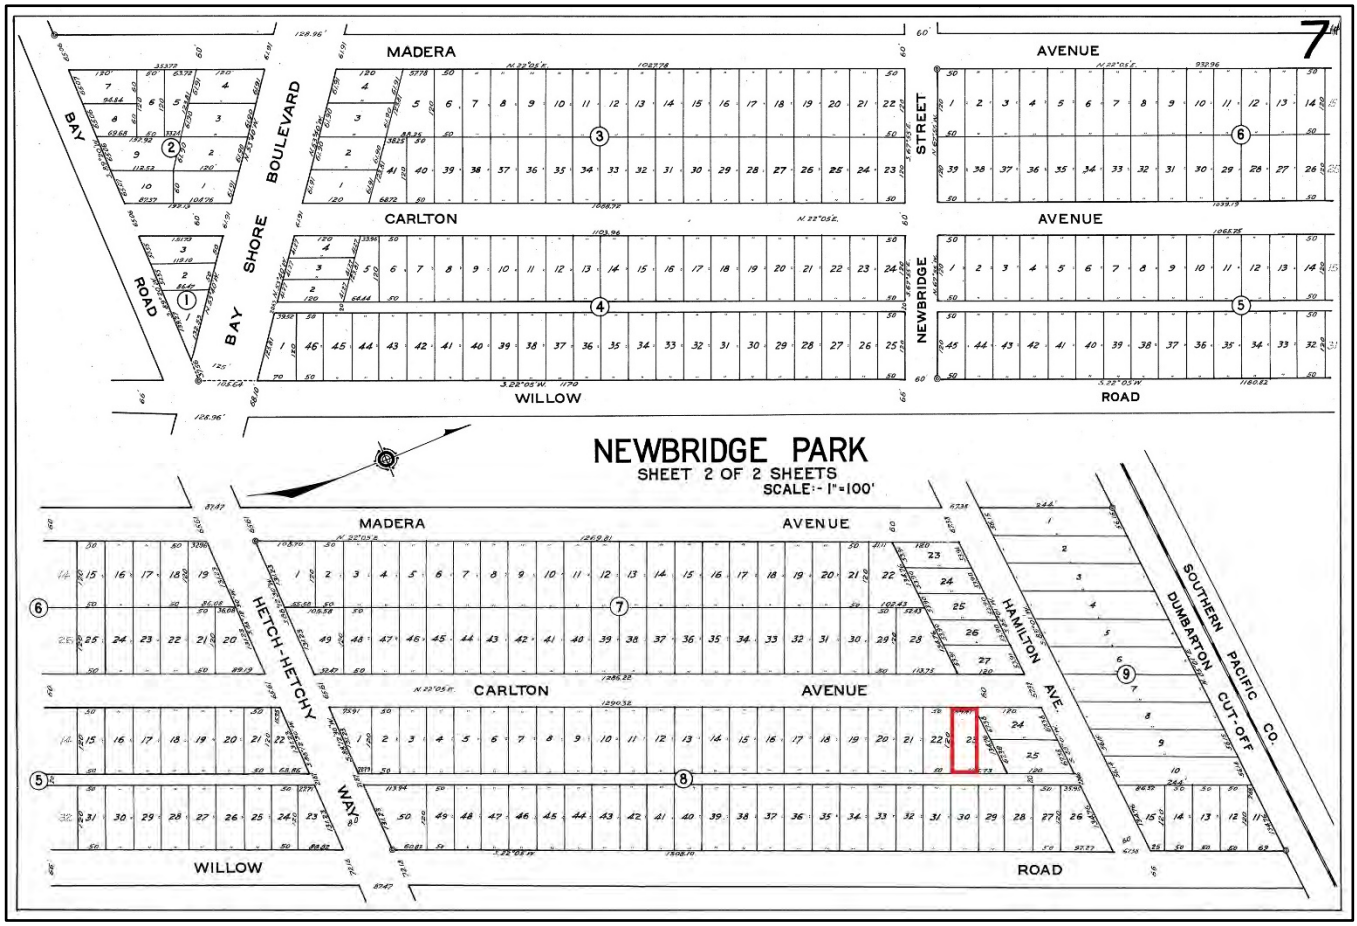

Figure 1. 1926 Newbridge Park subdivision map, approximate location of subject property outlined in red.[5]

The parcels west of Willow Road, on either side of Hamilton Avenue, were also developed in the mid twentieth century, but were commercial and residential in nature.[6] After the first commercial buildings appeared at the southwest corner, the other Newbridge Park parcels on Hamilton and Willow Road started to develop as well, and by the late 1940s and early 1950s a few small residences and a few roadside commercial buildings appeared in aerial photographs. Early in 1956, real estate agents Hare, Brewer & Kelly advertised property for sale in Menlo Park, including a "drive-in commercial corner opposite Hiller Helicopter plant, Willow Road, can be used for industry."[7]

Commercial and residential buildings dominated the development of the area through the rest of the twentieth century, including a row of apartment buildings along the west side of Willow Road in the 1950s and 1960s. In addition to a market,

restaurant, and bakery, a contractor's yard was among the businesses located on Willow Road near Hamilton Avenue in the 1960s and 1970s. The single-family homes—including the subject property—faced Hamilton Avenue or Carlton Avenue, the street running parallel to Willow Road one block west. A youth center and a church appeared north of Hamilton Avenue in the 1970s as well.[8]

Moore and Tahaney, presumably a local development firm, developed the property recorded on this form in 1952 on Lot 23, Block 8 of the Newbridge Park subdivision. As originally built, the subject property contained the Ranch Bungalow with attached garage on a roughly 0.24-acre, trapezoidal-shaped lot. The parcel attained its current configuration through subdivision in 1987 (**Figure 2** and **Figure 3**). For the first roughly 20 years of its history, numerous short-term occupants were listed at the address, indicating that it may have functioned as a rental property for at least part of this period. The earliest recorded residents were Harold W. Bryan, his wife Laverne, and at least two of their children by 1957. Harold Bryan was born in Oregon, raised in the San Francisco Bay Area, and worked as a carpenter for Schirmer Contractors, a local general contracting firm owned by Arthur Shirmer. Laverne Bryan was as a housewife. The Bryans remained at the subject property through about 1960, after which residents changed at least every two years or so. By 1971, Charlene Williams, a dietician at Stanford Hospital, was listed at the property, and she remained through 1978, and a relative—Melvie Lee Williams—retained ownership until sometime prior to 1987. The current owners and occupants acquired the property in 2012.[9]

Figure 2. Excerpt of 1956 aerial photograph, with subject property circled in red. Note the original trapezoidal lot configuration.[10]

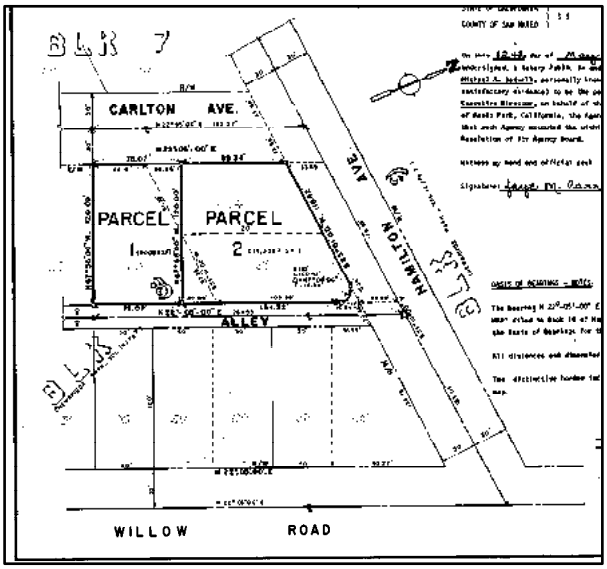

Figure 3. Excerpt of 1987 map; subject property is "Parcel 1."[11]

[11] Note that the subject parcel was resurveyed and contains most of the original Lot 23 and a portion of Lot 24, Block 8, from the original subdivision (see Figure 1). "Parcel Map," Book 59, page 52, filed 29 Jan 1987, San Mateo County Assessor.

Evaluation

This property does not have important associations with significant historic events, patterns, or trends of development at the local, state, or national level (NRHP Criterion A / CRHR Criterion 1). This residential property was developed in 1952 during a period of general expansion for the city of Menlo Park. While an example of this trend, 1396 Carlton Avenue did not play a demonstrably important role in the post-World War II growth of the city. Additionally, it does not have important associations with any other known local historic contexts or themes explored within this document, or any state or national historic contexts. Therefore, the property does not meet NRHP Criterion A / CRHR Criterion 1.

This property is not significant for an association with the lives of persons important to history (NRHP Criterion B/CRHR Criterion 2). It does not appear that any individual associated with the development, ownership, use, or occupancy of this residence made demonstrably important contributions to history at the local, state, or national level. The achievements of Howard and Laverne Bryan, Charlene Williams, and any other recorded occupant do not elevate them to the level of a person important to history.

Under NRHP Criterion C / CRHR Criterion 3, this residence is not significant as an important example of a type, period, or method of construction. The main building on this property is a Ranch Bungalow, a style that grew in popularity from the 1940s through the 1960s. The style is characterized by a single-story, compact rectilinear plan with a wide façade, and a broad, low- to medium-pitched roof. Other common elements include stucco cladding.[12] The building on the study parcel is a modest and typical example of the style and does not embody enough of the distinctive characteristics of the type necessary for significance under these criteria. The house also lacks high artistic value and is not the important work of a master architect or builder.

Under NRHP Criterion D / CRHR Criterion 4, this property is not a significant or likely source of important information about historic construction materials or technologies that otherwise would not be available through documentary evidence.

In addition to lacking historical significance and not meeting the criteria necessary for eligibility for listing in either the NRHP or CRHR, the replacement of all visible windows and doors, the reconfiguration of the parcel, and the addition of non-original landscape / hardscape features have changed the building relative to its historic-era appearance, thus diminishing its historic integrity.

Photograph 3: Alternate view of 1396 Carlton Avenue, showing north end of driveway; camera facing southeast, June 2, 2021.

P1. Other Identifier: Dumbarton Cutoff

*P2 e. Other Locational Data: The short segment of the Dumbarton Cutoff railroad line (MR 21a) in the APE is in Redwood City just south of the SR 84 Woodside Freeway Overpass where the Dumbarton Cutoff splits from the mainline at railroad M.P. 26.25.

***P3a. Description:** Only a short segment of the westernmost end of the Dumbarton Cutoff line is in the APE for the project listed in P11. This segment is bordered by private property, far from the public right-of-way, and obscured by fencing, conditions that made it difficult to view and photograph during field survey (**Photograph 1**). The resource at this location is a single track standard gauge railroad that appears to have wood ties and stone ballast, which was confirmed using current aerial photography. The railroad bed is roughly level with the surrounding flat terrain. This resource has been field checked and has not been altered since its last recordation (see attached previous documentation and B10).

***P3b. Resource Attributes:** HP11—Engineering Structure
***P6. Date Constructed/Age:** 1907–1910
***P8. Recorded by:** Heather Miller and Samuel Skow, JRP Historical Consulting, LLC, 2850 Spafford Street, Davis, CA 95618; January 25, 2017

***P11. Report Citation:** JRP Historical Consulting, LLC, "California High Speed Rail Authority San Francisco to San Jose Project Section Historical Architectural Survey Report," 2019.

***B10. Significance:**

John W. Snyder previously recorded the Dumbarton Cutoff (MR 21) in 1996 during a survey and evaluation that identified the Dumbarton Cutoff Linear Historic District as a National Register of Historic Places (NRHP)-eligible resource. Snyder defined the district contributors as the Dumbarton Cutoff railroad line and two bridges along the line: the Dumbarton Bridge and Newark Slough Bridge. Southern Pacific built the Dumbarton Cutoff between 1907 and 1910 as a 16.4-mile route to provide a shortcut between the mainline on the San Francisco Peninsula and the SPRR routes on the east side of San Francisco Bay. The APE for this project intersects only a very short segment of the westernmost end of the Dumbarton Cutoff line. Snyder concluded that the Dumbarton Cutoff Linear Historic District appeared eligible for the NRHP under Criterion A, B, and C, but the Dumbarton Cutoff line was only eligible as a contributor under Criterion A and B for its important association with "system-wide improvements to the Southern Pacific" in the early 20th century and "national defense efforts during World War I and World War II" and for its important association with E.B. Harriman, the president of SPRR who initiated the construction of the Dumbarton Cutoff. Snyder identified the period of significance for the district as from 1909, when the earliest contributor was completed, to 1945, presumably for the end of World War II (Snyder 1996). The California Register of Historical Resources (CRHR) had not been established at the time of Snyder's study.

In 2012, JRP prepared an update DPR 523 form for the Dumbarton Cutoff Linear Historic District and agreed with Snyder's conclusions. JRP also added an underpass and two culverts as contributors to the district and provided evaluations under each of the CRHR Criterion. It appears that the conclusions reached by Snyder in 1996 and JRP in 2012 have not received concurrence from the State Historic Preservation Officer (Snyder 1996; JRP 2012). The present study agrees with the previous conclusions that the Dumbarton Cutoff railroad line is eligible under NRHP Criterion A and B/CRHR Criterion 1 and 2 as a contributor to the Dumbarton Cutoff Linear Historic District. The previous studies do not explicitly state the character-defining features of the Dumbarton Cutoff line, but these are its alignment, location, and all rails, ties, ballast, and signal structures dating to the period of significance. The historic property boundaries are the footprint of the engineering structure within its alignment from its split at the mainline in Redwood City to the Niles Railroad Depot. The Dumbarton Cutoff line has been evaluated in accordance with Section 106 of the National Historic Preservation Act (NHPA) of 1966 (as amended) (54 U.S.C. 306108) and its implementing regulations (36 CFR Part 800), and Section 15064.5(a)(2)-(3) of the CEQA Guidelines, using the criteria outlined in Section 5024.1 of the California Public Resources Code. It is an historic property under Section 106, and an historical resource under CEQA.

***P3a. Description:**

This form updates a 1996 study by John Snyder of the Southern Pacific Railroad, Dumbarton Cutoff. In that study, Snyder inventoried and evaluated on separate DPR forms the Southern Pacific Railroad Dumbarton Cutoff, the Southern Pacific Railroad Dumbarton Bridge and the Newark Slough Bridge. This form is an update to only that portion of the Dumbarton Cutoff that enters the APE for this study, running from Redwood Junction in San Mateo County on the west side of the San Francisco Bay to just before the Niles station in Alameda County on the east side of the Bay. In 1998, a major fire damaged nearly 2000 feet of the western spans of the Dumbarton Bridge. All but the pilings are now gone in that section of the line. Otherwise, the railroad alignment appears as it did when John Snyder recorded it. In addition to the railroad and the two bridges, JRP also recorded two culverts and an underpass. The forms for these resources can be found attached to the HRIER prepared for this project. These resources are: the Henderson Underpass (Map Reference #12) in Menlo Park, the University Avenue / M.P. 30.80 culvert (Map Reference #13) and the Newark culvert (Map Reference #17). The Dumbarton Bridge (Map Reference #14) and Newark Slough Bridge (Map Reference #16) can also be found attached to the HRIER. (See Continuation Sheet.)

***P3b. Resource Attributes:** (List attributes and codes) (HP19) Bridge (HP 11) Engineering Structure

***P11. Report Citation:** (Cite survey report and other sources, or enter "none.") JRP Historical Consulting, LLC, "Historic Resources Inventory and Evaluation Report, Dumbarton Rail Corridor Project," 2012.

***B10: Significance:**

The previous study determined that the cutoff appeared to be eligible for listing in the National Register of Historic Places (NRHP) at the local level of significance in transportation and engineering. Snyder also concluded that the cutoff retained integrity of location, setting, feeling, and association, noting that the trestle replacements from the 1970s constituted a "minor compromise to integrity of design, materials, and workmanship." Under Criterion A, the Dumbarton Cutoff is associated with significant system-wide improvements to the Southern Pacific Railroad, and the economic growth of San Francisco in the first half of the twentieth century. It is also associated with the national defense activities during World War I and World War II. Under Criterion B, the Dumbarton Cutoff is associated with E.H. Harriman, who drove the growth of the Southern Pacific Railroad during the first two decades of the twentieth century. Harriman directed the construction of the bridge. Under Criterion C, Snyder concluded that contributive elements, such as the Dumbarton and Newark Slough Bridges, are representative examples of their type (Harriman Common Standard timber trestle, deck girder, and through truss bridges), period (first decade of the twentieth century), and method of construction. A 1995 fire and a more disastrous 1998 fire damaged the bridge. The 1998 fire destroyed most of the western ballast-deck timber trestle approach spans, comprising 1,766 feet of the bridge. Above water, only partial remains of some of the posts still exist. Other changes to the railroad include replacement rails and ties, as well as the placement of concrete grade-crossings and similar modernizing features. The fire damage appears to compromise the integrity of design, materials and workmanship; however, the bridge retains integrity of location, setting, feeling and association. While the damage to the bridge compromises the integrity, the segment that was destroyed is small enough to have a relatively minor effect on the integrity of the Dumbarton Cutoff as a whole. The modernization of the rails and ties and other mechanical elements of the railroad do not affect the integrity of the railroad route. The route the original railroad took remains the same. (see Continuation Sheet)

***B14. Evaluator:** Rand Herbert & Joseph Freeman ***Date of Evaluation:** June 2008

P3a. Description (continued):

JRP conducted a survey of the railroad alignment at several locations, usually at street crossings but also at underpasses, overpasses, bridges and some culverts. Access was limited to the railroad. The following is a detailed description of each of the recordation sites.

The segment begins in San Mateo County at Redwood Junction near Willow Street, just south of the State Route 84 crossing. Light and heavy industrial buildings surround this railroad wye, however no cultural resources aside from the rail line appear within the APE, which is aligned with the railroad right of way. The railroad line at this point consists of four standard-gauge tracks on the main line and two tracks along the Dumbarton Cutoff. Of the mainline tracks, three appear to be modernized, with concrete ties. On the Dumbarton Cutoff line, the tracks sit on wood ties and rock ballast.

The rail line continues along a slight curve to Middlefield Road, a wide, two-lane road. At this at-grade crossing the APE extends beyond the width of the railroad right-of-way; however the APE does not incorporate any features that are not associated with the rail line. The APE does include two street medians, both of which are inside the railroad right-of-way, as well as part of Middlefield Road, both north and south of the tracks. The surrounding area at this crossing, but outside the APE, is characterized by light and heavy industrial development, with some residential units located south of the crossing. This crossing also designates another railroad wye which connects the cutoff with the main line.

The next crossing along the rail line is at 2nd Street, a two lane road. The APE at this point does not extend beyond the railroad right-of-way, and the crossing is at-grade. Thus, there are no non-railroad features within the APE. This intersection is bordered to the north by residential units and a small parking lot and to the south by industrial buildings and a parking lot for an automobile towing company. The APE includes part of the street north of the tracks. East of this location is the 5th Avenue at-grade crossing, which intersects the two lines of track at this location (**Photograph 1**). As at 2nd Street, the area surrounding this intersection is characterized by residential development to the north and large warehouses to the south. The APE at this intersection does not encroach on any of these properties. The APE includes part of the street north of the rail line.

Marsh Road, the next crossing nearly a mile east of 5th Avenue, is a wide, four-lane road with a center median (**Photograph 2**). A modern office park is located at the northeast corner, while a strip mall is located across Marsh Road. Beyond the strip mall and south of the tracks are residential buildings. The Dumbarton Cutoff crosses over the US 101 on the Henderson Underpass (**Photograph 3**). The highway at this location is eight lanes wide. A variety of development constitutes the surrounding area. Office parks and large industrial-style warehouses are located north of the railroad, while residential development characterizes the area south of the railroad.

Chilco Street, which parallels the rail line to the north for a quarter of a mile, crosses the tracks at grade. The area north of the tracks and east of the freeway is comprised of large industrial warehouses, while residential buildings are located south of the railroad at this location. The APE at this location includes portions of the Chilco Street north and south of the tracks, but it does not include any structures. The area surrounding Willow Road, site of the next crossing, is characterized by modern commercial and industrial buildings. The APE at this location extends north and south of the tracks along Willow Road and parts of Hamilton Avenue. The Menlo Park Station is proposed for this site.

As the railroad nears the western shore of the bay, a culvert carries the railroad tracks over a small unnamed creek/drainage approximately 150 feet west of University Avenue (**Photograph 8**). At the University Avenue crossing, the APE remains within the railroad right-of-way. There are no buildings within the APE or in the close vicinity of the tracks. A residential development is located southeast of the tracks. At this point, the railroad crosses the San Francisco Bay on the Dumbarton Bridge (**Photograph 4**). It then passes through the marsh area before reaching the Newark Slough Bridge (both bridges are discussed in full on separate forms).

Near the Cargill Salt loading facility, the railroad passes over a culvert with a date stamp of 1924. Beyond the Cargill Salt facility, the current project proposes constructing a parking lot near the Willow Street crossing. This site is surrounded by modern construction and vacant lots. To the north the railroad is bordered by industrial warehouses west of Willow Street. South of the tracks an abandoned warehouse and office complex is located at 8787 Enterprise Drive. That building was determined to be ineligible for listing in the NRHP in the accompanying HRIER. Three other properties with all modern buildings are located within the APE near this intersection. Modern residential housing is located east of Willow Street and outside the APE for this project.

At the Spruce Street crossing, the APE remains within the railroad right-of-way. The surrounding area is characterized by residential buildings dating to the 1950s and 1960s. The Ash Street at-grade crossing is surrounded by residential buildings dating to the first decades of the twentieth century. At this intersection, the APE includes part of the street north and south of the railroad right-of-way for proposed road medians. The properties at 37069 Ash Street, 37144 Ash Street, 37115 Ash Street and 7590 Snow Avenue were recorded for this project. These properties were determined ineligible for listing in the NRHP. Past the Ash Street crossing, the railroad makes an S-turn before paralleling Baine Avenue. It crosses Cherry Street; however the APE remains within the railroad right-of-way (**Photograph 5**). It next passes under Newark Boulevard, which is carried over the tracks on the modern Newark Boulevard Overhead, designated by Caltrans as Bridge # 33C0137. This part of Newark is characterized by single- and multiple-family residences. The last crossing before the railroad enters the City of Fremont is at Cedar Boulevard, where the APE remains within the right-of-way.

In Fremont, the tracks cross over Interstate 880 on two through plate girder bridges designated by Caltrans as the East Newark Underpass, Bridge # 33-0262 (**Photograph 6**). While this crossing has been used since the construction of Interstate 880, the bridges were replaced in 1995. The APE for this overpass remains within the right-of-way and includes no historic resources. The area surrounding the overpass consists of single- and multiple-family residences as well as industrial-use warehouses. East of the Interstate 880 crossing, the railroad crosses Blacow Road, where the APE remains within the railroad right-of-way. No historic resources were recorded at this intersection. The surrounding area consists primarily of single-family residential buildings with some commercial and industrial development. The APE remains within the railroad right-of-way as it crosses Dusterberry Way and Maple Street. This area is characterized by a mixture of residential buildings and complexes, light industrial buildings and commercial properties.

Following Maple Street, the railroad tracks cross Fremont Boulevard and enter the Centerville Station (**Photograph 7**). The Centerville Station (Centerville Railroad Depot) is ineligible for listing in the NRHP. The APE extends outside the railroad right-of-way at this location to include improvements to the Centerville Railroad Depot. This part of Fremont Boulevard is generally represented by commercial buildings, many of which date to the late nineteenth or early twentieth century. North of the station and west of Fremont Boulevard, the APE incorporates part of two properties, on which sit three buildings. Among these are the buildings at 3810 and 3850 Bonde Way, which have been previously inventoried and evaluated, and are discussed in more detail below.

The railroad continues northeast to Niles, crossing the Paseo Padre Parkway on a bridge designated by Caltrans as 33C0225. Built in 1975 the Paseo Padre Parkway Underpass is a concrete box beam bridge. The railroad then passes under the Bay Area Rapid Transit (BART) line which is carried on a bridge. At this point, the APE leaves the Dumbarton Cutoff before it enters the Niles Railroad Depot.

B10. Significance (continued):

Southern Pacific Railroad built the Henderson Underpass in 1931 and expanded it from a single span to a double span in 1958 to accommodate the construction of four more lanes of highway.

Research did not indicate when the culvert west of University Avenue was built, but the type of construction and materials used suggest an early construction date in the history of the Southern Pacific Railroad Dumbarton Cutoff. Timber and concrete box culverts were used in early railroad construction. Aerial photographs, dating back to 1948, show a culvert of similar style at this location. The Newark culvert was built by Southern Pacific Railroad in 1924. [1]

These three resources are contributing structures to the historic district. They were all constructed within the period of significance (1909-1945) as defined by John Snyder. These resources were not included in the previous study. These resources are not eligible for listing in the NRHP or CRHR as individual historic properties. JRP conducted a survey of the railroad alignment at several locations, usually at street crossings but also at underpasses, overpasses, bridges and some culverts. Access was limited to the railroad.

REQUEST FOR

DETERMINATION OF ELIGIBILITY

FOR INCLUSION IN THE

NATIONAL REGISTER OF HISTORIC PLACES

SOUTHERN PACIFIC RAILROAD DUMBARTON CUTOFF

SOUTHERN PACIFIC RAILROAD DUMBARTON BRIDGE

SOUTHERN PACIFIC RAILROAD NEWARK SLOUGH BRIDGE

Alameda and San Mateo Counties, California

Submitted pursuant to 36 CFR 800.6(e)

U.S. Coast Guard

December 1996

ABSTRACT

This document has been prepared to report on the history, and evaluate the significance of, the Southern Pacific Railroad Dumbarton Cutoff Linear Historic District, which connects Niles in Alameda County, California with Redwood Junction in San Mateo County, California, and traverses the lower reached of San Francisco Bay. In addition, this document also seeks a determination of eligibility of two of the District's contributing features, the Southern Pacific Railroad Dumbarton Bridge, and the Southern Pacific Railroad Newark Slough Bridge. In evaluating the District's and the bridges' significance, this report will satisfy the requirements of 36 CFR 63, allowing a determination as to whether or not the resources meet the eligibility criteria of the National Register of Historic Places. The San Mateo County Transportation Agency (Samtrans), current owner of this rail line, is proposing rehabilitation of the two bridges, contributors to the District. This work will require a permit from the U.S. Coast Guard.

This document concludes that the Southern Pacific Railroad Dumbarton Cutoff Linear Historic District appears to be eligible for inclusion in the National Register of Historic Places, and that the Southern Pacific Railroad Dumbarton Bridge and Southern Pacific Railroad Newark Slough Bridge are contributors to that eligible district. In addition, this document concludes that the Southern Pacific Railroad Dumbarton Bridge is individually eligible for inclusion in the National Register of Historic Places as the first successful bridging of San Francisco Bay.

I. PROPERTY NAME

A. Historic Name: Southern Pacific Railroad Dumbarton Cutoff.

1. Original owner or builder: Southern Pacific Railroad; American Bridge Company.
2. Significant persons or events associated with the District: Edward H. Harriman.
3. Innovative or unusual characteristics of the District: The first successful crossing of San Francisco Bay. The two bridges are the second oldest known movable bridges in California.

B. Common Names: Dumbarton Cutoff; Samtrans Dumbarton Cutoff.

III. LOCATION

The Southern Pacific Railroad Dumbarton Cutoff Linear Historic District generally extends from Niles in southern Alameda County, southwestward to Redwood Junction in southern San Mateo County. The Cutoff was conceived in 1904 to provide a link between the railroad's Sunset Route (San Francisco-New Orleans) and the Ogden (San Francisco-Ogden) and Shasta (San Francisco-Portland) lines, obviating the need for trains to travel as far south as San Jose before turning north again. For the District's and the bridges' UTM references, see the attached forms.

IV. CLASSIFICATION

A. Category: Linear District; bridge.

V. OWNERSHIP: San Mateo County Transportation Agency.

VI. REPRESENTATION IN EXISTING SURVEYS: None.

VII. DESCRIPTION

In brief, the Southern Pacific Railroad Dumbarton Cutoff Linear Historic District is described as a 16.4-mile standard-gauge railroad line, with attendant turnouts, spurs, sidings, signals, culverts, bridges, and other contributive elements. For a more complete description of the line and its history, see the attached forms. While a full survey of the line and all its contributing elements was beyond the scope of this survey, the information developed in the evaluation of the two bridges will allow a finding of eligibility for the District, which is perhaps the most intact Harriman-era Southern Pacific rail line in California.

Dumbarton Bridge: In brief, this is a 1.4-mile long structure, built in 1908-9, crossing the south end of San Francisco Bay. Its elements include timber trestle spans, reinforced concrete trestle spans, steel deck girder spans, steel through Pratt truss spans, and a steel through Pennsylvania (Petit) truss swing span. This bridge, and the nearby Newark Slough Bridge, are the

second oldest movable bridges in California. For a complete description, see the attached forms.

Newark Slough Bridge: Built in 1908-9 across Newark Slough, southwest of Newark, Alameda County, this bridge has an overall length of 817 feet. Its elements include timber trestle spans, steel deck girder spans, and a steel through Baltimore (Petit) truss span. For a complete description, see the attached forms.

VIII. SIGNIFICANCE

A. History: For a complete history of the Southern Pacific Railroad Dumbarton Cutoff, Dumbarton Bridge, and Newark Slough Bridge, see the attached forms.

B. Evaluation: "The National Register of Historic Places is the official Federal list of districts, sites, buildings, structures, and objects significant in American history, architecture, archeology, engineering, and culture." [NPS, Bulletin 16A, p.i] In general, properties must be at least 50 years old to be eligible for listing in the National Register. The National Register defines as district as follows: "A district is a geographically definable area--urban or rural, small or large--possessing a significant concentration, linkage, or continuity of sites, buildings, structures, and/or objects united by past events or aesthetically by plan or physical development." [NPS Bulletin 15]

The National Register uses specific criteria, codified in 36 CFR 60, to assess the significance of these property types. Critical to this assessment are seven points of integrity, set apart from the criteria themselves. These points of integrity--location, design, setting, materials, workmanship, feeling, and association--serve to define the historic authenticity of any given property, through the survival of physical characteristics. According the *National Register Bulletin 16A*, "Not only must a property *resemble* [emphasis added] its historic appearance, but it must also retain physical materials, design features, and aspects of construction dating from the period when it attained significance." [NPS, Bulletin 16A, p.4] Properties that lack these qualities, or

in which these qualities are severely compromised, no longer meet the National Register eligibility criteria.

The Southern Pacific Railroad Dumbarton Cutoff Linear Historic District retains a high degree of integrity of location, design, setting, materials, workmanship, feeling, and association; with the exception of reinforced concrete trestle portions of the Dumbarton Bridge, which must be considered as non-contributors, all elements are virtually unmodified from the period of significance, 1909-1945. The Southern Pacific Railroad Dumbarton Cutoff Linear Historic District appears to meet National Register criteria A, B, and C; the Dumbarton Bridge and Newark Slough Bridge are contributors to the eligible district. In addition, the Dumbarton Bridge appears individually eligible under the three criteria, as the first successful bridging of San Francisco Bay. For a complete discussion of integrity and significance of the District and the bridges, see the attached forms.

Crossing San Francisco Bay at Dumbarton Point, linking Alameda and San Mateo counties between Niles and Redwood City. Parcel No.

P3. Description (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

The Southern Pacific Railroad Dumbarton Cutoff links the railroad's Sunset Route (San Francisco-New Orleans) line with the Ogden (San Francisco-Ogden) and Shasta (San Francisco-Portland) lines, providing a cutoff from the former route that required trains to transit via San Jose. Contributors to this property, and the subject of this survey, are the Southern Pacific Railroad Dumbarton Bridge, located at milepost 31.51, carrying the Dumbarton Cutoff across the south end of San Francisco Bay between Dumbarton Point in Alameda County and East Palo Alto in San Mateo County, and the Newark Slough Bridge, carrying the cutoff over the navigable waters of Newark Slough at milepost 34.53. The Dumbarton Cutoff is 16.4 miles long, connecting the two main lines between Niles, Alameda County, and Redwood Junction, San Mateo County. The cutoff is a single-track rail line with attendant spurs and sidings, turnouts and searchlight-type block and bridge approach signals. It crosses marsh areas on dredged fill, and crosses San Francisco Bay and Newark Slough on through truss swing bridges.

P2b. Quads for this resource are: Niles, 1961, photorevised 1968; Newark, 1959, photorevised 1980; Mountain View, 1991; Palo Alto, 1991. Township and Range varies, from T5S/R3W at Redwood Junction, to T5S/R2W at the Dumbarton Bridge, to T5S/R2W at the Newark Slough Bridge, Newark Junction, and Niles.

P2d. UTM (continued) UTM reference on Primary Record is for Redwood Junction at west end of Dumbarton Cutoff. UTM reference for west end of Dumbarton Bridge is 10-577450-4149100; east end of bridge is 10-579110-41500510. UTM Reference for Newark Slough Bridge is 10-581220-4152020. UTM reference for Newark Junction is 10-585260-4152550. UTM Reference for Niles Junction at east end of Dumbarton Cutoff is 10-591100-4158500.

P3. Description (continued) (Descriptions of the Dumbarton and Newark Slough Bridges can be found on the individual records compiled for those structures.) Rails on the Dumbarton Bridge, while continuous-welded, carry rolling dates of 1944 and 1951. Rails on adjacent fill approaches carry rolling dates of 1923 (siding) and 1939 (main line). Mainline rail east of the Newark Slough Bridge is largely 112-pound rail, rolled in 1935 and 1939. There is a handcar setout platform just east of the east approach spans to the Newark Slough Bridge, on the south side of the mainline.

All along the mainline track and on the trestle approaches to the bridges, ties still carry date nails from 1926, 1928, the 1930s and the 1940s; coupled with the rolling dates observed on the rails, these indicate a high degree of integrity of materials for this line.

The Southern Pacific Dumbarton Cutoff appears to meet the eligibility criteria of the National Register of Historic Places, at the local level of significance in transportation and engineering. It retains integrity of location, setting, feeling, and association; trestle replacements from the 1970s constitute a very minor compromise to integrity of design, materials, and workmanship. Under criterion A, it is associated with the system-wide improvements to the Southern Pacific that gave the railroad its 20th century form and made it the standard railroad of the West. It is inextricably linked with the economic growth of San Francisco and its port in the first half of the 20th century, and with the national defense efforts during both world wars. Under criterion B, it is associated with the life of E.H. Harriman, the genius of whom drove the modernization of the S.P. during the first two decades of this century, even beyond his death. Harriman saw the need for, and directed the building of, the Dumbarton Cutoff. Under criterion C, contributive elements of the Cutoff, such as the Dumbarton and Newark Slough Bridges, are representative examples of their type (Harriman Common Standard timber trestle, deck girder, and through truss ges), period (first decade of the 20th century), and method of construction. Built in 1908-9, they are among the oldest of their type in fornia, with only the Southern Pacific's Sacramento River Bridge at Tehama (1898) known to predate them. In addition, the Southern Pacific Dumbarton Bridge appears to be individually eligible for the National Register under criterion A, as the first successful bridging of San Francisco Bay.

2d. UTM (continued) UTM reference on Primary Record is for east end of Dumbarton Bridge. UTM reference for center pier of swing span is 10-578795-4150250. UTM reference for west end of Dumbarton Bridge is 10-577450-4149100.

P3. Description (continued) The Dumbarton Bridge, crossing San Francisco Bay is comprised of, from west to east:

a. A backfilled timber abutment.

b. 1,766 feet of Harriman Common Standard ballast-deck timber trestle approach spans on 7-pile timber bents, with each span comprising two lines of five timber stringers each below the rails, and a single timber stringer at each outer edge, with timber posts supporting timber guardrails.

c. Thirty reinforced concrete ballast-deck trestle approach spans of 30 feet each, on reinforced concrete 4-pile bents and bent caps, with railings of steel posts and wire cable.

d. Fifty-three reinforced concrete ballast-deck trestle approach spans of approximately totalling 2,374 feet, on cylindrical, cast-in-place 2-column bents and bent caps, with railings of steel posts and wire cable.

e. One 26-foot, three-inch Harriman Common Standard open-deck, steel deck girder approach span.

f. Three double-track Harriman Common Standard 180-foot open-deck riveted steel Pratt through truss approach spans, with the main line track carried on the north side of the deck, and a spur track carried on the south side. The westernmost truss span (historically Span 6) carries a mast-mounted searchlight-type block signal to protect the draw span, and a switch stand and turnout leading to the spur track. The trusses have boxed end posts and top chords with solid steel plate tops and sides, and latticed soffits; laced bottom chords; laced diagonal tension members; latticed and laced vertical compression members; latticed top laterals and struts; latticed portals and interior top transverse braces. The truss spans are carried on two-column bents, each column consisting of a concrete-filled steel cylinder, founded on timber piles.

g. One double-track, 310-foot open deck riveted steel through Pennsylvania (Petit) truss, with sub-struts and sub-ties, center-bearing swing span. Its built-up members are as described for the Pratt truss spans, above. The bridge operator's control cabin, containing operating machinery, is carried atop the trusses at the center of the span. The swing span is carried on a large, cylindrical, steel-shelled mass concrete center pier, which is founded on timber piles. When in the closed position, its ends rest on two-column bents as described for the Pratt truss spans, above. Lines of timber pile dolphins, connected by catwalks, delineate the navigable channel on each side of the draw span, and protect it when it is in the open position. The draw span is currently maintained in the open position (i.e., closed to rail traffic).

h. Three double-track Harriman Common Standard 180-foot open-deck riveted steel Pratt through truss approach spans, as described above. The searchlight-type block signal protecting the east end of the draw span is mounted on the north end post of the easternmost span (historically Span 1).

i. Eight reinforced concrete ballast-deck trestle approach spans of approximately totalling 394 feet, on cylindrical, cast-in-place 2-column bent s and bent caps, with railings of steel posts and wire cable.

j. One reinforced concrete ballast-deck trestle approach span of approximately 30 feet, on reinforced concrete pile bents and bent caps, with railings of steel posts and wire cable.

j. 610 feet of single-track Harriman Common Standard ballast-deck timber trestle approach spans on 6-pile timber bents, with each span comprising two lines of five timber stringers each below the rails, and a single timber stringer at each outer edge, with timber posts supporting timber guardrails.

Rails on the Dumbarton Bridge, while continuous-welded, carry rolling dates of 1944 and 1951. Rails on adjacent fill approaches carry rolling dates of 1923 (siding) and 1939 (main line). Mainline rail east of the Newark Slough Bridge is largely 112-pound rail, rolled in 1935 and 1939. There is a handcar setout platform just east of the east approach spans to the Newark Slough Bridge, on the south side of the mainline.

All along the mainline track and on the trestle approaches to the bridges, ties still carry date nails from 1926, 1928, the 1930s and the 1940s: coupled with the rolling dates observed on the rails, these indicate a high degree of integrity of materials for this line.

Period of Significance: 1909-45 **Property Type:** Bridge **Applicable Criteria:** A,B,C
(Discuss importance in terms of historical or architectural context as defined by theme, period and geographic scope. Also address integrity.)

By the 1890s, the Central Pacific and Southern Pacific Railroads were under the control of Colis P. Huntington, sole survivor of the "Big Four" who had undertaken construction of the Central Pacific portion of the transcontinental railroad beginning in 1863 (the others had been, of course, Charles Crocker, Mark Hopkins, and Leland Stanford). Huntington was parsimonious in his management, and the S.P. was in a period of retrenchment during this era, helped along by the Panic of 1893 that affected railroads nationwide. After Huntington's death, however, railroad magnate Edward H. Harriman was able in 1901 to obtain control of Huntington's interest in the S.P. from his heirs, adding that railroad to the Union Pacific, Illinois Central, and others already under his control. In contrast to the frugality of the Huntington era, Harriman, assuming the presidency of the Southern Pacific, immediately initiated large expenditures that began a series of system-wide improvements to the S.P. to improve its efficiency (and hence its rate of return to him and company stockholders). During the next two decades then, these improvements, representing engineering and construction on a scale not seen on the S.P. since the initial construction of the Central Pacific, shaped both the physical plant and the operations of the railroad into what we see today.

Map of Bay Shore and Dumbarton Cutoffs of the Southern Pacific

B8. The cutoff was built in conjunction with the Bayshore Cutoff and other Peninsula rail improvements during the administration of E.H. Harriman to expedite rail freight shipment between San Francisco and the Southern Pacific's Ogden and Shasta routes.

B10. Under Harriman's direction, beginning in 1903 the engineering and maintenance of way departments of all the railroads under his control undertook standardization of virtually all elements, from track spikes to locomotives, and from bridges to stations. This allowed the companies to achieve greater economies as they expanded and improved. Among the standardized bridge types developed at this period were the timber pile trestles, deck plate girders, and through truss types used on the S.P. Dumbarton Bridge. At the same time, the S.P. began to modernize its locomotive and car fleet, transitioning to much larger and heavier locomotives (including the first of the articulated Mallet engines that were to become its hallmark), converting to oil fuel, and to all-steel passenger cars; freight cars likewise increased in size and capacity. Harriman invested in oil lands so that the oil-hungry Southern Pacific would not be dependent on outside sources, amassing some of the largest oil holdings in the nation.

In addition, Harriman began massive construction projects all around the S.P. system to increase operating efficiency, and to upgrade lines and bridges for modern traffic loadings; often these efforts took the form of newly-incorporated railroads that were totally S.P.-controlled, and that would be subsumed by the parent company upon their completion; more about this later. He also instituted an enlightened plan of formal training for employees, and built employee club houses to offer an alternative to bars and saloons. By late 1910, his efforts had resulted in the once-moribund Southern Pacific becoming one of only three railroads in the United States with an annual gross income of more than $100 million!

By 1904 Harriman had completed the Lucin Cutoff across the Great Salt Lake, eliminating the original Central Pacific/Union Pacific route around the north end of the lake (and in the process bypassing the meeting site at Promontory Summit). In 1905 the S.P. began improvements to main lines between San Francisco and the Pacific northwest, between San Francisco and Ogden, and between San Francisco and New Orleans, where S.P. steamships connected to New York. Harriman authorized more than 400 miles of new line system-wide, at a cost of $14 million, and gained concessions for 775 miles of new line for S.P.'s wholly-owned subsidiary in Mexico. During this period Harriman obtained a $2 million loan from New York banks, and is alleged to have told S.P. General Manager Julius Kruttschnitt that it was all to be spent improving mainline track in California. According to author, Lucius Beebe, Harriman called to Kruttschnitt as the latter was leaving the Thursday meeting, saying, "Spend it this week." While apocryphal, the story illustrates Harriman's impact upon the S.P. By the end of the year, S.P. had installed automatic block signals on 1,038 miles of track, with 664 more miles projected to be so signalled in 1906. In the San Francisco area, the company began construction of the Bayshore Cutoff between San Francisco and San Bruno to replace the circuitous and hilly line that had originally been built into the city by the predecessor San Francisco and San Jose Railroad in 1863. The new line, built in tunnels and on fill across Visitacion Bay, would be shorter and virtually level, and would include a major new yard and shops on 200 acres of reclaimed land at Visitacion. The Bayshore Cutoff would materially shorten running times between San Francisco and San Jose, and would facilitate freight shipment into San Francisco.

Related to this, and to facilitate freight shipments between San Francisco and the Ogden and Shasta lines, Harriman also directed the incorporation of the Central California Railway, to build a 16.4 mile line between Niles in Alameda County, and Redwood Junction in San Mateo County. This would obviate the need to ship freight across the Bay by ferry, or by rail south to San Jose and then back up the east side of the Bay, a trip of more than 100 miles; it would also be a logical link in conjunction with the new Bayshore Cutoff, then building. Completion of the two cutoffs would unify and improve the railroad's terminal facilities in San Francisco, shortening the trip around the south end of the Bay by 50 miles, and dispensing with the need for two car ferry transfers of freight. While conceived before the April 18, 1906 disaster in San Francisco, that event demonstrated to Harriman the need to improve access to and from the city.

The Central California Railway incorporated on October 3, 1904 with a capital stock of $1 million, to build a standard gauge railroad, with all appurtenances, from Niles to Dumbarton Point, across San Francisco Bay to Redwood City, and then to a point near San Mateo. While the articles of incorporation made no mention of the Southern Pacific, save in noting the two end connections with the S.P. mainlines, the makeup of the Board of Directors left no doubt as to the seat of control of the Central California: Director, Nathaniel T. Smith was Treasurer of the Southern Pacific; Director, William Hood was S.P.'s Chief Engineer; Director, Edgar E. Calvin was a Southern Pacific Vice-President; Director, John E. Foulds was an S.P attorney; only Director, Frank Shay of Oakland seemingly had no connection to Southern Pacific. (Even more telling was the allocation of shares in 1912: members of the Board of Directors of the Central California held 300 shares; the Southern Pacific Railroad held 49,700 shares!)

.n 1906 the railroad built a new ferryboat facility at Alameda for both freight and passengers, replacing one built in the 1880s. It built new stations, including completing a stylish new Mission Revival station at Santa Barbara. When San Francisco was devastated by earthquake and fire on April 18, Harriman directed the railroad's response: in eighteen days the railroad carried in 1,252 cars of relief supplies, and carried out 115,295 passengers, 78,560 of which were carried free, some as far as Chicago. Harriman himself came west to the stricken city to direct efforts. In the southern part of the state, the Colorado River left its channel and began to flood the Imperial Valley, creating the Salton Sea. Forced to move its tracks five times, S.P. finally undertook the efforts, which would consume two years, to close the breach and force the river back into its natural channel. This year also saw Harriman decide to build a new line in Oregon to replace the steep and dangerous Siskiyou line; to build a cutoff line through eastern California to shorten times between Sparks, Nevada and Portland. In the few years remaining before his death in 1909, Harriman also began a major reconstruction of the original Central Pacific route over the Sierras. Under Harriman's presidency the Southern Pacific joined in cooperation with rival Santa Fe to build the Northwestern Pacific Railroad north from Willits to Eureka; such cooperation was hardly surprising, since Harriman owned controlling stock in Santa Fe.

The year 1906 saw Harriman and the S.P. investigating railroad electrification, including consideration of electrifying the S.P. main line over Donner Summit. Southern Pacific began acquisition of power generating plants and sites in the Sierras, but ultimately backed away from the expense when new, larger, oil-fired, and more efficient steam locomotives arrived. In the Bay Area, Harriman moved to electrify local lines in Oakland and the East Bay, with the ultimate intent to electrify all S.P. lines on both sides of the Bay, though his death, coupled with uncertainties related to government anti-trust proceedings would quash that effort. Related to this was the construction of the Dumbarton Cutoff, which would have carried electric-powered trains around the south end of the Bay.

Niles is located on the Southern Pacific mainline at the south end of Alameda County. Though Central Pacific crews had conducted initial surveys for a bridge between Dumbarton Point and Ravenswood as early as March 1875, the first actual rail link had been a narrow-gauge line projected between Santa Clara and Newark, intended to transport strawberries and other Santa Clara Valley produce to a steamer landing at Alviso, for transhipment to San Francisco. The company went bankrupt long before completion of the effort, and it fell upon Alfred Davis and the South Pacific Coast Railroad to complete it. Eventually connecting Oakland and Alameda with Santa Cruz, the narrow gauge SPC joined San Jose to Newark by 1877. Southern Pacific acquired the company in 1887, and eventually standard-gauged the line beginning in 1906, in conjunction with the other Harriman system improvements. Newark was to be the staging point for construction of the Dumbarton Cutoff and its attendant bridges.

he first surveying crews had actually arrived in 1905, setting off local speculation that the project would result in Newark receiving major yards and shops that would boost the local economy--speculation that was reinforced by similar reports in *The Railroad Gazette*; alas, this was not to be. Still, the little town boomed--sometimes literally with the off-loading and assembly of bridge steel--for the duration of the $15 million-dollar project to build the Dumbarton Cutoff. Bridge materials and other supplies arrived at Newark by rail from Oakland. Crews were busy grading the five miles between Niles and Newark, and the eleven miles between Newark and Redwood Junction. The most difficult work was to the west, for just outside Newark lay the tidal marshes of San Francisco Bay. By mid-1908, workers had completed nearly seven miles of track and an additional seven miles of grading, and were at work on the bridges. Construction steel, fabricated by American Bridge Company in Pennsylvania, was delivered by rail and off-loaded to the subassembly site at Dumbarton Point. Working from both sides of the Bay, and in several locations at once, crews began constructing the timber pile trestle approaches for the drawbridges at Newark Slough (subject of a separate form and evaluation) and at Dumbarton. Piledrivers rode both ends of isolated sections of trestles as crews built toward each other. Adjacent to Dumbarton Point, and paralleling the shoreline at right angles to the eventual alignment of the Dumbarton Bridge, workers erected falsework on pilings. Crews then moved steel subassemblies from shore onto the falsework, where they assembled them, one-by-one, into the six through truss approach spans. At the same time, a similar process was taking place in the fifty-foot-deep water of the navigable channel.

Here (and at Newark Slough), crews erected an elaborate system of timber pile dolphins topped by a timber truss falsework placed parallel to the navigable channel, allowing shipping to proceed relatively unimpeded during construction. With the falsework in place, they built a vertical steel guiding frame to place the steel shell of the central pivot pier. When they had placed the outside shell of the pier, the workers then proceeded to dredge the inside to a predetermined depth, after which they drove a forest of timber piles, finally filling the shell with concrete. (The two-column bents for the truss approach spans were constructed in similar fashion.) They then pulled cut the timber pile dolphins surrounding the pivot pier. With the pivot pier in place, workers began the task of assembling the machine they would use to erect the 310-foot swing span. With the machine in place, they could then begin assembly of the massive through truss, with subassemblies delivered by barge.

Meanwhile, other crews were erecting the through truss approach spans alongside the shoreline, making them ready for final placement by use of the area's twelve-foot tides. As each was completed, a pair of large barges (constructed by cutting the hull of the obsolete S.P. ferry *Thoroughfare* in half) was carefully maneuvered among the falsework and beneath the span at low tide. As the tide came in, the barges rose until timber cribbing on their decks lifted the span off the falsework. The S.P. fireboat *Ajax* took up the tow, with the steam launch *W.E. Marsh* pushing, and with equal care maneuvered the span over its waiting piers, holding the assembly in place until the tide went out and gently deposited the span into place. Six times the crews repeated the process, and six times the assemblies came to rest precisely as intended.

On land, crews used dredgers to build three miles of new railroad grade above the marsh, while in San Mateo County that scene was repeated to reach from the solid ground to the western trestle approaches. The line was finally completed on September 12, 1910 and the bridge was formally opened on September 24, amid festivities that included an all-night dance, a barbecue, special trains, and the obligatory speeches. As soon as construction was completed, the line was leased to the Central Pacific and was ultimately sold to the C.P. (itself a subsidiary of the S.P.) on February 29, 1912.

The Dumbarton Cutoff proved to be the valuable freight link that Harriman had foreseen, though he had died in 1909, before its completion. During World War 1, when U.S. railroads came under the control of the United States Railroad Administration, the USRA ordered the joint use of the line and its bridges by the S.P. and peacetime rival Western Pacific. Again during World War 2 the cutoff carried massive amounts of freight for the war effort. In peacetime, it served to drastically shorten times and distances between San Francisco and destinations in the Pacific northwest and in the east, proving a vital economic and transportation link. During the 1920s, heavy freight traffic from the Dumbarton Cutoff into San Francisco was a factor in renewed consideration by Southern Pacific to electrification of this and Peninsula lines, and to completing the Peninsula lines to their ultimate 4-track mainline design; ultimately, the Great Depression obviated such need.

By the 1970s, "hotshot" freight trains from the Overland Route used the Dumbarton Cutoff to access San Francisco, and late in that decade the railroad began to replace the timber trestles with ones of reinforced concrete. Then, a shift in shipping from the port of San Francisco to the Port of Oakland caused a substantial and irreversible decline in traffic into San Francisco. Hard on the heels of its improvements to the Dumbarton Cutoff, S.P. closed the line in May 1982. In the early 1990s, Caltrain planners began considering use of the line for commuter rail, and electrification was again discussed. Today, the line is owned by the San Mateo County Transportation Agency, which is pursuing re-opening the line for commuter rail use. This effort will require rehabilitation of the bridges, leading to preparation of this evaluation.

In terms of the bridge types involved, the timber pile trestle as a type finds its antecedants in Colonial America. By the time these were built, the Southern Pacific Railroad had adopted a standard design, first during the Harriman era, and later updated that standardization. The trestle elements of these bridges conform to plans C.S. 1600, "Southern Pacific Lines Common Standard Ballasted Deck Pile Trestle, Single Track, Six-Pile Bents, Five-Strunger Creosoted Packed Chords, Adopted May 18, 1937," and C.S. 1602, "Southern Pacific Lines Common Standard Ballasted Deck Pile Trestle, Single Track, Seven-Pile Bents, Six-Stringer Creosoted Packed Chords, Adopted May 18, 1937." The abutments conform to C.S. 1660, "Southern Pacific Lines Common Standard Straight Timber Bulkhead for Ballasted Deck Trestle C.S. 1600, Adopted October 10, 1931. Since period accounts identiry the original trestles as having 6-pile bents, those at the east end of the Dumbarton Bridge and at both ends of the Newark Slough Bridge appear to date from 1908-9.

Plate girder spans came into railroad use during the 1840s, first in iron, later in steel. The deck girder spans found at the Newark Slough and Dumbarton Bridges conform to Harriman Common Standard deck girders as adopted in 1905.

As a type, the Pratt truss dates to 1844 when Thomas and Caleb Pratt patented the design. Most of the first examples were so-called "combination" trusses, using wood for chords, endposts, and compression members, and iron tension members. The design offered lower initial cost and slightly longer life than its immediate predecessors. With the onset of iron bridge construction, American railroads quickly adopted the Pratt, first in iron, later in steel. Today it is the most common truss bridge type in the United States. The Pratt truss spans found at the Dumbarton Bridge are Harriman Common Standard riveted through trusses, as adopted in 1905. The Pennsylvania (Petit) truss, as used in the Dumbarton swing span, is a derivative of the Parker truss (itself a derivative of the basic Pratt truss), and was developed by the Pennsylvania Railroad circa1875, using a series of sub-struts and sub-ties for greater strength and carrying capacity. (The Parker truss uses a curved top chord, allowing deeper trusses of greater strength, and is usually used for longer spans that those achievable with the Pratt truss.)

Movable bridges are required for low level crossings where there is a necessity to provide for a navigable passage. Of the three types of movable bridges--swing, vertical lift, and bascule--the swing bridge is the least expensive to build. Among their disadvantages, however, are the facts that they are slow to operate, require a large pier in the center of the navigable channel, and have to be fully opened for even small vessels. There are two types of swing bridges, the center-bearing and the rim-bearing. Both of the subject bridges are center-bearing. When in the closed position, the center-bearing bridge has three points of support: the center pier and the end piers; when open, the weight of the bridge rests entirely on the large phosphor bronze center bearing. In operation, the operator releases a series of wedges and brakes that secure the ends of the swing span, then engages the motor drive system whereby power is transmitted through a pinion-gear drive train to a curved rack gear atop the center pier, opening the draw span. Normally, swing bridges only rotate ninety degrees.

The Southern Pacific Dumbarton Bridge is a contributive element of the Southern Pacific Dumbarton Cutoff, a property that appears to meet the eligibility criteria of the National Register of Historic Places, at the local level of significance in transportation and engineering. It retains integrity of location, setting, feeling, and association; trestle replacements from the 1970s constitute a very minor compromise to integrity of design, materials, and workmanship. Under criterion A, it is associated with the system-wide improvements to the Southern Pacific that gave the railroad its 20th century form and made it the standard railroad of the West. It is inextricably linked with the economic growth of San Francisco and its port in the first half of the 20th century, and with the national defense efforts during both world wars. Under criterion B, it is associated with the life of E.H. Harriman, the genius of whom drove the modernization of the S.P. during the first two decades of this century, even beyond his death. Harriman saw the need for, and directed the building of, the Dumbarton Cutoff. Under criterion C, contributive elements of the Cutoff, such as the Dumbarton and Newark Slough Bridges, are representative examples of their type (Harriman Common Standard timber trestle, deck girder, and through truss bridges), period (first decade of the 20th century), and method of construction. Built in 1908-9, they are among the oldest of their type in California, with only the Southern Pacific's Sacramento River Bridge at Tehama (1898) known to predate them. In addition, the Southern Pacific Dumbarton Bridge appears to be individually eligible for the National Register under criterion A, as the first successful bridging of San Francisco Bay.

P3. **Description** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

An element of the Southern Pacific Railroad Dumbarton Cutoff linking the railroad's Sunset Route (San Francisco-New Orleans) line with the Ogden (San Francisco-Ogden) and Shasta (San Francisco-Portland) lines, and providing a cutoff from a former route that required trains to transit via San Jose, are the Southern Pacific Railroad Newark Slough Bridge, located at milepost 34.53, carrying the cutoff over the navigable waters of Newark Slough, and the Dumbarton Bridge, located at milepost 31.51, carrying the cutoff across the south end of San Francisco Bay between Dumbarton Point in Alameda County and East Palo Alto in San Mateo County. See continuation sheet for complete description.

The Dumbarton Cutoff is 16.4 miles long, connecting the two main lines between Niles, Alameda County, and Redwood Junction, San Mateo County. The cutoff is a single-track rail line with attendant spurs and sidings, turnouts and searchlight-type block and bridge approach signals. It crosses marsh areas on dredged fill, and crosses San Francisco Bay and Newark Slough on through truss swing bridges.

3. Description (continued) The Newark Slough Bridge is a 182-foot double-track, riveted steel Baltimore (Petit) through truss, with sub-struts and sub-ties, center-bearing swing span. Its built-up members are as described for the Dumbarton Bridge truss spans, above. Its control cabin, clad in V-rustic siding and with gable roof with clipped eaves, is carried atop the center of the trusses. Remnants of protective dolphins, tied together with cables, can be seen in the channel. Approach spans on both ends are single-track Harriman Common Standard ballast-deck timber trestle approach spans on 6-pile timber bents, with each span comprising two lines of five timber stringers each below the rails, and a single timber stringer at each outer edge, with timber posts supporting timber guardrails; there are 450 feet of approach spans on the west, and 150 feet of approach spans on the east. The final approach span on each end is a sixteen-foot open-deck steel deck girder span, supported on 6-pile timber bents. Though the swing span is a double-track structure, it carries only one track, on the north side of centerline.

Mainline rail east of the Newark Slough Bridge is largely 112-pound rail, rolled in 1935 and 1939. There is a handcar setout platform just east of the east approach spans to the Newark Slough Bridge, on the south side of the mainline.

All along the mainline track and on the trestle approaches to the bridges, ties still carry date nails from 1926, 1928, the 1930s and the 1940s; coupled with the rolling dates observed on the rails, these indicate a high degree of integrity of materials for this line.

B7. **Moved?** ☒ No ☐ Yes ☐ Unknown Date : Original Location:
B8. **Related Features:** Southern Pacific Railroad Dumbarton Cutoff, connecting Newark in Alameda County with Redwood Junction in San Mateo County.

B9a. Architect: Engineering Department, Southern Pacific b. Builder: American Bridge Company ; S.P. Railroad
B10. **Significance: Theme:** Transportation Area: Engineering
Period of Significance: 1909-45 **Property Type:** Bridge **Applicable Criteria:** A,B,C
(Discuss importance in terms of historical or architectural context as defined by theme, period and geographic scope. Also address integrity.)

By the 1890s, the Central Pacific and Southern Pacific Railroads were under the control of Colis P. Huntington, sole survivor of the "Big Four" who had undertaken construction of the Central Pacific portion of the transcontinental railroad beginning in 1863 (the others had been, of course, Charles Crocker, Mark Hopkins, and Leland Stanford). Huntington was parsimonious in his management, and the S.P. was in a period of retrenchment during this era, helped along by the Panic of 1893 that affected railroads nationwide. After Huntington's death, however, railroad magnate Edward H. Harriman was able in 1901 to obtain control of Huntington's interest in the S.P. from his heirs, adding that railroad to the Union Pacific, Illinois Central, and others under his control. In contrast to the frugality of the Huntington era, Harriman immediately initiated large expenditures that began a series of system-wide improvements to the S.P. to improve its efficiency (and hence its rate of return to him and company stockholders). During the next two decades then, these improvements, representing engineering and construction on a scale not seen on the S.P. since the initial construction of the Central Pacific, shaped both the physical plant and the operations of the railroad into what we see today.

Map of Bay Shore and Dumbarton Cut-Offs of the Southern Pacific.

3. The cutoff was built in conjunction with the Bayshore Cutoff and other Peninsula rail improvements during the administration of E.H. Harriman to expedite rail freight shipment between San Francisco and the Southern Pacific's Ogden and Shasta routes.

The Baltimore (Petit) truss, as used in the Newark Slough swing span, is a derivative of the basic Pratt truss using a series of sub-struts and sub-ties for greater strength and carrying capacity, and was developed by the Pennsylvania Railroad in 1871.

B10. Significance (continued) Under Harriman's direction, beginning in 1903 the engineering and maintenance of way departments of all the railroads under his control undertook standardization of virtually all elements, from track spikes to locomotives, and from bridges to stations. This allowed the companies to achieve greater economies as they expanded and improved. Among the standardized bridge types developed at this period were the timber pile trestles, deck plate girders, and through truss types used on the S.P. Newark Slough Bridge. At the same time, the S.P. began to modernize its locomotive and car fleet, transitioning to much larger and heavier locomotives (including the first of the articulated Mallet engines that were to become its hallmark), converting to oil fuel, and to all-steel passenger cars; freight cars likewise increased in size and capacity. Harriman invested in oil lands so that the oil-hungry Southern Pacific would not be dependent on outside sources, amassing some of the largest oil holdings in the nation.

In addition, Harriman began massive construction projects all around the S.P. system to increase operating efficiency, and to upgrade lines and bridges for modern traffic loadings; often these efforts took the form of newly-incorporated railroads that were totally S.P.-controlled, and that would be subsumed by the parent company upon their completion; more about this later. He also instituted an enlightened plan of formal training for employees, and built employee club houses to offer an alternative to bars and saloons. By late 1910, his efforts had resulted in the once-moribund Southern Pacific becoming one of only three railroads in the United States with an annual gross income of more than $100 million!

By 1904 Harriman had completed the Lucin Cutoff across the Great Salt Lake, eliminating the original Central Pacific/Union Pacific route around the north end of the lake (and in the process bypassing the meeting site at Promontory Summit). In 1905 the S.P. began improvements to main lines between San Francisco and the Pacific northwest, between San Francisco and Ogden, and between San Francisco and New Orleans, where S.P. steamships connected to New York. Harriman authorized more than 400 miles of new line system-wide, at a cost of $14 million, and gained concessions for 775 miles of new line for S.P.'s wholly-owned subsidiary in Mexico. During this period Harriman obtained a $2 million loan from New York banks, and is alleged to have told S.P. General Manager Julius Kruttschnitt that it was all to be spent improving mainline track in California. According to author, Lucius Beebe, Harriman called to uttschnitt as the latter was leaving the Thursday meeting, saying, "Spend it this week." While apocryphal, the story illustrates Harriman's impact upon the S.P. By the end of the year, S.P. had installed automatic block signals on 1,038 miles of track, with 664 more miles projected to be so signalled in 1906. In the San Francisco area, the company began construction of the Bayshore Cutoff between San Francisco and San Bruno to replace the circuitous and hilly line that had originally been built into the city by the predecessor San Francisco and San Jose Railroad in 1863. The new line, built in tunnels and on fill across Visitacion Bay, would be shorter and virtually level, and would include a major new yard and shops on 200 acres of reclaimed land at Visitacion. The Bayshore Cutoff would materially shorten running times between San Francisco and San Jose, and would facilitate freight shipment into San Francisco.

Related to this, and to facilitate freight shipments between San Francisco and the Ogden and Shasta lines, Harriman also directed the incorporation of the Central California Railway, to build a 16.4 mile line between Niles in Alameda County, and Redwood Junction in San Mateo County. This would obviate the need to ship freight across the Bay by ferry, or by rail south to San Jose and then back up the east side of the Bay, a trip of more than 100 miles; it would also be a logical link in conjunction with the new Bayshore Cutoff, then building. Completion of the two cutoffs would unify and improve the railroad's terminal facilities in San Francisco, shortening the trip around the south end of the Bay by 50 miles, and dispensing with the need for two car ferry transfers of freight. While conceived before the April 18, 1906 disaster in San Francisco, that event demonstrated to Harriman the need to improve access to and from the city.

The Central California Railway incorporated on October 3, 1904 with a capital stock of $1 million, to build a standard gauge railroad, with all appurtenances, from Niles to Dumbarton Point, across San Francisco Bay to Redwood City, and then to a point near San Mateo. While the articles of incorporation made no mention of the Southern Pacific, save in noting the two end connections with the S.P. mainlines, the makeup of the Board of Directors left no doubt as to the seat of control of the Central California: Director, Nathaniel T. Smith was Treasurer of the Southern Pacific; Director, William Hood was S.P.'s Chief Engineer; Director, Edgar E. Calvin was a Southern Pacific Vice-President; Director, John E. Foulds was an S.P. attorney; only Director, Frank Shay of Oakland seemingly had no connection to Southern Pacific. (Even more telling was the allocation of shares in 1912: members of the Board of Directors of the Central California held 300 shares; the Southern Pacific Railroad held 49,700 shares!)

.n 1906 the railroad built a new ferryboat facility at Alameda for both freight and passengers, replacing one built in the 1880s. It built new stations, including completing a stylish new Mission Revival station at Santa Barbara. When San Francisco was devastated by earthquake and fire on April 18, Harriman directed the railroad's response: in eighteen days the railroad carried in 1,252 cars of relief supplies, and carried out 115,295 passengers, 78,560 of which were carried free, some as far as Chicago. Harriman himself came west to the stricken city to direct efforts. In the southern part of the state, the Colorado River left its channel and began to flood the Imperial Valley, creating the Salton Sea. Forced to move its tracks five times, S.P. finally undertook the efforts, which would consume two years, to close the breach and force the river back into its natural channel. This year also saw Harriman decide to build a new line in Oregon to replace the steep and dangerous Siskiyou line; to build a cutoff line through eastern California to shorten times between Sparks, Nevada and Portland. In the few years remaining before his death in 1909, Harriman also began a major reconstruction of the original Central Pacific route over the Sierras. Under Harriman's presidency the Southern Pacific joined in cooperation with rival Santa Fe to build the Northwestern Pacific Railroad north from Willits to Eureka; such cooperation was hardly surprising, since Harriman owned controlling stock in Santa Fe.

The year 1906 saw Harriman and the S.P. investigating railroad electrification, including consideration of electrifying the S.P. main line over Donner Summit. Southern Pacific began acquisition of power generating plants and sites in the Sierras, but ultimately backed away from the expense when new, larger, oil-fired, and more efficient steam locomotives arrived. In the Bay Area, Harriman moved to electrify local lines in Oakland and the East Bay, with the ultimate intent to electrify all S.P. lines on both sides of the Bay, though his death, coupled with uncertainties related to government anti-trust proceedings would quash that effort. Related to this was the construction of the Dumbarton Cutoff, which would have carried electric-powered trains around the south end of the Bay.

Niles is located on the Southern Pacific mainline at the south end of Alameda County. Though Central Pacific crews had conducted initial surveys for a bridge between Dumbarton Point and Ravenswood as early as March 1875, the first actual rail link had been a narrow-gauge line projected between Santa Clara and Newark, intended to transport strawberries and other Santa Clara Valley produce to a steamer landing at Alviso, for transhipment to San Francisco. The company went bankrupt long before completion of the effort, and it fell upon Alfred Davis and the South Pacific Coast Railroad to complete it. Eventually connecting Oakland and Alameda with Santa Cruz, the narrow gauge SPC joined San Jose to Newark by 1877. Southern Pacific acquired the company in 1887, and eventually standard-gauged the line beginning in 1906, in conjunction with the other Harriman system improvements. Newark was to be the staging point for construction of the Dumbarton Cutoff and its attendant bridges.

.ne first surveying crews had actually arrived in 1905, setting off local speculation that the project would result in Newark receiving major yards and shops that would boost the local economy--speculation that was reinforced by similar reports in *The Railroad Gazette*; alas, this was not to be. Still, the little town boomed--sometimes literally with the off-loading and assembly of bridge steel--for the duration of the $15 million-dollar project to build the Dumbarton Cutoff. Bridge materials and other supplies arrived at Newark by rail from Oakland. Crews were busy grading the five miles between Niles and Newark, and the eleven miles between Newark and Redwood Junction. The most difficult work was to the west, for just outside Newark lay the tidal marshes of San Francisco Bay. By mid-1908, workers had completed nearly seven miles of track and an additional seven miles of grading, and were at work on the bridges. Construction steel, fabricated by American Bridge Company in Pennsylvania, was delivered by rail and off-loaded to the subassembly site at Dumbarton Point. Working from both sides of the Bay, and in several locations at once, crews began constructing the timber pile trestle approaches for the drawbridges at Newark Slough (subject of a separate form and evaluation) and at Dumbarton. At Dumbarton, piledrivers rode both ends of isolated sections of trestles as crews built toward each other.

At Newark Slough (and at Dumbarton), crews erected an elaborate system of timber pile dolphins topped by a timber truss falsework placed parallel to the navigable channel, allowing shipping to proceed relatively unimpeded during construction. With the falsework in place, they built a vertical steel guiding frame to place the steel shell of the central pivot pier. When they had placed the outside shell of the pier, the workers then proceeded to dredge the inside to a predetermined depth, after which they drove a forest of timber piles, finally filling the shell with concrete. (The two-column bents for the rest piers were constructed in similar fashion.) They then pulled out the timber pile dolphins surrounding the pivot pier. With the pivot pier in place, workers began the task of assembling the swing span. They began assembly of the massive through truss, with subassemblies delivered by barge.

On land, crews used dredgers to build three miles of new railroad grade above the marsh, while in San Mateo County that scene was repeated to reach from the solid ground to the western trestle approaches of the Dumbarton Bridge. The line was finally completed on September 12, 1910 and the bridge was formally opened on September 24, amid festivities that included an all-night dance, a barbecue, special trains, and the obligatory speeches. As soon as construction was completed, the line was leased to the Central Pacific and was ultimately sold to the C.P. (itself a subsidiary of the S.P.) on February 29, 1912.

The Dumbarton Cutoff proved to be the valuable freight link that Harriman had foreseen, though he had died in 1909, before its completion. During World War 1, when U.S. railroads came under the control of the United States Railroad Administration, the USRA ordered the joint use of the line and its bridges by the S.P. and peacetime rival Western Pacific. Again during World War 2 the cutoff carried massive amounts of freight for the war effort. In peacetime, it served to drastically shorten times and distances between San Francisco and destinations in the Pacific northwest and in the east, proving a vital economic and transportation link. During the 1920s, heavy freight traffic from the Dumbarton Cutoff into San Francisco was a factor in renewed consideration by Southern Pacific to electrification of this and Peninsula lines, and to completing the Peninsula lines to their ultimate 4-track mainline design; ultimately, the Great Depression obviated such need.

By the 1970s, "hotshot" freight trains from the Overland Route used the Dumbarton Cutoff to access San Francisco, and late in that decade the railroad began to replace the timber trestles with ones of reinforced concrete. Then, a shift in shipping from the port of San Francisco to the Port of Oakland caused a substantial and irreversible decline in traffic into San Francisco. Hard on the heels of its improvements to the Dumbarton Cutoff, S.P. closed the line in May 1982. In the early 1990s, Caltrain planners began considering use of the line for commuter rail, and electrification was again discussed. Today, the line is owned by the San Mateo County Transportation Agency, which is pursuing re-opening the line for commuter rail use. This effort will require rehabilitation of the bridges, leading to preparation of this evaluation.

In terms of the bridge types involved, the timber pile trestle as a type finds its antecedants in Colonial America. By the time these were built, the Southern Pacific Railroad had adopted a standard design, first during the Harriman era, and later updated that standardization. The trestle elements of these bridges conform to plans C.S. 1600, "Southern Pacific Lines Common Standard Ballasted Deck Pile Trestle, Single Track, Six-Pile Bents, Five-Strunger Creosoted Packed Chords, Adopted May 18, 1937," and C.S. 1602, "Southern Pacific Lines Common Standard Ballasted Deck Pile Trestle, Single Track, Seven-Pile Bents, Six-Stringer Creosoted Packed Chords, Adopted May 18, 1937." The abutments conform to C.S. 1660, "Southern Pacific Lines Common Standard Straight Timber Bulkhead for Ballasted Deck Trestle C.S. 1600, Adopted October 10, 1931." Since period accounts identiry the original trestles as having 6-pile bents, those at the east end of the Dumbarton Bridge and at both ends of the Newark Slough Bridge appear to date from 1908-9.

Plate girder spans came into railroad use during the 1840s, first in iron, later in steel. The deck girder spans found at the Newark Slough and Dumbarton Bridges conform to Harriman Common Standard deck girders as adopted in 1905.

a type, the Pratt truss dates to 1844 when Thomas and Caleb Pratt patented the design. Most of the first examples were so-called combination" trusses, using wood for chords, endposts, and compression members, and iron tension members. The design offered lower initial cost and slightly longer life than its immediate predecessors. With the onset of iron bridge construction, American railroads quickly adopted the Pratt, first in iron, later in steel. Today it is the most common truss bridge type in the United States. The Baltimore (Petit) truss span found at the Newark Slough Bridge is a derivative of the Harriman Common Standard riveted through Pratt trusses, as adopted in 1905. The Baltimore (Petit) truss, as used in the Newark Slough swing span, was developed by the Pennsylvania Railroad in 1871, using a series of sub-struts and sub-ties for greater strength and carrying capacity.

Movable bridges are required for low level crossings where there is a necessity to provide for a navigable passage. Of the three types of movable bridges--swing, vertical lift, and bascule--the swing bridge is the least expensive to build. Among their disadvantages, however, are the facts that they are slow to operate, require a large pier in the center of the navigable channel, and have to be fully opened for even small vessels. There are two types of swing bridges, the center-bearing and the rim-bearing. The Newark Slough Bridge is center-bearing. When in the closed position, the center-bearing bridge has three points of support: the center pier and the end piers; when open, the weight of the bridge rests entirely on the large phosphor bronze center bearing. In operation, the operator releases a series of wedges and brakes that secure the ends of the swing span, then engages the motor drive system whereby power is transmitted through a pinion-gear drive train to a curved rack gear atop the center pier, opening the draw span. Normally, swing bridges only rotate ninety degrees.

ne Southern Pacific Dumbarton Cutoff appears to meet the eligibility criteria of the National Register of Historic Places, at the local level of significance in transportation and engineering. It retains integrity of location, setting, feeling, and association; trestle replacements from the 1970s constitute a very minor compromise to integrity of design, materials, and workmanship. Under criterion A, it is associated with the system-wide improvements to the Southern Pacific that gave the railroad its 20th century form and made it the standard railroad of the West. It is inextricably linked with the economic growth of San Francisco and its port in the first half of the 20th century, and with the national defense efforts during both world wars. Under criterion B, it is associated with the life of E.H. Harriman, the genius of whom drove the modernization of the S.P. during the first two decades of this century, even beyond his death. Harriman saw the need for, and directed the building of, the Dumbarton Cutoff. Under criterion C, contributive elements of the Cutoff, such as the Dumbarton and Newark Slough Bridges, are representative examples of their type (Harriman Common Standard timber trestle, deck girder, and through truss bridges), period (first decade of the 20th century), and method of construction. Built in 1908-9, they are among the oldest of their type in California, with only the Southern Pacific's Sacramento River Bridge at Tehama (1898) known to predate them.

Stephen L. Peterson, M.S., Wildlife Ecologist
Matthew Mosher, B.S., Plant Ecologist

Section 1. Introduction

This report describes the biological resources present in and adjacent to the area of Meta Platforms, Inc.'s (Meta) proposed Willow Village Master Plan project (project), as well as the potential impacts of the proposed project and measures necessary to reduce impacts to less-than-significant levels under the California Environmental Quality Act (CEQA). This report was prepared to facilitate CEQA review of the Willow Village Master Plan by the City of Menlo Park. In addition, this report contains the information needed to satisfy Mitigation Measure BIO-1 from the ConnectMenlo General Plan Environmental Impact Report (EIR) (Placeworks 2016), which requires preparation of a biological resources assessment containing information specified in that mitigation measure.

1.1 Project Description

The proposed project entails the redevelopment of the former Menlo Science and Technology Park, as well as an adjacent area west of Willow Road, to create a contemporary mixed-use district including housing, community-serving retail, new public parks and landscaped areas, and a new campus district to provide additional workspace for Meta. The approximately 64.0-acre project site (inclusive of the "main project site" east of Willow Road and "Hamilton Avenue Parcels North and South" west of Willow Road) is located within Menlo Park's Bayfront Area and is bounded by Willow Road and commercial development to the west, the Dumbarton Rail Corridor to the north, the Hetch Hetchy right-of-way corridor and Mid-Peninsula High School to the south, and an existing life science complex to the east (Figure 1). To the west are existing commercial and multi-family uses and Menlo Park's Belle Haven neighborhood.

The main project site is currently occupied by 20 office, industrial, and warehouse buildings that compose approximately 1,000,000 square feet (ft^2) of improvements, as well as surface parking (Figure 2). The Hamilton Avenue Parcels North and South portion of the project site is occupied primarily by restaurants and a gas station. Following the approval of the 2014-2016 update of the Land Use and Circulation Elements of the City of Menlo Park General Plan, identified as ConnectMenlo (City of Menlo Park 2016), Meta undertook an extensive planning effort for the Willow Village Master Plan. The project has been carefully designed to conform to the updated zoning requirements, including the provision for "master planned projects" which allows for a single project or phased development project on sites that exceed 15 acres in size and contain different zoning designations to aggregate density and uses across the entire project site. In addition, the project would aim to comply with all other development standards in the office and residential mixed-use zoning districts, including parking, setbacks, open space, paseos, building design (including bird-friendly design), green and sustainable building, and heritage trees.

Willow Village proposes to replace more than 1,000,000 ft^2 of existing industrial, office, and warehouse space in the Menlo Science and Technology Park with a new, mixed-used village that includes up to 1,735 residential units, 200,000 ft^2 of retail uses, a hotel with up to 193 rooms and accessory uses, 1,250,000 ft^2 of office uses,

Willow Village Master Plan Biological Resources Report (3375-21)

February 2022

and 500,000 square feet of accessory uses. The plan will require demolition of all existing site improvements consisting of buildings, streets, and utilities. Proposed improvements include site grading to elevate the property above the FEMA base flood elevation and to create buildable pads, construction of new circulation improvements to accommodate vehicles, bicycles, and pedestrians, utilities, park and open space improvements, residential mixed-use buildings, a hotel, and an office campus. Additional improvements will be completed at key connection points at O'Brien Drive, Park Street, Adams Court, and Hamilton Avenue. Mixed-use buildings will range in height from 55–80 ft; office buildings and associated accessory buildings will have a maximum height of 110 ft and would comply with the average heights as established by *ConnectMenlo's* zoning standards.

In order to accommodate the realignment of Hamilton Avenue (to connect to New Hamilton) and to construct the western access (ramp and elevator) to an elevated park, some of the existing development on the block located at the northwest corner and a portion of the block located at the southwest corner of Willow Road and the existing Hamilton Avenue may need to be reconfigured. The block on the northwest corner is approximately 1.83 acres and currently is developed with approximately 16,000 square feet of retail buildings. The portion of the block located at the southwest corner is approximately 1.34 acres and currently is developed with a gas station with approximately 4,500 sf of retail. Both sites are zoned C-2-S Neighborhood Commercial District Special. To accommodate the Hamilton Avenue road realignment, the gas station would be relocated further north in the retail site. In addition, the existing retail may be removed and replaced with new retail buildings in a new site configuration. It is anticipated that the replacement development would be similar to the existing development in size and use potentially adding 5,000 sf in shops, which could include an additional drive through option. Any construction related activities would occur in Phase 2 of the schedule.

The site lighting for Willow Village will comply with Title 24 and Menlo Park's lighting guidelines for both the Residential Mixed-use and Office zoning districts. All fixtures will be energy-efficient, reduce glare and unnecessary light spillage, while providing safe routes of travel for vehicles and pedestrians.

It is anticipated that all trees on the project site would be removed. Heritage trees, as defined by the City of Menlo Park, would be replaced at a ratio of 2:1 (replacement trees:impacted heritage tree) in accordance with City policies for commercial applicants[1]. The conceptual landscape plan envisions a combination of native, drought-tolerant, and adapted species from around the world and calls for approximately 800 new trees to be planted. Consistent with Menlo Park municipal codes on landscape design, no invasive species or noxious weeds would be used in landscaping for the redeveloped areas.

A chain of publicly accessible open spaces will be located along Main Street, and a new 2.1-acre elevated pedestrian and bike-friendly publicly accessible park is designed to accommodate pedestrian walking trails, bicycle paths, gardens with native drought-tolerant and adapted species, lawn areas, interpretive horticultural exhibits, seating areas, children's play areas, recreation areas, shading canopies, water features, cafés, picnic areas, and public restrooms, as well as security and safety infrastructure. The elevated park would be constructed

[1] https://menlopark.org/DocumentCenter/View/833/Heritage-Tree-Replacement-Procedures

above grade, providing views south over Willow Village and Town Square, north to the Don Edwards San Francisco Bay National Wildlife Refuge, and east towards San Francisco Bay.

Offsite improvements will be made as well. Safe crossing design improvements will be incorporated in the northwest corner of the site to provide safe pedestrian, bicycle, and vehicular movements at Hamilton Avenue and between the two adjoining office campuses. Improvements along Willow Road will include widening of the right-of-way to accommodate additional left turn pockets, installation of new traffic signals, utility points of connections, sidewalk improvements, and landscape improvements. At the southeast corner of the site, in the Residential/Shopping District, a new intersection is proposed at O'Brien Drive, requiring new traffic signals and roadway layout alterations. Along the southern property line, an existing open channel located both on and off-site within the study area directs storm water flows to an existing storm drain main along the east property line. To accommodate site improvements, the drainage flows within this channel will be undergrounded and the channel filled.

It is currently anticipated that Willow Village will be constructed in two primary phases, with Phase 1 being divided into two sub-phases. Construction will commence on the southern portion of the site and move northward. Each construction phase will include the grading of that phase and construction of the circulation (including transit, auto, bicycle, and pedestrian) and utility infrastructure necessary to serve that phase. There may be some overlap in construction phases.

1.2 Bird-Safe Design

In 2014, the City of Menlo Park initiated the process of updating its General Plan Land Use and Circulation Elements as well as its zoning for the M-2 area (also known as the Bayfront Area) in the northern portion of Menlo Park. Collectively, this update to the General Plan and zoning is known as *ConnectMenlo*. On November 29, 2016, the City Council certified the *ConnectMenlo: General Plan Land Use & Circulation Elements and M-2 Area Zoning Update Environmental Impact Report* (ConnectMenlo EIR) and approved the General Plan Land Use and Circulation Elements. The Willow Village project is located within the ConnectMenlo area.

Mitigation Measure BIO-1 of the ConnectMenlo EIR requires measures to ensure that the project reduces bird collisions with new buildings. Pursuant to Mitigation Measure BIO-1, the project must comply with bird-safe design requirements subsequently incorporated into Municipal Code Sections 16.43.150(6) and 16.43.130(6), which include measures to reduce bird collisions. These requirements are as follows:

A. No more than 10% of façade surface area shall have non-bird-friendly glazing.

B. Bird-friendly glazing includes, but is not limited to, opaque glass, covering the outside surface of clear glass with patterns, paned glass with fenestrations, frit or etching patterns, and external screens over nonreflective glass. Highly reflective glass is not permitted.

C. Occupancy sensors or other switch control devices with an astronomic time clock shall be installed on nonemergency lights and shall be programmed to shut off during non-work hours and between 10:00 p.m. and sunrise.

D. Placement of buildings shall avoid the potential funneling of flight paths towards a building façade.

E. Glass skyways or walkways, free-standing (see-through) glass walls and handrails, and transparent building corners shall not be allowed.

F. Transparent glass shall not be allowed at the rooflines of buildings, including in conjunction with roof decks, patios and roofs with landscape vegetation.

G. Use of rodenticides shall not be allowed.

A project may receive a waiver from requirements A through F, subject to the submittal of a site-specific evaluation from a qualified biologist and review and approval by the Planning Commission. A waiver from requirement G is not authorized.

The Willow Village Master Plan incorporates robust bird-safe design measures to minimize bird collisions with project buildings, in accordance with Mitigation Measure BIO-1. H. T. Harvey & Associates (2021a) prepared a *Willow Village Master Plan Bird-Safe Design Assessment* that assessed the potential for bird collisions with various Master Plan components based on the locations of those components and the project's conceptual Conditional Development Permit (CDP) application. For that bird-safe design assessment, H. T. Harvey worked with Meta's design team to identify features of the architecture of project buildings and lighting principles that would reduce the frequency of avian collisions; the components of the City's bird-safe design requirements (from Mitigation Measure BIO-1 of the ConnectMenlo EIR) that Master Plan components could comply with; and proposed waivers from the requirements identified in Municipal Code Sections 16.43.150(6) and 16.43.130(6) and alternative measures that the project would incorporate to meet the intent and effectiveness of any City bird-safe design requirements that the project could not comply with to the letter. In addition, H. T. Harvey also proposed mitigation measures to further minimize impacts related to bird collisions. The *Willow Village Master Plan Bird-Safe Design Assessment* documents that with implementation of these design features, lighting principles, bird-safe design requirements or alternative measures, and mitigation measures, project impacts due to bird collisions with buildings would be reduced to less-than-significant levels under CEQA.

Section 2. Methods

2.1 Background Review

Prior to conducting initial field work, H. T. Harvey & Associates ecologists reviewed the original project plans and description provided by Meta in November 2017; aerial images (Google Inc. 2021); a U.S. Geological Survey (USGS) topographic map; the California Department of Fish and Wildlife's (CDFW's) California Natural Diversity Database (CNDDB 2021); and other relevant scientific literature and technical databases. Previous reports prepared for the project and vicinity were also reviewed, including the arborist report for the main project site (SBCA Tree Consulting 2017); the Final EIRs for the nearby Menlo Park Facebook Campus (Atkins 2012) and the Facebook Campus Expansion Project (ICF International 2016); the Final EIR for the ConnectMenlo: General Plan Land Use & Circulation Elements and M-2 Area Zoning Update for the City of Menlo Park (PlaceWorks 2016); and the Comprehensive Conservation Plan and Environmental Assessment for the Don Edwards San Francisco Bay National Wildlife Refuge (NWR) (USFWS 2012). In addition, for plants, we reviewed all species on current California Native Plant Society (CNPS) California Rare Plant Rank (CRPR) 1A, 1B, 2A, and 2B lists occurring in the *Palo Alto, California* USGS quadrangle and surrounding eight quadrangles (*Woodside, San Mateo, Redwood Point, Newark, Mountain View, Cupertino, Mindego Hill,* and *La Honda, California*). Quadrangle-level results are not maintained for CRPR 3 and 4 species, so we also conducted a search of the CNPS Inventory records for these species occurring in San Mateo County (CNPS 2021). In addition, we queried the CNDDB (2021) for natural communities of special concern that occur in the project region. For the purposes of this report, the "project vicinity" encompasses a 5-mile (mi) radius surrounding the project site.

After the Willow Village design and program were revised in May 2020, we reviewed the updated plans (Peninsula Innovation Partners 2020) and current CNDDB and CNPS information to ensure that our updated assessment of the project's potential impacts on biological resources was based on up-to-date information.

In addition, H. T. Harvey & Associates (2021b) performed a delineation of jurisdictional wetlands and other waters of the U.S./State within the study area in 2021. A field visit for that delineation was conducted in August 2021, and a follow-up visit to assess conditions in a drainage ditch was conducted on December 31, 2021.

2.2 Site Visits

The project site discussed in this report includes the area enclosed by the project boundary shown in Figure 2. For the purposes of ensuring evaluation of all potential direct, indirect, and cumulative effects on biological resources, the project's biological resources study area includes the project site (main site and Hamilton Avenue Parcels North and South) and areas within 100 ft beyond the project boundary (Figure 2). Reconnaissance-level field surveys of the main project site, as well as areas within the Dumbarton Rail Corridor both east and west of Willow Road, were initially conducted by H. T. Harvey & Associates senior wildlife ecologist Steve Rottenborn, Ph.D., on October 26, 2017 and by H. T. Harvey & Associates wildlife ecologist, Stephen L.

Peterson, M.S., and plant ecologist Matthew Mosher, B.S., on November 13, 2017, with an additional visit by M. Mosher on November 15, 2017. After the project was redesigned in 2019, S. Rottenborn visited the main project site again on April 22, 2019. After the project was redesigned in 2020, H. T. Harvey & Associates senior wildlife ecologist Robin Carle, M.S., visited the Hamilton Avenue Parcels North and South portion of the site on June 10, 2020 and H. T. Harvey & Associates senior plant ecologist Mark Bibbo, M.S., visited this area on June 12, 2020. The purpose of these surveys was to provide a project-specific impact assessment for the proposed project as described above. Specifically, surveys were conducted to (1) assess existing biotic habitats and general plant and wildlife communities in the study area, (2) assess the potential for the project to impact special-status species or their habitats, and (3) identify potential jurisdictional habitats, such as Waters of the U.S./State and riparian habitat.

In addition, focused surveys for Congdon's tarplant (*Centromadia parryi* var. *congdonii*) were conducted by H. T. Harvey & Associates plant ecologists on November 13, 2017 (main project site) and June 12, 2020 (Hamilton Avenue Parcels North and South). These surveys targeted areas of potential suitable habitat along the Dumbarton Rail Corridor in the northern portion of the study area.

Section 3. Regulatory Setting

Biological resources on the project site are regulated by a number of federal, state, and local laws and ordinances, as described below.

3.1 Federal

3.1.1 Clean Water Act

The Clean Water Act (CWA) functions to maintain and restore the physical, chemical, and biological integrity of Waters of the U.S., which include, but are not limited to, tributaries to traditionally navigable waters currently or historically used for interstate or foreign commerce, and adjacent wetlands. Historically, in non-tidal waters, U.S. Army Corp of Engineers (USACE) jurisdiction extends to the ordinary high water (OHW) mark, which is defined in Title 33, Code of Federal Regulations (CFR), Part 328.3. If there are wetlands adjacent to channelized features, the limits of USACE jurisdiction extend beyond the OHW mark to the outer edges of the wetlands. Wetlands that are not adjacent or tributaries to Waters of the U.S. are termed "isolated wetlands" and, depending on the circumstances, typically are not subject to USACE jurisdiction. In tidal waters, USACE jurisdiction extends to the landward extent of vegetation associated with salt or brackish water or the high tide line. The high tide line is defined in 33 CFR Part 328.3 as "the line of intersection of the land with the water's surface at the maximum height reached by a rising tide."

Construction activities within jurisdictional waters are regulated by the USACE. The placement of fill into such waters must comply with permit requirements of the USACE. No USACE permit will be effective in the absence of Section 401 Water Quality Certification. The State Water Resources Control Board (SWRCB) is the state agency (together with the Regional Water Quality Control Boards [RWQCBs] charged with implementing water quality certification in California.

Project Applicability: The project site itself does not support wetland or aquatic habitats. A small, isolated segment of forested wetland that may be claimed as Waters of the U.S. is located in a drainage ditch along the northern edge of the study area, just outside the project boundary (H. T. Harvey & Associates 2021b). Similarly, a linear area of herbaceous-dominated seasonal wetland is present in the Dumbarton Rail Corridor immediately north of the Hamilton Avenue Parcels North and South portion of the project site. Another herbaceous seasonal wetland is present just outside the northeast corner of the project boundary (H. T. Harvey & Associates 2021b). These seasonal wetlands might also be claimed as Waters of the U.S. The San Francisco office of the USACE would ultimately determine whether or not these features are subject to USACE jurisdiction under Section 404 of the CWA (under either current regulations or any amended regulations). It is our understanding that the project will avoid to the extent feasible placing fill in those features, in which case no permit from the USACE would be needed for activities associated with these features even if determined to be jurisdictional. However, if these features are determined to be jurisdictional and are impacted by project grading, a Section

404 permit from the USACE would be required., and mitigation of impacts would be required as described in Mitigation Measures BIO-11 and 12 in Section 6.2.1.

A ditch located partially on-site and partially within the Hetch Hetchy easement corridor immediately south of the main project site (and within the study area) was dominated by upland (non-wetland) vegetation during our April 2019 site visit (as well as the August 2021 site visit for the delineation of waters of the U.S./State [H. T. Harvey & Associates 2021b]), is concrete-lined in at least some locations, and is excavated in uplands to collect stormwater runoff from the surrounding development. A visit to the site on December 31, 2021, after a prolonged, heavy rain event, revealed evidence of only a very small amount of runoff that had flowed through this ditch during the storm. As such, we do not expect this feature to be claimed as Waters of the U.S. by the USACE.

Brackish marsh habitat is present outside and well to the north and northeast of the study area. We expect that this brackish marsh would be considered Waters of the U.S. under both current and proposed definitions of Waters of the U.S. because it is adjacent to tidal channels that would either be considered navigable or tributaries to navigable waters. This brackish marsh habitat is located well off-site, however, and no impacts to this marsh would result from the proposed project.

3.1.2 Rivers and Harbors Act

Section 10 of the Rivers and Harbors Act of 1899 prohibits the creation of any obstruction to the navigable capacity of Waters of the U.S., including discharge of fill and the building of any wharfs, piers, jetties, and other structures without Congressional approval or authorization by the Chief of Engineers and Secretary of the Army (33 U.S.C. 403).

Navigable Waters of the U.S., which are defined in 33 CFR, Part 329.4, include all waters subject to the ebb and flow of the tide, and those which are presently or have historically been used to transport commerce. The shoreward jurisdictional limit of tidal waters is further defined in 33 CFR, Part 329.12 as "the line on the shore reached by the plane of the mean (average) high water." It is important to understand that the USACE does not regulate wetlands under Section 10, only the aquatic or open waters component of bay habitat, and that there is overlap between Section 10 jurisdiction and Section 404 jurisdiction. According to 33 CFR, Part 329.9, a waterbody that was once navigable in its natural or improved state retains its character as "navigable in law" even though it is not presently used for commerce as a result of changed conditions or the presence of obstructions. Historical Section 10 Waters may occur behind levees in areas that are not currently exposed to tidal or muted-tidal influence, and meet the following criteria: (1) the area is presently at or below the mean high water line; (2) the area was historically at or below mean high water in its "unobstructed, natural state"; and (3) there is no evidence that the area was ever above mean high water.

As mentioned above, Section 404 of the CWA authorizes the USACE to issue permits to regulate the discharge of dredged or fill material into Waters of the U.S. If a project also proposes to discharge of dredged or fill

material or introduce of other potential obstructions in navigable Waters of the U.S., a Letter of Permission authorizing these impacts must be obtained from the USACE under Section 10 of the Rivers and Harbors Act.

Project Applicability: Based on mapping of the historical margins of San Francisco Bay marshes (Nichols and Wright 1971), which depict the margins of baylands being located well north of the project site, no current or historical Section 10 waters are present within the project boundary or elsewhere within the study area (e.g., in the wetlands immediately north and northeast of the project boundary). Therefore, no Section 10 Letter of Permission from the USACE is required for the project.

3.1.3 Federal Endangered Species Act

The Federal Endangered Species Act (FESA) protects federally listed wildlife species from harm or "take", which is broadly defined as "to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, collect, or attempt to engage in any such conduct." Take can also include habitat modification or degradation that directly results in death or injury of a listed wildlife species. An activity can be defined as "take" even if it is unintentional or accidental. Generally, listed plant species are provided less protection than listed wildlife species. Listed plant species are legally protected from take under the FESA only if they occur on federal lands.

The U.S. Fish and Wildlife Service (USFWS) and the National Marine Fisheries Service (NMFS) have jurisdiction over federally listed, threatened, and endangered species under FESA. The USFWS also maintains lists of proposed and candidate species. Species on these lists are not legally protected under FESA, but may become listed in the near future and are often included in their review of a project.

Project Applicability: No suitable habitat for any federally listed plant or animal species occurs in the study area. Thus, no federally listed species are reasonably expected to occur in the study area.

3.1.4 Magnuson-Stevens Fishery Conservation and Management Act

The Magnuson-Stevens Fishery Conservation and Management Act governs all fishery management activities that occur in federal waters within the United States' 200-nautical-mile limit. The Act establishes eight Regional Fishery Management Councils responsible for the preparation of fishery management plans (FMPs) to achieve the optimum yield from U.S. fisheries in their regions. These councils, with assistance from NMFS, establish Essential Fish Habitat (EFH) in FMPs for all managed species. Federal agencies that fund, permit, or implement activities that may adversely affect EFH are required to consult with NMFS regarding potential adverse effects of their actions on EFH, and respond in writing to recommendations by NMFS.

Project Applicability: No EFH is present in the study area.

3.1.5 Federal Migratory Bird Treaty Act

The federal Migratory Bird Treaty Act (MBTA), 16 U.S.C. Section 703, prohibits killing, possessing, or trading of migratory birds except in accordance with regulations prescribed by the Secretary of the Interior. The MBTA

protects whole birds, parts of birds, and bird eggs and nests, and it prohibits the possession of all nests of protected bird species whether they are active or inactive. An active nest is defined as having eggs or young, as described by the USFWS in its June 14, 2018 memorandum "Destruction and Relocation of Migratory Bird Nest Contents". Nest starts (nests that are under construction and do not yet contain eggs) and inactive nests are not protected from destruction.

In its June 14, 2018 memorandum, the USFWS clarified that the destruction of an active nest "while conducting any activity where the intent of the action is not to kill migratory birds or destroy their nests or contents" is not prohibited by the MBTA. On February 3, 2020, the USFWS published a proposed rule to codify the scope of the MBTA as it applies to activities resulting in the injury or death of migratory birds (85 FR 5915-5926); the USFWS is currently considering comments on the proposed rule.

Project Applicability: All native bird species that occur in the study area are protected under the MBTA. Mitigation Measures BIO-13, 14, 15, and 16 shall be implemented to ensure that project activities comply with the MBTA as described in Section 6.4.1.

3.2 State

3.2.1 Porter-Cologne Water Quality Control Act

The SWRCB works in coordination with the nine RWQCBs to preserve, protect, enhance, and restore water quality. Each RWQCB makes decisions related to water quality for its region, and may approve, with or without conditions, or deny projects that could affect Waters of the State. Their authority comes from the CWA and the State's Porter-Cologne Water Quality Control Act (Porter-Cologne). Porter-Cologne broadly defines Waters of the State as "any surface water or groundwater, including saline waters, within the boundaries of the state." Because Porter-Cologne applies to any water, whereas the CWA applies only to certain waters, California's jurisdictional reach overlaps and may exceed the boundaries of Waters of the U.S. For example, Water Quality Order No. 2004-0004-DWQ states that "shallow" Waters of the State include headwaters, wetlands, and riparian areas. Moreover, the San Francisco Bay Region RWQCB's Assistant Executive Director has stated that, in practice, the RWQCBs may claim jurisdiction over riparian areas. Where riparian habitat is not present, such as may be the case at headwaters, jurisdiction is taken to the top of bank.

On April 2, 2019, the SWRCB adopted the State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Waters of the State. In these new guidelines, riparian habitats are not specifically described as Waters of the State but instead as important buffer habitats to streams that do conform to the State Wetland Definition. The Procedures describe riparian habitat buffers as important resources that may both be included in required mitigation packages for permits for impacts to Waters of the State.

Pursuant to the CWA, projects that are regulated by the USACE must also obtain a Section 401 Water Quality Certification permit from the RWQCB. This certification ensures that the proposed project will uphold state water quality standards. Because California's jurisdiction to regulate its water resources is much broader than

that of the federal government, proposed impacts on Waters of the State may require Waste Discharge Requirements even if the area occurs outside of USACE jurisdiction. Moreover, the RWQCB may impose mitigation requirements even if the USACE does not, for example for riparian habitats which are buffers to Waters of the State. Under the Porter-Cologne, the SWRCB and the nine regional boards also have the responsibility of granting CWA National Pollutant Discharge Elimination System (NPDES) permits and Waste Discharge Requirements for certain point-source and non-point discharges to waters. These regulations limit impacts on aquatic and riparian habitats from a variety of urban sources.

Project Applicability: No aquatic, wetland, or riparian habitats are present within the project boundary. However, as noted above in Section 3.1.1, a small, isolated segment of forested wetland that would likely be claimed as Waters of the State is located in a drainage ditch along the northern edge of and within the study area, just outside the project boundary (H. T. Harvey & Associates 2021b). Similarly, a linear area of herbaceous-dominated seasonal wetland is present in the Dumbarton Rail Corridor immediately north of the Hamilton Avenue Parcels North and South portion of the project site. Another herbaceous seasonal wetland is present just outside the northeast corner of the project boundary (H. T. Harvey & Associates 2021b). These seasonal wetlands might also be claimed as Waters of the State. It is our understanding that the project will avoid to the extent feasible placing fill in those wetlands, in which case no permit from the RWQCB would be needed for activities associated with wetlands even if these features are determined to be jurisdictional. However, if these features are determined to be jurisdictional and are impacted by the project, Section 401 water quality certification or Waste Discharge Requirements from the RWQCB would be required, and mitigation of impacts would be required as described in Mitigation Measures BIO-11 and 12 in Section 6.2.1. A ditch located partially on-site and partially within the Hetch Hetchy easement corridor immediately south of the main project site (but within the study area) was dominated by upland (non-wetland) vegetation during our April 2019 site visit, is concrete lined in at least some locations, and is excavated in uplands to collect stormwater runoff from the surrounding development. As such, we do not expect this feature to be claimed as Waters of the State by the RWQCB (H. T. Harvey & Associates 2021b).

Brackish marsh habitat is present well to the north and northeast of the study area. We expect that this brackish marsh would be considered Waters of the State because it is adjacent to tidal channels that would either be considered navigable or tributaries to navigable waters. This brackish marsh habitat is located well off-site, however, and no impacts to this marsh would result from the proposed project.

3.2.2 California Endangered Species Act

The California Endangered Species Act (CESA; California Fish and Game Code, Chapter 1.5, Sections 2050-2116) prohibits the take of any plant or animal listed as an endangered, threatened, or candidate species. In accordance with the CESA, the CDFW has jurisdiction over state-listed species (Fish and Game Code 2070). The CDFW regulates activities that may result in "take" of individuals (i.e., "hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill"). Habitat degradation or modification is not expressly included in the definition of "take" under the California Fish and Game Code. The CDFW, however, has

interpreted "take" to include the "killing of a member of a species which is the proximate result of habitat modification."

Project Applicability: No suitable habitat for any state listed plant or animal species occurs in the study area, and thus no state listed species are expected to occur in the study area.

3.2.3 California Environmental Quality Act

CEQA is a state law that requires state and local agencies to document and consider the environmental implications of their actions and to refrain from approving projects with significant environmental effects if there are feasible alternatives or mitigation measures that can substantially lessen or avoid those effects. CEQA requires the full disclosure of the environmental effects of agency actions, such as approval of a general plan update or the projects covered by that plan, on resources such as air quality, water quality, cultural resources, and biological resources. The State Resources Agency promulgated guidelines for implementing CEQA are known as the State CEQA Guidelines.

Section 15380(b) of the State CEQA Guidelines provides that a species not listed on the federal or state lists of protected species may be considered rare if the species can be shown to meet certain specified criteria. These criteria have been modeled after the definitions in the FESA and the CESA and the section of the California Fish and Game Code dealing with rare or endangered plants and animals. This section was included in the guidelines primarily to deal with situations in which a public agency is reviewing a project that may have a significant effect on a species that has not yet been listed by either the USFWS or CDFW or species that are locally or regionally rare.

The CDFW has produced three lists (amphibians and reptiles, birds, and mammals) of "species of special concern" that serve as "watch lists". Species on these lists are of limited distribution or the extent of their habitats has been reduced substantially, such that threat to their populations may be imminent. Thus, their populations should be monitored. They may receive special attention during environmental review as potential rare species, but do not have specific statutory protection. All potentially rare or sensitive species, or habitats capable of supporting rare species, are considered for environmental review per the CEQA Section 15380(b).

The CNPS, a non-governmental conservation organization, has developed CRPRs for plant species of concern in California in the Inventory of Rare and Endangered Plants (CNPS 2021). The CRPRs include lichens, vascular, and non-vascular plants, and are defined as follows:

- CRPR 1A Plants considered extinct.
- CRPR 1B Plants rare, threatened, or endangered in California and elsewhere.
- CRPR 2A Plants considered extinct in California but more common elsewhere.
- CRPR 2B Plants rare, threatened, or endangered in California but more common elsewhere.
- CRPR 3 Plants about which more information is needed - review list.

- CRPR 4 Plants of limited distribution-watch list.

The CRPRs are further described by the following threat code extensions:

- .1—seriously endangered in California;
- .2—fairly endangered in California;
- .3—not very endangered in California.

Although the CNPS is not a regulatory agency and plants on these lists have no formal regulatory protection, plants appearing as CRPR 1B or 2 are, in general, considered to meet CEQA's Section 15380 criteria, and adverse effects on these species may be considered significant. Impacts on plants that are listed by the CNPS as CRPR 3 or 4 are also considered during CEQA review, although because these species are typically not as rare as those of CRPR 1B or 2, impacts on them are less frequently considered significant.

Compliance with CEQA Guidelines Section 15065(a) requires consideration of plant or animal natural communities. Vegetation types of "special concern" are tracked in Rarefind (CNDDB 2021). Further, the CDFW ranks sensitive vegetation alliances based on their global (G) and state (S) rankings analogous to those provided in the CNDDB. Global rankings (G1–G5) of natural communities reflect the overall condition (rarity and endangerment) of a habitat throughout its range, whereas S rankings are a reflection of the condition of a habitat within California. If an alliance is marked as a G1–G3, all of the associations within it would also be of high priority. The CDFW provides the Vegetation Classification and Mapping Program's currently accepted list of vegetation alliances and associations (CDFW 2010).

Project Applicability: All potential impacts on biological resources will be considered during CEQA review of the project. This Biological Resources Report assesses these impacts to facilitate CEQA review of the project by the City of Menlo Park. Project impacts are discussed in Section 6 below.

3.2.4 California Fish and Game Code

Ephemeral and intermittent streams, rivers, creeks, dry washes, sloughs, blue line streams on USGS maps, and watercourses with subsurface flows generally fall under CDFW jurisdiction. Canals, aqueducts, irrigation ditches, and other means of water conveyance may also be considered streams if they support aquatic life, riparian vegetation, or stream-dependent terrestrial wildlife. A *stream* is defined in Title 14, California Code of Regulations Section 1.72, as "a body of water that flows at least periodically or intermittently through a bed or channel having banks and that supports fish and other aquatic life. This includes watercourses having surface or subsurface flow that supports or has supported riparian vegetation." Using this definition, CDFW extends its jurisdiction to encompass riparian habitats that function as a part of a watercourse. California Fish and Game Code Section 2786 defines *riparian habitat* as "lands which contain habitat which grows close to and which depends upon soil moisture from a nearby freshwater source." The lateral extent of a stream and associated riparian habitat that would fall under the jurisdiction of CDFW can be measured in several ways, depending on the particular situation and the type of fish or wildlife at risk. At minimum, CDFW would claim jurisdiction

over a stream's bed and bank. In areas that lack a vegetated riparian corridor, CDFW jurisdiction would be the same as USACE jurisdiction. Where riparian habitat is present, the outer edge of riparian vegetation is generally used as the line of demarcation between riparian and upland habitats.

Pursuant to California Fish and Game Code Section 1603, CDFW regulates any project proposed by any person that will "substantially divert or obstruct the natural flow or substantially change the bed, channel, or bank of any river, stream, or lake designated by the department, or use any material from the streambeds." California Fish and Game Code Section 1602 requires an entity to notify CDFW of any proposed activity that may modify a river, stream, or lake. If CDFW determines that proposed activities may substantially adversely affect fish and wildlife resources, a Lake and Streambed Alteration Agreement (LSAA) must be prepared. The LSAA sets reasonable conditions necessary to protect fish and wildlife, and must comply with CEQA. The applicant may then proceed with the activity in accordance with the final LSAA.

Certain sections of the California Fish and Game Code describe regulations pertaining to protection of certain wildlife species. For example, Code Section 2000 prohibits take of any bird, mammal, fish, reptile, or amphibian except as provided by other sections of the code.

The California Fish and Game Code Sections 3503, 3513, and 3800 (and other sections and subsections) protect native birds, including their nests and eggs, from all forms of take. Disturbance that causes nest abandonment and/or loss of reproductive effort is considered "take" by the CDFW. Raptors (i.e., eagles, hawks, and owls) and their nests are specifically protected in California under Code Section 3503.5. Section 3503.5 states that it is "unlawful to take, possess, or destroy any birds in the order Falconiformes or Strigiformes (birds of prey) or to take, possess, or destroy the nest or eggs of any such bird except as otherwise provided by this code or any regulation adopted pursuant thereto."

Bats and other non-game mammals are protected by California Fish and Game Code Section 4150, which states that all non-game mammals or parts thereof may not be taken or possessed except as provided otherwise in the code or in accordance with regulations adopted by the commission. Activities resulting in mortality of non-game mammals (e.g., destruction of an occupied nonbreeding bat roost, resulting in the death of bats), or disturbance that causes the loss of a maternity colony of bats (resulting in the death of young), may be considered "take" by the CDFW.

Project Applicability: The drainage ditches located along the northern and southern edges of the study area are not downstream continuations of terrestrial streams and only collect localized runoff from the surrounding development. Additionally, no flows continue downstream of these features out to the Bay or other stream or slough. As such, these features are not considered rivers or streams and are not regulated by the CDFW under California Fish and Game Code Section 1603 (H. T. Harvey & Associates 2021b).

Most native bird, mammal, and other wildlife species that occur on the project site and in the immediate vicinity are protected by the California Fish and Game Code. Mitigation Measures BIO-13, 14, 15, and 16 shall be

implemented to ensure that project activities comply with the Fish and Game Code with respect to nesting birds, as described in Section 6.4.1.

3.3 Local

3.3.1 Menlo Park Municipal Code

The City of Menlo Park Municipal Code contains all ordinances for Menlo Park. Title 16, Zoning, includes regulations relevant to biological resources on the project site as discussed below.

Bird-Friendly Design. Sections 16.43.140 (6) (with respect to the O District) and 16.45.130(6) (with respect to the RMU District) require all new construction, regardless of size, to implement the following bird-friendly design measures:

- No more than 10% of facade surface area shall have non-bird-friendly glazing.
- Bird-friendly glazing includes, but is not limited to, opaque glass, covering of clear glass surface with patterns, paned glass with fenestration patterns, and external screens over non-reflective glass.
- Placement of buildings shall avoid the potential funneling of flight paths towards a building facade.
- Glass skyways or walkways, freestanding glass walls, and transparent building corners shall not be allowed.
- Transparent glass shall not be allowed at the rooflines of buildings, including in conjunction with green roofs.
- Use of rodenticides shall not be allowed.

A project may receive a waiver from one (1) or more of the items listed in subsections (6)(A) to (F) of this section, subject to the submittal of a site-specific evaluation from a qualified biologist and review and approval by the planning commission. (Ord. 1024 § 3 (part), 2016).

Project Applicability: Bird-friendly design will be incorporated into the project design as required by the City of Menlo Park Municipal Code. The project's incorporation of bird-safe design is discussed in Sections 1.2 and 6.5.2.

Landscape Design Plan. Chapter 12.44.090(a)(1)(G) provides that the use of invasive or noxious plant species is strongly discouraged. Invasive species are defined as those plants not historically found in California that spread outside cultivated areas and can damage environmental or economic resources. A noxious weed refers to any weed designated by the weed control regulations in the Weed Control Act and identified on a regional district noxious weed control list.

Project Applicability: No invasive and/or noxious plant species will be used in the project's landscape design plan.

Heritage Trees. Chapter 13.24, Heritage Trees, establishes regulations for the preservation of heritage trees, defined as:

- Trees of historical significance, special character or community benefit, specifically designated by resolution of the City Council;
- An oak tree (*Quercus* sp.), which is native to California and has a trunk with a circumference of 31.4 inches (diameter of 10 inches) or more, measured at 54 inches above natural grade; and
- All trees other than oaks, which have a trunk with a circumference of 47.1 inches (diameter of 15 inches) or more, measured 54 inches above natural grade, with the exception of trees that are less than 12 ft in height, which will be exempt from this section.

To protect heritage trees, Section 13.24.025 requires that a tree protection plan prepared by a certified arborist be submitted for any work performed within a tree protection zone, which is an area ten times the diameter of the tree. Furthermore, all tree protection plans should be reviewed and approved by the Public Works Director or his or her designee prior to issuance of any permit for grading or construction.

The removal of heritage trees or pruning of more than one-fourth of the branches or roots within a 12-month period requires a permit from the City's Director of Public Works or his or her designee and payment of a fee. The Director of Public Works may issue a permit when the removal or major pruning of a heritage tree is reasonable based on a number of criteria, including condition of the tree, need for removal to accommodate proposed improvements, the ecological and long-term value of the tree, and feasible alternatives that would allow for tree preservation.

Project Applicability: The project site includes 274 trees that qualify as heritage trees under the City ordinance (SBCA Tree Consulting 2017, Peninsula Innovation Partners 2020). It is anticipated that 269 heritage trees would be removed as part of the proposed project. Therefore, a permit from the City would be required.

3.3.2 Menlo Park General Plan

The City of Menlo Park General Plan includes goals, policies, and programs relevant to the environmental factors potentially affected by the proposed project, including the following:

- *Goal LU-4:* Promote the development and retention of business uses that provide goods or services needed by the community that generate benefits to the City, and avoid or minimize potential environmental and traffic impacts.
    - *Policy LU-4.5: Business Uses and Environmental Impacts.* Allow modifications to business operations and structures that promote revenue-generating uses for which potential environmental impacts can be mitigated.
- *Goal LU-6:* Preserve open-space lands for recreation; protect natural resources and air and water quality; and protect and enhance scenic qualities.

- *Policy LU-6.5: Open Space Retention*. Maximize the retention of open space on larger tracts (e.g., portions of the St. Patrick's Seminary site) through means such as rezoning consistent with existing uses, clustered development, acquisition of a permanent open space easement, and/or transfer of development rights.
- *Policy LU 6.6: Public Bay Access*. Protect and support public access to the Bay for the scenic enjoyment of open water, sloughs, and marshes, including restoration efforts, and completion of the Bay Trail.
- *Policy LU-6.7: Habitat Preservation*. Collaborate with neighboring jurisdictions to preserve and enhance the Bay, shoreline, San Francisquito Creek, and other wildlife habitat and ecologically fragile areas to the maximum extent possible.
- *Policy LU-6.8: Landscaping in Development*. Encourage extensive and appropriate landscaping in public and private development to maintain the City's tree canopy and to promote sustainability and healthy living, particularly through increased trees and water-efficient landscaping in large parking areas and in the public right-of-way.
- *Policy LU-6.11. Baylands Preservation.* Allow development near the Bay only in already developed areas.
    - *Program LU-6.D: Design for Birds*. Require new buildings to employ façade, window, and lighting design features that make them visible to birds as physical barriers and eliminate conditions that create confusing reflections to birds.

- Goal OSC1: Maintain, Protect, and Enhance Open Space and Natural Resources.
    - *Policy OSC1.1: Natural Resources Integration with Other Uses*. Protect Menlo Park's natural environment and integrate creeks, utility corridors, and other significant natural and scenic features into development plans.
    - *Policy OSC1.2: Habitat for Open Space and Conservation Purposes*. Preserve, protect, maintain, and enhance water, water-related areas, plant and wildlife habitat for open space and conservation purposes.
    - *Policy OSC1.3: Sensitive Habitats*. Require new development on or near sensitive habitats to provide baseline assessments prepared by qualified biologists, and specify requirements relative to the baseline assessments.
    - *Policy OSC1.4: Habitat Enhancement*. Require new development to minimize the disturbance of natural habitats and vegetation, and require revegetation of disturbed natural habitat areas with native or non-invasive naturalized species.
    - *Policy OSC1.5: Invasive, Non-Native Plant Species*. Avoid the use of invasive, non-native species, as identified on the lists of invasive plants maintained at the California Invasive Plant Inventory and United States Department of Agriculture invasive and noxious weeds database, or other authoritative sources, in landscaping on public property.

- *Policy OSC1.15: Heritage Trees*. Protect Heritage Trees, including during construction activities through enforcement of the Heritage Tree Ordinance (Chapter 13.24of the Municipal Code).

Project Applicability: The project is located within the Menlo Park General Plan area and would conform to all applicable requirements.

Section 4. Environmental Setting

4.1 General Project Area Description

The 81.1-acre study area (including the approximately 64-acre project site) is located in the *Palo Alto*, *California* 7.5-minute USGS quadrangle. The approximately 64-acre project site (inclusive of the "main project site" east of Willow Road and "Hamilton Avenue Parcels North and South" west of Willow Road) is bounded by Willow Road to the west, the Hetch Hetchy easement corridor to the south, an existing life science complex to the east, and a drainage ditch, rail line, and Extra Space Storage self-storage units to the north. A review of historical aerial photographs indicates that the study area was largely agriculture in 1943. By 1991, the project site was developed with numerous buildings and parking lots known as the Menlo Science and Technology Park. Currently, the site is occupied by 21 office, industrial, and warehouse buildings (Figure 2).

The site is generally level, with elevations ranging from approximately 6 to 13 ft (North American Vertical Datum of 1988) above sea level. The site is underlain by one soil type, Urban land-Orthents, reclaimed complex, 0 to 2 percent slopes (NRCS 2021). This soil type has a variable profile to a depth of approximately 40 inches, with silty clay generally occurring from 40 to 60 inches, and is considered a well-drained soil.

4.2 Biotic Habitats

Reconnaissance-level surveys identified four habitat types/land uses in the study area: developed/landscaped (77.16 acres), California annual grassland (3.66 acres), forested wetland (0.07 acre[2]), and herbaceous seasonal wetlands (0.07 acre) (Figure 3). These habitats are described in detail below. Plant species observed during the reconnaissance survey are listed in Appendix A.

4.2.1 Developed/Landscaped

Vegetation. The entire project site, and the vast majority of the study area, are occupied by developed/landscaped land uses (Photo 1) that include office buildings, restaurants, a gas station, parking lots, walking paths, mulched and irrigated areas, and extensive plantings

Photo 1. Developed/Landscaped habitat.

[2] The depression comprising the footprint of the forested wetland is 0.07 acre in size; the canopy of the willows rooted within that wetland comprise an additional 0.13 acre.

Ecological Consultants

Figure 3. Habitats Map
Willow Village Master Plan Biological Resources Report (3375-21)
February 2022

of ornamental trees and other landscaping species. Species characteristic of this area include Canary Island pine (*Pinus canariensis*), Chinese pistache (*Pistacia chinensis*), London plane (*Platanus* x*hispanica*), eucalyptus (*Eucalyptus* sp.), and crepe myrtle (*Lagerstroemia* sp.). Common understory plants include buckbrush (*Ceanothus* sp.) and rosemary (*Rosmarinus officinalis*). Immediately outside the southern edge of the project boundary (but within an area where off-site improvements will be made), a ditch is located partially on-site and partially within the Hetch Hetchy easement area (Photo 2). This ditch was dominated by upland (non-wetland) vegetation during our April 2019 site visit, as well as during the August 2021 site visit conducted for the delineation of waters of the U.S./State, and is concrete lined in at least some locations (H. T. Harvey & Associates 2021b). The ditch collects some water from the surrounding uplands and flows into a stormdrain. However, a visit to the site on December 31, 2021, after a prolonged, heavy rain event, revealed evidence of only a very small amount of runoff in this ditch during the storm. It is evident that this ditch receives little runoff from surrounding areas.

Photo 2. A drainage ditch in the southeastern part of the site.

Wildlife. The wildlife most often associated with developed/landscaped areas are those that are tolerant of periodic human disturbances, including introduced species such as the European starling (*Sturnus vulgaris*), rock pigeon (*Columba livia*), house mouse (*Mus musculus*), Norway rat (*Rattus norvegicus*), and black rat (*Rattus rattus*). Numerous common, native species are also able to utilize these habitats, especially the landscaped areas, including the western fence lizard (*Sceloporus occidentalis*), striped skunk (*Mephitis mephitis*), and a variety of birds, such as the American crow (*Corvus brachyrhynchos*), Anna's hummingbird (*Calypte anna*), California towhee (*Melozone crissalis*), bushtit (*Psaltriparus minimus*), chestnut-backed chickadee (*Poecile rufescens*), and California scrub-jay (*Aphelocoma californica*), all of which were observed on the project site during the reconnaissance survey. In addition, the eaves of the buildings on the project site may be attractive to other nesting and/or roosting bird species in the area, such as the black phoebe (*Sayornis nigricans*). Further, a number of large eucalyptus trees found in the northern portion of the project site may provide suitable nesting habitat for a pair of raptors, such as the red-tailed hawk (*Buteo jamaicensis*), which was observed in the study area during the reconnaissance survey. However, a focused survey of the study area detected no evidence (i.e., old nests) of raptors having previously nested on the site. Similarly, an examination of trees and structures on the site failed to find any large cavities that might provide suitable bat roosting habitat. Therefore, large roosting or maternity colonies of bats are not expected to occur in the study area. The ditch immediately south of the project boundary provides no aquatic habitat, and therefore no aquatic or wetland-associated wildlife species are associated with this feature.

4.2.2 California Annual Grassland

Photo 3. California annual grassland habitat in the northeast corner of the study area.

Vegetation. California annual grassland habitat occurs in the northern portion of the study area along the Dumbarton Rail Corridor, primarily outside of the project boundary, but with a very small area encroaching into the project boundary in the northeast corner of the main project site (Photo 3). At the time of the reconnaissance survey, this habitat was dominated by non-native grasses and forbs such as wild oat (*Avena* sp.), fennel (*Foeniculum vulgare*), bull mallow (*Malva nicaeensis*), black mustard (*Brassica nigra*), and bristly ox-tongue (*Helminthotheca echioides*). Many of these non-native plant species are ranked as moderately or highly invasive by the California Invasive Plant Council (Cal-IPC 2021). For example, fennel is highly invasive and has severe ecological impacts on physical processes, plant and animal communities, and vegetation structure. Moderately invasive species, such as wild oats and black mustard, have substantial and apparent ecological impacts (Cal IPC 2021).

Wildlife. Wildlife use of California annual grasslands in the study area is limited by frequent human disturbance, the abundance of non-native and invasive species, and isolation of the grassland habitat remnants from more xtensive grasslands. As a result, wildlife species associated with more extensive grasslands, such as the grasshopper sparrow (*Ammodramus savannarum*) and western meadowlark (*Sturnella neglecta*), are absent from the small patches of grassland in the study area. Most of the bird species using this habitat during the breeding season nest in nearby landscaped habitats, using the California annual grassland only for foraging. Such species include the mourning dove (*Zenaida macroura*), lesser goldfinch (*Spinus psaltria*), dark-eyed junco (*Junco hyemalis*), American crow, and Brewer's blackbird (*Euphagus cyanocephalus*). Similarly, a few species nesting on nearby buildings, such as the cliff swallow (*Petrochelidon pyrrhonota*), barn swallow (*Hirundo rustica*), rock pigeon (*Columba livia*), black phoebe, and European starling, also forage on or over the California annual grassland habitat. Several other species of birds use the California annual grassland habitat during the nonbreeding season. These species, which include the golden-crowned sparrow (*Zonotrichia atricapilla*), savannah sparrow (*Passerculus sandwichensis*), and white-crowned sparrow (*Zonotrichia leucophrys*), forage on the ground or in herbaceous vegetation, primarily for seeds.

Few species of reptiles and amphibians occur in the California annual grassland in the study area due to its disturbed nature and low habitat heterogeneity. Nevertheless, reptiles such as the western fence lizard and

gopher snake (*Pituophis melanoleucus*) occur in this type of habitat, and amphibians such as the Sierran chorus frog (*Pseudacris sierra*) and western toad (*Anaxyrus boreas*), which breed in freshwater marshes in the area, forage in this habitat. Small mammals expected to be present include the native western harvest mouse (*Reithrodontomys megalotis*) and nonnative house mouse, Norway rat, and black rat. Small burrowing mammals, such as the Botta's pocket gopher (*Thomomys bottae*) and California ground squirrel (*Spermophilus beecheyi*), are also present. Larger mammals, such as the striped skunk, Virginia opossum (*Didelphis virginiana*), raccoon (*Procyon lotor*), and black-tailed jackrabbit (*Lepus californicus*) are also likely to occur here.

4.2.3 Forested Wetland

Vegetation. A small, isolated segment of forested wetland occurs in a drainage ditch along the northern edge of the study area, just outside of the project boundary (Photo 4). This segment of the ditch is characterized by a dense overstory of willow (*Salix* sp.), with minimal groundcover predominantly consisting of tall flatsedge (*Cyperus eragrostis*) and poison oak (*Toxicodendron diversilobum*). The wetland hydrology here is supported by localized freshwater runoff from the surrounding area, which pools in or saturates the soils in the lowest portion of the drainage ditch during the wet season. No standing water was observed during the November 2017 site visit, but shallow water was pooled here during the April 2019 visit.

Photo 4. Willow dominated isolated forested wetland located in the northern potions of the study area.

Wildlife. Due to its small size, isolation, and lack of pooled water, wildlife diversity in the isolated forested wetland is fairly low. However, the dense foliage provided by this willow stand is likely to support several species of nesting birds and provide cover and foraging habitat for others. Bird species that may forage in this habitat include many of the same species as described in the habitats above, as well as species such as the Bewick's wren (*Thryomanes bewickii*), northern mockingbird (*Mimus polyglottos*), and the yellow-rumped warbler (*Setophaga coronata*). Amphibians such as the Sierran chorus frog and western toad may also be present in this habitat, and if water ponds long enough in this ditch, these species could potentially breed there.

4.2.4 Herbaceous Seasonal Wetlands

Vegetation. An herbaceous seasonal wetland is located off-site within the Dumbarton Rail Corridor between Willow Street and Chilco Street in the extreme northwest part of the study area, entirely outside the project boundary. Another herbaceous seasonal wetland is located just outside of the northeast corner of the project

boundary. These wetlands are characterized by slight depressions. The northwestern herbaceous seasonal wetland is dominated by Italian rye grass (*Festuca perenne*), Bermuda grass (*Cynodon dactylon*) and bird's foot trefoil (*Lotus corniculatus*), with obligate species such as narrow-leaved cattail (*Typha angustifolia*) and chairmaker's bulrush (*Schoenoplectus americanus*) scattered throughout the feature (Photo 5). The northeastern herbaceous seasonal wetland is dominated by narrow-leaved cattail, with saltmarsh baccharis (*Baccharis glutinosa*) and dallis grass (*Paspalum dilatatum*) also present. Freshwater hydrology in these areas is likely a result of localized runoff and possibly groundwater upwelling that reaches the rooting zone but does not typically cause inundation. At the time of the wetland delineation survey, there was no ponding water observed, but soils were saturated approximately 6 inches below the ground's surface.

Photo 5. Seasonal freshwater wetland located north of the railway between Willow Street and Chilco Street.

Wildlife. The herbaceous seasonal wetlands in the study area provide only marginal habitat for most wildlife species due to their limited extent and limited depth and duration of ponding, if these wetlands even support ponding at all, and wildlife diversity is expected to be low. However, many of the same bird species described in the developed/landscaped and California annual grassland habitats above may forage in the herbaceous seasonal wetlands, such as the dark-eyed junco, white-crowned sparrow, and California towhee, all of which were observed during the reconnaissance survey. Amphibians such as the native Sierran chorus frog and western toad may also be present in this habitat during wet times of the year but are not expected to breed due to the limited depth and duration of ponding.

4.2.5 Nearby Land Uses and Biotic Habitats outside the Study Area

Outside the study area, developed/landscaped land uses dominate surrounding areas to the west and south for miles in each direction. East of the study area, developed lands associated with existing commercial land uses are present, and north of the study area, beyond the inactive Dumbarton Rail Corridor, a storage facility is present. A large brackish marsh is present north of the storage area and on both the north and south sides of the old rail line farther north and northeast. This brackish marsh, which extends north to State Route 84 and east to University Avenue, is dominated by salt marsh and brackish marsh plants and contains several channels. As a result, marsh-associated wildlife species such as the San Francisco common yellowthroat (*Geothlypis trichas sinuosa*), Alameda song sparrow (*Melospiza melodia pusillula*), northern harrier (*Circus hudsonius*), and possibly the

salt marsh harvest mouse (*Reithrodontomys raviventris*) may occur in that brackish marsh. Farther to the north and northeast are former salt ponds, now managed as waterbird habitat, and the waters and marshes of San Francisco Bay.

Section 5. Special-Status Species and Sensitive Habitats

CEQA requires assessment of the effects of a project on species that are protected as "threatened, rare, or endangered"; such species are typically described as "special-status species". For the purpose of the environmental review of the project, special-status species have been defined as described below. Impacts on these species are regulated by some of the federal, state, and local laws and ordinances described in Section 3.0 above.

For purposes of this analysis, "special-status" plants are considered plant species that are:

- Listed under FESA as threatened, endangered, proposed threatened, proposed endangered, or a candidate species.
- Listed under CESA as threatened, endangered, rare, or a candidate species.
- Listed by the CNPS as CRPR 1A, 1B, 2, 3, or 4.

For purposes of this analysis, "special-status" animals are considered animal species that are:

- Listed under FESA as threatened, endangered, proposed threatened, proposed endangered, or a candidate species.
- Listed under CESA as threatened, endangered, or a candidate threatened or endangered species.
- Designated by the CDFW as a California species of special concern.
- Listed in the California Fish and Game Code as fully protected species (fully protected birds are provided in Section 3511, mammals in Section 4700, reptiles and amphibians in Section 5050, and fish in Section 5515).

Information concerning threatened, endangered, and other special-status species that potentially occur in the study area was collected from several sources and reviewed by H. T. Harvey & Associates biologists as described in Section 2.1 above. Figure 4 depicts CNDDB records of special-status plant species in the general vicinity of the project site and Figure 5 depicts CNDDB records of special-status animal species. These generalized maps show areas where special-status species are known to occur or have occurred historically.

5.1 Special-Status Plant Species

The CNPS (2021) and CNDDB (2021) identify 89 special-status plant species as potentially occurring in at least one of the nine USGS quadrangles containing or surrounding the study area for CRPR 1 or 2 species, or in San Mateo County for CRPR 3 and 4 species. Eighty-eight of those potentially occurring special-status plant species were determined to be absent from the study area for at least one of the following reasons: (1) lack of suitable habitat types; (2) absence of specific microhabitat or edaphic requirements, such as serpentine soils; (3) the elevation range of the species is outside of the range on the study area; or (4) the species is considered extirpated

February 2022

from the project vicinity. Appendix B lists these plants along with the basis for the determination of absence. Suitable habitat, edaphic requirements, and elevation range were determined to be present in the study area for one plant species, Congdon's tarplant (*Centromadia parryi* ssp. *congdonii*), which can persist in disturbed grasslands and has been documented by the CNDDB in the project vicinity (Figure 4). While no suitable habitat occurs on the project site itself, there is suitable habitat for Congdon's tarplant within the study area, in the California annual grassland along the old rail line immediately north of the project boundary. However, this species should still have been flowering and detectable during our November 2017 reconnaissance survey, and a focused survey for the species was conducted in the Dumbarton Rail Corridor on June 12[3], yet no individuals of this species were observed. Therefore, this species is determined to be absent from the study area.

5.2 Special-Status Animal Species

The protected classifications and likelihood of occurrence in the study area of special-status animal species known to occur, or potentially occurring, in the pregion are presented in Table 1. Most of the special-status species listed in Table 1 are not expected to occur in the study area because it lacks suitable habitat, is outside the known range of the species, or is isolated from the nearest known extant populations by development or otherwise unsuitable habitat. Special-status animal species not expected to occur on the project site for these reasons include the Crotch bumble bee (*Bombus crotchii*), western bumble bee (*Bombus occidentalis*), green sturgeon (*Acipenser medirostris*), Central California coast steelhead (*Oncorhynchus mykiss*), California tiger salamander (*Ambystoma californiense*), California red-legged frog (*Rana draytonii*), western pond turtle (*Actinemys marmorata*), San Francisco garter snake (*Thamnophis sirtalis tetrataenia*), California Ridgway's rail (*Rallus obsoletus obsoletus*), California black rail (*Laterallus jamaicensis coturniculus*), western snowy plover (*Charadrius alexandrinus nivosus*), California least tern (*Sterna antillarum browni*), black skimmer (*Rynchops niger*), burrowing owl (*Athene cunicularia*), northern harrier, loggerhead shrike (*Lanius ludovicianus*), salt marsh harvest mouse, salt marsh wandering shrew (*Sorex vagrans halicoetes*) and American badger (*Taxidea taxus*). Although some of these species, such as the northern harrier, loggerhead shrike, white-tailed kite (*Elanus leucurus*), salt marsh harvest mouse, and salt marsh wandering shrew, may occur in wetland habitats not far outside the study area to the north and northeast, they are absent from the study area itself (including areas of proposed off-site improvements), and the proposed development footprint is well removed from suitable habitat for these species. Several other special-status species have some potential to occur in the study area only as visitors, migrants, or transients, but are not expected to reside or breed on the project site, to occur in large numbers, or otherwise to make substantial use of the project site. These include the San Francisco common yellowthroat, Alameda song sparrow, and pallid bat (*Antrozous pallidus*).

[3] Congdon's tarplant was documented flowering at the Sunnyvale Baylands Park, which is 9.4 miles southeast of the study area, on June 10, 2020. Therefore, given that this species was documented as flowering at a site that is relatively near the study area (but not located on the project site) on June 10, 2020, this species would have been detectable at the time of the June 12, 2020 site visit.

Table 1. Special-Status Animal Species, Their Status, and Potential Occurrence in the Study Area

Name	*Status	Habitat	Potential for Occurrence in the Study Area
Federal or State Endangered, Rare, or Threatened Species			
Crotch bumble bee (*Bombus crotchii*)	SC	Occurs in open grassland and scrub habitats. Like most other species of bumble bees, nests primarily underground (Williams et al. 2014). Generalist foragers that visit a variety of floral resources.	**Absent.** There is one historical record of the species approximately 4 miles southwest of the project site (CNDDB 2021), but there are no recent records in the vicinity. Although the species was historically found throughout the southern two-thirds of California, it now appears to be absent from most of its former range (Xerces Society 2018). It is not recently or currently known from the project area and is not expected to occur currently due to these recent range contractions.
Western bumble bee (*Bombus occidentalis occidentalis*)	SC	Occurs in meadows and grasslands with abundant floral resources. Nests are primarily underground.	**Absent.** There are several records of this species from the project vicinity, but all records are historical (CNDDB 2021). Although this species was historically found throughout much of central and northern California, it is now confined to high elevation sites and a small number of records on the northern California coast (Xerces Society 2018). It is not expected to occur in the project area due to these recent range contractions.
Green sturgeon (*Acipenser medirostris*)	FT, CSSC	Spawns in large river systems such as the Sacramento River; forages in nearshore oceanic waters, bays, and estuaries.	**Absent.** No suitable aquatic habitat is present in the study area. Green sturgeon may forage infrequently, and in low numbers in the open Bay, which is 1.5 mi north and east of the project site; however, there is no aquatic connection between the Bay and the project site. Determined to be absent.
Central California Coast steelhead (*Oncorhynchus mykiss*)	FT	Cool streams with suitable spawning habitat and conditions allowing migration between spawning and marine habitats.	**Absent.** No suitable aquatic habitat is present in the study area. Steelhead may forage in the open Bay, which is 1.5 mi north and east of the project site; however, there is no aquatic connection between the Bay and the project site. Determined to be absent.
California tiger salamander (*Ambystoma californiense*)	FT, ST	Vernal or temporary pools in annual grasslands or open woodlands.	**Absent.** No suitable habitat is present in the surrounding study area. Further, populations have largely been extirpated from San Mateo County due to habitat loss, and the species is now considered absent from the majority of the project vicinity, including the study area. The closest occurrence in the project vicinity is at Lake Lagunita on the Stanford campus, which is 4 mi south of the study area (CNDDB 2021). Determined to be absent.

Name	*Status	Habitat	Potential for Occurrence in the Study Area
San Francisco garter snake (*Thamnophis sirtalis tetrataenia*)	FE, SE	Prefer densely vegetated freshwater habitats. May use upland burrows for aestivation.	**Absent.** No suitable habitat is present in the study area. Furthermore, the project vicinity is outside of the known range of the species. Determined to be absent.
California red-legged frog (*Rana draytonii*)	FT, CSSC	Streams, freshwater pools, and ponds with emergent or overhanging vegetation.	**Absent.** No suitable habitat is present in the study area. Further, this species has been extirpated from the majority of the project vicinity, due to development, the alteration of hydrology of its aquatic habitats, and the introduction of non-native predators such as non-native fishes and bullfrogs (*Lithobates catesbeianus*). The most recent record of the species in the project vicinity is from 2016 near Bear Gulch reservoir, over 4.8 mi to the southwest of the study area (CNDDB 2021). Determined to be absent.
California Ridgway's rail (*Rallus obsoletus obsoletus*)	FE, SE, SP	Salt marshes characterized by large expanses of saltmarsh cordgrass (*Spartina* spp.) or pickleweed (*Salicornia* spp.), with well-developed tidal channels.	**Absent.** Although the species is known to occur in the Palo Alto Baylands and the Ravenswood Open Space Preserve located 1 mi east of the study area, as well as on Greco Island 1 mi northwest of the study area, no salt marsh habitat is present in the study area. Further, the only marsh habitat located within 700 ft of the project site (which is equivalent to the size of the non-disturbance buffer typically required around active nests by the USFWS and CDFW) is a mosaic of both fresh water and salt marsh habitats located north of the study area. This marsh habitat lacks extensive patches of cordgrass or pickleweed and tidally influenced, braided channels, and therefore is not considered suitable habitat for the California Ridgway's rail. Determined to be absent.
California black rail (*Laterallus jamaicensis coturniculus*)	ST, SP	Breeds in fresh, brackish, and tidal salt marsh.	**Absent.** This species occurs in the project region primarily as a scarce winter visitor, with individuals recently recorded as close as a slough 0.5 mi north of the study area (CNDDB 2021). However, no suitable nesting or foraging habitat for the California black rail is present in the study area. Determined to be absent.
Western snowy plover (*Charadrius nivosus nivosus*)	FT, CSSC	Sandy beaches on marine and estuarine shores and salt pans in Bay saline managed ponds.	**Absent.** Although western snowy plovers are known to nest in salt panne habitat within 0.5 mi to the northwest, north, and east of the study area in the NWR's Ravenswood complex (CNDDB 2021), no suitable nesting or foraging habitat is present in the study area. Determined to be absent.

Name	*Status	Habitat	Potential for Occurrence in the Study Area
California least tern (*Sternula antillarum browni*)	FE, SE, SP	Nests along the coast on bare or sparsely vegetated, flat substrates. In the South Bay, nests in salt pannes and on an old airport runway. Forages for fish in open waters.	**Absent**. Suitable nesting habitat for the California least tern is not present in the study area. Least terns have been recorded in the project vicinity during the post-breeding season, and have been known to forage in the Redwood City salt ponds, 2.5 mi west of the study area (CNDDB 2021). Least terns have also been known to forage infrequently along the shores of the Palo Alto Baylands Preserve, located 3 mi southeast of the study area. However, least terns are not expected to forage in the study area due to the lack of any open water habitats supporting fish. Determined to be absent.
Salt marsh harvest mouse (*Reithrodontomys raviventris*)	FE, SE, SP	Salt marsh habitat dominated by common pickleweed or alkali bulrush.	**Absent.** The species has been recorded in salt marsh habitat in the project vicinity, including on the NWR to the north and east of the site (CNDDB 2021), and suitable pickleweed/alkali bulrush-dominated salt marsh habitat is present within several hundred feet northeast of the study area. However, no suitable habitat is present in the study area itself. Determined to be absent.
California Species of Special Concern			
Western pond turtle (*Actinemys marmorata*)	CSSC	Permanent or nearly permanent water in a variety of habitats.	**Absent.** No suitable aquatic habitat is present in the study area. Determined to be absent.
Northern harrier (*Circus cyaneus*)	CSSC (nesting)	Nests in marshes and moist fields, forages over open areas.	**Absent.** Northern harriers nest and forage in the wetlands immediately north and northeast of the study area, but they are not expected to nest or forage in the study area due to a lack of suitable habitat.
Black skimmer (*Rynchops niger*)	CSSC (nesting)	Nests on sparsely vegetated beaches, isolated islands, and levees.	**Absent.** No suitable nesting or foraging habitat is present in or near the study area. Determined to be absent.
Burrowing owl (*Athene cunicularia*)	CSSC	Nests and roosts in open grasslands and ruderal habitats with suitable burrows, usually those made by California ground squirrels (*Spermophilus beecheyi*).	**Absent.** No nesting burrowing owls are known to occur in the surrounding project vicinity (CNDDB 2021), and no suitable burrowing owl roosting or nesting habitat (i.e., open grasslands with ground squirrel burrows) is present in the study area. The narrow strip of California annual grassland at the northern edge of the study area is too limited and too hemmed in by trees and development to provide good burrowing owl habitat. Thus, the species is not expected to occur in the study area.

Name	*Status	Habitat	Potential for Occurrence in the Study Area
Loggerhead shrike (*Lanius ludovicianus*)	CSSC (nesting)	Nests in tall shrubs and dense trees; forages in grasslands, marshes, and ruderal habitats.	**Absent.** No suitable breeding habitat is present in the study area, and the California annual grasslands in the study area are not sufficiently extensive to provide suitable foraging habitat. Determined to be absent.
San Francisco common yellowthroat (*Geothlypis trichas sinuosa*)	CSSC	Nests in herbaceous vegetation, usually in wetlands or moist floodplains.	**Absent as Breeder.** The San Francisco common yellowthroat breeds commonly in wetlands immediately north and northeast of the study area, but no suitable breeding habitat is present in the study area itself. Small numbers may occasionally forage along the northern edge of the study area.
Alameda song sparrow (*Melospiza melodia pusillula*)	CSSC	Nests in salt marsh, primarily in marsh gumplant and cordgrass along channels.	**Absent as Breeder.** Song sparrows breed commonly in wetlands immediately north and northeast of the study area, but no suitable breeding habitat is present in the study area itself. Small numbers may occasionally forage along the northern edge of the study area.
Salt marsh wandering shrew (*Sorex vagrans halicoetes*)	CSSC	Medium to high marsh 6 to 8 ft above sea level with abundant driftwood and common pickleweed.	**Absent.** Suitable pickleweed-dominated salt marsh habitat is present within several hundred feet northeast of the study area. However, no suitable habitat is present in the study area itself. Determined to be absent.
Pallid bat (*Antrozous pallidus*)	CSSC	Forages over many habitats; roosts in caves, rock outcrops, buildings, and hollow trees.	**Absent as Breeder.** Historically, pallid bats were likely present in a number of locations throughout the project region, but their populations have declined in recent decades. This species has been extirpated as a breeder from urban areas close to the Bay, as is the case in the study area. No suitable roosting habitat is present on the project site or in the study area and no known maternity colonies are present on or adjacent to the study area. There is a low probability that the species occurs in the project vicinity at all due to urbanization; however, individuals from more remote colonies could potentially forage over the study area on rare occasions.
American badger (*Taxidea taxus*)	CSSC	Burrows in grasslands and occasionally in infrequently disked agricultural areas.	**Absent.** Badgers are not known to occur in the project region due to the lack of extensive grasslands and agricultural areas with friable soils, needed for digging burrows. No suitable habitat is present on the project site or in the study area. Determined to be absent.

California Fully Protected Species			
White-tailed kite (*Elanus leucurus*)	SP	Nests in trees and forages in extensive grasslands or marshes.	**Absent.** No suitable breeding habitat is present in the study area, and the California annual grasslands in the study area are not sufficiently extensive to provide suitable foraging habitat. May nest north and northeast of the study area, but determined to be absent from the study area itself.

SPECIAL-STATUS SPECIES CODE DESIGNATIONS

FE = Federally Listed Endangered
FT = Federally Listed Threatened
SE = State Listed Endangered
ST = State Listed Threatened
SC = Candidate for State Listing
CSSC = California Species of Special Concern
SP = State Fully Protected Species

5.3 Sensitive Natural Communities, Habitats, and Vegetation Alliances

Natural communities have been considered part of the Natural Heritage Conservation triad, along with plants and animals of conservation significance, since the state inception of the Natural Heritage Program in 1979. The CDFW determines the level of rarity and imperilment of vegetation types, and tracks sensitive communities in its Rarefind database (CNDDB 2021). Global rankings (G) of natural communities reflect the overall condition (rarity and endangerment) of a habitat throughout its range, whereas state (S) rankings are a reflection of the condition of a habitat within California. Natural communities are defined using NatureServe's standard heritage program methodology as follows (Faber-Langendoen et al. 2012):

G1/S1: Critically imperiled

G2/S2: Imperiled

G3/S3: Vulnerable.

G4/S4: Apparently secure

G5/S4: Secure

In addition to tracking sensitive natural communities, the CDFW also ranks vegetation alliances, defined by repeating patterns of plants across a landscape that reflect climate, soil, water, disturbance, and other environmental factors (Sawyer et al. 2009). If an alliance is marked G1-G3, all of the vegetation associations within it will also be of high priority (CDFW 2021). The CDFW provides the Vegetation Classification and Mapping Program's (VegCAMP) currently accepted list of vegetation alliances and associations (CDFW 2021).

Impacts on CDFW sensitive natural communities, vegetation alliances/associations, or any such community identified in local or regional plans, policies, and regulations, must be considered and evaluated under CEQA (Title 14, Division 6, Chapter 3, Appendix G of the California Code of Regulations). Furthermore, aquatic, wetland and riparian habitats are also protected under applicable federal, state, or local regulations, and are generally subject to regulation, protection, or consideration by the USACE, RWQCB, CDFW, and/or the USFWS.

5.3.1 CDFW Sensitive Habitats

A query of sensitive habitats in Rarefind (CNDDB 2021) identified three sensitive habitats as occurring within the nine USGS quadrangles containing or surrounding the study area: serpentine bunchgrass grassland (Rank G2/S2.2), valley oak woodland (G3/S2.1), and northern coastal salt marsh (Rank G3/S3.2). Serpentine bunchgrass occurs only on serpentine soils, which do not occur in the study area. Valley oak woodland is characterized by valley oak (*Quercus lobata*) as the dominant or co-dominant species in the tree canopy. While some valley oak individuals do occur in the study area, they are ornamental plantings along buildings and roadways, and thus do not constitute this sensitive habitat type. The last sensitive habitat type, northern coastal

salt marsh, is described by Holland (1986) as occurring along sheltered inland margins of bays, often co-dominated by pickleweed (*Salicornia* spp.), cordgrass (*Spartina* spp.), and sometimes saltgrass (*Distichlis spicata*). None of these species was noted in the study area, thus this habitat type is also absent.

5.3.2 CDFW Sensitive Vegetation Alliances

CDFW Sensitive alliances are not present on the project site (CDFW 2021).

5.3.3 Sensitive Habitats (Waters of the U.S./State)

As described above our surveys did not identify any wetlands or other waters that would fall under the jurisdiction of the USACE (Waters of the U.S.), or under the jurisdiction of the RWQCB or CDFW (Waters of the State), on the project site itself. Outside the project boundary, but within the study area, an isolated forested wetland depression is located immediately north of the main project site. One linear area of herbaceous seasonal wetland is located immediately north of the Hamilton Avenue Parcels North and South. Another herbaceous seasonal wetland is located just outside the northeast corner of the project boundary. As discussed in Section 3.1.1 above, the USACE may claim these features as jurisdictional Waters of the U.S., and the RWQCB could consider these wetlands (and possibly an additional 0.13-acre area where the canopy of willows extends outside the 0.07-acre forested wetland footprint within which the willows are rooted) to be Waters of the State. It is our understanding that the project will avoid to the extent feasible placing fill in those wetlands, in which case no permits from the USACE or RWQCB would be needed for activities associated with wetlands even if these features are determined to be jurisdictional. However, if these features are determined to be jurisdictional and are impacted by the project, permits from the USACE and RWQCB would be required, and mitigation of impacts would be required as described in Mitigation Measures BIO-11 and 12 in Section 6.2.1.

These wetlands would be considered sensitive habitats for CEQA assessment purposes. These wetlands are not associated with a stream and would therefore not constitute sensitive riparian habitat claimed by CDFW.

A ditch located partially on-site and partially in the Hetch Hetchy easement area immediately south of the main project site, but within the study area, is dominated by upland (non-wetland) vegetation, receives relatively little runoff from surrounding areas, and drains to the City stormwater system, and is therefore not considered sensitive or expected to be jurisdictional (H. T. Harvey & Associates 2021b). Brackish marsh habitat well north and northeast of the site provides higher-quality habitat than any wetland or aquatic features within the study area, but it is located well outside of the study area.

5.4 Non-Native and Invasive Species

Several non-native, invasive plant species occur in the study area in the California annual grassland habitat. Of these, fennel has the potential to cause the more severe ecological impacts. In addition, black mustard and wild oats were observed in the study area and can have substantial and apparent ecological impacts if they spread into native, sensitive habitats (Cal-IPC 2021). However, all of these species are also present in abundance in

and around the wetland/grassland habitats to the north and northeast of the study area. The remainder of the project vicinity is developed/landscaped, and invasive species would not result in adverse effects on developed and landscaped areas.

Section 6. Impacts and Mitigation Measures

The State CEQA Guidelines provide direction for evaluating the impacts of projects on biological resources and determining which impacts will be significant. CEQA defines a "significant effect on the environment" as "a substantial adverse change in the physical conditions which exist in the area affected by the proposed project." Under State CEQA Guidelines Section 15065, a project's impacts on biological resources are deemed significant if the project would:

A. "substantially reduce the habitat of a fish or wildlife species"
B. "cause a fish or wildlife population to drop below self-sustaining levels"
C. "threaten to eliminate a plant or animal community"
D. "reduce the number or restrict the range of a rare or endangered plant or animal"

In addition to the Section 15065 criteria that trigger mandatory findings of significance, Appendix G of State CEQA Guidelines provides a checklist of other potential impacts to consider when analyzing the significance of project effects. The impacts listed in Appendix G may or may not be significant, depending on the level of the impact. For biological resources, these impacts include whether the project would:

A. "have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service"

B. "have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or U.S. Fish and Wildlife Service"

C. "have a substantial adverse effect on state or federally protected wetlands" (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling hydrological interruption, or other means)

D. "interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites"

E. "conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance"

F. "conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan"

The impact assessment below is structured based on the six significance criteria (A-F) listed above.

6.1 Impacts on Special-Status Species: Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS (Less than Significant with Mitigation)

6.1.1 Impacts on Special-Status Species during Demolition and Construction (Less than Significant)

No special-status plants are present within the study area, and therefore, none will be impacted by demolition of existing structures, construction of the project, or any other project components. No special-status animals are expected to breed in the study area. However, as noted in Table 1, nonbreeding individuals of the San Francisco common yellowthroat, Alameda song sparrow, and pallid bat could possibly forage on the site on occasion. San Francisco common yellowthroats and Alameda song sparrows breeding in the off-site brackish marsh to the north and northeast of the site may disperse (particularly during the nonbreeding season) along the Dumbarton Rail Corridor to the dense vegetation along the northern edge of the site, where they may forage. Pallid bats are expected to occur on or near the site rarely, if at all, but dispersing individuals could occasionally forage on the site. Due to the absence of high-quality roosting sites for pallid bats, this species is not expected to roost on the project site.

During demolition and construction, the removal of vegetation, as well as noise and operation of heavy equipment, could disturb foraging yellowthroats and song sparrows, and disturbance of existing vegetation could result in loss or degradation of foraging habitat and declines in food resources for these bird species as well as the pallid bat. However, the project site does not provide high-quality habitat for any of these species, in its current state. These species would not be likely to occur on the site, or close enough to the project site to be disturbed by demolition or construction activities. Given the project site's relatively urban characteristics, the amount of habitat that may be degraded and the number of individuals of these species that would be disturbed by project activities are minimal.

Construction on offsite areas could include the placement of utilities lines under existing rights-of-way, construction of roundabout, and improvements to a Pacific Gas and Electric Company substation. All of these areas are developed and have no natural features that provide habitat for special-status species. Construction of offsite project components will not result in impacts to special-status species or other sensitive biological resources.

Therefore, project activities would not result in substantial impacts to these species' population and habitat, and such impacts would be less than significant.

6.1.2 Impacts on Wildlife from Artificial Lighting (Less than Significant with Mitigation)

The installation of lighting on buildings and around roads, paths, and parking lots may result in potential impacts on animal species. Many animals, both special-status and common species, are sensitive to light cues,

which influence their physiology and shape their behaviors, particularly during the breeding season (Ringer 1972, de Molenaar et al. 2006). Artificial light has been used as a means of manipulating breeding behavior and productivity in captive birds for decades (de Molenaar et al. 2006), and has been shown to influence the territorial singing behavior of wild birds (Longcore and Rich 2004, Miller 2006, de Molenaar et al. 2006). While it is difficult to extrapolate results of experiments on captive birds to wild populations, it is known that photoperiod (the relative amount of light and dark in a 24-hour period) is an essential cue triggering physiological processes as diverse as growth, metabolism, development, breeding behavior, and molting (de Molenaar et al. 2006). This holds true for mammals and other taxa as well (Beier 2006), suggesting that increases in ambient light may interfere with these processes across a wide range of species, resulting in impacts on wildlife populations.

Artificial lighting may also indirectly affect animals by increasing the nocturnal activity of predators such as owls, hawks, and mammalian predators (Negro et al 2000, Longcore and Rich 2004, DeCandido and Allen 2006, Beier 2006). The presence of artificial light may influence habitat use by rodents (Beier 2006) and breeding birds (Rogers et al. 2006, de Molenaar et al. 2006) by causing avoidance of well-lit areas, resulting in a net loss of habitat availability and quality.

The *Willow Village Master Plan Bird-Safe Design Assessment*, provides a comprehensive analysis of lighting impacts for the Willow Village Master Plan based on the project's conceptual Conditional Development Permit (CDP) application. The report provides documentation of the lighting measures that will be incorporated into the project to ensure that (1) project impacts due to lighting are reduced to less-than-significant levels under CEQA, and (2) the project complies with City of Menlo Park lighting requirements. CEQA mitigation measures related to minimizing lighting impacts are identified below.

For all exterior lighting in the northern portion of the main project site (i.e., areas north of Main Street and Office Buildings 03 and 05 surrounding the hotel, Town Square retail pavilion, Office Building 04, event building, and North Garage):

- **Mitigation Measure BIO-1.** To the maximum extent feasible, up-lighting (i.e., lighting that projects upward above the fixture) shall be avoided in the project design. All lighting shall be fully shielded to block illumination from shining upward above the fixture.

  If up-lighting cannot be avoided in the project design, up-lights shall be shielded and/or directed such that no luminance projects above/beyond objects at which they are directed (e.g., trees and buildings) and such that the light would not shine directly into the eyes of a bird flying above the object. If the objects themselves can be used to shield the lights from the sky beyond, no substantial adverse effects on migrating birds are anticipated.

- **Mitigation Measure BIO-2.** All lighting shall be fully shielded to block illumination from shining outward towards San Francisco Bay habitats to the north. No light trespass shall be permitted more than 80 feet beyond the site's northern property line (i.e., beyond the JPB rail corridor).

- **Mitigation Measure BIO-3.** Exterior lighting shall be minimized (i.e., total outdoor lighting lumens shall be reduced by at least 30% or extinguished, consistent with recommendations from the International Dark-Sky Association [2011]) from 10:00 p.m. until sunrise, except as needed for safety and City code compliance.

- **Mitigation Measure BIO-4.** Temporary lighting that exceeds minimal site lighting requirements may be used for nighttime social events. This lighting shall be switched off no later than midnight. No exterior up-lighting (i.e., lighting that projects upward above the fixture, including spotlights) shall be used during events.

Due to the potential for lighting within the stair/elevator towers to result in bird collisions, the project will implement the following measure:

- **Mitigation Measure BIO-5.** Lights shall be shielded and directed so that lighting does not spill outwards from the elevator/stair towers into adjacent areas.

Due to the potential for interior lighting within the buildings within the atrium to spill outwards to the north and affect birds, the project shall implement the following mitigation measure for interior lights within the buildings within the atrium to minimize impacts due to lighting:

- **Mitigation Measure BIO-6.** Interior or exterior blinds shall be programmed to close on north-facing windows of interior buildings within the atrium from 10:00 p.m. to sunrise in order to block lighting from spilling outward from these windows.

If birds are able to distinguish illuminated interior vegetation, trees, and structures within the atrium at night, collisions with the building are expected to be appreciably higher as birds attempt to fly through glazing to reach these features (e.g., during descent from migration at dawn). The project shall implement Mitigation Measures BIO-1 and BIO-3 above as well as Mitigation Measure BIO-7 below to ensure that structures, trees, and vegetation in the atrium are not illuminated by up-lighting or accent lighting such that they are more conspicuous to birds from outside compared to ambient conditions (i.e., lighting levels from fixtures within the atrium that do not specifically illuminate these features). Structures, trees, and vegetation are considered 'more conspicuous' to birds when they would be more conspicuous when viewed by the human eye from outside the atrium at any elevation.

- **Mitigation Measure BIO-7.** Accent lighting within the atrium shall not be used to illuminate trees or vegetation. OR

  The applicant shall provide documentation to the satisfaction of a qualified biologist that the illumination of vegetation and/or structures within the atrium by accent lighting and/or up-lighting will not make these features more conspicuous to the human eye from any elevation outside the atrium compared to ambient conditions within the atrium. The biologist shall submit a report to the City following the completion of the lighting design documenting compliance with this requirement.

For Office Buildings 01, 02, 03, 05, and 06 and the residential/mixed-use buildings, the project shall implement Mitigation Measure BIO-1 above as well as the following mitigation measure to minimize impacts due to increased lighting:

- **Mitigation Measure BIO-8.** Exterior lighting shall be minimized (i.e., total outdoor lighting lumens shall be reduced by at least 30% or extinguished, consistent with recommendations from the International Dark-Sky Association [2011]) from midnight until sunrise, except as needed for safety and City code compliance.

6.1.3 Impacts on Wildlife from Feral Cat Predation (Less than Significant with Mitigation)

Mammalian predation of birds and small mammals is a natural process. However, when natural levels of predation are increased due to the presence of non-native species, the health of local animal populations, including populations of special-status species, can be adversely affected. Feral cats (*Felis catus*) have been implicated as a major predator on many native wildlife species, including birds and small mammals such as the salt marsh harvest mouse, which is known to occur in wetlands north and northeast of the study area (CNDDB 2021). Not only does predation by feral cats have a potential impact on animal populations, but feral cat feeding stations also attract other predators such as raccoons and skunks, increasing predation pressure on native species in these locations.

During the reconnaissance survey on November 13, 2017, multiple feral cats were observed on the main project site and in the surrounding study area. Implementation of the proposed project has the potential to result in an increase in the feral cat population, for example as a result of an influx of renters and their pets or the establishment of feral cat feeding stations by residents or workers. This impact would be potentially significant under CEQA due to the impact on native wildlife species (Criterion A). Implementation of Mitigation Measure BIO-9 will reduce potential impacts due to feral cats to a less-than-significant level.

Mitigation Measure BIO-9. Feral Cat Management Program. The developer shall implement a Feral Cat Management Program similar to the program developed in conjunction with the Peninsula Humane Society and the Society for the Prevention of Cruelty to Animals for Meta's East Campus in 2013. For one week, every three months (i.e., each quarter), three live trap cages designed to trap cats shall be placed around the perimeter of the main Project Site in locations where feral cats are likely to prey upon native wildlife species. Each trap cage shall be monitored and maintained on a daily basis during the week the traps have been set to determine whether a feral cat has been caught and whether the trap has inadvertently captured a non-target species. If a feral cat is caught, a representative from a pest control operator (or a similar service organization/company) shall be contacted and dispatched to transport the trapped cat to either the Humane Society of San Mateo County, a local cat shelter, a local cat rescue facility, or other local facility that accepts feral cats. If an animal other than a feral cat is caught in one of the traps, it shall be released immediately at the trap location.

6.2 Impacts on Sensitive Communities: Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service

6.2.1 Impacts on Riparian Habitat or Other Sensitive Natural Communities (Less than Significant with Mitigation)

No riparian habitats or other sensitive natural communities are present on the project site itself. A small, isolated segment of forested wetland is located in a drainage ditch along the northern edge of the study area, just outside the project boundary. A linear area of herbaceous seasonal wetland is present immediately north of the Hamilton Avenue Parcels North and South portion of the project site. Another herbaceous seasonal wetland is present just outside the northeast corner of the project boundary. These wetlands are small and isolated, being in depressional areas, rather than having a surface connection to more extensive wetlands. Due to their small, isolated nature and lack of high-quality habitat for wildlife, these are not high-quality habitat features. Nevertheless, forested wetlands are relatively scarce along the edge of the bay, and seasonal wetlands along the edge of the bay have declined due to development and fill. Therefore, we consider these wetlands to be sensitive habitat areas.

Although these wetlands are outside of the project's property boundary, it is possible that these features may be impacted, either temporarily or permanently, during project grading. Elevation of the site and construction of a bicycle/pedestrian path along the northern edge of the main project site will require import of fill into that area, and although a retaining wall may be constructed to support the trail, some clearing of vegetation within, and fill of, these wetlands (or portions of these wetlands) may occur. As a result, it is possible that up to the entire 0.07-acre isolated forested wetland (as well as an additional 0.13-acre area where the canopy of willows extends outside the 0.07-acre forested wetland footprint within which the willows are rooted) and 0.07-acre herbaceous seasonal wetlands may be lost due to fill. Even if these wetlands are not permanently impacted, temporary impacts to wetlands may occur due to construction access, potentially resulting in degradation of wetland vegetation or hydrology. Owing to the scarcity of forested wetlands along the edge of the bay and the decline in seasonal wetlands in the region, this impact would be significant (Criterion B). Implementation of Mitigation Measures BIO-10, 11, and 12 will reduce this impact to a less-than-significant level. Indirect impacts on these wetlands will be avoided and minimized as described under *Impacts on Wetlands and Water Quality* below.

Mitigation Measure BIO-10. Avoidance and Minimization. To the extent feasible, construction activities should avoid or minimize the removal of wetland vegetation or the placement of fill in the wetlands immediately north and northeast of the project site. If all direct impacts to wetlands (i.e., vegetation removal and fill) are avoided, Mitigation Measures BIO-11 and BIO-12 do not need to be implemented, but if any wetland vegetation needs to be removed from the wetlands, or any fill needs to be placed in the wetlands, Measure BIO-11 (and Measure BIO-12, if permanent impacts will occur) will be implemented.

Mitigation Measure BIO-11. In-Situ Restoration of Temporary Impacts. If impacts to the wetlands immediately north and northeast of the project site are temporary, resulting in vegetation removal or temporary fill, but no permanent fill of the wetland is necessary, then the wetland area will be restored by the Project Sponsor following construction. The herbaceous seasonal wetlands are likely to become recolonized easily without the need for seeding and planting, as long as their existing hydrology and topography are restored following temporary impacts. Depending on the level of impact, there is potential for the arroyo willow clumps in the isolated forested wetland to regrow from cut stumps. In such a case, the in-situ restoration would involve simply protecting the area with exclusion fencing following construction to allow for re-growth of vegetation. For temporary impacts that may have removed willow root masses, but where in-situ restoration is still an option, a more detailed restoration plan will need to be developed. The mitigation should, at a minimum, achieve no net loss of wetland acreage (i.e., jurisdictional wetlands lost to fill will be replaced by creation or restoration of wetland habitat, of the same type that was impacted [either forested or herbaceous seasonal] at a minimum 1:1 ratio, on an acreage basis, or as otherwise required by any state or federal permitting agencies) or ecological functions and values through the restoration and enhancement of the impacted wetland that are equal to or greater than the baseline conditions for the existing wetlands. An in-situ restoration approach could involve salvage of wetland plant material prior to construction (e.g., willow cuttings or salvage of willow clumps, in the case of the isolated forested wetland) and then replanting those clumps if the seasonal timing of the construction were appropriate. USACE and/or RWQCB approvals may be required to authorize temporary impacts to these features.

Mitigation Measure BIO-12. Compensatory Mitigation. If any permanent fill of the isolated forested wetland or the herbaceous seasonal wetlands will occur, the project proponent will provide new wetland habitat of the same type that was impacted (either forested or herbaceous seasonal) to offset this impact, either through the creation enhancement, or restoration of wetlands in an appropriate location or via the purchase of mitigation credits in a USACE or RWQCB-approved wetland mitigation bank. The purchase of such credits shall serve as full mitigation for impacts to these wetland features. If project-specific creation, enhancement, or restoration of wetland habitat is implemented, habitat will be restored or created at a minimum ratio of 2:1 (compensation : impact) on an acreage basis, or as otherwise required by any state of federal permitting agencies. This ratio is not higher due to the relatively low quality of the wetlands in the study area relative to more extensive, less fragmented wetlands elsewhere in the region, but it is not lower due to the temporal loss of wetland functions and values that would result from the lag between impacts to the wetlands and maturation of the mitigation habitat. USACE and/or RWQCB approvals may be required to authorize permanent impacts to this feature.

To the extent compensatory mitigation is not provided by purchasing mitigation credits from a USACE- or RWQCB-approved wetland mitigation back, then, if feasible, compensation will be provided by creating, enhancing, or restoring wetland habitat so as to achieve the 2:1 ratio somewhere in San Mateo County, or as otherwise required by any state or federal permitting agencies. A qualified biologist shall develop a "Wetland Mitigation and Monitoring Plan" describing the mitigation, which will contain the following components (or as otherwise modified by regulatory agency permitting conditions):

- Summary of habitat impacts and proposed mitigation ratios
- Goal of the restoration to achieve no net loss of habitat functions and values
- Location of mitigation site(s) and description of existing site conditions
- Mitigation design:
    - Existing and proposed site hydrology
    - Grading plan if appropriate, including bank stabilization or other site stabilization features
    - Soil amendments and other site preparation elements as appropriate
    - Planting plan
    - Irrigation and maintenance plan
    - Remedial measures and adaptive management
- Monitoring plan (including final and performance criteria, monitoring methods, data analysis, reporting requirements, and monitoring schedule). Success criteria will include quantifiable measurements of wetland vegetation type (e.g., dominance by natives) and extent appropriate for the restoration location, and provision of ecological functions and values equal to or exceeding those in the wetland habitat affected. At a minimum, success criteria will include following:
    - At Year 5 post-mitigation, at least 75 percent of the mitigation site will be dominated by native hydrophytic vegetation.

The Wetland Mitigation and Monitoring Plan must be approved by the City of Menlo Park prior to the wetland impacts, and implementation of the Plan must begin within one year after the discharge of fill into these wetland features.

Alternately, off-site mitigation could be provided via the purchase of mitigation credits at an agency-approved mitigation bank, as noted above.

6.2.2 Impacts Caused by Non-Native and Invasive Species (Less than Significant)

Several non-native, invasive plant species occur in the California annual grassland habitat located along the northern edge of the study area. Invasive species can spread quickly and can be difficult to eradicate. Many non-native, invasive plant species produce seeds that germinate readily following disturbance. Further, disturbed areas are highly susceptible to colonization by non-native, invasive species that occur locally, or whose propagules are transported by personnel, vehicles, and other equipment.

Development undertaken because of the proposed project would result in a large portion of the site being subject to soil disturbance due to replacement of the existing outdated industrial complex with a new, mixed-used campus. Activities such as trampling, equipment staging, and vegetation removal are all factors that would also contribute to disturbance. Areas of disturbance could serve as the source for promoting the spread of non-

native species, which could degrade the ecological values of wetlands that occur immediately adjacent to the project site, and adversely affect native plants and wildlife that occur there. Local propagule sources of one highly invasive weed, fennel, and other moderately invasive weeds such as wild oats and black mustard were observed on and surrounding the northern portion of the study area during the November 2017 and April 2019 surveys. Although no invasive weeds were observed on the project site itself, it is possible that some off-site grading in areas along the northern edge of the site will be necessary. Such grading may mobilize weeds within the immediate vicinity of the grading. However, given the minimal amount of disturbance in this off-site area, and the fact that surrounding areas are already developed, we do not expect this disturbance to result in an increased source population for the spread of non-native, invasive species into sensitive habitat areas.

Further, the project would comply with the City of Menlo Park Municipal Code, Chapter 12.44.090(a)(1)(G), which discourages the use of invasive or noxious plant species for landscaping. Thus, project activities would not result in the introduction of invasive species onto the project site or facilitate the spread of invasive plants into sensitive habitats (e.g., wetlands) surrounding the project site. In addition, the invasive species observed in the study area are already present in or around wetland habitats to the north and northeast, and the remainder of the surrounding area is developed/landscaped and thus not susceptible to habitat degradation by the spread of invasive plants. Therefore, the project would result in no impact due to the spread of non-native, invasive species.

6.3 Impacts on Wetlands: Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling hydrological interruption, or other means.

6.3.1 Impacts on Wetlands and Water Quality (Less than Significant with Mitigation)

No wetlands occur on the project site, but an isolated forested wetland and herbaceous seasonal wetlands are located to the north of the project site and to the northeast of the project site within the study area , and further, brackish wetlands occur to the north and northeast of the study area boundary. The isolated forested wetland, herbaceous seasonal wetlands, and brackish marsh may be subject to the regulatory jurisdiction of the USACE and RWQCB. Wetlands serve a variety of important functions, such as sediment stabilization, sediment/toxicant retention, nutrient removal/transformation, and terrestrial wildlife species habitat. Even though the acreage of these wetlands in the study area is small, wetlands are relatively scarce regionally, and even small wetland areas have disproportionate contributions to water quality, groundwater recharge, watershed function, and wildlife habitat in the region. In particular, forested wetlands are scarce along the edges of San Francisco Bay.

As discussed under *Impacts on Riparian Habitat or Other Sensitive Natural Communities* above, while the project proposes to avoid these features to the extent feasible, it is possible that the 0.07-acre isolated forested wetland (as well as an additional 0.13-acre area where the canopy of willows extends outside the 0.07-acre forested wetland footprint within which the willows are rooted) and 0.07-acre seasonal wetlands along the northern edge

of the site may be impacted, either temporarily or permanently, during project grading. Owing to the scarcity of wetlands along the edge of the bay, this direct impact would be significant (Criterion C). Implementation of Mitigation Measures BIO-10, 11, and 12 will reduce impacts from the direct loss or modification of wetlands to a less-than-significant level. The brackish wetlands are located approximately 220 ft from the nearest proposed building and are separated from the main project site by an approximately 25 – 40 ft tall self-storage business. The project would not cause any direct impacts on these brackish wetlands.

Redevelopment has the potential to cause indirect impacts on nearby wetlands or water quality within those wetlands based on site runoff patterns. Currently during the 100-year storm, approximately 16% of the main project site's runoff flows overland to the brackish wetlands located northeast of the study area, with the rest flowing west to the Willow Road storm drain (Sherwood Design Engineers 2017). The project is expected to increase the area of overland flow that drains to the northeast corner of the main project site during the 100-year storm event somewhat, but would detain water on-site to not exceed existing peak flow rates. Such infrequent storm events are not expected to shape the species composition or habitat quality of wetlands to the north and northeast, as those habitats are governed by much more regular/frequent physical and ecological processes. As a result, an increase in runoff from the main project site during 100-year storm events would not have substantial impacts on wetlands to the north and northeast of the study area. The proposed project's storm drainage system would be designed to convey the 10-year storm event and lesser events from the entire main project site to the existing Willow Road storm drain main. During such 10-year and lesser events, no runoff would flow overland to the brackish wetlands located north and northeast of the study area. Therefore, due to the infrequency with which overland flows would enter off-site wetlands, the potential impact on wetland community composition or quality due to an influx of freshwater during large storm events is considered less than significant. Additionally, because the peak flow rate will not be increased to the marsh in large storm events over the existing condition, no significant erosion or sedimentation impacts would occur to the brackish marsh during site discharges to the area in large storm events.

In addition, the project would install stormwater infrastructure to collect site run-off and direct it into the City's storm drain system, rather than into the isolated forested wetland or herbaceous seasonal wetlands adjacent to the project boundary. This would prevent post-construction changes in run-off, including run-off carrying sediment or oil and grease, that could degrade water quality from entering the feature. Construction projects in California causing land disturbances that are equal to 1 acre or greater must comply with State requirements to control the discharge of stormwater pollutants under the NPDES *General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities* (Construction General Permit; Water Board Order No. 2009-0009-DWQ). Prior to the start of construction/demolition, a Notice of Intent must be filed with the State Water Board describing the project. A Storm Water Pollution Prevention Plan (SWPPP) must be developed and maintained during the project and it must include the use of Best Management Practices (BMPs) to protect water quality until the site is stabilized. Standard permit conditions under the Construction General Permit require that the applicant utilize various measures including: on-site sediment control best management practices, damp street sweeping, temporary cover of disturbed land surfaces to control erosion during construction, and utilization of stabilized construction entrances or wash racks, among other elements.

Finally, in many Bay Area counties, including San Mateo County, projects must also comply with the *California Regional Water Quality Control Board, San Francisco Bay Region, Municipal Regional Stormwater NPDES Permit* (MRP) (Water Board Order No. R2-2015-0049). This MRP requires that all projects implement BMPs and incorporate Low Impact Development practices into the design to prevent stormwater runoff pollution, promote infiltration, and hold/slow down the volume of water coming from a site after construction has been completed. In order to meet these permit and policy requirements, projects must incorporate the use of green roofs, impervious surfaces, tree planters, grassy swales, bioretention and/or detention basins, among other factors. These same features will be used to treat any stormwater that flows to the off-site brackish marsh during large storm events.

Reductions in ambient light levels in wetland habitat can lead to a decrease in the amount of aquatic vegetation present, which results in a reduction in primary production, as well as the amount of cover and herbaceous food available in the wetland habitat. The proposed project would result in an increase in the maximum height of buildings on the project site from approximately 34 ft currently to 110 ft. Thus, the project has the potential to affect vegetation near taller buildings due to changes in ambient lighting (i.e., shading). However, the increased height of the proposed buildings is not expected to result in a substantial change in the ambient light reaching nearby wetlands. The isolated forested wetlands immediately north of the project boundary are currently bordered to the south by an area of tall trees that already provide some shade, and under the proposed project, regardless of the height of buildings that are constructed nearby, these wetlands would still have exposure to the eastern sky, unimpeded by new buildings. Thus, shading of this wetland under the proposed project is not expected to increase substantially over current levels.

The herbaceous seasonal wetland immediately outside the northeast corner of the project site is in an open area, with no substantive shading from trees or buildings. The herbaceous seasonal wetland immediately north of the Hamilton Avenue Parcels North and South portion of the project site is currently bordered to the south by shrubs and small trees that provide minimal shade, as well as two approximately 20-foot tall buildings located approximately 15–25 feet from the wetland that also shade portions of the wetlands. Shading of both herbaceous seasonal wetlands by new buildings would reduce the amount of light received by wetland plants, potentially affecting the health and growth of these plants, and we would expect some degradation of the wetland habitat over time as a result. However, these wetlands would still have exposure to the eastern sky, unimpeded by new buildings, so they would not be completely shaded. Because these herbaceous seasonal wetlands in the study area would continue to receive adequate lighting, impacts to their functions and values would not rise to a level of significance under CEQA.

The brackish marsh to the north of the study area is located approximately 220 ft from the nearest proposed building and is separated from the main project site by an approximately 25 – 40 ft tall self-storage business. Thus, shading of the marsh by the existing storage units currently have an effect on aquatic vegetation, and the net increase in shading from the proposed project would be insignificant given the project site's distance from the marsh. Shade from the proposed buildings would only reach the marsh for short periods of the day when the sun is low in the sky and ambient light is dimmer and providing less photosynthetic input. Further, because

of the open nature of the proposed development, with extensive open space, the project would not result in one large, continuous shadow but would allow light to penetrate through the campus. Therefore, shading impacts on wetlands from the proposed buildings would be less than significant.

Compliance with state requirements to control the discharge of stormwater pollutants during construction under the NPDES Construction General Permit and the RWQCB required SWPPP, and post-construction measures and design features required by the MRP would reduce the project's potential impact on water quality to a less-than-significant level.

6.4 Impacts on Wildlife Movement: Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites (Less than Significant)

6.4.1 Impacts on Wildlife Movement and Native Wildlife Nursery Sites (Less than Significant)

For many species, a typical urban landscape is a mosaic of suitable and unsuitable habitat types. Environmental corridors are segments of land that provide a link between these different habitats while also providing cover. Development that fragments natural habitats (i.e., breaks them into smaller, disjunct pieces) can have a twofold impact on wildlife: first, as habitat patches become smaller they are unable to support as many individuals (patch size), and second, the area between habitat patches may be unsuitable for wildlife species to traverse (connectivity).

All proposed project activities are located within an already developed footprint that is surrounded by existing development. Therefore, the project would not result in fragmentation of natural habitats. Further, the proposed project includes extensive open space. Thus, any common, urban adapted species that currently move through the project site would continue to be able to do so following project construction, and the project would not interfere with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors.

Construction disturbance during the avian breeding season (February 1 through August 31, for most species) could result in the incidental loss of eggs or nestlings, either directly through the destruction or disturbance of active nests or indirectly by causing the abandonment of nests. Due to the absence of sensitive habitats from the project site, the habitats on the project site support only regionally common, urban-adapted breeding birds and support only a very small proportion of these species' regional populations. In addition, many birds are expected to continue to nest and forage on the project site after project construction is completed. These birds are habituated to disturbance related to the existing technology park, and the project incorporates trees, shrubs, and forbs into the landscape design, which will provide some food and structural resources for the common, urban-adapted birds of the area, as well as for migrants that may use the area during spring and fall migration. Therefore, project impacts on nesting and foraging birds that use the site, due to habitat impacts or disturbance

of nesting birds, would not rise to the CEQA standard of having a substantial adverse effect, and these impacts would not constitute a significant impact on these species or their habitats under CEQA. However, all native bird species are protected from direct take by federal and state statutes (see Sections 3.1.5 and 3.2.4). Therefore, Mitigation Measures BIO-13, 14, 15, and 16 shall be implemented to ensure that project activities comply with the MBTA and California Fish and Game Code:

Mitigation Measure BIO-13. Avoidance. To the extent feasible, construction activities should be scheduled to avoid the nesting season. If construction activities are scheduled to take place outside the nesting season, all impacts on nesting birds protected under the MBTA and California Fish and Game Code will be avoided. The nesting season for most birds in San Mateo County extends from February 1 through August 31.

Mitigation Measure BIO-14. Preconstruction/Pre-disturbance Surveys. If it is not possible to schedule construction activities between September 1 and January 31 then preconstruction surveys for nesting birds should be conducted by a qualified ornithologist to ensure that no nests of migratory birds will be disturbed during project implementation. We recommend that these surveys be conducted no more than seven days prior to the initiation of construction activities for each construction phase. During this survey, the ornithologist will inspect all trees and other potential nesting habitats (e.g., trees, shrubs, California annual grasslands, buildings) in and immediately adjacent to the impact areas for migratory bird nests.

Mitigation Measure BIO-15. Buffers. If an active nest is found within trees or other potential nesting habitats that would be disturbed by these activities, the ornithologist will determine the extent of a construction-free buffer zone to be established around the nest (typically 300 ft for raptors and 100 ft for other species), to ensure that no nests of species protected by the MBTA and California Fish and Game Code will be disturbed during Project implementation.

Mitigation Measure BIO-16. Inhibition of Nesting. If construction activities will not be initiated until after the start of the nesting season, all potential nesting substrates (e.g., bushes, trees, grasses, and other vegetation) that are scheduled to be removed by the project may be removed prior to the start of the nesting season (e.g., prior to February 1). This will preclude the initiation of nests in this vegetation, and prevent the potential delay of the project due to the presence of active nests in these substrates.

6.5 Impacts due to Conflicts with Local Policies: Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance (Less than Significant)

6.5.1 Impacts Related to Compliance with Municipal Code Chapter 13.24, Heritage Trees (Less than Significant)

Per City of Menlo Park Municipal Code Chapter 13.24, Heritage Trees, permits from the City's Director of Public Works or his or her designee and payment of a fee are required for the removal of any trees which meets the definition of heritage tree, as defined in Section 3.3.1 above. Of the 925 trees currently present on the

project site, including 292 that qualify as heritage trees, 821 (including 269 heritage trees) are expected to be removed during project construction activities (SBCA Tree Consulting 2017, Peninsula Innovation Partners 2020). The removal or pruning of trees protected by the City of Menlo Park municipal code is considered potentially significant under CEQA (Criterion I). However, the project would comply with the City's heritage tree ordinance Sections 16.43.140(6) (with respect to the O District) and 16.45.130(6) (with respect to the RMU District), including obtaining a permit from the City to remove protected trees and paying any applicable fee. The project proposes to provide replacement trees for all heritage trees removed by the project, so that a greater number of trees will be planted than removed. Therefore, impacts related to conflict with local policies or ordinances protecting heritage trees would be less than significant.

6.5.2 Impacts Related to Compliance with Municipal Code Chapters 16.43.140(6) and 16.45.130(6), Bird Safe Design (Less than Significant with Mitigation)

Development of the proposed project would result in the replacement of existing multi-story buildings with new multi-story buildings on the main project site, and the new buildings will incorporate glazing into their facades. Glass windows and building facades can result in injury or mortality of birds due to collisions with these surfaces. Because birds do not perceive glass as an obstruction the way humans do, they may collide with glass when the sky or vegetation is reflected in glass (e.g., they see the glass as sky or vegetated areas); when transparent windows allow birds to perceive an unobstructed flight route through the glass (such as at corners); and when the combination of transparent glass and interior vegetation (such as in planted atria) results in attempts by birds to fly through glass to reach that vegetation.

The majority of avian collisions with buildings occur within the first 60 ft of the ground (City of San Francisco 2011), where birds spend the majority of their time engaged in foraging, territorial defense, nesting, and roosting activities, and where vegetation is most likely to be reflected in glazed surfaces. However, very tall buildings (e.g., buildings 500 ft or more high) may pose a threat to birds that are migrating through the area, particularly to nocturnal migrants that may not see the buildings or that may be attracted to lights on the buildings.

Currently, terrestrial land uses and habitat conditions in and adjacent to the project site consist primarily of developed and landscaped uses such as buildings, parking lots, and roads. Vegetation in these areas is limited in extent, and consists primarily of non-native landscaped trees and shrubs. Although a number of bird species will use such vegetation, they typically do so in low numbers. Non-native vegetation supports fewer of the resources required by native birds than native vegetation, and the structural simplicity of the vegetation (without well-developed ground cover, understory, and canopy layers) further limits resources available to birds. In addition, although numerous waterbirds are known to congregate at the Don Edwards San Francisco Bay NWR to the north and east of the project site, because the area surrounding the project site to the west and south is heavily urbanized and contains no habitats of high value to estuarine birds using the NWR, we do not expect large numbers of waterbirds to be flying over the project site at altitudes low enough for bird-strike mortality to occur. The bird species with the greatest potential to collide with any buildings would consist primarily of the common, urban-adapted passerine species that currently use the project site, as these are the species that would spend the most time in the vicinity of the new buildings.

Zoning regulations set forth in Municipal Code Chapter 16.43.140 (6) require projects such as the Willow Village project to implement the following bird-safe design measures to reduce collision risk:

- No more than 10% of facade surface area shall have non-bird-friendly glazing.
- Bird-friendly glazing includes, but is not limited to opaque glass, covering of clear glass surface with patterns, paned glass with fenestration patterns, and external screens over non-reflective glass.
- Placement of buildings shall avoid the potential funneling of flight paths towards a building facade.
- Glass skyways or walkways, freestanding glass walls, and transparent building corners shall not be allowed.
- Transparent glass shall not be allowed at the rooflines of buildings, including in conjunction with green roofs.
- Use of rodenticides shall not be allowed.

However, these regulations allow that a project may receive a waiver from one or more of the items listed above, excluding the prohibition on use of rodenticides, subject to the submittal of a project-specific evaluation from a qualified biologist and review and approval by the planning commission (Ord. 1024 § 3 (part), 2016). To provide such a project-specific evaluation for the Willow Village project, H. T. Harvey & Associates (2021a) prepared the *Willow Village Master Plan Bird-Safe Design Assessment*, which comprehensively analyzes bird collision risk for the Willow Village Master Plan based on the project's conceptual Conditional Development Permit (CDP) application. The report provides documentation of the bird-safe design measures and mitigation measures that will be incorporated into the project to ensure that project impacts due to bird collisions with buildings are reduced to less-than-significant levels under CEQA.

Based on the *Willow Village Master Plan Bird-Safe Design Assessment*, the project shall comply with the following for purposes of addressing the potential for avian collision risk associated with the project:

1. The "beneficial project features" identified in Appendix A of the *Willow Village Master Plan Bird-Safe Design Assessment* (H. T. Harvey & Associates 2021a). These are features of the proposed buildings' architecture that would reduce the frequency of avian collisions by making the buildings' facades appear conspicuous to birds.
2. City Bird-Safe Design Requirements
    a. The City Bird-Safe Design Requirements identified in Mitigation Measure BIO-1 of the *ConnectMenlo: General Plan Land Use & Circulation Elements and M-2 Area Zoning Update Environmental Impact Report* (ConnectMenlo EIR), certified by the City of Menlo Park in 2016 and codified in Sections 16.43.140(6) and 16.45.130(6) of the City's Municipal Code (collectively referred to as the "City Bird-Safe Design Requirements"), as described in Sections 5.2.2.1, 5.3.2.1, 5.4.2.1, 5.5.2.1, and 6.2.2 of the Bird-Safe Design Assessment.
    b. Subject to City approval of waivers to certain City Bird-Safe Design Requirements, the Alternative Measures Proposed, as described in Sections 5.2.2.2, 5.3.2.2, 5.4.2.2, 5.5.2.2, and 6.2.2 of the Bird-Safe Design Assessment. These Alternative Measures are derived from the

City of Menlo Park's requirements but are tailored specifically to the Willow Village Master Plan to achieve a reduction in collision risk commensurate with the City Bird-Safe Design Requirements.

3. The "lighting design principles," as described in Section 6.2.1 of the Bird-Safe Design Assessment.
4. Additional mitigation measures, including BIO-1 through BIO-8 described above for impacts on wildlife from artificial lighting, and BIO-17 through BIO-21 described below for the atrium.

As described in the *Willow Village Master Plan Bird-Safe Design Assessment*, an assessment of the conceptual design of most of the proposed structures in the Master Plan area (i.e., the hotel, residential/mixed-use buildings, office campus buildings, and event building and nearby buildings) determined that impacts from bird collisions with these buildings would be less than significant under CEQA with incorporation of beneficial project features, compliance with City Bird-Safe Design Requirements, implementation of Alternative Measures as described above, and implementation of Mitigation Measures BIO-1 through BIO-8 described above for impacts on wildlife from artificial lighting. As such, no additional mitigation measures (i.e., related to the buildings' facades) for impacts related to avian collisions are proposed for those buildings.

However, due to the unique design of the atrium, incorporation of beneficial project features, compliance with City Bird-Safe Design Requirements, and implementation of Alternative Measures may not reduce collision impacts with this structure sufficiently to avoid a significant impact under CEQA. Therefore, additional CEQA mitigation measures are necessary to reduce impacts. With the implementation of the following mitigation measures, which go above and beyond the City's bird-safe design requirements, impacts due to bird collisions with the atrium will be reduced to less-than-significant levels under CEQA, in our professional opinion.

- **Mitigation Measure BIO-17.** The project shall treat 100% of glazing on the 'dome-shaped' portions of the atrium's façades (i.e., all areas of the north façade, and all areas of the south façade above the elevated park) with a bird-safe glazing treatment to reduce the frequency of collisions. This glazing shall have a Threat Factor[4] of 15 or lower.

  Because a Threat Factor is a nonlinear index, its value is not equivalent to the percent reduction in collisions that a glazing product provides. However, products with lower threat factors result in fewer bird collisions. Because the City's bird-safe design requirements (and requirements of other municipalities in the Bay Area) do not specify the effectiveness of required bird-safe glazing, Mitigation Measure BIO-17 goes above and beyond what would ordinarily be acceptable to the City, as well as what is considered the industry standard for the Bay Area.

[4] A material's Threat Factor is assigned by the American Bird Conservancy, and refers to the level of danger posed to birds based on birds' ability to perceive the material as an obstruction, as tested using a "tunnel" protocol (a standardized test that uses wild birds to determine the relative effectiveness of various products at deterring bird collisions). The higher the Threat Factor, the greater the risk that collisions will occur. An opaque material will have a Threat Factor of 0, and a completely transparent material will have a Threat Factor of 100. Threat Factors for many commercially available façade materials can be found at https://abcbirds.org/wp-content/uploads/2021/01/Master-spreadsheet-1-25-2021.xlsx.

- **Mitigation Measure BIO-18.** The project shall treat 100% of glazing on the atrium's east and west facades with a bird-safe glazing treatment to reduce the frequency of collisions. This glazing shall have a Threat Factor of 15 or lower.

- **Mitigation Measure BIO-19.** Interior trees and woody shrubs will be set back from the atrium's east, west, and non-sloped (i.e., vertical/perpendicular to the ground) portions of the south facades by at least 50 feet to reduce the potential for collisions with these facades due to the visibility of interior trees. This 50-foot distance is greater than the distance used in the project design for the north and sloped portions of the south facades (e.g., 20-25 feet for the north façade) due to the vertical nature of the east, west, and non-sloped portions of the south facades, as opposed to the articulated nature of the north and sloped portions of the south facades (which is expected to reduce the visibility of internal vegetation to some extent), as well as the direct line-of-sight views between interior and exterior vegetation through the east, west, and non-sloped portions of the south facades compared to the north façade (where internal vegetation is elevated above exterior vegetation). Interior trees and shrubs that are not visible through the east, west, and south facades may be planted closer than 50 feet to glass facades.

- **Mitigation Measure BIO-20.** Because the glass production process can result in substantial variations in the effectiveness of bird-safe glazing, a qualified biologist will review physical samples of all glazing to be used on the atrium to confirm that the bird-safe frit will be visible to birds in various lighting conditions, and is expected to be effective.

- **Mitigation Measure BIO-21.** The project shall monitor bird collisions around the atrium for a minimum of two years following completion of construction of the atrium to identify if there are any collision "hotspots" (i.e., areas where collisions occur repeatedly).

  A monitoring plan for the atrium shall be developed by a qualified biologist that includes focused surveys for bird collisions in late April–May (spring migration), September–October (fall migration), and mid-November–mid-January (winter) to maximize the possibility that the surveys will detect any bird collisions that might occur. Surveys of the atrium will be conducted daily for three weeks during each of these periods (i.e., 21 consecutive days during each season, for a total of 63 surveys per year). In addition, for the two-year monitoring period, surveys of the atrium will be conducted the day following all nighttime events held in the atrium during which temporary lighting exceeds typical levels (i.e., levels specified in the International Dark-Sky Association's defined lighting zone LZ-2 from dusk until 10:00 p.m., or 30% below these levels from 10:00 p.m. to midnight, as described in Section 6.5 below). The applicant can assign responsibility for tracking events and notifying the biologist when a survey is needed to a designated individual who is involved in the planning and scheduling of atrium events. The timing of the 63 seasonal surveys (e.g., morning or afternoon) will vary on different days to the extent feasible; surveys conducted specifically to follow nighttime events will be conducted in the early morning.

  At a frequency of no less than every six months, a qualified biologist will review the bird collision data for the atrium in consultation with the City to determine whether any potential hotspots are present (i.e., if collisions have occurred repeatedly in the same locations). A "potential hotspot" is defined as a cluster of three or more collisions that occur within one of the three-week monitoring periods described above at a

given "location" on the atrium. The "location" shall be identified by the qualified biologist as makes sense for the observed collision pattern and may consist of a single pane of glass, an area of glass adjacent to a landscape tree or light fixture, the 8,990 square-foot vertical façade beneath the elevated park, the façade adjacent to vegetation on the elevated park, the atrium's east façade, the atrium's west façade, or another defined area where the collision pattern is observed. "Location" shall be defined based on observations of (1) collision patterns and (2) architectural, lighting, and/or landscape features contributing to the collisions, and not arbitrarily (e.g., by assigning random grids).

If any potential hotspots are found, the qualified biologist will provide an opinion regarding whether the potential hotspot will impact bird populations over the long-term to the point that additional measures (e.g., adjustments to lighting or the placement of vegetation) are needed to reduce the frequency of bird strikes at the hotspot location in order to reduce impacts to a less-than-significant level under CEQA (i.e., whether it constitutes an actual "hotspot"). This will be determined based on the number and species of birds that collide with the atrium over the monitoring period. In addition, a "hotspot" is automatically defined if a cluster of five or more collisions are identified at a given "location" on the atrium within one of the three-week monitoring periods described above. If a hotpot is identified, additional measures will be implemented at the potential hotspot location at the atrium; these may include one or more of the following options in the area of the hotspot depending on the cause of the collisions:

- The addition of a visible bird-safe frit pattern, netting, exterior screens, art, printed sheets, interior shades, grilles, shutters, exterior shades, or other features to untreated glazing (i.e., on the façade below the elevated park) to help birds recognize the façade as a solid structure.
- Installing interior or exterior blinds in the buildings within the atrium to prevent light from spilling outward though glazed facades at night.
- Reducing lighting by dimming fixtures, redirecting fixtures, turning lights off, and/or adjusting programmed timing of dimming/shutoff.
- Replacing certain light fixtures with new fixtures to provide increased shielding or redirect lighting.
- Adjusting or reducing lighting during events.
- Adjusting the timing of events to reduce the frequency of events during certain times of year (e.g., spring and/or fall migration) when relatively high numbers of collisions occur.
- Adjusting landscape vegetation by removing, trimming, or relocating trees or other plants (e.g., moving them farther from glass), or blocking birds' views of vegetation through glazing (e.g., using a screen or other opaque feature).

If modifications to the atrium are implemented to reduce collisions at a hotspot, one year of subsequent focused monitoring of the hotspot location will be performed to confirm that the modifications effectively reduce bird collisions to a less-than-significant level under CEQA. This monitoring may or may not extend beyond the two-year monitoring period described above, depending on the timing of the hotspot detection.

It is our understanding that the project proposes to use a frit consisting of ¼-inch white dots spaced in a 2x2-inch grid (i.e., similar in specifications to the Solyx SX-BSFD Frost Dot Bird Safety Film product rated with a Threat Factor of 15 by the American Bird Conservancy) for all treated façade areas on the atrium. We further understand that the atrium's glazing will have a dark gray thermal frit treatment (e.g., dark dots incorporated into the glass) in addition to the lighter-toned frit pattern that composes the bird-safe treatment. The extent of thermal frit will vary from the lower portions of the atrium to the upper portions of the atrium, with the upper portions incorporating more extensive (i.e., greater percent cover) thermal frit. Based on our review of preliminary physical glass samples supporting potential combinations of thermal frit and bird-safe frit, provided by the project team, it is our opinion that the combination of the bird-safe frit treatment with the thermal frit would produce very low Threat Factors. We are unaware of any glazing products that incorporate thermal frit patterns and have been assigned a Threat Factor by the American Bird Conservancy; however, the U.S. Green Building Council allows Threat Factors to be determined via any of the following options: (1) using a glass product that has been tested and rated by the American Bird Conservancy; (2) using a glass product with the same characteristics as a product that has been tested and rated by the American Bird Conservancy; or (3) using a glass product that has not been tested and rated, and asking the American Bird Conservancy to provide their opinion regarding an appropriate Threat Factor. We reached out to Dr. Christine Sheppard at the American Bird Conservancy to request her concurrence that the presence of the solar frit would not reduce the effectiveness of the bird-safe frit (and may even increase the effectiveness of the bird-safe frit). Dr. Sheppard responded in an email dated April 9, 2021 agreeing that the solar frit should make the lighter bird-safe frit dots more visible, and the proposed bird-safe treatment would have a Threat Factor of 15 as long as the bird-safe frit dots are ¼-inch in diameter (Sheppard 2021). Thus, the proposed bird-safe glazing treatment is appropriate for the atrium facades and goes above and beyond the City's minimum requirements, as well as the local standard for the San Francisco Bay Area.

The project will also implement Mitigation Measures BIO-1 through BIO-8 to minimize the contribution of project lighting on bird collision risk.

Prior to City approval of each Architectural Control Plan ("ACP") for the project, a qualified biologist shall review the final ACP to confirm that the above features, requirements, alternative measures, and mitigation measures, or other alternative features, requirements, alternative measures, and mitigation measures proposed by the applicant and reasonably acceptable to the qualified biologist, are incorporated into the final design, such that project impacts due to bird collisions would be less than significant under CEQA as indicated in the Bird-Safe Design Assessment.

6.5.3 Impacts Related to Compliance with General Plan Policy OSC1.3, Sensitive Habitats (Less than Significant with Mitigation)

General Plan Policy OSC1.3, Sensitive Habitats, requires new development on or near sensitive habitats to (1) provide a baseline assessment prepared by qualified biologists and specify requirements relative to the baseline assessments, (2) consult with appropriate regulatory and resource agencies, (3) incorporate appropriate avoidance and minimization measures, and (4) obtain necessary permits/authorizations. Further, Mitigation

Measure BIO-1 of the ConnectMenlo EIR (PlaceWorks 2016) specifies that the required biological resources assessment must address a number of specific requirements. The following summarizes the project's compliance with the requirements of General Plan Policy OSC1.3 and ConnectMenlo Mitigation Measure BIO-1.

- The baseline biological resources report is required to provide a determination on whether any sensitive biological resources, including jurisdictional wetlands and waters, essential habitat for special-status species, and sensitive natural communities, are present on the site or on any adjacent undeveloped lands that could be affected by the project and lands of the NWR. In compliance with this requirement, Section 4.2 of this report describes the biotic habitat types present in the study area. Sections 5.1 and 5.2 discuss the potential for these habitats to support special-status plants and animals and analyze the potential for special-status species to occur on the study area or close enough to be impacted by proposed project activities; Section 6.1 analyzes potential impacts to special-status species. No plant or animal species listed as threatened or endangered by the USFWS or CDFW are expected to occur within the study area. Further, no species designated as a species of special concern is expected to breed in the study area.

  Section 5.3 addresses the presence of sensitive habitats in the project vicinity, and Sections 6.2 and 6.3 analyze the potential for the project to result in impacts on such habitats. No habitats under the jurisdiction of the USFWS, CDFW, USACE, or RWQCB were determined to be present on the project site, but 0.07 acre of isolated forested wetland (and an additional 0.13-acre area where the canopy of willows extends outside the 0.07-acre forested wetland footprint within which the willows are rooted) and 0.07 acre of herbaceous seasonal wetlands are present immediately north and northeast of the site, and could potentially be impacted by construction. Implementation of Mitigation Measures BIO-10, 11, and 12 as described in Section 6.2.1 would reduce impacts on sensitive/jurisdictional habitats to less-than-significant levels.

- The baseline biological resources report is required to incorporate guidance from relevant regional conservation plans related to determining the potential presence or absence of sensitive biological resources. As described above, Sections 5.1 and 5.2 analyze the potential for special-status plant or animal species to occur on the project site. This analysis incorporates information from the NWR Comprehensive Conservation Plan and Environmental Assessment (U.S. Fish and Wildlife Service 2012), which includes a discussion of all the special-status species potentially occurring on the NWR.

- The baseline biological resources report is required to include an evaluation of the potential effects of the project on sensitive biological resources. The potential for the proposed project to result in significant impacts on sensitive biological resources is analyzed in Section 6 of this report. This analysis takes into consideration the habitat types present in the study area (Section 4.2), the potential for special-status species to be present in the study area (Sections 5.1 and 5.2), and the proximity of the project site to sensitive habitats (Section 5.3). Based on the analysis, it is determined that the project

would not result in significant impacts on special-status plant or animal species. The project could potentially result in impacts on sensitive habitats under the jurisdiction of the USACE and RWQCB, in the form of the small areas of isolated forested wetland (0.07 acre plus an additional 0.13-acre area where the canopy of willows extends outside the 0.07-acre forested wetland footprint within which the willows are rooted) and herbaceous seasonal wetlands (0.07 acre) present immediately north and northeast of the site. Implementation of Mitigation Measures BIO-10, 11, and 12 as described in Section 6.2.1 would reduce impacts on sensitive/jurisdictional habitats to less-than-significant levels.

- The baseline biological resources report is required to include avoidance, minimization, and mitigation measures for adverse impacts. Based on the *Willow Village Master Plan Bird-Safe Design Assessment*, Mitigation Measures BIO-1 through BIO-8, described in Section 6.1.2, were identified to reduce impacts of project lighting on wildlife and help to mitigate bird collision risk with project buildings, and Mitigation Measures BIO-17 through BIO-21, described in Section 6.5.2, will reduce impacts from bird collisions with the proposed atrium. Mitigation Measure BIO-9, described in Section 6.1.3, will reduce potential impacts of feral cats on native animals. Mitigation Measures BIO-10, 11, and 12, as described in Section 6.2.1, will reduce impacts on sensitive/jurisdictional habitats. Mitigation Measures BIO-13, 14, 15, and 16, described in Section 6.4.1, will avoid project conflicts with the MBTA and California Fish and Game Code related to nesting birds. Collectively all these mitigation measures will reduce Master Plan impacts on biological resources to less-than-significant levels.
- Per Mitigation Measure BIO-1 of the ConnectMenlo EIR, if sensitive biological resources are determined to be present on the project site or may be present on any adjacent parcel containing natural habitat, coordination with the appropriate regulatory and resource agencies must occur. The project could potentially result in impacts on sensitive habitats under the jurisdiction of the USACE and RWQCB, if these habitats are jurisdictional, in the form of the small areas of isolated forested wetland (0.07 acre plus an additional 0.13-acre area where the canopy of willows extends outside the 0.07-acre forested wetland footprint within which the willows are rooted) and herbaceous seasonal wetlands (0.07 acre) present immediately north and northeast of the site. As discussed in Mitigation Measure 2 of this biological resources report, the project will avoid and minimize impacts to these features to the extent feasible. If all direct impacts can be avoided, so that no clearing of wetland vegetation or fill of these wetlands will occur, no regulatory permitting related to these features would be necessary even if these habitats are jurisdictional. However, if these habitats are jurisdictional and will be impacted by vegetation clearing or fill, the applicant will obtain the necessary 404/401 permits from the USACE and RWQCB.

  The project would not result in impacts on plant or animal species listed as threatened or endangered by the USFWS or CDFW, and therefore, no coordination with regulatory agencies regarding impacts on special-status species is warranted. Resource agencies would be provided the opportunity to comment on the proposed project as part of the CEQA process for the project.

- Per Mitigation Measure BIO-1, where jurisdictional waters or federally or State listed special-status species would be affected by the project, appropriate authorizations shall be obtained by the project applicant. As described above, the applicant will obtain any necessary 404/401 permits from the USACE and RWQCB if the off-site isolated forested wetland and/or herbaceous seasonal wetlands are determined to be jurisdictional and will be impacted by vegetation clearing or fill. The project would not result in impacts on plant or animal species listed as threatened or endangered by the USFWS or CDFW. The project would comply with the City's heritage tree ordinance, including obtaining a permit from the City to remove protected trees and paying any applicable fee, as described in Section 6.5.1.

Thus, provided that this project incorporates the mitigation measures described in this biological resources report, the project will not conflict with General Plan Policy OSC1.3. This biological resources report represents compliance with ConnectMenlo EIR Mitigation Measure BIO-1 by providing all the information required by that mitigation measure for a biological resources assessment.

6.6 Impact due to Conflicts with an Adopted Habitat Conservation Plan: Conflict with the provisions of an adopted habitat conservation plan, natural community conservation plan, or other approved local, regional, or state habitat conservation plan (No Impact)

6.6.1 Impacts due to Conflicts with an Adopted Habitat Conservation Plan (No Impact)

The project site is not located within an area covered by an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan. Therefore, the project would not conflict with any such documents.

6.7 Cumulative Impacts

Cumulative impacts arise due to the linking of impacts from past, current, and reasonably foreseeable future projects in the region. Future development activities in the City of Menlo Park will result in impacts on the same habitat types and species that will be affected by the proposed project. The proposed project, in combination with other projects in the area and other activities that impact the species that are affected by this project, could contribute to cumulative effects on special-status species. Other projects in the area include office/retail/commercial development, mixed use, and residential projects that could adversely affect these species, as well as restoration projects (e.g., the South Bay Salt Pond Restoration Project Phase 2, SAFER Bay Project) that will benefit these species. The South Bay Salt Pond Restoration Project has active restoration sites approximately 750 feet north of the Hamilton Avenue Parcel North component of the project.

The cumulative impact on biological resources resulting from the project in combination with other projects in the project area and larger region would be dependent on the relative magnitude of adverse effects of these projects on biological resources compared to the relative benefit of impact avoidance and minimization efforts prescribed by planning documents, CEQA mitigation measures, and permit requirements for each project;

compensatory mitigation and proactive conservation measures associated with each project. In the absence of such avoidance, minimization, compensatory mitigation, and conservation measures, cumulatively significant impacts on biological resources would occur.

However, the project would comply with applicable law regarding protection of biological resources, including among others federal and state law related to jurisdictional waters, federal and state law related to migratory birds, and local regulations regarding bird safety. In addition, the Menlo Park General Plan contains conservation measures that would benefit biological resources, as well as measures to avoid, minimize, and mitigate impacts on these resources. Further, the project would implement mitigation measures (Measures BIO-1-21) to mitigate impacts on sensitive and regulated habitats, and to minimize impacts on nesting and migratory birds, as described above. Thus, the project will make a less than cumulatively considerable contribution to cumulative impacts on biological resources.

Appendix A. Plants Observed

Family	Scientific Name	Common Name
Aceraceae	*Acer palmatum*	Japanese maple
Aceraceae	*Acer rubrum*	red maple
Anacardiaceae	*Pistacia chinensis*	Chinese pistache
Anacardiaceae	*Schinus molle*	Peruvian pepper
Anacardiaceae	*Toxicodendron diversilobum*	poison oak
Apiaceae	*Foeniculum vulgare*	fennel
Araliaceae	*Hedera helix*	English ivy
Arecaceae	*Pheonix canariensis*	Canary Island palm
Asteraceae	*Baccharis pilularis*	coyote brush
Asteraceae	*Helminthotheca echioides*	bristly ox-tongue
Betulaceae	*Alnus cordata*	Italian alder
Bignoniaceae	*Jacaranda mimosifolia*	jacaranda
Brassicaeae	*Brassica nigra*	black mustard
Brassicaeae	*Raphanus sativus*	cultivated radish
Casuarinaceae	*Casuarina cunninghamiana*	casuarina
Cupresaceae	*Sequoia sempervirens*	coast redwood
Cupressaceae	*Cupressus sempervirens*	Italian cypress
Cyperaceae	*Cyperus eragrostis*	tall flatsedge
Fabaceae	*Acacia melanoxylon*	blackwood acacia
Fagaceae	*Quercus agrifolia*	coast live oak
Fagaceae	*Quercus lobata*	valley oak
Fagaceae	*Quercus rubra*	red oak
Ginkgoaceae	*Ginkgo biloba*	maidenhair
Lamiaceae	*Rosmarinus officinalis*	rosemary
Lythraceae	*Lagerstroemia spp.*	crepe myrtle
Magnoliaceae	*Magnolia soulangeana*	saucer magnolia
Malvaceae	*Malva nicaeensis*	bull mallow
Moraceae	*Ficus carica*	fig
Myrtaceae	*Eucalyptus camaldulensis*	red river gum
Myrtaceae	*Eucalyptus globulus*	Tasmanian blue gum
Myrtaceae	*Eucalyptus polyanthemos*	silver dollar gum
Myrtaceae	*Lophostemon confertus*	Brisbane box
Oleaceae	*Fraxinus oxycarpa 'Raywood'*	raywood ash
Oleaceae	*Fraxinus pennslyvanica*	Pennsylvania ash
Oleaceae	*Fraxinus uhdie*	shamel ash
Oleaceae	*Olea europaea*	olive
Papaveraceae	*Eschscholzia californica*	California poppy
Pinaceae	*Cedrus atlantica*	atlas cedar
Pinaceae	*Cedrus deodara*	deodar cedar
Pinaceae	*Pinus canariensis*	Canary Island pine

Pinaceae	*Pinus halepensis*	aleppo pine
Pinaceae	*Pinus pinea*	Italian stone pine
Pinaceae	*Pinus radiata*	Monterey pine
Platanaceae	*Planatus xhispanica*	London plane
Poaceae	*Avena* sp.	Wild oats
Poaceae	*Bromus diandrus*	ripgut brome
Poaceae	*Phragmites australis*	common reed
Poaceae	*Stipa miliaceae* var. *miliacea*	smilo grass
Podocarpaceae	*Afrocarpus gracilior*	African fern pine
Polygonaceae	*Rumex crispus*	curly dock
Rhamnaceae	*Rhamnus alaternus*	Italian buckthorn
Rosaceae	*Prunus cerasifera 'Krauter Vesuvis'*	purple leaf plum
Rosaceae	*Prunus serrulata*	cherry
Rosaceae	*Pyrus calleryana*	flowering pear
Rosaceae	*Pyrus kawakamii*	evergreen pear
Salicaceae	*Salix babylonica*	weeping willow
Salicaceae	*Salix* sp.	willow

Appendix B. Special-Status Plants Considered for Potential Occurrence

Common Name	Scientific Name	Suitable Habitat Absent	Edaphic Conditions Absent	Outside Elevation Range	Extirpated from Project Vicinity
alkali milk-vetch	Astragalus tener var. tener	x	x		
Anderson's manzanita	Arctostaphylos andersonii	x		x	
arcuate bush-mallow	Malacothamnus arcuatus	x		x	
bay buckwheat	Eriogonum umbellatum var. bahiiforme	x	x	x	
Ben Lomond buckwheat	Eriogonum nudum var. decurrens	x		x	
bent-flowered fiddleneck	Amsinckia lunaris	x			
Brewer's calandrinia	Calandrinia breweri	x		x	
Brewer's clarkia	Clarkia breweri	x	x	x	
bristly leptosiphon	Leptosiphon acicularis	x		x	
California androsace	Androsace elongata ssp. acuta	x		x	
California seablite	Suaeda californica	x			
caper-fruited tropidocarpum	Tropidocarpum capparideum	x	x		
chaparral ragwort	Senecio aphanactis	x		x	
Choris' popcornflower	Plagiobothrys chorisianus var. chorisianus	x			
clay buckwheat	Eriogonum argillosum	x	x	x	
clustered lady's-slipper	Cypripedium fasciculatum	x	x	x	
coast iris	Iris longipetala	x			
coast lily	Lilium maritimum	x			
coastal marsh milk-vetch	Astragalus pycnostachyus var. pycnostachyus	x			
Congdon's tarplant	Centromadia parryi ssp. congdonii				
Contra Costa goldfields	Lasthenia conjugens	x	x		
cotula navarretia	Navarretia cotulifolia	x	x		
Crystal Springs fountain thistle	Cirsium fontinale var. fontinale	x	x	x	
Crystal Springs lessingia	Lessingia arachnoidea	x	x	x	
Davidson's bush-mallow	Malacothamnus davidsonii	x		x	
Delta woolly-marbles	Psilocarphus brevissimus var. multiflorus	x		x	
Dudley's lousewort	Pedicularis dudleyi	x		x	
dusky-fruited malacothrix	Malacothrix phaeocarpa	x		x	
elongate copper moss	Mielichhoferia elongata	x	x		
fragrant fritillary	Fritillaria liliacea	x	X		
Franciscan onion	Allium peninsulare var. franciscanum	x		x	
Gairdner's yampah	Perideridia gairdneri ssp. gairdneri	x			
hairless popcornflower	Plagiobothrys glaber			x	x

Common Name	Scientific Name	Suitable Habitat Absent	Edaphic Conditions Absent	Outside Elevation Range	Extirpated from Project Vicinity
Hickman's popcornflower	Plagiobothrys chorisianus var. hickmanii	x		x	
Hillsborough chocolate lily	Fritillaria biflora var. ineziana	x	x	x	
Hoover's button-celery	Eryngium aristulatum var. hooveri	x			
Howell's onion	Allium howellii var. howellii	x		x	
Jepson's coyote-thistle	Eryngium jepsonii	x			
Jepson's woolly sunflower	Eriophyllum jepsonii	x		x	
Kings Mountain manzanita	Arctostaphylos regismontana	x	x	x	
large-flowered leptosiphon	Leptosiphon grandiflorus	x			
legenere	Legenere limosa	x			
Loma Prieta hoita	Hoita strobilina	x	x	x	
long-styled sand-spurrey	Spergularia macrotheca var. longistyla	x			
lost thistle	Cirsium praeteriens				x
maple-leaved checkerbloom	Sidalcea malachroides	x			
Marin western flax	Hesperolinon congestum	x	x		
Methuselah's beard lichen	Usnea longissima	x		x	
Mexican mosquito fern	Azolla microphylla	x		x	
Michael's rein orchid	Piperia michaelii	x			
minute pocket moss	Fissidens pauperculus	x		x	
Montara manzanita	Arctostaphylos montaraensis	x		x	
Mt. Diablo cottonweed	Micropus amphibolus	x		x	
narrow-petaled rein orchid	Piperia leptopetala	x		x	
Oakland star-tulip	Calochortus umbellatus	x	x	x	
Oregon polemonium	Polemonium carneum	x			
Patterson's navarretia	Navarretia paradoxiclara	x	x	x	
phlox-leaf serpentine bedstraw	Galium andrewsii ssp. gatense	x	x	x	
pincushion navarretia	Navarretia myersii ssp. myersii	x		x

Section 1. Introduction

H. T. Harvey & Associates has conducted a background review and field survey to assess the potential for sensitive biological resources identified in the *ConnectMenlo: General Plan Land Use & Circulation Elements and M-2 Area Zoning Update Environmental Impact Report* (ConnectMenlo EIR) to occur on the Willow Village Tunnel and North Ramp project site, or close enough to the site to be affected by project activities. It is our understanding that the proposed project entails the construction of a tunnel beneath Willow Road to connect Facebook's Willow Village Campus with its Bayfront Expansion Campus. The project site is currently occupied by a commercial office building, associated landscape vegetation, existing roadways, and a small portion of the Dumbarton Rail Corridor. This report provides our assessment of biological resources on the project site, and identifies appropriate avoidance and minimization measures to comply with Mitigation Measure BIO-1 of the ConnectMenlo EIR.

1.1 Background

In 2014, the City of Menlo Park initiated the process of updating its General Plan Land Use and Circulation Elements as well as its zoning for the M-2 area (also known as the Bayfront Area), which is located the northern portion of Menlo Park. Collectively, this update to the General Plan and zoning is known as *ConnectMenlo*. On November 29, 2016, the City Council certified the ConnectMenlo EIR and approved the General Plan Land Use and Circulation Elements. The Willow Village Tunnel and North Ramp project is located within the ConnectMenlo area, and subject to the requirements of the ConnectMenlo EIR.

Mitigation Measure BIO-1 of the ConnectMenlo EIR requires all new construction and building addition projects, regardless of size, to have a qualified biologist prepare a project-specific baseline biological resources assessment if the project would occur on or adjacent to a parcel containing natural habitat with features such as mature and native trees, unused structures that could support special-status species, other sensitive biological resources, and/or active nests of common birds protected under the Migratory Bird Treaty Act (MBTA). The Willow Village Tunnel and North Ramp project site supports suitable habitat that may contain active nests of common birds protected under the MBTA; hence, a baseline biological resources assessment is required for the project.

1.2 Project Description

The project site is located at the intersection of Willow Road and the Dumbarton Rail Corridor in Menlo Park, just south of State Route 84 (Figure 1). The project proposes to construct a tunnel beneath Willow Road to connect the future Willow Village Campus with Facebook's existing Bayfront Expansion Campus. The provision of a new, direct diagonal crossing below Willow Village would significantly reduce the crossing signal usage by pedestrians and bicyclists, which impedes the flow of vehicular traffic on Willow Road. A 200-foot-long ramp will be constructed east of Facebook Building MPK20 west of Willow Road, and a 230-foot-long

ramp will be constructed east of Willow Road at the Willow Village Campus. These ramps would lead tram, bicycle and pedestrian traffic under Willow Road and then back up to the surface. Existing pedestrian and bicycle pathways and vehicle roadways located east of Building MPK20 will also be realigned and modified to accommodate the new connection.

The project is envisioned to be constructed using cut-and-cover methods. Construction would be conducted in two phases to allow traffic on Willow Road to flow on detours achieved by locally widening the roadway. The first phase would involve removing a section of Willow Road pavement as well as the railroad tracks within the Willow Road right-of-way. The railroad tracks would be stored and subsequently reinstalled at their original location following conclusion of tunnel construction. The second phase of the tunnel construction would require temporary relocation of Facebook Way and its intersection with Willow Road to the north to allow completion of the cut-and-cover tunnel and north portal under Facebook Way.

Section 2. Methods

2.1 Background Review

Prior to conducting field work, H. T. Harvey & Associates ecologists reviewed the project plans and description provided by Signature Development Group in June 2021; aerial photos (Google Inc. 2021) and topographic maps; the *Don Edwards San Francisco Bay National Wildlife Refuge Comprehensive Conservation Plan* (U.S. Fish and Wildlife Service [USFWS] 2012); the *South Bay Salt Pond Restoration Project Final Environmental Impact Statement/Report* (EDAW et al. 2007); the *Recovery Plan for Tidal Marsh Ecosystems of Northern and Central California* (USFWS 2013); the *Recovery Plan for the Pacific Coast Population of the Western Snowy Plover* (USFWS 2007); USFWS species accounts, listing notices, and critical habitat notices; the California Department of Fish and Wildlife's (CDFW's) California Natural Diversity Database (CNDDB) (2021); the Calflora database on special-status plant occurrences (2021); the California Native Plant Society (CNPS) Inventory of Rare and Endangered Plants of California (CNPS 2021); bird records from the project vicinity reported to the eBird database (Cornell Lab of Ornithology 2021), which has been established by the Cornell University Laboratory of Ornithology to archive records of birds seen worldwide; and other relevant scientific literature and technical databases in order to assess the current distribution of special-status plants and animals in the site vicinity. In addition, for plants, we reviewed all species currently ranked by the CNPS as California Rare Plant Rank (CRPR) 1A, 1B, 2, or 3 occurring in the *Palo Alto, California* 7.5-minute U.S. Geological Survey 7.5-minute quadrangle and eight surrounding quadrangles (*Woodside, San Mateo, Redwood Point, Newark, Mountain View, Cupertino,* and, *Mindego Hill*). We also considered the CNPS plant list for San Mateo County, as the CNPS does not maintain quadrangle-level records for CRPR 4 species. In addition, we reviewed the *Willow Village Master Plan Biological Resources Report* (H. T. Harvey & Associates 2020), because the proposed project overlaps a portion of the Master Plan area east of Willow Road.

2.2 Site Visit

Following our background review, H. T. Harvey & Associates senior wildlife ecologist Robin Carle, M.S., conducted a reconnaissance-level survey of the project site on June 9, 2021. The purpose of this survey was to identify existing biological conditions and the site's potential to support special-status species of plants and animals; other legally protected animals, such as migratory birds; and sensitive/regulated habitats such as jurisdictional wetlands and other waters of the U.S. regulated under Section 404 of the Clean Water Act, potential waters of the state regulated under Section 401 of the Clean Water Act and the Porter-Cologne Water Quality Control Act, and riparian habitats regulated under Section 1602 of the California Fish and Game Code. The survey included an assessment of habitats for special-status species and other protected animals both on the site and in adjacent areas (e.g., in developed and landscaped areas on adjacent properties) that could be impacted either directly or indirectly by proposed activities, as well as an assessment of adjacent habitats that could potentially support source populations of sensitive species that could then disperse onto the project site.

A focused survey for Congdon's tarplant (*Centromadia parryi* var. *congdonii*) was conducted on the project site by H. T. Harvey & Associates plant ecologist Mark Bibbo, M.S., on June 12, 2020 in support of the Willow Village Master Plan Biological Resources Report (H. T. Harvey & Associates 2020). That survey targeted all areas of suitable habitat along the Dumbarton Rail Corridor within the boundaries of the Willow Village Tunnel and North Ramp project. Because the remaining portions of the project site are completely occupied by developed land uses, no additional suitable habitat for special-status plants is present on the site. As a result, additional focused botanical surveys to support this assessment were not warranted.

Section 3. Environmental Setting

3.1 General Project Area Description

The project site is surrounded by dense commercial and residential development in Menlo Park. The site is generally bordered by California State Route 84 to the north, commercial development and a large brackish marsh to the east, and commercial development to the west and south (Figure 2). The site is bisected by Willow Road, which is oriented north to south, and the Dumbarton Rail Corridor, which is oriented east to west.

Elevations on the project site range from approximately 6.1 to 12.9 feet above sea level (North American Vertical Datum of 1988). The Natural Resources Conservation Service has mapped two soil units on the project site: urban land-orthents reclaimed complex, 0–2% slopes; and Novato clay, 0–1% slopes (Natural Resources Conservation Service 2021). In soil taxonomy, orthents are defined as young soils that lack horizon development due to either steep slopes or parent materials that lack weatherable minerals. Typically, these are very shallow soils. Novato clay soils are deep, poorly drained soils that form in alluvium deposits along bay margins (Natural Resources Conservation Service 2021).

3.2 Biotic Habitats

The project site and surrounding areas have been heavily modified by anthropogenic activities as a result of urbanization and the development of commercial buildings and roadways. The reconnaissance-level survey identified two habitat/land use types on the project site: developed/landscaped and ruderal grassland (Figure 3). These habitat/land use types are described in detail below.

3.2.1 Developed/Landscaped

Vegetation. West of Willow Road, developed portions of the project site consist of paved pedestrian pathways and vehicle roadways with surrounding areas of landscape vegetation (Photo 1). Landscape trees within these areas include native coast live oak (*Quercus agrifolia*) and nonnative Monterey cypress (*Hesperocyparis macrocarpa*), ginkgo (*Ginkgo biloba*), and desert willow (*Chilopsis linearis*). Landscape plants within these areas include native California fuchsia (*Epilobium canum*) and nonnative trumpet vine (*Vampsis radicans*), ceanothus (*Ceanothus* sp.), and deer grass (*Muhlenbergia rigens*). East of Willow Road, developed portions of the project site are located entirely within a paved parking area (Photo 2).

Willow Village Tunnel and North Ramp Biological Resources Assessment (10704)
July 2021

Photo 1. Developed/landscaped habitat on the project site west of Willow Road.

Photo 2. Developed/landscaped habitat on the project site east of Willow Road.

Wildlife. The developed/landscaped habitat on the project site provides nesting and foraging opportunities for some urban-adapted species of birds. Bird species that occur in these areas include the native Anna's hummingbird (*Calypte anna*), house finch (*Haemorhous mexicanus*), lesser goldfinch (*Spinus psaltria*), dark-eyed junco (*Junco hyemalis*), and American crow (*Corvus brachyrhynchos*). These species may use the trees or ground vegetation on the site for nesting. No nests of raptors (e.g., hawks, owls, and falcons) were observed on the project site or in immediately adjacent areas during the reconnaissance-level survey, although larger trees on the site provide suitable nesting habitat for raptors such as the Cooper's hawk (*Accipiter cooperii*).

No signs of the presence of roosting bats (e.g., guano, urine staining, or visual or auditory detections of bats) were observed during the June 2021 survey, and no suitable roosting habitat for bats (e.g., cavities, crevices or exfoliating bark) was observed in the trees on the site.

Common urban-adapted mammal species that may occur in developed areas of the project site include the native raccoon (*Procyon lotor*) and nonnative house mouse (*Mus musculus*), Norway rat (*Rattus norvegicus*), black rat (*Rattus rattus*), and eastern gray squirrel (*Sciurus carolinensis*). In addition, small numbers of burrows of California ground squirrels (*Otospermophilus beecheyi*) and Botta's pocket gophers (*Thomomys bottae*) were observed within landscaped areas west of Willow Road.

3.2.2 Ruderal Grassland

Vegetation. Ruderal grassland habitat occurs within the portion of the project site that falls along the Dumbarton Rail Corridor (Photo 3). At the time of the June 2021 survey, this habitat had been recently mown. This habitat is dominated by non-native grasses and forbs such as wild oat (*Avena* sp.), fennel (*Foeniculum vulgare*), bull mallow (*Malva nicaeensis*), black mustard (*Brassica nigra*), and bristly ox-tongue (*Helminthotheca echioides*). Many of these plant species are ranked as moderately or highly invasive by the California Invasive Plant Council (2021).

Wildlife. Wildlife use of ruderal grassland habitat on the project site is limited by frequent human disturbance, the abundance of nonnative and invasive species, and isolation of this habitat from more extensive grasslands in the region. As a result, wildlife species associated with more extensive grasslands, such as the grasshopper sparrow (*Ammodramus savannarum*) and western meadowlark (*Sturnella neglecta*), are absent from the small area of grasslands on the project site.

Photo 3. Ruderal grassland habitat on the project site.

The majority of bird species that use grasslands on the project site inhabit nearby developed/landscaped areas and use grasslands primarily for foraging. Such species include the mourning dove (*Zenaida macroura*), lesser goldfinch, dark-eyed junco, American crow, and Brewer's blackbird (*Euphagus cyanocephalus*). Several other species of birds use the ruderal grassland habitat during the nonbreeding season. These include the golden-crowned sparrow (*Zonotrichia atricapilla*), savannah sparrow (*Passerculus sandwichensis*), and white-crowned sparrow (*Zonotrichia leucophrys*), all of which forage on the ground or in herbaceous vegetation, primarily for seeds.

Few species of reptiles and amphibians occur in the ruderal grassland habitat on the site due to its disturbed nature and low habitat heterogeneity. Nevertheless, reptiles such as the western fence lizard (*Sceloporus occidentalis*) and gopher snake (*Pituophis melanoleucus*) occur in this type of habitat. No burrows of small fossorial mammals, such as the California ground squirrel and Botta's pocket gopher, were observed in grasslands on the site during the June 2021 survey. Common small mammal species expected to occur in this area include the native western harvest mouse (*Reithrodontomys megalotis*) and nonnative house mouse, Norway rat, and black rat. Larger native mammal species that are associated with developed areas such as the striped skunk (*Mephitis mephitis*), Virginia opossum (*Didelphis virginiana*), and raccoon are also likely to occur here.

3.3 Adjacent and Surrounding Areas

A large brackish marsh is present approximately 215 feet northeast of the project site, north of the Dumbarton Rail Corridor and east of Willow Road. This brackish marsh, which extends north to State Route 84 and east to University Avenue, is dominated by salt marsh and brackish marsh plants and contains several channels. As a result, marsh-associated wildlife species such as the San Francisco common yellowthroat (*Geothlypis trichas sinuosa*), Alameda song sparrow (*Melospiza melodia pusillula*), northern harrier (*Circus hudsonius*), and possibly the salt marsh harvest mouse (*Reithrodontomys raviventris*) may occur in that brackish marsh.

An area of native upland vegetation that surrounds the marsh is present approximately 43 feet northeast of the project site (Photo 4). This area is planted with native shrubs including coyote brush (*Baccharis pilularis*), California sagebrush (*Artemisia californica*), and toyon (*Heteromeles arbutifolia*). Nonnative grasses and forbs including wild oat, stinkwort (*Dittricia graveolens*), prickly lettuce (*Lactuca serriola*), and Italian thistle (*Carduus pychnocephala*) are also present in this area. At the time of the June 2021 survey, this habitat was disturbed by apparent homeless activity and scattered garbage present throughout this area. No sensitive wildlife species inhabit this area; however, sensitive species that inhabit the nearby marsh will forage opportunistically in these uplands.

Photo 4. An upland area planted with native woody vegetation is present east of Willow Road near the project site.

Sensitive biological areas identified in the ConnectMenlo EIR are also present in the site vicinity, but at greater distances from the project site. The Don Edwards San Francisco Bay National Wildlife Refuge (NWR) is located north of the project site; salt pond R3 is approximately 340 feet to the northwest, and salt pond SF2 is approximately 0.6 mile to the northeast. Ravenswood Open Space Preserve is located approximately 0.9 mile east of the project site. These areas provide foraging habitat for waterbirds such as the American coot (*Fulica americana*), bufflehead (*Bucephala albeola*), American wigeon (*Mareca americana*), and northern shoveler (*Spatula clypeata*), which occur in flocks of varying size during winter and migration. In addition, the coastal salt marsh habitat, mudflats, and tidal channels provide important shorebird habitat. Many species of shorebirds such as the western sandpiper (*Calidris mauri*), black-bellied plover (*Pluvialis squatarola*), marbled godwit (*Limosa fedoa*), dunlin (*Calidris alpina*), long-billed curlew (*Numenius americanus*), and American avocet (*Recurvirostra americana*) forage in the mudflats in this area, often also in flocks. Special-status species such as the California Ridgway's rail (*Rallus obsoletus obsoletus*), salt marsh harvest mouse, and others occur in these sensitive areas; however, as discussed in Section 4 below, the closest suitable habitat for Ridgway's rails is located approximately 0.5 mile to the east, and suitable habitat for salt marsh harvest mice approximately 340 feet to the north is isolated from the site by dense urban development and California State Route 84. As a result, special-status species that inhabit these areas are not expected to occur on or adjacent to the project site, or to be impacted by the project.

Section 4. Special-Status Species and Sensitive Habitats

Mitigation Measure BIO-1 requires an assessment of the effects of a project on "special-status" species. For the purpose of this report, special-status plants are considered plant species that are:

- Listed under the Federal Endangered Species Act as threatened, endangered, proposed threatened, proposed endangered, or a candidate species.
- Listed under the California Endangered Species Act as threatened, endangered, rare, or a candidate species.
- Listed by the CNPS as CRPR 1A, 1B, 2, 3, or 4.

In addition, "special-status" animals are considered animal species that are:

- Listed under the Federal Endangered Species Act as threatened, endangered, proposed threatened, proposed endangered, or a candidate species.
- Listed under the California Endangered Species Act as threatened, endangered, or a candidate threatened or endangered species.
- Designated by the CDFW as a California species of special concern.
- Listed in the California Fish and Game Code as fully protected species (fully protected birds are provided in Section 3511, mammals in Section 4700, reptiles and amphibians in Section 5050, and fish in Section 5515).

Information concerning threatened, endangered, and other special-status species that potentially occur on the project site was collected from several sources and reviewed by H. T. Harvey & Associates biologists as described in Section 2.1 above. Figures 4 and 5 depict CNDDB records of special-status plant and animal species in the general vicinity of the project site, respectively. These generalized maps show areas where special-status species are known to occur or have occurred historically.

Figure 5. CNDDB-Mapped Records of Special-Status Animals

Willow Village Tunnel and North Ramp Biological Resources Assessment (10704)
June 2021

4.1 Special-Status Plant Species

The CNPS (2021) and CNDDB (2021) identify a number of special-status plant species as potentially occurring in at least one of the nine U.S. Geological Survey 7.5-minute quadrangles containing or surrounding the project site for species in CRPR 1 and 2, or in San Mateo County for CRPR 3 and 4 species. However, the site is dominated by heavily disturbed anthropogenic habitat (i.e., developed/landscaped areas), which precludes the presence of special-status plant species that occur in more natural habitats in the region. The majority of the special-status plant species identified as potentially occurring in the region were determined to be absent from the project site for at least one of the following reasons: (1) absence of suitable habitat types; (2) lack of specific microhabitat or edaphic requirements, such as serpentine soils; (3) the elevation range of the species is outside of the range on the project site; and/or (4) the species is considered extirpated from the project region.

Suitable habitat, edaphic requirements, and elevation range were determined to be present on the project site for one special-status plant species: Congdon's tarplant. This species can persist in disturbed grasslands and has been documented by the CNDDB in the project vicinity (Figure 4). Suitable habitat for Congdon's tarplant is present on the project site within the small area of ruderal grassland habitat along the Dumbarton Rail Corridor. However, a focused survey for Congdon's tarplant was conducted within this area on June 12, 2020[1], and no individuals of this species were observed. Therefore, this species is determined to be absent from the project site.

4.2 Special-Status Animal Species

A number of special-status animal species are known to occur in the general project vicinity, including the western snowy plover (*Charadrius alexandrinus nivosus*), white-tailed kite (*Elanus leucurus*), California Ridgway's rail, California black rail (*Laterallus jamaicensis coturniculus*), northern harrier, loggerhead shrike (*Lanius ludovicianus*), Alameda song sparrow, Bryant's savanna sparrow (*Passerculus sandwichensis alaudinus*), San Francisco common yellowthroat, salt marsh harvest mouse, and salt marsh wandering shrew (*Sorex vagrans halicoetes*) (CNDDB 2021) (Figure 5). However, the dense urban surroundings and absence of specific habitat features favored by various special-status animal species make the site unsuitable for all of these species, as follows:

- The western snowy plover, federally listed as threatened, nests on dry, relatively homogenous salt pond bottoms surrounding the San Francisco Bay. Snowy plovers are known to nest in Don Edwards NWR, including at salt pond R3 located approximately 340 feet northwest of the project site and at salt pond SF2 located approximately 0.6 mile northeast of the project site (CNDDB 2021). However, no suitable foraging or nesting habitat is present on or adjacent to the project site, and the site is separated from these nesting areas by dense urban development and California State Route 84.
- The white-tailed kite, a California fully protected species, nests in tall shrubs and trees and forages in grasslands, marshes, and ruderal habitats. Tall trees on and adjacent to the project site provide ostensibly

[1] Congdon's tarplant was documented flowering at the Sunnyvale Baylands Park on June 15, 2020. Thus, this species would have been detectable at the time of the June 12, 2020 site visit.

suitable nesting sites for white-tailed kites, and open marsh areas to the north and east provide suitable foraging habitat. However, high levels of human disturbance on the project site preclude this species from nesting and foraging in this area. Thus, white-tailed kites may nest and forage in open space areas located near the site, but they are not expected to occur on the site itself.

- The California Ridgway's rail, state and federally listed as endangered and a California fully protected species, is a secretive marsh bird that is endemic to marshes of the San Francisco Bay. California Ridgway's rails nest in salt and brackish marshes along the edge of the Bay, and are most abundant in extensive salt marshes and brackish marshes dominated by Pacific cordgrass (*Spartina foliosa*), pickleweed (*Salicornia* spp.), and marsh gumplant (*Grindelia stricta*) and that contain complex networks of tidal channels. A population of California Ridgway's rails is known to occur in the wider portions of Ravenswood Slough approximately 0.5 mile northeast of the site and in Ravenswood Open Space Preserve approximately 0.9 mile east of the project site (CNDDB 2021). However, no suitable foraging or nesting habitat for this species is present on or adjacent to the project site, and the site is separated from suitable habitat areas by dense urban development.

- The California black rail, state listed as threatened and a California fully protected species, is a secretive marsh bird that nests in fresh, brackish, and tidal salt marshes. California black rails have been observed in the Faber-Laumeister Marsh, a coastal salt marsh located approximately 1.1 miles east of the project site (CNDDB 2021), and suitable habitat for this species is also present along wider portions of Ravenswood Slough approximately 0.5 mile northeast of the site, and in Ravenswood Open Space Preserve approximately 0.9 mile east of the site. However, no suitable foraging or nesting habitat for this species is present on or adjacent to the project site, and the site is separated from suitable habitat areas by dense urban development.

- The northern harrier, a California species of special concern, nests and forages in the large brackish marsh located 215 feet northeast of the project site. No suitable marsh habitat or open fields to support nesting or foraging by this species occurs on the project site itself, and high levels of human disturbance along Willow Road are expected to preclude nesting by this species in portions of the marsh located near the project site. Northern harriers are expected to nest in portions of this marsh located farther to the east, away from human disturbance.

- The loggerhead shrike, a California species of special concern, may nest in dense stands of coyote brush and other woody vegetation surrounding the large brackish marsh northeast of the site. However, Bay-area populations have declined substantially, and if the species breeds in or near this area, no more than one pair is expected to be present. In addition, high levels of disturbance along Willow Road are expected to preclude nesting by this species in portions of this habitat located close to (i.e., within at least 100 feet of) the project site.

- The Alameda song sparrow, a California species of special concern, is a subspecies of song sparrow that is endemic to the Central and South San Francisco Bay. This subspecies breeds in salt marsh habitats, primarily in marsh gumplant and cordgrass (*Spartina* sp.) along channels. Alameda song sparrows are known to commonly breed and occur in the brackish marsh approximately 215 feet northeast of the project site,

and in other wetlands in the site vicinity. However, no suitable foraging or nesting habitat is present on the project site or in adjacent areas.

- The Bryant's savannah sparrow, a California species of special concern, nests in pickleweed-dominant salt marsh and adjacent ruderal grasslands. This subspecies nests and occurs in the brackish marsh approximately 215 feet northeast of the project site, and in grasslands adjacent to the marsh. However, no suitable foraging or nesting habitat is present on the project site or in adjacent areas.

- The San Francisco common yellowthroat, a California species of special concern, is a subspecies of common yellowthroat that nests in fresh and saltwater marshes near the edge of the Bay. San Francisco common yellowthroats are known to commonly breed and occur in the brackish marsh approximately 215 feet northeast of the project site, and in other wetlands in the site vicinity. However, no suitable foraging or nesting habitat is present on the project site or in adjacent areas.

- The salt marsh harvest mouse, state and federally listed as endangered and a California fully protected species, and the salt marsh wandering shrew, a California species of special concern, are rodents endemic to salt and brackish marshes and adjacent tidally influenced areas of the San Francisco Bay estuary. Salt marsh harvest mice are known to occur in tidal marshes in the vicinity of the project site, including the salt marshes of Ravenswood Open Space Preserve approximately 0.9 mile to the east and in Faber-Laumeister Marsh approximately 1.1 miles to the east (CNDDB 2021). Suitable habitat for this species is also present in the brackish marsh approximately 215 feet northeast of the project site. However, no suitable habitat for salt marsh harvest mice is present on or adjacent to the project site, and the site is isolated from suitable habitat areas by dense urban development. The distribution of salt marsh wandering shrews in the project vicinity is poorly known, but this species can potentially occur in the same areas as the salt marsh harvest mouse.

- No suitable aquatic habitat to support special-status fish species is present on the project site. Suitable habitat for special-status fish species is present within Ravenswood Slough, which extends as close as 260 feet north of the site. However, the project site is not hydrologically connected to Ravenswood Slough, and is isolated from Ravenswood Slough by State Route 84. Thus, special-status fish species are determined to be absent from the site, adjacent areas, and downstream areas that would potentially be affected by the project.

- Although the Crotch bumble bee (*Bombus crotchii*) and western bumble bee (*Bombus occidentalis*) were historically found in the project vicinity, they are not expected to occur on the site or in nearby areas due to recent range contractions.

- The pallid bat (*Antrozous pallidus*), a California species of special concern, may forage aerially over habitats in the site vicinity, and several historical records of pallid bats are located in the site vicinity (CNDDB 2021). However, the buildings and trees on the site do not provide suitable roosting habitat for pallid bats, and the site does not provide suitable foraging habitat for this species.

- The California red-legged frog (*Rana draytonii*) is known to occur in less developed areas in San Mateo County, but is not known or expected to be present in valley-floor areas as heavily urbanized as the project

site. The closest California red-legged frog occurrences to the project site are more than 4.0 miles to the south in the Atherton Channel and at Stanford University (CNDDB 2021). However, no suitable aquatic or upland habitat to support California red-legged frogs is present on or near the site, and the project site is effectively isolated from the closest records of this species by dense urban development.

- The western pond turtle (*Emys pallida*) is known to occur approximately 9.3 miles to the east near Crystal Springs Reservoir, 6.7 miles to the southeast at Moffett Federal Airfield, and 6.7 miles to the south at Jasper Ridge (CNDDB 2021). No suitable foraging habitat for western pond turtles is present on the site or in adjacent areas. Further, the site is not hydrologically connected to any known populations of western pond turtles in the region. This species is considered absent from the project site and the surrounding vicinity.

The western snowy plover, white-tailed kite, California Ridgway's rail, California black rail, northern harrier, loggerhead shrike, Alameda song sparrow, Bryant's savanna sparrow, San Francisco common yellowthroat, saltmarsh harvest mouse, salt marsh wandering shrew, special-status fish, Crotch bumble bee, western bumble bee, pallid bat, California red-legged frog, western pond turtle, and other special-status animals are therefore not expected to nest, roost, or breed on or immediately adjacent to the project site, and are not expected to be affected by proposed site redevelopment. In addition, per the regional conservation plans reviewed as described in Section 2.1 above, no sensitive biological resources for special-status animals are identified on the project site.

4.3 Sensitive and Regulated Habitats

Sensitive and regulated habitats are rare, ecologically valuable, and/or protected by federal, state, regional, and/or local laws. Generally, such habitats require permits from regulatory agencies if they are to be disturbed, altered, or lost. The CDFW ranks certain rare or threatened plant communities, such as wetlands, tracked in the CNDDB. The most commonly regulated habitats are wetland and aquatic habitats including rivers, streams, ponds, and seasonal wetlands, which fall under the jurisdiction of the U. S. Army Corps of Engineers (USACE) via Section 404 of the Clean Water Act, the Regional Water Quality Control Board (RWQCB) via Section 401 of the Clean Water Act and the Porter-Cologne Water Quality Control Act, and/or the CDFW via Section 1602 of the California Fish and Game Code.

No potentially jurisdictional features (e.g., wetlands or drainages that would be subject to jurisdiction of any resource agencies) were identified on or immediately adjacent to the project site during the reconnaissance-level survey. Thus, sensitive and regulated habitats are determined to be absent from the project site.

4.4 Wildlife Movement

For many species, the landscape is a mosaic of suitable and unsuitable habitat types. Environmental corridors are segments of land that provide a link between patches of suitable habitat and that allow animals to move among suitable habitat patches. Development that fragments natural habitats (i.e., breaks them into smaller, disjunct pieces) can have a twofold impact on wildlife: first, as habitat patches become smaller they are unable

to support as many individuals (patch size), and second, the area between habitat patches may be unsuitable for wildlife species to traverse (connectivity).

All proposed project activities are located within, or are surrounded by, existing development that is surrounded by a dense urban matrix of residential and commercial development to the east, west, and south and California State Route 84 to the north. Therefore, the project would not result in the fragmentation of natural habitats. Any common, urban-adapted wildlife species that currently move through the project site would continue to be able to do so following project construction, and any wildlife species associated with open habitats along the San Francisco Bay would also continue to be able to move past the site following construction. Thus, the project would not interfere with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors in the site vicinity.

Section 5. Project Impacts on Sensitive Biological Resources and Identification of Avoidance and Minimization Measures

Mitigation Measure BIO-1 requires consideration of a number of issues related to sensitive biological resources. Issues that do not apply to the project, along with explanations regarding why they do not apply, are as follows:

- As discussed in Section 4.3 above, no jurisdictional wetlands are present on the project site or are expected to be impacted by the project.
- No undeveloped lands that support sensitive biological resources are present on or adjacent to the site such that they could be affected by the project, and the project will have no effect on sensitive biological resources at the Don Edwards San Francisco Bay NWR.
- No regional conservation plans apply to the project site.
- No take of state or federally listed species or California fully protected species will occur due to redevelopment of the project site.
- No species protected under the Marine Mammal Protection Act or the Magnuson-Stevens Fishery Conservation and Management Act are present on or immediately adjacent to the project site, or will be impacted by the project.
- No areas subject to the jurisdiction of the San Francisco Bay Conservation and Development Commission will be impacted by the project.
- Suitable habitat for or occurrences of special-status species are not present on the project site, and roosting bats are absent from the project site.
- No sensitive natural communities are present on the project site.
- There are no important movement corridors for wildlife on the project site.
- No buildings with glazed facades are proposed as part of the project; hence, no bird-safe design measures are required.

Sensitive biological resource issues that are required to be addressed under Mitigation Measure BIO-1 are related to the presence of common bird species protected under the MBTA and California Fish and Game Code. Section 5.1 below provides a discussion of project impacts on these resources and identifies appropriate avoidance and minimization measures to comply with Mitigation Measure BIO-1.

5.1 Impacts on Common Nesting Birds

A variety of common, urban-adapted bird species could nest on the site. Construction disturbance during the bird nesting season could result in the incidental loss of eggs or nestlings, either directly through the destruction or disturbance of active nests or indirectly by causing the abandonment of nests.

The project is also expected to increase the number of human users of the project site, potentially subjecting nesting birds to increased human disturbance. However, the project site is already heavily used by pedestrians, cyclists, and vehicles. The increase in human activity on the site as a result of this project is not expected to contribute substantially to human disturbance of birds that may nest on the site or in nearby areas.

All native birds that may nest in trees and vegetation on or immediately adjacent to the project site are protected under the MBTA and/or California Fish and Game Code. The removal of vegetation supporting active nests may cause the direct loss of eggs or young, while construction-related activities located near an active nest may cause adults to abandon their eggs or young. Therefore, per the requirements of Mitigation Measure BIO-1, measures to ensure that the project avoids impacts on nesting birds protected by the MBTA and California Fish and Game Code are required; recommended measures are provided below.

Measure 1. Nesting-Season Avoidance. To the extent feasible, construction activities should be scheduled to avoid the nesting season. If construction activities are scheduled to take place outside the nesting season, all impacts to nesting birds protected under the MBTA and California Fish and Game Code would be avoided. The nesting season for most birds in San Mateo County extends from February 1 through August 31, inclusive.

Measure 2. Preconstruction/Pre-Disturbance Surveys and Buffers. If it is not possible to schedule construction activities and/or tree removal between September 1 and January 31, preconstruction surveys for nesting birds shall be conducted by a qualified ornithologist to ensure that no nests shall be disturbed during project implementation. These surveys shall be conducted no more than seven days prior to the initiation of demolition or construction activities, including tree removal and pruning. During this survey, the ornithologist shall inspect all trees and other potential nesting habitats (e.g., trees, shrubs, ruderal grasslands, buildings) in and immediately adjacent to the impact areas for nests. If an active nest is found sufficiently close to work areas to be disturbed by these activities, the ornithologist shall determine the extent of a construction-free buffer zone to be established around the nest (typically 300 feet for raptors and 100 feet for other species), to ensure that no nests of species protected by the MBTA and California Fish and Game Code shall be disturbed during project implementation.

5.2 Impacts on Brackish Marsh Habitat

As discussed in Section 3.3 above, a large brackish marsh is present approximately 215 northeast of the project site, north of the Dumbarton Rail Corridor and east of Willow Road. A number of sensitive wildlife species may occur in this marsh, such as the San Francisco common yellowthroat, Alameda song sparrow, northern

harrier, and possibly the salt marsh harvest mouse. The areas in between the project site and the brackish marsh consist of a storage facility, the Dumbarton Rail Corridor, Willow Road, and an area of uplands planted with native vegetation. Due to the intervening 215-foot distance between the project site and the brackish marsh, and because the planted uplands surrounding the marsh are elevated above both the marsh and the project site, no direct or indirect impacts on the brackish marsh habitat, or sensitive species that may occur in this habitat, will occur as a result of the project.

Section 6. Additional Requirements

6.1 Coordination with Appropriate Agencies

Per Mitigation Measure BIO-1, if sensitive biological resources are determined to be present on the project site or may be present on any adjacent parcel containing natural habitat, coordination with the appropriate regulatory and resource agencies must occur.

As described above, we reviewed information from the Don Edwards San Francisco Bay NWR, USFWS, and CDFW, such as the NWR's *Comprehensive Conservation Plan* and information on special-status species regulated by those agencies, in enough detail to determine that the project will not have any impacts on the NWR or on sensitive species regulated by those agencies. As a result, no agency coordination (e.g., with the CDFW, USFWS, or Don Edwards NWR) regarding potential effects of the project on sensitive species is necessary, and no such coordination occurred.

6.2 Obtain Necessary Permits/Authorizations

Per Mitigation Measure BIO-1, where jurisdictional waters or federally and/or state-listed special-status species would be affected by the project, appropriate authorizations shall be obtained by the project applicant.

As described above, the project will not result in direct impacts on jurisdictional waters, or any impacts on federally and/or state-listed species. Therefore, permits from the USACE, RWQCB, CDFW, USFWS, National Marine Fisheries Service, San Francisco Bay Conservation and Development Commission, or other agencies are not required.

6.3 Applicable Zoning Regulations

Per Mitigation Measure BIO-1, the project will comply with zoning regulations enacted by the following ordinances:

- 16.43 O-Office District.
- 16.43.080 Corporate housing.
- 16.43.140 Green and sustainable building.
- 16.44 LS-Life Science District.
- 16.44.130 Green and sustainable building.

Section 7. Conclusions

The proposed project complies with the requirements of Mitigation Measure BIO-1 by documenting sensitive biological and regulated resources associated with the Willow Village Tunnel and North Ramp project site, the effects of the proposed project on these resources and on sensitive lands in the vicinity (such as Don Edwards NWR), and measures that the project will implement to avoid and minimize impacts on these resources.

Section 1. Introduction and Purpose

Per the request of Peninsula Innovation Partners, H. T. Harvey & Associates has performed an assessment of avian collision risk for the proposed Willow Village Master Plan project (Master Plan) located in Menlo Park, California.

It is our understanding that the project proposes to replace more than one million square feet of existing industrial, office, and warehouse space in the 59-acre Menlo Science and Technology Park with a new residential/mixed-used village that includes up to 1,730 residential units, up to 200,000 square feet of retail uses, a hotel with up to 193 rooms and accessory uses, approximately 1,600,000 square feet of space for office and accessory uses (with a maximum of 1,250,000 square feet of office uses and the balance 350,000 square feet [if office use is maximized] of accessory uses) on the project site. The site is bounded by Willow Road to the west, the Joint Powers Board (JPB) rail corridor to the north, the Hetch Hetchy right-of-way corridor and Mid-Peninsula High School to the south, and an existing life science complex to the east. To allow for the transformation of the site into a vibrant residential/mixed-use community, the plan will require demolition of all existing site improvements consisting of buildings, streets, and utilities.

This report provides an analysis of bird collision hazards associated with the conceptual design for the Master Plan and documents the bird-safe design measures that will be incorporated into the project to ensure that (1) project impacts due to bird collisions with buildings are reduced to less-than-significant levels under the California Environmental Quality Act (CEQA), and (2) the project complies with City of Menlo Park bird-safe design requirements.

This assessment is based on the project's Conditional Development Permit (CDP) application, as well as additional design details for the various Master Plan components identified in Appendix A to support our assessment. We will also review the final Architectural Control Plans (ACPs) and produce a subsequent final report for each Master Plan component to document (1) compliance with the CEQA mitigation measures the project will implement to mitigate significant CEQA impacts; and (2) compliance with City of Menlo Park bird-safe design requirements (with requests for waivers of certain requirements as permitted by the City bird-safe design requirements and including compliance with alternative City measures, where appropriate); and (3) compliance with the lighting design principles identified herein. If we find that modifications are needed to the ACPs to ensure that impacts are reduced to less-than-significant levels under CEQA and/or compliance with City requirements, we will provide recommended modifications in our reports for individual ACPs.

Section 2. City Bird-Safe Design Requirements

In 2014, the City of Menlo Park initiated the process of updating its General Plan Land Use and Circulation Elements as well as its zoning for the M-2 area (also known as the Bayfront Area) in the northern portion of Menlo Park. Collectively, this update to the General Plan and zoning is known as *ConnectMenlo*. On November 29, 2016, the City Council certified the *ConnectMenlo: General Plan Land Use & Circulation Elements and M-2 Area Zoning Update Environmental Impact Report* (ConnectMenlo EIR) and approved the General Plan Land Use and Circulation Elements. The Willow Village project is located within the ConnectMenlo area.

Mitigation Measure BIO-1 of the ConnectMenlo EIR requires measures to ensure that the project reduces bird collisions with new buildings. For the purpose of this report, we assume that the project will comply with City of Menlo Park bird-safe design requirements (including obtaining waivers, as permitted by the City bird-safe design requirements, where applicable) provided in Municipal Code Sections 16.43.140(6) and 16.45.130(6), which include measures to reduce bird collisions. Hereafter, the bird-safe design measures in the ConnectMenlo EIR and the City's Municipal Code are referred to together as *City bird-safe design requirements*. These requirements are as follows:

A. No more than 10% of facade surface area shall have non-bird-friendly glazing.

B. Bird-friendly glazing includes, but is not limited to, opaque glass, covering the outside surface of clear glass with patterns, paned glass with fenestration, frit or etching patterns, and external screens over nonreflective glass. Highly reflective glass is not permitted.

C. Occupancy sensors or other switch control devices with an astronomic time clock shall be installed on nonemergency lights and shall be programmed to shut off during non-work hours and between 10:00 p.m. and sunrise.

D. Placement of buildings shall avoid the potential funneling of flight paths towards a building facade.

E. Glass skyways or walkways, free-standing (see-through) glass walls and handrails, and transparent building corners shall not be allowed.

F. Transparent glass shall not be allowed at the rooflines of buildings, including in conjunction with roof decks, patios and roofs with landscape vegetation.

G. Use of rodenticides shall not be allowed.

A project may receive a waiver from requirements A through F, subject to the submittal of a site-specific evaluation from a qualified biologist (defined as an ornithologist familiar with local bird communities and populations and with expertise assessing avian collision risk) and review and approval by the planning commission. A waiver from requirement G is not authorized. The project will comply with requirement G, and this requirement is not discussed further in the body of this report.

However, to address collision risk with the project buildings, tailored alternative bird-safe design measures, derived from the City of Menlo Park's requirements with appropriate waivers, are provided in Section 5 of this report based on the conceptual designs in the project's CDP application to reduce collision impacts to less-than-significant levels under CEQA (hereafter, these alternative measures are referred to as *alternative City measures*). Sections 5 and 6 of this report provides a discussion of how the Master Plan components will comply with the City's bird-safe design requirements, as well as examples of locations where waivers to the City requirements are, in our professional opinion, appropriate in areas of low collision risk. Waivers are requested in order for the project to achieve design excellence (e.g., related to aesthetics, energy efficiency, or project objectives). Waivers are requested only where strict adherence to the City's bird-safe design requirements (a) is not necessary to reduce project impacts to less-than-significant levels under CEQA and (b) would not substantively reduce bird collision risk beyond the alternative City measures proposed in Sections 5 and 6 (discussed in detail in Sections 5 and 6 below).

This report documents the CEQA mitigation measures and alternative City measures the project will implement to reduce impacts to less-than-significant levels and comply with the City's bird-safe design requirements. Documentation of compliance with this report will be provided in subsequent reports for each ACP for the project.

Section 3. Project Site Conditions

3.1 Existing Conditions

Habitat conditions and bird occurrence in the immediate vicinity of the project site (i.e., on the site and on immediately adjacent lands) are typical of much of the urbanized San Francisco Bay area. The approximately 64.0-acre project site currently supports office buildings, roadways, restaurants, a gas station, parking lots, walking paths, mulched and irrigated areas, and landscape areas (Photos 1–4). The site is located across the inactive JPB rail corridor from a storage facility and large brackish marsh to the north, and is otherwise surrounded by high-density commercial and residential development to the east, west, and south (Figure 1).

Photo 1. Office buildings, parking lots, and landscape areas on the project site.

Photo 2. Landscape areas and trees on the project site.

Photo 3. An overgrown wooded area with landscape trees on the project site.

Photo 4. Office buildings and landscape trees on the project site.

Figure 1. The project site (delineated in yellow) is surrounded by commercial and residential development to the east, west, and south. The inactive JPB rail corridor, a storage facility, and a large brackish marsh are located to the north.

Habitat conditions on the site are of low quality for most native birds found in the region due to the scarcity of vegetation, the lack of well-layered vegetation (e.g., with ground cover, shrub, and canopy tree layers in the same areas), and the small size of the vegetated habitat patches. Landscaped areas on the site support nonnative Canary Island pine (*Pinus canariensis*), Chinese pistache (*Pistacia chinensis*), London plane (*Platanus* x *hispanica*), eucalyptus (*Eucalyptus* sp.), and crepe myrtle (*Lagerstroemia* sp.) trees. Common understory plants include nonnative buckbrush (*Ceanothus* sp.) and rosemary (*Rosmarinus officinalis*). Nonnative vegetation supports fewer of the resources required by native birds compared to native vegetation, and the structural simplicity of the vegetation further limits resources available to birds (Anderson 1977, Mills et al. 1989). Nevertheless, there is a suite of common, urban-adapted bird species that occur in such urban areas that are expected to occur on the site regularly. These include the native Anna's hummingbird (*Calypte anna*), American crow (*Corvus brachyrhynchos*), Bewick's wren (*Thryomanes bewickii*), bushtit (*Psaltriparus minimus*), dark-eyed junco (*Junco hyemalis*), and house finch (*Haemorhous mexicanus*), as well as the non-native European starling (*Sturnus vulgaris*) and house sparrow (*Passer domesticus*). All of these birds are year-round residents that can potentially nest on or immediately adjacent to the project site. A number of other species, primarily migrants or winter visitors (i.e., nonbreeders), are expected to occur occasionally on the site as well, including the white-crowned sparrow (*Zonotrichia leucophrys*), golden-crowned sparrow (*Zonotrichia atricapilla*), and yellow-rumped warbler (*Setophaga coronata*). All of the species expected to occur regularly are regionally abundant species, and no special-status birds (i.e., species of conservation concern) are expected to nest or occur regularly on the site.

The habitat conditions located to the east, west, and south of the project site are very similar to those on the project site itself. These areas are dominated by commercial and residential uses and have landscaping similar to that on the project site (Figure 1). As a result, bird use of these surrounding areas is as described above for the project site.

A large brackish marsh is present approximately 150 feet north of the project site, north of the inactive JPB rail corridor and a storage facility (Figure 1). This brackish marsh, which extends north to State Route 84 and east to University Avenue, is dominated by salt marsh and brackish marsh plants and contains several channels. As a result, marsh-associated special-status birds such as the San Francisco common yellowthroat (*Geothlypis trichas sinuosa*), Alameda song sparrow (*Melospiza melodia pusillula*), and northern harrier (*Circus hudsonius*) – all of which are California species of special concern – may occur in this area. However, state and federally listed birds associated with tidal salt marshes, salt pannes, and aquatic habitats, such as the California Ridgway's rail (*Rallus obsoletus obsoletus*), California black rail (*Laterallus jamaicensis coturniculus*), western snowy plover (*Charadrius nivosus nivosus*), and California least tern (*Sternula antillarum browni*), are absent from these habitats.

Further to the northeast and northwest are former salt ponds, now managed as waterbird habitat, and the waters and marshes of the San Francisco Bay. Ravenswood Pond R3 is located approximately 750 feet north of the site, and is separated from the site by the inactive JPB rail corridor, commercial development, and Highway 84 (Figure 1). Ravenswood Pond SF2 is located approximately 1,760 feet northeast of the site, and is separated from the site by the inactive JPB rail corridor, a large brackish marsh (discussed above), and University Avenue (Figure 1). These ponds provide foraging habitat for a wide variety of waterbirds such as the American avocet (*Recurvirostra americana*), western sandpiper (*Calidris mauri*), marbled godwit (*Limosa fedoa*), ruddy duck (*Oxyura jamaicensis*), semipalmated plover (*Charadrius semipalmatus*), dunlin (*Calidris alpina*), least sandpiper (*Calidris minutilla*), red knot (*Calidris canutus*), long-billed dowitcher (*Limnodromus scolopaceus*), northern shoveler (*Spatula clypeata*), green-winged teal (*Anas crecca*), canvasback (*Aythya valisineria*), American white pelican (*Pelecanus erythrorhynchos*), black-bellied plover (*Pluvialis squatarola*) and others (Cornell Lab of Ornithology 2021). The federally threatened western snowy plover also nests and forages in Pond SF2.

Due to their location along the edge of the San Francisco Bay and the extensive areas of habitat present, the managed ponds located northeast and northwest of the project site support relatively high numbers of species of birds compared to areas located farther inland in San Mateo (Figure 2). Based on observations by birders over the years, approximately 138 species of birds have been recorded at pond SF2 and 136 species along the Bay Trail adjacent to Pond R3, including year-round resident, migrant, and wintering landbirds (associated with upland areas), shorebirds (associated with the shoreline), and waterbirds (associated with open water habitat) (Cornell Lab of Ornithology 2021). Ebird records suggest that some species of shorebirds and waterbirds can occur in these areas in large numbers (i.e., 1,000 individuals), but the majority of these species occur in smaller flocks. A number of migrant bird species will remain in this area for days to weeks to rest and forage. Resident birds that are present in the vicinity year-round are similarly attracted to the open habitats within these salt ponds in relatively large numbers for foraging opportunities (Cornell Lab of Ornithology 2021).

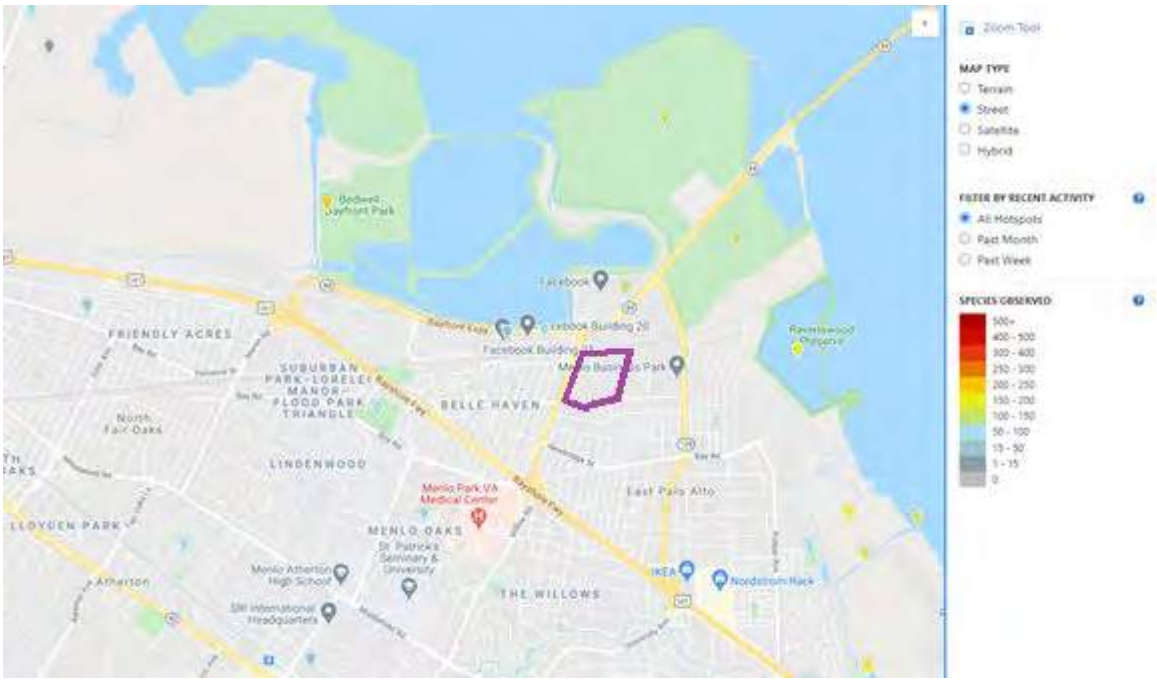

Figure 2. Map of eBird hotspots in the site vicinity. The project site is outlined in purple.

3.2 Proposed Conditions

The project would construct office and accessory space, parking garages, a hotel, retail, residential, and residential/mixed-use buildings on the majority of the site. A portion of the office and accessory space would be located inside a glass atrium. We do not expect these artificial structures to provide high-quality habitat for birds. However, the project will also create approximately 20 acres of open space areas consisting of paved pedestrian areas and landscape vegetation. The conceptual planting plans for these areas predominantly include nonnative trees, shrubs, and herbaceous plants (Appendix B). Nonnative trees to be planted on the site may include red maple (*Acer rubrum*), deodar cedar (*Cedrus deodara*), Canary Island pine, European olive (*Olea europea*), Mexican fan palm (*Washingtonia robusta*), agave (*Agave* sp.), ginkgo (*Ginkgo biloba*), Chinese elm (*Ulmus parvifolia*), crape myrtle, London plane, Brisbane box (*Lophostemon confertus*), coast redwood (*Sequoia sempervirens*) (which is not locally native to the project site), and red alder (*Alnus rubra*). In addition, native California sycamores (*Platanus racemosa*) and coast live oaks (*Quercus agrifolia*) may be planted on the site. Shrubs, forbs, and grasses that may be planted on the site include nonnative European grey sedge (*Carex divulsa*), small cape rush (*Chondropetalum tectorum*), horsetails (*Equisetum hyemale*), slender weavers (*Bambusa textilis*), bougainvillea (*Bougainvillea* sp.), and New Zealand flax (*Phormium* sp.); natives include common yarrow (*Achillea millefolium*), California wild rose (*Rosa californica*), California lilac (*Ceanothus* spp.), toyon (*Heteromeles arbutifolia*), and common rush (*Juncus patens*). While we understand that the exact species to be planted may change, we assume for purposes of this report that the characterization of proposed conditions as a mix of native and nonnative tree and plant species, with predominantly nonnative species, will remain the same.

In general, native plant species provide higher-quality food, nesting, roosting, and cover resources for native birds compared to nonnative plant species. Thus, under proposed conditions, the predominantly nonnative tree and plant species to be planted on the site will provide resources such as food (e.g., seeds, fruits, nectar, or foliage that supports insect prey), nesting sites, roosting sites, and cover from predators that is similar to existing conditions. However, due to the anticipated greater extent of this vegetation compared to existing conditions, this vegetation is expected to attract greater numbers of landbirds, including both resident birds and migrating birds, to the site compared to existing conditions. Nocturnal migrant landbirds that travel along the edge of San Francisco Bay are expected to be attracted to vegetated open space areas on the site following construction, as these areas will be visible from the San Francisco Bay as potential nesting, roosting, and foraging opportunities along a densely developed urban shoreline. Such migrants are expected to descend from their migration flights to the project site to rest and forage. Thus, a slight increase in the abundance of resident birds and a somewhat larger increase in the abundance of migrating birds is expected as a result of the proposed landscaping. Still, due to the extent of hardscape proposed in these open space areas, bird use will be much lower than in natural areas in the region.

Section 4. Method of Analysis

This assessment was prepared by H. T. Harvey & Associates wildlife ecologists/ornithologists Steve Rottenborn, Ph.D., and Robin Carle, M.S. Their qualifications are provided in Appendix C. Reconnaissance-level field surveys of the portion of the site located east of Willow Road, as well as areas within the JPB rail corridor east and west of Willow Road, were initially conducted by S. Rottenborn on October 26, 2017. After the project was redesigned in 2019, S. Rottenborn visited the project site again on April 22, 2019.

Although the subject of bird-friendly design is relatively new to the West Coast, S. Rottenborn and R. Carle have performed avian collision risk assessments and identified measures to reduce collision risk for several projects in the Bay Area, including projects in the cities of San Francisco, Oakland, Berkeley, South San Francisco, Redwood City, Menlo Park, Palo Alto, Mountain View, Santa Clara, Sunnyvale, and San José. The methods of analysis used for this report are consistent with the methods of analysis used for these other projects in the San Francisco Bay Area.

Section 5. Project Analysis

5.1 Analysis of Overall Project Site Conditions

Because birds do not necessarily perceive glass as an obstacle (Sheppard and Phillips 2015), windows or other structures that reflect the sky, trees, or other habitat may not be perceived as obstacles, and birds may collide with these structures. Similarly, transparent windows can result in bird collisions when they allow birds to perceive an unobstructed flight route through the glass (such as at corners), and when the combination of transparent glass and interior vegetation results in attempts by birds to fly through glass to reach vegetation. A number of factors play a role in determining the risk of bird collisions with buildings, including the amount and type of glass used, lighting, properties of the building (e.g., size, design, and orientation), type and location of vegetation around the building, and building location.

As noted above, moderate numbers of native, resident birds occur in the project vicinity. Because resident birds are present within an area year-round, they are more familiar with their surroundings and can be less likely to collide with buildings compared with migrant birds (discussed below). However, the numbers of resident birds that collide with buildings can still be relatively high over time. Young birds that are more naïve regarding their surroundings are more likely to collide with glass compared to adult birds. In addition, although adult birds are often more familiar with their surroundings, they still collide with glass with some frequency, especially when they are startled (e.g., by a predator) and have limited time to assess their intended flight path to avoid glazed facades. As a result, a moderate number of resident (i.e., breeding or overwintering) landbirds may collide with the project buildings over time.

Nocturnal migrant landbirds are also expected to be attracted to the project vicinity, especially the marsh and scrub habitat to the north of the site, during migration periods in the spring and fall. When these birds arrive in the site vicinity they are tired from flying all night, they are hungry, and they are less likely to be aware of risks such as glass compared to well-fed, local resident, summering, or wintering birds familiar with their surroundings. As these migrants descend from higher elevations, they will seek suitable resting and foraging resources in the new landscape vegetation adjacent to the buildings. During this reorientation process, migrants will be susceptible to collisions with the buildings if they cannot detect the glass as a solid structure to be avoided. Migrant birds that use structures for roosting and foraging (such as swifts and swallows) will also be vulnerable to collisions if they perceive building interiors as potential habitat and attempt to enter the buildings through glass walls.

Once migrants have descended and decided to settle into vegetation on or adjacent to the project site, they may collide with the glass because they do not detect it as a solid surface and think they can fly through the building (e.g., if they are on the west side of the building and try to fly through a glazed corner to reach trees on the north side). Foggy conditions may exacerbate collision risk, as birds may be even less able to perceive that glass is present in the fog. The highest collision risk would likely occur when inclement weather enters the region on

a night of heavy bird migration, when clouds and fog make it difficult for birds to find high-quality stopover sites once they reach ground level.

The project site is located in a highly urbanized area, and is surrounded on three sides by high-intensity development (Figure 1). As a result, relatively low numbers of birds are expected to occur in the general vicinity of the site to the east, west, and south (i.e., away from less developed, higher-quality habitats along the edge of the baylands to the north).

In addition, several features of the proposed buildings' architecture would further reduce the frequency of avian collisions (referred to in this report as *beneficial project features*) (Appendix A). For instance, the presence of beneficial project features such as overhangs and awnings on many of the project buildings may reduce the potential for bird collisions with buildings by helping buildings to appear as more solid structures from a distance (San Francisco Planning Department 2011, Sheppard and Phillips 2015), and we expect that birds using habitats on the project site or in adjacent areas would be more likely to interpret the building as a solid structure (rather than as reflected sky or vegetation) due to the presence of these beneficial project features. At a more localized scale, these beneficial project features reduce collisions by blocking views of glazing to birds using areas of trees or roof vegetation located above the overhangs and awnings. However, overhangs and awnings do not eliminate issues related to reflections or transparency, or block the view of birds unless birds are located above the overhang or awning (San Francisco Planning Department 2011, Sheppard and Phillips 2015). Thus, these beneficial project features are typically used in combination with bird-safe glazing treatments, such as incorporation of visible patterns on the glass, as scientific trial studies have documented that these treatments effectively reduce bird collisions. Incorporation of the beneficial project features identified in this Assessment as depicted on the figures included in Appendix A will be required as a condition of the CDP so that they are part of the project description for CEQA review of the Master Plan.

Many of the project buildings are also articulated, with numerous features that break up the building's exterior surfaces so they do not appear smooth and unbroken. Well-articulated buildings are better perceived by birds as solid structures, particularly as birds approach buildings from a distance (San Francisco Planning Department 2011); as discussed above for awnings and overhangs, this is expected to reduce bird collisions. At a more localized/closer scale, building articulations can influence the potential for collisions in different ways. A recent study (Riding et al. 2020) found that buildings with alcoves (i.e., indentations/concavities in the building outline when viewed from above) experienced higher collision rates compared to other façade types (including flat facades), possibly because these features "trap" birds within an area where they are surrounded on three sides by glazing. These findings suggest that alcoves represent high-risk collision hazards to birds that are attracted to vegetation within the alcoves. In contrast, porticos (i.e., areas where an overhang creates a covered paved walkway), which are present in several locations on the Master Plan buildings, have been found to have relatively low collision rates compared to other façade types (Riding et al 2020). However, if porticos are vegetated (rather than entirely paved) or located immediately adjacent to native vegetation and trees that will attract birds, collision rates are expected to be higher because birds would be drawn towards the glass by the vegetation. In addition, porticos on the project buildings include transparent glass corners, which represent high-risk collision

hazards. Thus, it is necessary to consider the presence of collision hazards at porticos that may be created by vegetation and/or transparent glass corners when determining if porticos should be used independently, or in combination with bird-safe glazing treatments, to ensure that collision hazards are effectively addressed.

The project includes landscape vegetation that will be planted immediately adjacent to glazed facades in a number of locations, especially at the elevated park adjacent to the south façade of the atrium and in landscape areas adjacent to the north façade of the atrium. Where landscape vegetation must be planted adjacent to buildings, some agencies recommend planting the vegetation very close to (i.e., within 3 feet of) glazed facades to reduce bird collisions, as this obscures reflections of the vegetation in glazing and reduces fatal collisions by reducing birds' flight speed if they should fly into the glass (Klem 1990, New York City Audubon Society, Inc. 2007). However, not all studies have documented a reduction in bird collisions when resources are placed within 3 feet of windows (Kummer and Bayne 2015), and birds are fragile enough that they may still be killed due to window collisions when flying at relatively slow speeds (Klem 2008). In our professional opinion, vegetation that is (1) dense enough that birds cannot fly swiftly through it to reach glazed windows, and (2) located close enough to windows that birds will not be flying fast when they leave the vegetation and hit the glass, reduces the potential for collisions with glazing that is immediately adjacent to the vegetation. However, while dense shrubs and herbaceous plants will reduce collision hazards with immediately adjacent glazing, they will not protect glazing located above or to the side of the vegetation. Similarly, while a dense crown of a tree located immediately adjacent to a façade will reduce collision hazards on the adjacent glass, birds may still have a relatively high collision risk with glass located below the crown, where there is no dense vegetation. All trees and vegetation also grow and are trimmed over time, and areas of adjacent facades with higher or lower collision risk are expected to change accordingly over time. As a result, although planting vegetation adjacent to facades is expected to reduce collision hazards with immediately adjacent glazing, the effectiveness of this strategy is limited because (1) birds may still be killed or injured even when they fly into windows at relatively low speeds; (2) the vegetation only reduces the collision hazard where it is dense very close to the façade, and not in adjacent areas; and (3) vegetation is not uniformly shaped, and grows or is trimmed back over time, and so does not provide uniform or consistent protection for entire facades over time.

There are also some features evident in the project's plans where bird collisions may be more frequent than at other features because they may not be easily perceived by birds as physical obstructions; these features are related to the presence of a location-related hazard on the site as well as feature-related hazards on the proposed new buildings. A *location-related hazard* occurs where new construction is located within 300 feet of an *urban bird refuge*, which is defined as an open space 2 acres or larger dominated by vegetation (San Francisco Planning Department 2011). The project is located immediately adjacent to open areas to the north that provide habitat for birds. In addition, the project will construct new landscape areas on the site within approximately 20 acres of open space (composed of extensive paved areas with some landscape vegetation) that is accessible to birds. The connectivity of the new open space on the site with open habitats to the north is expected to draw birds onto the site, especially where trees are present to attract migrant birds. The northern portion of the site is expected to attract the highest numbers of birds due to its proximity to open habitats along the edge of San Francisco Bay. Although some birds will also occur farther south within the project site, the number of

individuals is likely to decline farther south due to the urbanized conditions that will be present on the project site and urbanization present to the west, south, and east.

Within areas of relatively high collision risk, the greatest potential for bird collisions is where a feature-related hazard is located adjacent to a location-related hazard. A *feature-related hazard* is a design feature that represents a high-risk collision hazard regardless of its location. Feature-related hazards on the site include free-standing glass railings, transparent glass corners with clear sight lines through a building, and alcoves and atria surrounded by glazing. In addition, feature-related hazards include areas of extensive glazing, as the extent of glazing on a building and the presence of vegetation opposite the glazing are known to be two of the strongest predictors of avian collision rates (Gelb and Delacretaz 2009, Borden et al. 2010, San Francisco Planning Department 2011, Cusa et al. 2015, Sheppard and Phillips 2015, Riding et al. 2020). The risk of collision is highest when a feature-related hazard is located adjacent to a location-related hazard, especially when vegetation is present on either side of the hazard, creating a perceived "flight path" through the glazing. Where these features are located along potential flight paths that birds may use when traveling to and from landscape vegetation on the site or in nearby areas, the risk of bird collisions is higher because birds may not perceive the intervening glass and may therefore attempt to fly to vegetation on the far side of the glass.

5.2 Hotel and Residential/Mixed-Use Buildings

The hotel and residential/mixed-use buildings are discussed together because the conceptual designs indicate that their facades are predominantly opaque (with the exception of retail areas on the lower levels of the buildings) and they are located in portions of the site with less extensive vegetation. Thus, bird collisions with these buildings are generally expected to be lower compared to other buildings on the project site, although certain facades of these buildings face areas of landscape vegetation (e.g., parks and courtyards) where bird collisions are generally expected to be relatively higher.

5.2.1 Building Descriptions

5.2.1.1 Hotel

A hotel is located at the eastern end of the Town Square District, adjacent to Willow Road; the hotel will be a maximum of 120 feet tall (Figure 3). The conceptual design of the hotel includes a central courtyard on Level 1, a pool deck on Level 3, and balconies on Level 6 (Figure 4). A bridge will connect the hotel's Level 3 pool deck to the elevated park to the north. The facades of the hotel are intended to be predominantly opaque, with extensive glazing on Level 1 on the west, east, and south facades as well as all Level 1 facades surrounding the courtyard (Figure 5). Free-standing glass railings may be included in the hotel design, and landscape vegetation may be present on roof terraces.

Figure 3. Illustration of buildings in the northern portion of the site showing the proposed atrium, elevated park, hotel, Town Square, Office Building 04, and event building.

Figure 4. The conceptual hotel plan includes a central courtyard on Level 1, a pool deck on Level 3, and vegetated balconies on Level 6.

Figure 5. The conceptual east (top left), north (top right), west (bottom left), and south (bottom right) facades of the hotel.

Birds using open marsh and scrub habitats, or migrating, north of the site may be attracted to landscape vegetation along the façades of the hotel. The conceptual project plans show vegetation and trees at the elevated park to the northeast within the Town Square to the east, and within the hotel's central courtyard (Figures 3 and 5). Street trees and limited vegetation are proposed along Willow Road to the northwest and future Main Street to the southwest (Figure 5).

Although the hotel is located in the northern portion of the site and adjacent to the elevated park (i.e., in areas where higher numbers of birds are expected to be present, compared to areas farther south within the Master Plan area), the extensive opaque panels on the exterior facades as shown in the conceptual design are beneficial project features that substantially reduce the expected frequency of bird collisions with this building by helping the building appear as a solid structure from a distance (Figure 5). Features of the architecture of the hotel where collision risk is expected to be relatively highest include transparent glass corners (through which sight lines between vegetation on either side of the corners create collision hazards for birds), at roofs with landscape vegetation (which are expected to attract birds towards glazing on the building), in the central courtyard (where birds are surrounded on three or three sides by glazed facades), and at areas of contiguous glazing that face landscape vegetation within approximately 60 feet of the ground.

5.2.1.2 Residential/Mixed-Use Buildings

The residential/mixed-use buildings on Parcels 2–7 are assessed together because they are similar in structure, and collision hazards with these buildings are expected to be similar. These buildings are located in the southeast portion of the Master Plan area (Figure 6) and will be a maximum of 85 feet tall. Figures 7 and 8, which show the Parcel 2 building, are representative of the conceptual appearance of the residential/mixed-use buildings: their facades are intended to be predominantly opaque with residential windows, with more extensive glazing typically present at ground-floor public spaces. All buildings incorporate courtyards and open space areas, and landscape vegetation may be present on roof terraces. Free-standing glass railings may be included in the building designs.

Figure 6. Illustrative site plan showing the proposed residential/mixed-use buildings and associated open space areas. Facades with relatively highest collision risk are delineated in red.

Figure 7. The conceptual Parcel 2 residential/mixed-use building plan includes open space courtyards on Level 3.

Figure 8. The conceptual east (top), west (middle), south (bottom left), and north (bottom right) facades of the Parcel 2 residential/mixed-use building.

Birds are expected to use landscape vegetation planted adjacent to the façades of the residential/mixed-use buildings within public areas (e.g., street trees), planted landscape areas, and parks. However, according to the conceptual designs, the majority of the residential/mixed-use buildings are not located adjacent to large open space areas; as a result, fewer birds are expected to occur along these buildings compared to other buildings on the project site. In general, higher numbers of birds are expected to be present at the approximately 3.5-acre publicly accessible park on Parcel A and at the Town Square to the north/northeast of Parcels 2 and 3, and fewer birds are expected to be present in smaller/narrower vegetated areas (e.g., in between buildings).

Beneficial project features of the architecture of residential/mixed-use buildings that would reduce the frequency of avian collisions include opaque panels, overhangs, mullions, and porticos that are not vegetated or located immediately adjacent to vegetation (Figure 8). Nevertheless, some bird collisions with these façades are expected to occur despite the presence of certain features that reduce collision risk. Features of the architecture of the facades of the residential/mixed-use buildings where collision risk is expected to be relatively highest include transparent glass corners (through which sight lines between vegetation on either side of the corners create collision hazards for birds), at alcoves (which surround trees and vegetation that are expected to attract birds), at green roofs (which are expected to attract birds towards glazing on the building), in courtyards (where birds are surrounded on three or four sides by glazed facades), and at areas of contiguous glazing that face landscape vegetation within approximately 60 feet of the ground (Figure 8). At transparent glass corners, the collision hazard extends as far from the corner as it is possible to see through the corner (and can potentially extend through an entire floor or section of a building, if it is possible to see through from one side of the building to the other).

5.2.2 Compliance with City Bird-Safe Design Requirements

Collision risk for the hotel and residential/mixed-use buildings is expected to be lower compared with other buildings in the Master Plan area because the conceptual designs indicate that their facades are predominantly opaque (with the exception of retail areas on the lower levels of the buildings) and they are located in portions of the site with less extensive vegetation. To address collision risk, the project will comply with City bird-safe design requirements, with requests for appropriate waivers, as permitted by the City bird-safe design requirements, by focusing bird-safe treatment of glazing within areas of relatively highest collision risk.

5.2.2.1 Requirements for which No Waiver is Requested

As currently proposed, the hotel and residential/mixed-use buildings anticipate complying with City bird-safe design requirements B, D, and G without requesting waivers; requirements B and D are listed below. Where the project's bird-safe design strategy is more specific than the City's requirements, sub-bullets specify how the project will comply with those requirements.

B. Bird-friendly glazing includes, but is not limited to, opaque glass, covering the outside surface of clear glass with patterns, paned glass with fenestration, frit or etching patterns, and external screens over nonreflective glass. Highly reflective glass is not permitted.

- Specifically, glazing used on the hotel and residential/mixed-use buildings shall have the following specifications:

    a. Vertical elements of the window patterns should be at least 0.25 inches wide at a maximum spacing of four inches and/or have horizontal elements at least 0.125 inches wide at a maximum spacing of two inches;

    OR

    b. Bird-safe glazing shall have a Threat Factor[1] less than or equal to 30.

- To reduce reflections of clouds and vegetation in glass and help ensure that bird-safe treatments on the lower surfaces of glass are visible below any reflections, all glazing on the hotel and residential/mixed-use buildings will have a visible reflectance of 15% or lower.

D. Placement of buildings shall avoid the potential funneling of flight paths towards a building facade.

Discussion of project compliance with City requirement C, related to occupancy sensors, is provided in Section 6.2.2 below.

[1] A material's Threat Factor is assigned by the American Bird Conservancy, and refers to the level of danger posed to birds based on birds' ability to perceive the material as an obstruction, as tested using a "tunnel" protocol (a standardized test that uses wild birds to determine the relative effectiveness of various products at deterring bird collisions). The higher the Threat Factor, the greater the risk that collisions will occur. An opaque material will have a Threat Factor of 0, and a completely transparent material will have a Threat Factor of 100. Threat Factors for many commercially available façade materials can be found at https://abcbirds.org/wp-content/uploads/2021/01/Master-spreadsheet-1-25-2021.xlsx.

5.2.2.2 Requirements for which Waivers will be Requested

Waivers Requested. As currently proposed, the project anticipates complying with City bird-safe requirements A, E, and F by requesting waivers for the hotel and residential/mixed-use buildings, as permitted by the City bird-safe design requirements. These waivers are requested in order for the project to achieve design excellence. City requirements A, E, and F are as follows:

A. No more than 10% of facade surface area shall have non-bird-friendly glazing.

E. Glass skyways or walkways, free-standing (see-through) glass walls and handrails, and transparent building corners shall not be allowed.

F. Transparent glass shall not be allowed at the rooflines of buildings, including in conjunction with roof decks, patios and roofs with landscape vegetation.

Alternative City Measures Proposed. As an alternative to these requirements, to ensure that the project meets the City's intent of designing bird-safe buildings and addresses high-risk collision hazards, the project proposes to implement the following alternative City measures:

- The hotel and residential/mixed-use buildings shall focus bird-friendly glazing treatments within areas of extensive glazing on lower floors and roof terraces that face the approximately 3.5-acre publicly accessible park (Parcel A), Town Square, and elevated park (i.e., the north, east, and south facades of the hotel; the north and south façades of the Parcel 2 building; the north/northeast facades of the Parcel 3 buildings; a portion of the south façade of the Parcel 4 building; and the west façades of the Parcel 6 building as indicated on Figure 6), as these represent areas of heightened collision risk. The focal façade areas to be treated shall be identified by a qualified biologist on building-specific façade views; no more than 10% of these areas shall have non-bird-friendly glazing.
- If free-standing glass railings are included on the hotel and/or residential/mixed-use buildings, all glazing on free-standing glass railings shall be 100% treated with a bird-safe glazing treatment.
    - Specifically, all glazing on free-standing glass railings on the buildings shall have a Threat Factor (see footnote 1 above) less than or equal to 15. This Threat Factor is relatively low (and the effectiveness of the bird-safe treatment correspondingly high) due to the relatively high risk of bird collisions with free-standing glass railings.
- All glazed features of the hotel and residential/mixed-use with clear sight lines between vegetation on either side of the feature (e.g., at glazed corners) shall be 100% treated with a bird-safe glazing treatment where they are located within or adjacent to (i.e., on both sides of a corner where one side of the corner falls within a focal treatment area) the focal treatment areas identified by the qualified biologist. These transparent building corners shall treated as far from the corner as it is possible to see through to the other side of the corner.

With respect to the bird-safe glazing treatments recommended in connection with these alternatives, Figure 9 provides an example of identified areas that would be required to be treated on the conceptual Parcel 2 residential/mixed-use building based on the January 2021 façade elevations.

Figure 9. An example mark-up of areas (shown in blue) that would be required to be treated on north (top left), south (top right), east (middle) and west (bottom) facades of the conceptual Parcel 2 residential/mixed-use building to ensure that avian collisions are less-than-significant. Transparent glass corner delineations are estimated; these corners should be treated as far from the corner as it is possible to see through the corner. Free-standing glass railings are not indicated on this figure but are required to be treated in all locations.

In lieu of complying with City requirements A, E, and F per se, this proposed approach would reduce bird collisions at the locations where bird collisions are most likely to occur and, in our professional opinion, adequately meet the objective of the City's requirements (i.e., to minimize bird collisions with the buildings). Therefore, the requested waivers to the City's bird-safe design requirements are appropriate. Alternatively, if the City does not grant a waiver for requirements A, E, and F, the project will comply with these City requirements. In our professional opinion, this strategy (i.e., compliance with City requirements or compliance via approved waivers, as permitted by the City bird-safe design requirements, and alternative City measures) will avoid significant CEQA impacts for these buildings.

5.2.3 Additional Mitigation Measures Proposed Under CEQA

Based on our assessment of the conceptual design of the hotel and residential/mixed-use buildings, we have determined that there is an overall low likelihood of collisions with the buildings. With the project's compliance with City requirements (either via compliance with the listed requirements or by requesting waivers, as permitted by the City bird-safe design requirements, and proposing alternative City measures, where

appropriate), it is our professional opinion that project impacts due to bird collisions with the hotel and residential/mixed-use buildings would be less than significant under CEQA. As such, no additional mitigation measures under CEQA for impacts related to avian collisions are proposed.

5.2.4 CEQA Impacts Summary

The hotel and residential/mixed-use buildings will comply with the City's bird-safe design requirements by implementing requirements B, D, and G; requesting waivers for requirements A, E, and F, as permitted by the City bird-safe design requirements; and implementing alternative City measures for requirements A, E, and F. Compliance with requirement C is discussed in Section 6.2.2 below. No additional mitigation measures under CEQA for impacts related to avian collisions are proposed. As stated above, with compliance with City requirements (including the implementation of the proposed alternative City measures), it is our professional opinion that project impacts due to bird collisions with the hotel and residential/mixed-use buildings would be less than significant under CEQA.

A subsequent report prepared by a qualified biologist will accompany the final ACPs for each of the residential/mixed-use buildings and the hotel. It is our understanding based on coordination with the design teams that (1) the final ACP designs for the residential/mixed-use buildings and hotel will substantially conform with the conceptual designs reviewed for this report, such that our analysis and conclusions are expected to be valid for the final designs; (2) the proposed bird-safe treatments within the areas where such treatments are expected to be necessary (per the example shown in Figure 9) are feasible; and (3) the project will implement alternative City measures as described herein. Nevertheless, because the designs and renderings for the hotel and residential/mixed-use buildings that were reviewed for this assessment are conceptual, a qualified biologist shall review the final ACPs for the hotel and residential/mixed-use buildings to confirm that the alternative City measures described herein, or other alternative measures reasonably acceptable to the qualified biologist[2], are incorporated into the final design, such that project impacts due to bird collisions would be less than significant under CEQA as indicated herein.

5.3 Office Campus

Office Buildings 01, 02, 03, 05, and 06 are assessed together because the conceptual designs indicate that they are similar in structure, and collision hazards with these buildings are expected to be similar.

5.3.1 Building Descriptions

5.3.1.1 Office Buildings 01, 02, 03, 05, and 06

Office Buildings 01, 02, 03, 05, and 06 will be a maximum of 120 feet tall. As shown on Figure 13 in Section 5.4.1.2 below, Office Building 04 is representative of the appearance of all proposed office buildings; their facades are predominantly glazed, although portions of the lower levels incorporate opaque wall panels. All

[2] If alternative measures are used that are not discussed in this report for the project's CDP, those measures will be submitted to the City for review in accordance with the City's Zoning Code and CEQA with the project's ACPs.

buildings have open space areas on rooftops that may support landscape vegetation. Free-standing glass railings may be included in the design of Office Buildings 01, 02, 03, 05, and 06.Birds are expected to use landscape vegetation along the façades of the office buildings. In general, higher numbers of birds are expected to be present in larger vegetated open space areas (e.g., in the plaza north of Office Building 05), and fewer birds are expected to be present in smaller/narrower vegetated areas (e.g., in between Office Building 06 and the South Garage) (Figure 10).

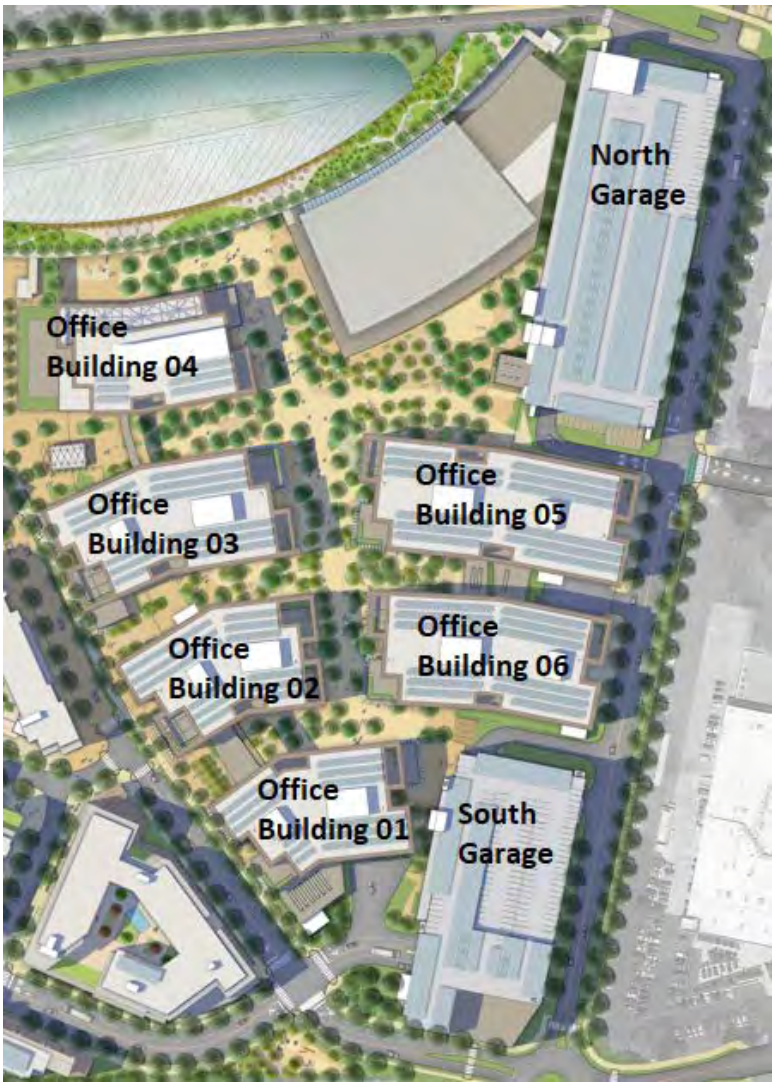

Figure 10. Conceptual site plan showing the locations of proposed office buildings and garages, as well as the proposed extent of landscape vegetation and trees.

Beneficial project features of the architecture of office building facades that would reduce the frequency of avian collisions include opaque panels, exterior vertical and horizontal solar shades, overhangs, mullions, and porticos that are not vegetated or located immediately adjacent to native vegetation. Nevertheless, because (1) the façades of the office buildings are extensively glazed and (2) this glazing faces landscape vegetation, bird

collisions with these façades are expected to occur despite the presence of certain features that reduce collision risk. Features of the architecture of the facades of the office buildings where collision risk is expected to be relatively highest include transparent glass corners (through which sight lines between vegetation on either side of the corners create collision hazards for birds), at alcoves (which surround trees and vegetation that are expected to attract birds), at roofs with landscape vegetation (which are expected to attract birds towards glazing on the building), at free-standing glass railings, and at areas of contiguous glazing that face landscape vegetation within approximately 60 feet of the ground. At transparent glass corners, the collision hazard extends as far from the corner as it is possible to see through the corner (and can potentially extend through an entire floor or section of a building, if it is possible to see through from one side of the building to the other).

5.3.1.2 Parking Garages

The North Garage is located in the northeast corner of the project site and the South Garage is located in the southeast corner of the project site (Figure 10). These garages are similar in structure, and will be a maximum of 120 feet tall. The conceptual plans indicate that the facades of the garages are predominantly opaque, with limited glazing only on two approximately 15-foot wide elevator towers on the west and north facades on all levels (Figure 11). Free-standing glass railings may be included in the project design, and landscape vegetation may be present above the ground level.

Figure 11. Conceptual North Garage elevations: east (top), west (middle), north (bottom left), and south (bottom right). The building facades are predominantly opaque; glazed areas are located on all levels the elevator towers on the west and north facades.

Birds using open marsh and scrub habitats, or migrating, north of the site may use landscape vegetation along the façades of the North Garage and South Garage. In general, higher numbers of birds are expected to be present opposite the north façade of the North Garage (which faces open habitats associated with the San Francisco Bay) and in larger vegetated open space areas (e.g., in the plaza southwest of the North Garage), and

fewer birds are expected to be present in smaller/narrower vegetated areas opposite the garage facades (e.g., in between the North Garage and Office Building 05).

The extensive opaque facades on the North Garage and South Garage shown on the conceptual plans are beneficial project features that will substantially reduce bird collisions with these buildings. Nevertheless, bird collisions are expected to occur where glazing is present opposite open space areas and landscape vegetation, at free-standing glass railings, and at roofs where landscape vegetation is located adjacent to glazing. No high-risk collision hazards (e.g., transparent glass corners) are present on these buildings.

5.3.2 Compliance with City Bird-Safe Design Requirements

Although a number of beneficial project features in the project design mentioned above will reduce bird collisions (e.g., opaque facades, exterior solar shades, mullions, and porticos), the number of collisions with Office Buildings 01, 02, 03, 05, and 06 as well as the North Garage and South Garage is expected to be relatively higher compared with certain other buildings in the Master Plan area (e.g., the hotel and mixed-use buildings described above) because (1) the building facades incorporate extensive glazing, and (2) this glazing faces landscape vegetation that will be used by birds. To address collision risk, the project will comply with City bird-safe design requirements, with appropriate waivers, as permitted by the City bird-safe design requirements.

5.3.2.1 Requirements for which No Waiver is Requested

As currently proposed, Office Buildings 01, 02, 03, 05, and 06 as well as the North Garage and South Garage anticipate complying with City bird-safe design requirements A, B, C, D, and G without requesting waivers; requirements A, B, C, and D are listed below. Where the project's bird-safe design strategy is more specific than the City's requirements, sub-bullets specify how the project will comply with those requirements.

A. No more than 10% of facade surface area shall have non-bird-friendly glazing.

   - Specifically, all portions of Office Buildings 01, 02, 03, 05, and 06 shall be treated with a bird-safe glazing treatment with the exception of certain portions of the facades on Level 1. The area of untreated glazing shall be less than 10% of the total surface area of the atrium. Specific treatment areas on the North Garage and South Garage are unknown, but will comply with this requirement.

B. Bird-friendly glazing includes, but is not limited to, opaque glass, covering the outside surface of clear glass with patterns, paned glass with fenestration, frit or etching patterns, and external screens over nonreflective glass. Highly reflective glass is not permitted.

   - Specifically, glazing used on Office Buildings 01, 02, 03, 05, and 06 as well as the North Garage and South Garage shall have the following specifications:

     c. Vertical elements of the window patterns should be at least 0.25 inches wide at a maximum spacing of four inches and/or have horizontal elements at least 0.125 inches wide at a maximum spacing of two inches;

     OR

d. Bird-safe glazing shall have a Threat Factor (see footnote 1 above) less than or equal to 30.

- To reduce reflections of clouds and vegetation in glass and help ensure that bird-safe treatments on the lower surfaces of glass are visible below any reflections, all glazing on Office Buildings 01, 02, 03, 05, and 06 as well as the North Garage and South Garage will have a visible reflectance of 15% or lower.

D. Placement of buildings shall avoid the potential funneling of flight paths towards a building facade.

Discussion of project compliance with City requirement C, related to occupancy sensors is provided in Section 6.2.2 below.

5.3.2.2 Requirements for which Waivers will be Requested

Waivers Requested. As currently proposed, the project anticipates complying with City bird-safe design requirements E and F by requesting waivers for Office Buildings 01, 02, 03, 05, and 06 as well as the North Garage and South Garage, as permitted by the City bird-safe design requirements. City requirements E and F are as follows:

E. Glass skyways or walkways, free-standing (see-through) glass walls and handrails, and transparent building corners shall not be allowed.

F. Transparent glass shall not be allowed at the rooflines of buildings, including in conjunction with roof decks, patios and roofs with landscape vegetation.

Alternative City Measures Proposed. As an alternative to these requirements, to ensure that the project meets the City's intent of designing bird-safe buildings and addresses high-risk collision hazards, the project proposes to implement the following alternative City measures:

- All glazed features with clear sight lines between vegetation on either side of the feature (e.g., at glazed corners and free-standing glass railings) shall be 100% treated with a bird-safe glazing treatment. Transparent building corners shall be treated as far from the corner as it is possible to see through to the other side of the corner (and will potentially extend through an entire floor or section of a building, if it is possible to see through from one side of the building to the other).
- All glazing above Level 1 of Office Buildings 01, 02, 03, 05, and 06 (i.e., all glazing adjacent to roof terraces with landscape vegetation) will be 100% treated with a bird-safe glazing treatment. Specific treatment areas on the North Garage and South Garage are unknown, but no more than 10% of the façade surface area shall have non-bird-friendly glazing.
- All transparent glass at the rooflines adjacent to vegetated roof decks will be 100% treated with a bird-safe glazing treatment. The only untreated glazing on for Office Buildings 01, 02, 03, 05, and 06 will be located on the ground level, which does not create a collision hazard due to landscape vegetation on roofs. No vegetated roof decks are proposed for the North Garage and South Garage, and all transparent glass at the rooflines of these buildings will be 100% treated with a bird-safe glazing treatment.

- If free-standing glass railings are included on Office Buildings 01, 02, 03, 05 and/or 06, all glazing on free-standing glass railings shall be 100% treated with a bird-safe glazing treatment.
    - Specifically, all glazing on free-standing glass railings on the building shall have a Threat Factor (see footnote 1 above) less than or equal to 15. This Threat Factor is relatively low (and the effectiveness of the bird-safe treatment correspondingly high) due to the relatively high risk of bird collisions with free-standing glass railings.

In lieu of complying with City requirements E and F per se, this proposed approach would reduce bird collisions at the locations where bird collisions are most likely to occur and, in our professional opinion, adequately meet the objective of the City's requirements (i.e., to minimize bird collisions with the buildings). Therefore, the requested waivers to the City's bird-safe design requirements are appropriate. Alternatively, if the City does not grant a waiver for requirements E and F, the project will comply with these City requirements. In our professional opinion, this strategy (i.e., compliance with City requirements or compliance via approved waivers, as permitted by the City bird-safe design requirements, and alternative City measures) will avoid significant CEQA impacts for these buildings.

5.3.3 Additional Mitigation Measures Proposed Under CEQA

With the project's compliance with City requirements (either via compliance with the listed requirements or by requesting waivers, as permitted by the City bird-safe design requirements, and proposing alternative City measures, where appropriate), it is our professional opinion that project impacts due to bird collisions with Office Buildings 01, 02, 03, 05, and 06 would be less than significant under CEQA. As such, no additional mitigation measures under CEQA for impacts related to avian collisions are proposed.

5.3.4 CEQA Impacts Summary

Office Buildings 01, 02, 03, 05, and 06 as well as the North Garage and South Garage will comply with the City's bird-safe design requirements by implementing requirements A, B, C, D, and G; requesting waivers for requirements E and F, as permitted by the City bird-safe design requirements; and implementing alternative City measures for requirements E and F. Compliance with requirement C is discussed in Section 6.2.2 below. No additional mitigation measures under CEQA for impacts related to avian collisions are proposed. As stated above, with compliance with City requirements (including the implementation of the proposed alternative City measures), it is our professional opinion that project impacts due to bird collisions with Office Buildings 01, 02, 03, 05, and 06 as well as the North Garage and South Garage would be less than significant under CEQA.

A subsequent report prepared by a qualified biologist will accompany the final ACPs for Office Buildings 01, 02, 03, 05, and 06 as well as the North Garage and South Garage. It is our understanding based on coordination with the design teams that (1) the final ACP designs for these buildings will substantially conform with the conceptual designs reviewed for this report, such that our analysis and conclusions are expected to be valid for the final designs; (2) the proposed bird-safe treatments within the areas where such treatments are expected to be necessary are feasible; and (3) the project will implement alternative City measures as described herein.

Nevertheless, because the designs and renderings for Office Buildings 01, 02, 03, 05, and 06 as well as the North Garage and South Garage that were reviewed for this assessment are conceptual, a qualified biologist shall review the final ACPs for these buildings to confirm that the alternative City measures described herein, or other alternative measures reasonably acceptable to the qualified biologist (see footnote 2 above), are incorporated into the final design such that project impacts due to bird collisions would be less than significant under CEQA as indicated herein.

5.4 Event Building and Nearby Buildings

The event building, Office Building 04, Town Square retail pavilion, pavilions SP1 and SP2, and stair/elevator towers are discussed together because the conceptual designs indicate that they are located in the northern portion of the project site reasonably close to open space areas with extensive trees and landscape vegetation (Figure 3). Because these open space areas are relatively large compared to other areas of the project site, and because the structures addressed in this section all incorporate extensive glazing, avian collision risk with these buildings is expected to be relatively higher than on the other office campus buildings, hotel, and residential/mixed-use buildings discussed in Sections 5.2 and 5.3 above.

5.4.1 Building Descriptions

5.4.1.1 Event Building

An event building is located southeast of the atrium (Figure 3), and it will have a maximum height of 120 feet. The northwest façade of this facility abuts the elevated park, and the facility connects directly with the atrium via a partially glazed passageway that extends beneath the elevated park (Figure 12). The southwest and northeast facades of the event building will be entirely opaque, and the lower portions of the northwest and southeast facades will also be opaque (Figure 12). Glazing will be present on the upper portions of the northwest and southeast facades; this glazing will face the vegetation at the adjacent elevated park (Figure 12). Landscape vegetation may be present on the sides of the building above the ground level, and free-standing glass railings may be included in the project design.

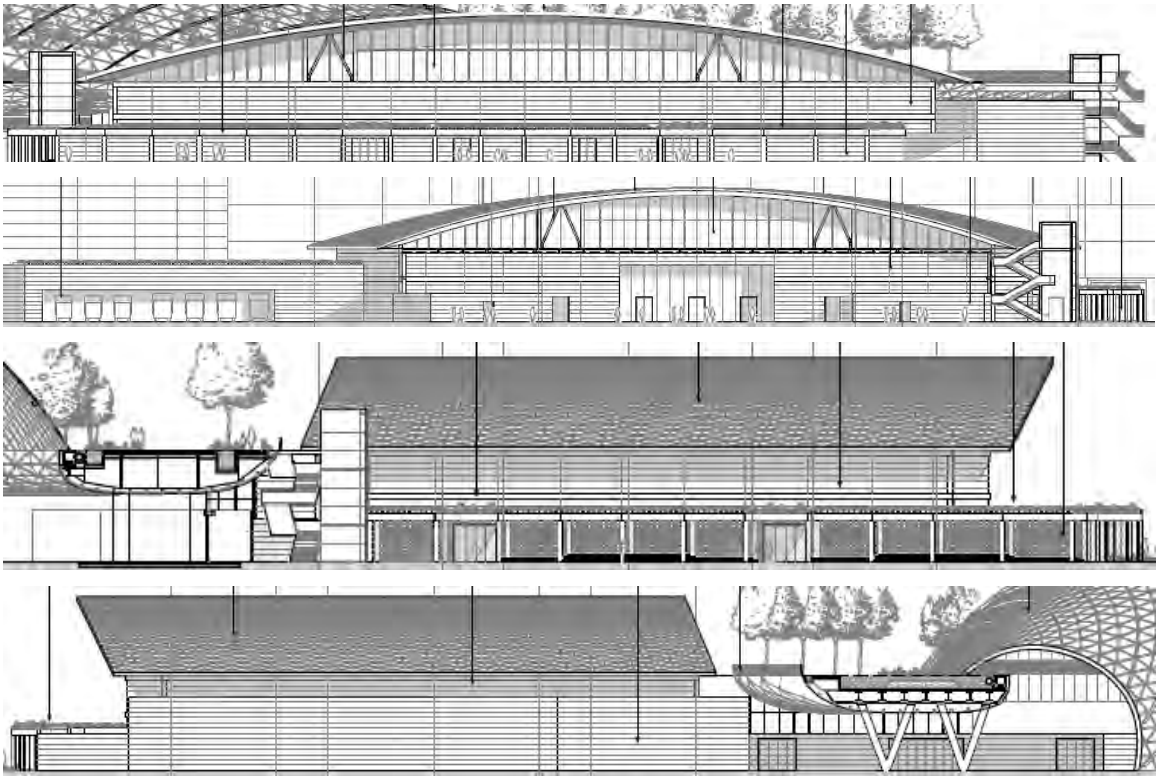

Figure 4. Illustration of the event building façades. Top to bottom: the southeast, northwest, northeast, and southwest facades.

Birds using open marsh and scrub habitats, or migrating, north of the site may be attracted to landscape vegetation along the façades of the event building. Because the conceptual plans show that the event building is surrounded by vegetated open space areas, including the elevated park to the northwest and a plaza with landscape vegetation to the southwest and southeast, relatively high numbers of birds are expected to be present around the building (Figure 3).

The extensive opaque facades on the event building are beneficial project features that will substantially reduce bird collisions with the building. However, bird collisions are expected to occur in several locations where glazing is present. For instance, birds using vegetation at the elevated park northwest of the event building will be able to see vegetation within the open space area southeast of the building, and vice-versa, through the glazing on the building's northwest and southeast facades. In addition, birds using vegetation adjacent to the glazed passageway will also be able to see vegetation on the other side of this feature. The risk of bird collisions at these locations is expected to be relatively high because birds may not perceive the intervening glass and may therefore attempt to fly to vegetation on the far side of the glass. Bird collisions are also expected to be relatively high where vegetation above the ground level is located adjacent to glazing, and at free-standing glass railings.

5.4.1.2 Office Building 04

Office Building 04 will have a maximum height of 120 feet. Open space areas will be located on rooftop terraces that may support landscape vegetation, and free-standing glass railings may be included in the project design.

Figure 13 shows the facades of Office Building 04, which are predominantly glazed, although portions of the lower levels incorporate opaque wall panels.

Figure 13. Conceptual Office Building 04 elevations: west (top left), east (top right), north (middle), and south (bottom).

Birds using open marsh and scrub habitats, or migrating, north of the site may be attracted to landscape vegetation along the façades of Office Building 04. Higher numbers of birds are expected to be present around this building compared to buildings located farther south on the project site (e.g., Office Buildings 01–03 and 05–06, which are discussed in Section 5.3 above) due to the presence of large open space areas with landscape vegetation in the northern portion of the site. The conceptual plans show vegetation and trees at the elevated park north of Office Building 04 and within open space areas at grade level to the east, west, and south of this building (Figure 10).

Features of the architecture of the facades of Office Building 04 (and connected building TS3) that represent beneficial project features that would reduce the frequency of avian collisions include opaque panels, exterior vertical and horizontal solar shades, overhangs, mullions, and porticos that are not vegetated or located immediately adjacent to native vegetation (Figure 13). Nevertheless, because (1) the façades of the office building are extensively glazed and (2) this glazing faces landscape vegetation, bird collisions with these façades are expected to occur despite the presence of certain features that reduce collision risk. Features of the architecture of the building where collision risk is expected to be relatively highest include transparent glass corners (through which sight lines between vegetation on either side of the corners create collision hazards for birds), at roofs with landscape vegetation (which are expected to attract birds towards glazing on the building), at free-standing glass railings, and at areas of contiguous glazing that face landscape vegetation within approximately 60 feet of the ground. At transparent glass corners, the collision hazard extends as far from the

corner as it is possible to see through the corner (and can potentially extend through an entire floor or section of a building, if it is possible to see through from one side of the building to the other).

5.4.1.3 Town Square

The Town Square is located east of the hotel, south of the elevated park, and west of Office Building 04 (Figure 3). This area includes a new access road (West Street), a below-grade parking garage, a paved plaza with landscape vegetation and trees, several seating areas, bicycle parking, and a retail pavilion (Figure 14). Glazing will be present on the facades of the retail pavilion, which will have a maximum height of 120 feet (Figure 15). Free-standing glass railings may be included in the Town Square design, and landscape vegetation may be present on the roof of the retail pavilion.

Figure 14. The conceptual Town Square includes a paved plaza with landscape vegetation and trees, seating areas, a glazed elevator to the elevated park, bicycle parking, and a retail pavilion.

Figure 15. The conceptual west (top left), east (top right), south (middle), and north (bottom) facades of the Town Square retail pavilion.

Birds using open marsh and scrub habitats, or migrating north of the site may be attracted to landscape vegetation in the Town Square. The Town Square is an open space area with paved pedestrian areas as well as landscape vegetation and trees, and vegetation is also present to the north of the Town Square at the elevated park (Figures 3 and 14).

Beneficial project features of the Town Square retail pavilion that would reduce the frequency of avian collisions include opaque panels and mullions (Figure 15). Nevertheless, because (1) the façades of the retail pavilion are extensively glazed and (2) this glazing faces landscape vegetation, bird collisions with these façades are expected to occur despite the presence of certain features that reduce collision risk. Features of the architecture of the pavilion where collision risk is expected to be relatively highest include transparent glass corners (through which sight lines between vegetation on either side of the corners create collision hazards for birds), at the roof (which is expected to attract birds towards glazing on the pavilion due to the potential presence of landscape vegetation), at free-standing glass railings, and at areas of contiguous glazing that face landscape vegetation. In addition, birds using vegetation north of the pavilion will be able to see vegetation south of the pavilion, and vice-versa, though the glazing on the pavilion's north and south facades. The risk of bird collisions at these locations is expected to be relatively high because birds may not perceive the intervening glass and may therefore attempt to fly to vegetation on the far side of the glass.

5.4.1.4 Security Pavilions

Accessory buildings Security Pavilions 1 and 2 (SP1 and SP2) are located in the northern portion of the site: SP1 in between Office Buildings 03 and 04, and SP2 at the southwest corner of the North Garage (Figure 10). These pavilions are discussed together because they are similar in structure, and collision risk with the pavilions' facades is expected to be similar. SP1 and SP2 will have a maximum height of 120 feet. Figure 16 is

representative of the appearance of these buildings, and indicates that glazing will be present on all sides of the buildings and pergolas will be present above the roofs. Free-standing glass railings may be included in the design of the pavilions, and landscape vegetation may be present on the building's roofs.

Figure 16. The conceptual south (top left), west (top right), north (bottom left), and east (bottom right) facades of buildings SP1 and SP2.

Birds using open marsh and scrub habitats, or migrating, north of the site may be attracted to landscape vegetation along the pavilions. Higher numbers of birds are expected to be present around these buildings compared to buildings located farther south on the project site (e.g., Office Buildings 01–03 and 05–06, which are discussed in Section 5.3 above) due to the presence of large open space areas with landscape vegetation in the northern portion of the site. The conceptual project plans show vegetation and trees in large open space areas/plazas surrounding buildings SP1 and SP2 (Figure 10).

Features of the architecture of the pavilions that represent beneficial project features that would reduce the frequency of avian collisions include opaque panels and mullions (Figure 16). Nevertheless, because the facades of these pavilions incorporate extensive glazing that faces landscape vegetation, bird collisions with these facades are expected to occur despite the presence of certain features that reduce collision risk. Features of the architecture of the pavilions where collision risk is expected to be relatively highest include transparent glass corners (through which sight lines between vegetation on either side of the corners create collision hazards for birds), at free-standing glass railings, where rooftop vegetation is located adjacent to glazing, and at areas of contiguous glazing that face landscape vegetation. In addition, birds using vegetation east of the pavilions will be able to see vegetation west of the pavilions, and vice-versa, though the glazing on the pavilion's east and west facades (Figure 16). The risk of bird collisions at these locations is expected to be relatively high because birds may not perceive the intervening glass and may therefore attempt to fly to vegetation on the far side of the glass.

5.4.1.5 Stair/Elevator Towers

Five stair/elevator towers are present that connect the ground level with the elevated park in the following locations (Figure 3):

- At the eastern end of the elevated park
- At the northwest corner of the event building (also see Figure 12)
- At the Town Square (also see Figure 14)
- At the hotel (also see Figure 5)
- At the western end of the elevated park

The conceptual plans indicate that the stair/elevator towers incorporate extensive glazing; as a result, bird collisions with facades of these towers are expected to occur. Because these towers create clear sight lines between vegetation on either side of the towers, the risk of bird collisions at these locations is expected to be relatively high because birds may not perceive the intervening glass and may therefore attempt to fly to vegetation on the far side of the glass.

5.4.2 Compliance with City Bird-Safe Design Requirements

To address collision risk, the project will comply with City bird-safe design requirements, with appropriate waivers, as permitted by the City bird-safe design requirements.

5.4.2.1 Requirements for which No Waiver is Requested

As currently proposed, the event building, Office Building 04, Town Square retail pavilion, security pavilions, and elevator towers shall anticipate complying with City bird-safe design requirements A–D and G without requesting waivers; requirements A–D are listed below. Where the project's bird-safe design strategy is more specific than the City's requirements, sub-bullets specify how the project will comply with those requirements.

A. No more than 10% of facade surface areas shall have non-bird-friendly glazing.

B. Bird-friendly glazing includes, but is not limited to, opaque glass, covering the outside surface of clear glass with patterns, paned glass with fenestration, frit or etching patterns, and external screens over nonreflective glass. Highly reflective glass is not permitted.

   - Specifically, glazing used on the event building, Office Building 04, Town Square retail pavilion, security pavilions, and elevator towers shall have the following specifications:

     e. Vertical elements of the window patterns should be at least 0.25 inches wide at a maximum spacing of four inches and/or have horizontal elements at least 0.125 inches wide at a maximum spacing of two inches;

     OR

     f. Bird-safe glazing shall have a Threat Factor (see footnote 1 above) less than or equal to 30.

   - To reduce reflections of clouds and vegetation in glass and help ensure that bird-safe treatments on the lower surfaces of glass are visible below any reflections, all glazing on the event building, Office

Building 04, Town Square retail pavilion, security pavilions, and elevator towers will have a visible reflectance of 15% or lower.

D. Placement of buildings shall avoid the potential funneling of flight paths towards a building facade.

Discussion of project compliance with City requirement C, related to occupancy sensors, is provided in Section 6.2.2 below.

5.4.2.2 Requirements for which Waivers will be Requested

Waivers Requested. As currently proposed, the project anticipates complying with City bird-safe design requirements E and F by requesting waivers for the event building, Office Building 04, Town Square retail pavilion, security pavilions, and elevator towers, as permitted by the City bird-safe design requirements. City requirements E and F are as follows:

E. Glass skyways or walkways, free-standing (see-through) glass walls and handrails, and transparent building corners shall not be allowed.

F. Transparent glass shall not be allowed at the rooflines of buildings, including in conjunction with roof decks, patios and roofs with landscape vegetation.

Alternative City Measures Proposed. As an alternative to these requirements, to ensure that the project meets the City's intent of designing bird-safe buildings and addresses high-risk collision hazards, the project proposes to implement the following alternative City measures:

- All glazed features of the event building, Office Building 04, Town Square retail pavilion, security pavilions, and elevator towers with clear sight lines between vegetation on either side of the feature (e.g., at glazed corners) shall be 100% treated with a bird-safe glazing treatment. Transparent building corners of these buildings shall be treated as far from the corner as it is possible to see through to the other side of the corner (and will potentially extend through an entire floor or section of a building, if it is possible to see through from one side of the building to the other).
- Any glazing of the event building, Office Building 04, Town Square retail pavilion, security pavilions, and elevator towers that creates see-through conditions where vegetation will be visible from one side of the building to the other shall be 100% treated. Examples include the north and south facades of the event building, the north and south facades of the Town Square retail pavilion, and facades of pavilions SP1 and SP2.
- If free-standing glass railings are included on the event building, Office Building 04, Town Square retail pavilion, security pavilions, and elevator towers, all glazing on free-standing glass railings shall be 100% treated with a bird-safe glazing treatment.
    - Specifically, all glazing on free-standing glass railings on the event building, Office Building 04, Town Square retail pavilion, security pavilions, and elevator towers shall have a Threat Factor (see footnote 1 above) less than or equal to 15. This Threat Factor is relatively low (and the effectiveness of the bird-

safe treatment correspondingly high) due to the relatively high risk of bird collisions with free-standing glass railings.

- All glazing above Level 1 of Office Building 04 (i.e., all glazing adjacent to roof terraces with landscape vegetation) will be 100% treated with a bird-safe glazing treatment.

In lieu of complying with City requirements E and F per se, this proposed approach would reduce bird collisions at the locations where bird collisions are most likely to occur and, in our professional opinion, adequately meet the objective of the City's requirements (i.e., to minimize bird collisions with the buildings). Therefore, the requested waivers to the City's bird-safe design requirements are appropriate. Alternatively, if the City does not grant a waiver for requirements E and F, the project will comply with these City requirements. In our professional opinion, this strategy (i.e., compliance with City requirements or compliance via approved waivers, as permitted by the City bird-safe design requirements, and alternative City measures) will avoid significant CEQA impacts for these buildings.

5.4.3 Additional Mitigation Measures Proposed Under CEQA

With the project's compliance with City requirements (either via compliance or by requesting waivers, as permitted by the City bird-safe design requirements, and proposing alternative City measures, where appropriate), it is our professional opinion that project impacts due to bird collisions with the event building and nearby buildings would be less than significant under CEQA. As such, no additional mitigation measures under CEQA for impacts related to avian collisions are proposed.

5.4.4 CEQA Impacts Summary

The Town Square retail pavilion, security pavilions, and stair/elevator towers will comply with the City's bird-safe design requirements by implementing requirements A–D and G, requesting waivers for requirements E and F, as permitted by the City bird-safe design requirements, and implementing alternative City measures for requirements E and F. Compliance with requirement C is discussed in Section 6.2.2 below. No additional mitigation measures under CEQA for impacts related to avian collisions are proposed. As stated above, with compliance with City requirements (including the implementation of the proposed alternative City measures), it is our professional opinion that project impacts due to bird collisions with the Town Square retail pavilion, security pavilion, and stair/elevator towers would be less than significant under CEQA.

A subsequent report prepared by a qualified biologist will accompany the final ACPs for the event building, Office Building 04, the Town Square retail pavilion, the security pavilions, and the stair/elevator towers. It is our understanding based on coordination with the design teams that (1) the final ACP designs for these buildings will substantially conform with the conceptual designs reviewed for this report, such that our analysis and conclusions are expected to be valid for the final designs; (2) the proposed bird-safe treatments within the areas where such treatments are expected to be necessary are feasible; and (3) the project will implement alternative City measures as described herein. Nevertheless, because the designs and renderings for the event building, Office Building 04, the Town Square retail pavilion, the security pavilions, and the stair/elevator

towers that were reviewed for this assessment are conceptual, a qualified biologist shall review the final ACPs for these buildings to confirm that the alternative City measures described herein, or other alternative measures reasonably acceptable to the qualified biologist (see footnote 2 above), are incorporated into the final design such that project impacts due to bird collisions are less than significant under CEQA as described herein.

5.5 Atrium

Due to the unique structure of the atrium and the potential for bird collisions with the atrium to occur, additional supporting information from the project's ACP for the atrium was referenced for this analysis (Appendix A). Although the ACP for the atrium is not yet final, it is our understanding based on considerable coordination with the design teams that the designs in the final ACP for the atrium will substantially conform with the designs referenced in this report, such that our analysis and conclusions are expected to be valid for the final design. Incorporation of the beneficial project features identified in this Assessment as depicted on the figures included in Appendix A will be required as a condition of the CDP so that they are part of the project description for CEQA review of the Master Plan.

5.5.1 Building Description

5.5.1.1 Overall Description of the Atrium Structure

The structure located north of the elevated park is proposed to be covered by an approximately 117-foot tall, 129,000 square-foot glass atrium (hereafter referred to as the *atrium*) with four interior levels of office and accessory space and approximately 3.7 acres of interior open space that will include paved pedestrian areas, landscape vegetation, and trees. For the purpose of these sections, landscape vegetation, structures, and features outside the atrium are referred to as *exterior*, and landscape vegetation, structures, and features within the atrium are referred to as *interior*. The interior of the atrium will not be accessible to birds. The northern side of the atrium faces open marsh and scrub habitats and the San Francisco Bay, and the southern side of the atrium faces the remainder of the project site. A roadway, an open space area, and a bicycle park will be constructed along the northern side of the atrium (Figure 3). An approximately 36-foot tall elevated park will be constructed along the southern side of the atrium, and an event building, office building, town square, and hotel will be located immediately south of the elevated park (Figure 3). Vegetation and trees at the elevated park and in the area immediately north of the atrium will be planted as close to the atrium's north and south façades as feasible (this is discussed as a general 'good practice' in Section 5 above).

The lower approximately 12.5 feet[3] of the atrium's south façade will consist of vertical glazing with several building entrances, and the remaining areas of the atrium's north and south facades will be composed of a network of glass panels that create a curved 'dome' shape (Figure 17). At its eastern end along the south façade, the atrium is connected to the event building via a partially glazed passageway; this connection is discussed in Section 5.4 above. A visitor center is located on the ground floor below the elevated park at the western end of

[3] The vertical façade beneath the elevated park consists of 12.5-foot tall contiguous untreated glazing below a solid roof, and a 4.5-foot tall zone of framed glass louvers in between the roof and the elevated park. The total height of the glazed façade beneath the elevated park is 18.5 feet.

the atrium, and connects with the atrium's westernmost interior building. Glass facades surround the visitor center (Figure 18) and are contiguous with the atrium's vertical south façade (Figure 17). The eastern and western ends of the atrium are closed off via large vertical predominantly glazed facades that are approximately 45–50 feet tall (Figure 18).

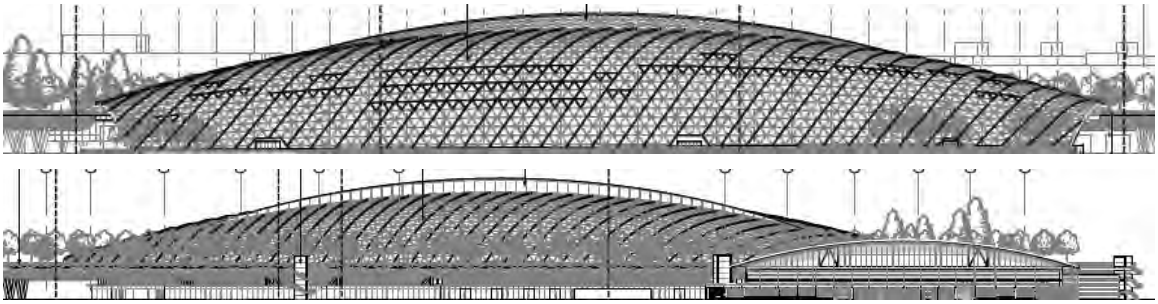

Figure 17. Conceptual drawings of the north façade (top) and south façade (bottom) of the atrium. Trees to be planted along the north façade are not shown.

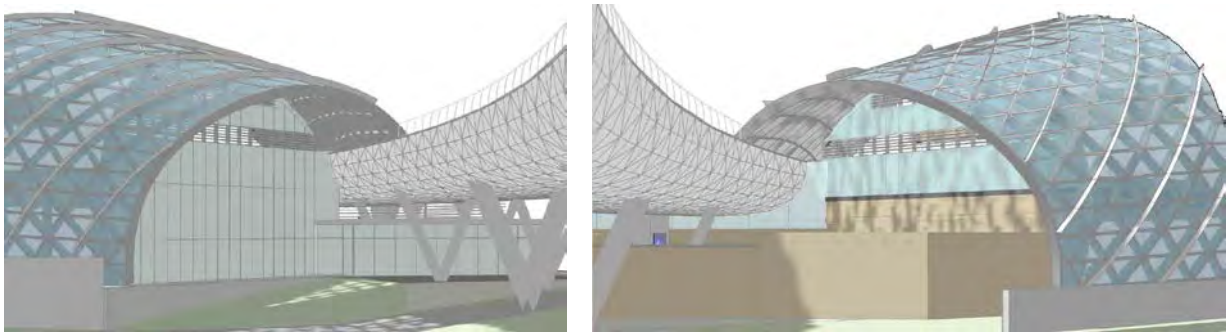

Figure 18. An illustration of the appearance of the vertical glass facades at the western (left) and eastern (right) ends of the atrium.

Figure 19 provides illustrative overhead views of proposed vegetation on each level inside the atrium. The vegetation in the atrium's interior will be similar in character to the exterior vegetation described in Section 3.2 (i.e., predominantly nonnative plant species).

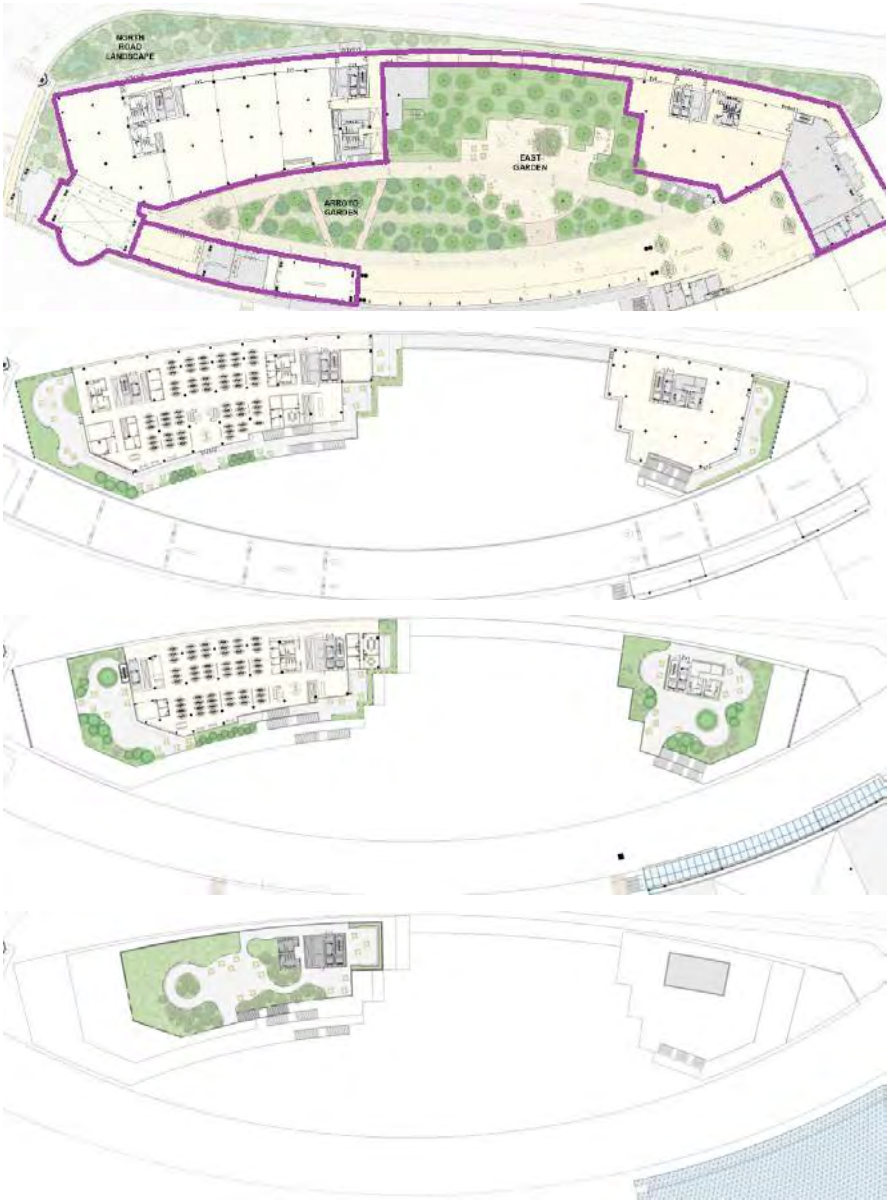

Figure 19. From top to bottom, illustrative views of landscape vegetation on Levels 1, 2, 3, and 4 of the atrium's interior. The interior building footprints and the connection between them are outlined in purple on the top image.

One four-story building and one three-story building will be located within the atrium, and the atrium's north façade composes the north façades of these buildings (Figure 19). These buildings incorporate vegetated terraces approximately 37 feet high on Level 2, 56 feet high on Level 3, and (on the westernmost building only) 75 feet high on Level 4 (Figure 19). A raised walkway connects the two buildings at Level 2 along the atrium's north facade; the area beneath the raised walkway is open with the exception of structural support beams. A security office and café with glass facades will be located beneath the elevated park; however, no interior structures will be located along the atrium's south façade; rather, this area will consist of open space gardens

with landscape vegetation and pedestrian pathways (Figure 19). An approximately 12.5-foot tall vertical glass façade is present along the base of the atrium's south facade beneath the elevated park, with several doorways/entrances that connect with the Town Square and courtyards to the south. As mentioned above and discussed in Section 5.4, a passageway directly connects the atrium with the event building to the south. In addition, a visitor center with glazed facades and a glazed entrance in the shape of a half-circle projects outwards from beneath the elevated park near the atrium's western end, connecting the interior building with the Town Square to the south, and a security office and café with glazed facades are located immediately east of this entrance beneath the elevated park (Figure 19). The only vegetation proposed beneath the elevated park consists of small low interior planters adjacent to the event building near the eastern end of the atrium and small low exterior planters adjacent to a bicycle parking area near the western end of the atrium.

The potential for avian collisions differs between the north, south, east, and west facades of the atrium due to differences in the designs of these facades; the habitats located opposite the façades; and the presence, location, and orientation of interior vegetation, structures, and features within the atrium. Due to these differences, Sections 5.5.1.2, 5.5.1.3, and 5.5.1.4 provide separate assessments of the frequency of bird collisions with the north, south, and east/west facades of the atrium, respectively. The atrium will be sealed such that birds are not expected to be able to enter the atrium's interior; as a result, bird collisions with the interior surfaces of the atrium and/or building facades within the atrium would not occur, and no bird-safe treatment of glazing inside the atrium would be necessary.

5.5.1.2 North Façade

Birds using habitats or descending from migration flights to the north of the site may be attracted to the exterior landscape vegetation along the northern façade of the atrium. There is also some potential for higher-flying birds (e.g., birds descending from migration) to be attracted to the interior vegetation within the atrium; however, the visibility of this interior vegetation to birds located north of the structure will be very limited for the following reasons: (1) interior structures located along the northern facade of the atrium will block the view of the majority of interior vegetation from the north, and (2) the articulated shape of the atrium's facades will substantially reduce the visibility of interior vegetation to birds.

The majority of interior vegetation planted on Level 1 of the atrium's interior will be entirely screened from view to birds located at grade level to the north by the presence of interior buildings along the northern periphery of the atrium (Figure 19). Although some interior trees will be partially visible to birds to the north beneath the walkway that connects the two interior buildings, most will be blocked from view by terraces of the East Garden. No exterior trees will be planted immediately adjacent to the atrium's north façade along the East Garden such that birds would be attracted to this section of the façade where they would be able to see interior vegetation within the East Garden.

Some interior trees planted on roof terraces on Levels 2, 3, and 4 of interior buildings will be visible to birds from the north; however, all trees on these terraces will be set back from the atrium's north façade by approximately 20 feet on Levels 2 and 3, and 25 feet on Level 4 (Figure 19). As a result, birds using exterior

vegetation and trees north of the atrium will have limited line-of-sight views to interior trees at grade level and no line-of-sight views to trees on rooftops. This reduces the potential for bird collisions with the atrium's north façade by blocking direct "flight paths" for birds between interior and exterior vegetation.

The articulated structure of the atrium is a beneficial project feature that will substantially reduce the visibility of all interior vegetation to birds, especially from a distance (Figure 20), reducing the likelihood that birds will collide with glazing on the north façade (in any location) because they are attempting to reach interior vegetation. The architect for the Willow Village atrium has indicated that a good comparison, with respect to birds' ability to view vegetation inside the atrium, is the Jewel Changi Airport in Singapore (Figure 20), which was also designed by the same architecture firm. Although the Jewel Changi Airport building also contains extensive vegetation in its interior, like the Jewel Changi Airport building, the articulated glass surface and fins at the Willow Village atrium (see Figure 21) would combine to mask the visibility of that vegetation, so that birds flying outside the Willow Village atrium will not be able to clearly see, and therefore will not be attracted to, interior vegetation.

Figure 20. The Jewel Changi Airport building, which has a comparable design and exterior appearance to the proposed atrium. Although extensive vegetation is present inside this building, it is largely invisible from outside the atrium.

Fin-like mullions on the exterior surface of the atrium's façade are a beneficial project feature that will help break up the smooth surface and increase the visibility of the façade to birds (Figure 21). As a result, birds located north of the atrium that are attracted to the project site are more likely to view the atrium as a solid structure and are less likely to collide with the atrium.

Figure 21. Fin-like mullions on the exterior surface of the conceptual north and south facades of the atrium will break up the smooth surface and increase the visibility of the facades to birds, especially from a distance.

5.5.1.3 South Façade

Birds are expected to be attracted to exterior landscape vegetation along the south side of the atrium, especially at the elevated park located immediately adjacent to the atrium's south façade. Vegetation will also be present in open space courtyards and at the Town Square to the south, and some birds are expected to be attracted to these areas as well. Interior vegetation consisting of small low planters adjacent to the event building will be present below the elevated park; these planters will be screened from the outside by the event building and an adjacent enclosed room, and hence will not be directly visible to birds on the atrium's exterior. Additional exterior vegetation proposed beneath the elevated park consists of small low planters adjacent to a bicycle parking area near the western end of the south façade.

The visibility of vegetation within the glass atrium to birds using vegetation at the elevated park will be limited for the following reasons: (1) interior solar shades will block the view of interior vegetation from the south in certain locations, and (2) the articulated shape of the atrium's façades will substantially reduce the visibility of interior vegetation to birds, as indicated in Figure 20. In addition, vegetation located at the elevated park will be planted immediately adjacent to glass, as feasible, so that birds' flight speeds may be reduced as they approach the glazing, further reducing the potential for collisions.

Interior operable, suspended solar shades along a large portion of the south façade are a beneficial project feature that will block views of interior vegetation to birds located south of the atrium (Figure 22). As a result, birds using exterior vegetation and trees or flying in certain areas south of the atrium (i.e., areas from which the solar shades block views of vegetation in the atrium's interior) will not have line-of-sight views to interior vegetation where these shades are present. This reduces the potential for bird collisions with portions of the atrium's south façade by preventing that interior vegetation from being a strong attractant to birds. However, birds located elsewhere along the south façade (i.e., areas where the solar shades do not block views of vegetation in the atrium's interior) would have line-of-sight views to interior vegetation. As discussed above for the north façade, the articulated structure of the atrium will substantially reduce the visibility of interior vegetation to birds on the atrium's south facade, especially from a distance (Figure 20), reducing the likelihood

that birds will collide with glazing on the south façade because they are attempting to reach interior vegetation. In addition, fin-like mullions on the exterior surface of the façade will help break up the smooth surface and increase the visibility of the façade to birds (Figure 21).

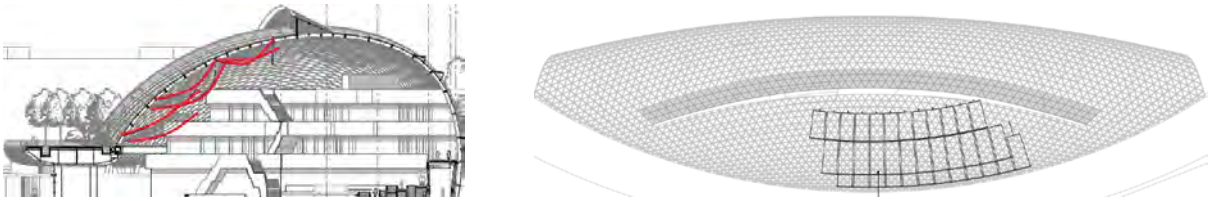

Figure 22. Interior sail shades, shown in red on the left cross-section image, are located along portions of the south façade of the atrium and will block views of interior vegetation to birds located at the elevated park or flying overhead. The approximate extent of the sail shades is shown in dark gray on the right (overhead) image.

To the extent feasible, exterior vegetation at the elevated park will be planted such that high-branching clear-stemmed trees are set back from the glass façade, and dense trees, shrubs, and other plants would be located immediately adjacent to glass facades (Figure 23). As discussed above, we expect this planting strategy to reduce the frequency of collisions with glazing that is immediately adjacent to the vegetation by obscuring reflections of the vegetation in glazing, and to reduce fatal collisions by reducing birds' flight speed if they should fly into the glass. However, even with this orientation of plantings, (1) birds may still be killed or injured even when they fly into windows at relatively low speeds; (2) the vegetation only reduces the collision hazard where it is dense very close to the façade, and not in adjacent areas; and (3) vegetation is not uniformly shaped, and grows or is trimmed back over time, and so does not provide uniform or consistent protection for entire facades over time. As a result, while this strategy represents a good practice for bird-safe design, collisions with the facades adjacent to the elevated park are still expected to occur.

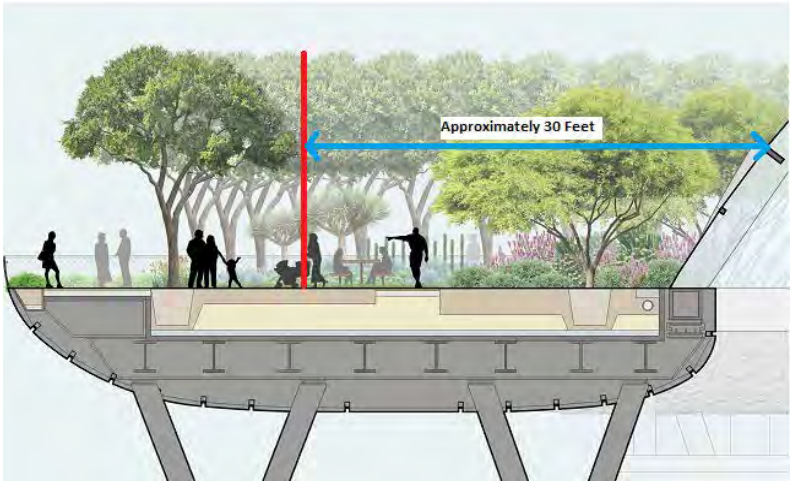

Figure 23. To the extent feasible, vegetation at the elevated park south of the site will be planted such that trees are set back from the glass façade, and dense shrubs and plants are located immediately adjacent to glass facades.

We expect potential bird collisions with the approximately 12.5-foot tall vertical glass façade beneath the elevated park to be reduced due to the following:

- The elevated park is approximately 50–65 feet wide, and trees on Level 1 within the atrium will be set back approximately 50 feet from the vertical glass façade. The resulting more than 50-foot distance of separation is expected to reduce the visibility of trees in the atrium to birds in the Town Square and courtyard.
- Birds would need to traverse more than 50 feet of minimally vegetated areas to attempt to travel in between trees in the Town Square/courtyard and the atrium's interior. Although some birds are expected to attempt to travel along this flight path, in our professional opinion the majority of birds will choose to travel to the immediately adjacent trees at the elevated park due to the closer proximity of these resources.
- A recent study (Riding et al. 2020) found that glass facades located at porticos (i.e., areas where an overhang creates a covered paved walkway, such as beneath the elevated park) have relatively low collision rates compared to other façade types. Thus, the overhang created by the elevated park, in combination with the lack of vegetation beneath the park, is expected to reduce the potential for collision risk.

Nevertheless, due to the presence of vegetation on either side of the atrium's south facade, birds are expected to collide with glazing on this façade when attempting to reach vegetation inside the atrium. Based on the project plans, this is especially true where vegetation on the Level 2 and 3 terraces are located adjacent to the atrium's south façade, because both of these areas are elevated at similar heights (Figure 19).

5.5.1.4 East and West Facades

Birds are expected to be attracted to exterior landscape vegetation along the east and west sides of the atrium. Within the atrium, Level 1 immediately adjacent to the west façade consists of the interior of a building, Level 2 consists of a vegetated roof terrace set back 30 feet from the facade, and Levels 3 and 4 consist of open air with vegetated roof terraces set back farther from the façade (Figure 19). Within the atrium immediately adjacent to the east façade, Level 1 consists of the interior of a building, Level 2 consists of a vegetated roof terrace set back 30 feet from the facade, Level 3 consists of open air with a vegetated roof terrace set back farther from the façade, and Level 4 consists of open air with an unvegetated roof terrace (Figure 19). Vegetation on the Level 2 terraces will be directly visible to birds using landscape vegetation in exterior areas east and west of the atrium. Vegetation on the Level 3 terraces will have limited visibility to birds east and west of the building due to the height of these terraces and because they are set back from the facades (Figure 19). Vegetation on the Level 4 terrace on the westernmost building is not expected to be visible to birds through the atrium's west façade (Figure 19).

Due to the presence of vegetation on either side of the atrium's east and west facades, birds are expected to collide with glazing on these facades when attempting to reach vegetation inside the atrium, especially at the Level 2 and 3 terraces.

5.5.2 Compliance with City Bird-Safe Design Requirements

To address collision risk with the atrium in part, the project will comply with City bird-safe design requirements, with appropriate waivers, as permitted by the City bird-safe design requirements.

5.5.2.1 Requirements for which No Waiver is Requested

As currently proposed, the atrium anticipates complying with City bird-safe design requirements A–D and G without requesting waivers; requirements A–D are listed below. Where the project's bird-safe design strategy is more specific than the City's requirements, sub-bullets specify how the project will comply with those requirements.

A. No more than 10% of facade surface area shall have non-bird-friendly glazing.
    - Specifically, all portions of the atrium shall be treated with a bird-safe glazing treatment with the exception of the vertical façade on the south side of the atrium below the elevated park. The area of untreated glazing shall be no more than 10% of the total surface area of the atrium.

B. Bird-friendly glazing includes, but is not limited to, opaque glass, covering the outside surface of clear glass with patterns, paned glass with fenestration, frit or etching patterns, and external screens over nonreflective glass. Highly reflective glass is not permitted.
    - Specifically, to reduce reflections of clouds and vegetation in glass and help ensure that bird-safe treatments on the lower surfaces of glass are visible below any reflections, all glazing on the atrium will have a visible reflectance of 15% or lower.

D. Placement of buildings shall avoid the potential funneling of flight paths towards a building facade.

Discussion of project compliance with City requirement C, related to occupancy sensors, is provided in Section 6.2.2 below.

5.5.2.2 Requirements for which Waivers will be Requested

Waivers Requested. As currently proposed, the project anticipates complying with the City's bird-safe design requirements E and F by requesting waivers for the atrium, as permitted by the City bird-safe design requirements. These waivers are requested in order for the project to achieve design excellence. City requirements E and F are as follows:

E. Glass skyways or walkways, free-standing (see-through) glass walls and handrails, and transparent building corners shall not be allowed.

F. Transparent glass shall not be allowed at the rooflines of buildings, including in conjunction with roof decks, patios and roofs with landscape vegetation.

Alternative City Measures Proposed. As an alternative to these requirements, to ensure that the project meets the City's intent of designing bird-safe buildings and addresses high-risk collision hazards, the project proposes to implement the following alternative City measures for the atrium:

- All glazed features of the atrium with clear sight lines between vegetation on either side of the feature (e.g., at glazed corners) shall be 100% treated with a bird-safe glazing treatment. Transparent building corners shall be treated in all locations where it is possible to see through to the other side of the visitor center.
- If free-standing glass railings are included in the project design in exterior areas adjacent to the atrium (e.g., at the elevated park), all glazing on free-standing glass railings shall be 100% treated with a bird-safe glazing treatment.
    - Specifically, all glazing on free-standing glass railings in exterior areas adjacent to the atrium shall have a Threat Factor (see footnote 1 above) less than or equal to 15. This Threat Factor is relatively low (and the effectiveness of the bird-safe treatment correspondingly high) due to the relatively high risk of bird collisions with free-standing glass railings.
- All transparent glass at the rooflines of the atrium adjacent to roof decks (i.e., the elevated park) will be 100% treated with a bird-safe glazing treatment. The only untreated glazing on the atrium will be located on the vertical façade beneath the elevated park, which does not create a collision hazard due to landscape vegetation on roofs.

In lieu of complying with City requirements E and F per se, this proposed approach would reduce bird collisions at the locations where bird collisions are most likely to occur and, in our professional opinion, adequately meet the objective of the City's requirements (i.e., to minimize bird collisions with the buildings). Therefore, the requested waivers to the City's bird-safe design requirements are appropriate. Alternatively, if the City does not grant a waiver for requirements E and F, the project will comply with these City requirements.

5.5.3 Additional Mitigation Measures Proposed Under CEQA

Due to the unique design of the atrium, compliance with City bird-safe design requirements (either via compliance with the listed requirements or by requesting waivers, as permitted by the City bird-safe design requirements, and proposing alternative City measures, where appropriate) may not reduce collision impacts with this structure sufficiently to avoid significant impacts under CEQA, and therefore these impacts may be potentially significant even with incorporation of the alternative City measures provided in Section 5.5.2 above. Therefore, additional CEQA mitigation measures are necessary to reduce impacts. With the implementation of the following mitigation measures, which go above and beyond the City's bird-safe design requirements as well as the alternative City measures, impacts due to bird collisions with the atrium will be reduced to less-than-significant levels under CEQA, in our professional opinion.

- **Mitigation Measure 1.** The project shall treat 100% of glazing on the 'dome-shaped' portions of the atrium's façades (i.e., all areas of the north façade, and all areas of the south façade above the elevated park)

with a bird-safe glazing treatment to reduce the frequency of collisions. This glazing shall have a Threat Factor (see footnote 1 above) of 15 or lower.

Because a Threat Factor is a nonlinear index, its value is not equivalent to the percent reduction in collisions that a glazing product provides. However, products with lower threat factors result in fewer bird collisions. Because the City's bird-safe design requirements (and requirements of other municipalities in the Bay Area) do not specify the effectiveness of required bird-safe glazing, Mitigation Measure 1 goes above and beyond what would ordinarily be acceptable to the City, as well as what is considered the industry standard for the Bay Area.

- **Mitigation Measure 2.** The project shall treat 100% of glazing on the atrium's east and west facades with a bird-safe glazing treatment to reduce the frequency of collisions. This glazing shall have a Threat Factor[1] of 15 or lower.

- **Mitigation Measure 3.** Interior trees and woody shrubs will be set back from the atrium's east, west, and non-sloped (i.e., vertical/perpendicular to the ground) portions of the south facades by at least 50 feet to reduce the potential for collisions with these facades due to the visibility of interior trees. This 50-foot distance is greater than the distance used in the project design for the north and sloped portions of the south facades (e.g., 20-25 feet for the north façade) due to the vertical nature of the east, west, and non-sloped portions of the south facades, as opposed to the articulated nature of the north and sloped portions of the south facades (which is expected to reduce the visibility of internal vegetation to some extent), as well as the direct line-of-sight views between interior and exterior vegetation through the east, west, and non-sloped portions of the south facades compared to the north façade (where internal vegetation is elevated above exterior vegetation). Interior trees and shrubs that are not visible through the east, west, and south facades may be planted closer than 50 feet to glass facades.

- **Mitigation Measure 4.** Because the glass production process can result in substantial variations in the effectiveness of bird-safe glazing, a qualified biologist will review physical samples of all glazing to be used on the atrium to confirm that the bird-safe frit will be visible to birds in various lighting conditions, and is expected to be effective.

- **Mitigation Measure 5.** The project shall monitor bird collisions around the atrium for a minimum of two years following completion of construction of the atrium to identify if there are any collision "hotspots" (i.e., areas where collisions occur repeatedly).

  A monitoring plan for the atrium shall be developed by a qualified biologist that includes focused surveys for bird collisions in late April–May (spring migration), September–October (fall migration), and mid-November–mid-January (winter) to maximize the possibility that the surveys will detect any bird collisions that might occur. Surveys of the atrium will be conducted daily for three weeks during each of these periods (i.e., 21 consecutive days during each season, for a total of 63 surveys per year). In addition, for the two-year monitoring period, surveys of the atrium will be conducted the day following all nighttime events held in the atrium during which temporary lighting exceeds typical levels (i.e., levels specified in the International Dark-Sky Association's defined lighting zone LZ-2 from dusk until 10:00 p.m., or 30% below these levels

from 10:00 p.m. to midnight, as described in Section 6.5 below). The applicant can assign responsibility for tracking events and notifying the biologist when a survey is needed to a designated individual who is involved in the planning and scheduling of atrium events. The timing of the 63 seasonal surveys (e.g., morning or afternoon) will vary on different days to the extent feasible; surveys conducted specifically to follow nighttime events will be conducted in the early morning.

At a frequency of no less than every six months, a qualified biologist will review the bird collision data for the atrium in consultation with the City to determine whether any potential hotspots are present (i.e., if collisions have occurred repeatedly in the same locations). A "potential hotspot" is defined as a cluster of three or more collisions that occur within one of the three-week monitoring periods described above at a given "location" on the atrium. The "location" shall be identified by the qualified biologist as makes sense for the observed collision pattern and may consist of a single pane of glass, an area of glass adjacent to a landscape tree or light fixture, the 8,990 square-foot vertical façade beneath the elevated park, the façade adjacent to vegetation on the elevated park, the atrium's east façade, the atrium's west façade, or another defined area where the collision pattern is observed. "Location" shall be defined based on observations of (1) collision patterns and (2) architectural, lighting, and/or landscape features contributing to the collisions, and not arbitrarily (e.g., by assigning random grids).

If any potential hotspots are found, the qualified biologist will provide an opinion regarding whether the potential hotspot will impact bird populations over the long-term to the point that additional measures (e.g., adjustments to lighting or the placement of vegetation) are needed to reduce the frequency of bird strikes at the hotspot location in order to reduce impacts to a less-than-significant level under CEQA (i.e., whether it constitutes an actual "hotspot"). This will be determined based on the number and species of birds that collide with the atrium over the monitoring period. In addition, a "hotspot" is automatically defined if a cluster of five or more collisions are identified at a given "location" on the atrium within one of the three-week monitoring periods described above. If a hotpot is identified, additional measures will be implemented at the potential hotspot location at the atrium; these may include one or more of the following options in the area of the hotspot depending on the cause of the collisions:

- The addition of a visible bird-safe frit pattern, netting, exterior screens, art, printed sheets, interior shades, grilles, shutters, exterior shades, or other features to untreated glazing (i.e., on the façade below the elevated park) to help birds recognize the façade as a solid structure.
- Installing interior or exterior blinds in the buildings within the atrium to prevent light from spilling outward though glazed facades at night.
- Reducing lighting by dimming fixtures, redirecting fixtures, turning lights off, and/or adjusting programmed timing of dimming/shutoff.
- Replacing certain light fixtures with new fixtures to provide increased shielding or redirect lighting.
- Adjusting or reducing lighting during events.
- Adjusting the timing of events to reduce the frequency of events during certain times of year (e.g., spring and/or fall migration) when relatively high numbers of collisions occur.

- Adjusting landscape vegetation by removing, trimming, or relocating trees or other plants (e.g., moving them farther from glass), or blocking birds' views of vegetation through glazing (e.g., using a screen or other opaque feature).

If modifications to the atrium are implemented to reduce collisions at a hotspot, one year of subsequent focused monitoring of the hotspot location will be performed to confirm that the modifications effectively reduce bird collisions to a less-than-significant level under CEQA. This monitoring may or may not extend beyond the two-year monitoring period described above, depending on the timing of the hotspot detection.

It is our understanding that the project proposes to use a frit consisting of ¼-inch white dots spaced in a 2x2-inch grid (i.e., similar in specifications to the Solyx SX-BSFD Frost Dot Bird Safety Film product rated with a Threat Factor of 15 by the American Bird Conservancy) for all treated façade areas on the atrium. We further understand that the atrium's glazing will have a dark gray thermal frit treatment (e.g., dark dots incorporated into the glass) in addition to the lighter-toned frit pattern that composes the bird-safe treatment. The extent of thermal frit will vary from the lower portions of the atrium to the upper portions of the atrium, with the upper portions incorporating more extensive (i.e., greater percent cover) thermal frit. Based on our review of preliminary physical glass samples supporting potential combinations of thermal frit and bird-safe frit, provided by the project team, it is our opinion that the combination of the bird-safe frit treatment with the thermal frit would produce very low Threat Factors (Figure 24). We are unaware of any glazing products that incorporate thermal frit patterns and have been assigned a Threat Factor by the American Bird Conservancy; however, the U.S. Green Building Council allows Threat Factors to be determined via any of the following options: (1) using a glass product that has been tested and rated by the American Bird Conservancy; (2) using a glass product with the same characteristics as a product that has been tested and rated by the American Bird Conservancy; or (3) using a glass product that has not been tested and rated, and asking the American Bird Conservancy to provide their opinion regarding an appropriate Threat Factor. We reached out to Dr. Christine Sheppard at the American Bird Conservancy to request her concurrence that the presence of the solar frit would not reduce the effectiveness of the bird-safe frit (and may even increase the effectiveness of the bird-safe frit). Dr. Sheppard responded in an email dated April 9, 2021 agreeing that the solar frit should make the lighter bird-safe frit dots more visible, and the proposed bird-safe treatment would have a Threat Factor of 15 as long as the bird-safe frit dots are ¼-inch in diameter (Sheppard 2021). Thus, the proposed bird-safe glazing treatment is appropriate for the atrium facades and goes above and beyond the City's minimum requirements, as well as the local standard for the San Francisco Bay Area.

Figure 24. Two preliminary glass samples that combine the dark gray thermal frit and lighter-toned bird-safe frit were reviewed by H. T. Harvey & Associates. The frit on these samples had very good visibility in different lighting conditions due to the contrast between the light and dark frit, and in our professional opinion are likely to reduce bird collisions with the atrium.

It is our understanding that only the proposed 12.5-foot tall vertical glazed facades on the south side of the atrium will remain untreated. This untreated area is relatively large (approximately 8,990 square feet, per the August 2021 ACPs); however, it will be less than 10% of the entire façade area in compliance with City bird-safe design requirements. Some collisions with this glazing are expected to occur when birds attempt to fly from trees and vegetation within the Town Square and courtyard located south of the elevated park to trees and vegetation within the atrium. As discussed above, because trees on either side of the untreated vertical glass façade will be separated by a distance of approximately 50 feet, and because the vertical glazed façade is located beneath the elevated park (creating a 'portico'), it is our opinion that the potential for collisions with this glazing would be low.

5.5.4 CEQA Impacts Summary

The atrium will comply with the City's bird-safe design requirements by implementing requirements A–D and G, requesting waivers for requirements E and F, as permitted by the City bird-safe design requirements, and implementing alternative City measures for requirements E and F. Compliance with requirement C is discussed in Section 6.2.2 below. In addition, the project will implement Mitigation Measures 1–5 above to reduce impacts to less-than-significant levels under CEQA. As stated above, with compliance with City requirements (including the implementation of proposed alternative City measures) and Mitigation measures 1–5 above, it is our professional opinion that project impacts due to bird collisions with the atrium would be less than significant under CEQA.

A subsequent report prepared by a qualified biologist will accompany the final ACP for the atrium. It is our understanding based on coordination with the design team that (1) the final ACP design for the atrium will

substantially conform with the designs reviewed for this report, such that our analysis and conclusions are expected to be valid for the final design; (2) the proposed bird-safe treatments within the areas where such treatments are expected to be necessary are feasible; and (3) the project will implement alternative City measures and CEQA mitigation measure as described herein. Nevertheless, because the designs and renderings for the atrium were based on conceptual CDP plans and preliminary ACP designs, a qualified biologist shall review the final ACP for the atrium to confirm that the alternative City measures and CEQA mitigation measures described herein , or other alternative measures reasonably acceptable to the qualified biologist (see footnote 2 above) are incorporated into the final design such that project impacts due to bird collisions are reduced to less-than-significant levels under CEQA as described herein.

Section 6. Assessment of Lighting Impacts on Birds

6.1 Overview of Potential Impacts on Birds from Artificial Lighting

Numerous studies indicate that artificial lighting associated with development can have an impact on both local birds and migrating birds. Below is an overview of typical impacts on birds from artificial lighting, including lighting impacts related to general site lighting conditions and up-lighting.

6.1.1 Impacts Related to General Site Lighting Conditions

Evidence that migrating birds are attracted to artificial light sources is abundant in the literature as early as the late 1800s (Gauthreaux and Belser 2006). Although the mechanism causing migrating birds to be attracted to bright lights is unknown, the attraction is well documented (Longcore and Rich 2004, Gauthreaux and Belser 2006). Migrating birds are frequently drawn from their migratory flight paths into the vicinity of an artificial light source, where they will reduce their flight speeds, increase vocalizations, and/or end up circling the lit area, effectively "captured" by the light (Herbert 1970, Gauthreaux and Belser 2006, Sheppard and Phillips 2015, Van Doren et al. 2017). When birds are drawn to artificial lights during their migration, they may become disoriented and possibly blinded by the intensity of the light (Gauthreaux and Belser 2006). The disorienting and blinding effects of artificial lights directly impact migratory birds by causing collisions with light structures, buildings, communication and power structures, or even the ground (Gauthreaux and Belser 2006). Indirect impacts on migrating birds might include orientation mistakes and increased length of migration due to light-driven detours.

6.1.2 Impacts Related to Up-Lighting

Up-lighting refers to light that projects upwards above the fixture. There are two primary ways in which the luminance of up-lights might impact the movements of birds. First, local birds using habitats on a site may become disoriented during flights among foraging areas and fly toward the lights, colliding with the lights or with nearby structures. Second, nocturnally migrating birds may alter their flight direction or behavior upon seeing lights; the birds may be drawn toward the lights or may become disoriented, potentially striking objects such as buildings, adjacent power lines, or even the lights themselves. These two effects are discussed separately below.

Local Birds. Seabirds may be especially vulnerable to artificial lights because many species are nocturnal foragers that have evolved to search out bioluminescent prey (Imber 1975, Reed et al. 1985, Montevecchi 2006), and thus are strongly attracted to bright light sources. When seabirds approach an artificial light, they seem unwilling to leave it and may become "trapped" within the sphere of the light source for hours or even days, often flying themselves to exhaustion or death (Montevecchi 2006). Seabirds using habitats associated with the San Francisco Bay to the north include primarily gulls and terns. Although none of these species are primarily nocturnal foragers, there is some possibility that gulls, which often fly at night, may fly in areas where they

would be disoriented by project up-lights under conditions dark enough that the lights would affect the birds. Shorebirds forage along the San Francisco Bay nocturnally as well as diurnally, and move frequently between foraging locations in response to tide levels and prey availability. Biologists and hunters have long used sudden bright light as a means of blinding and trapping shorebirds (Gerstenberg and Harris 1976, Potts and Sordahl 1979), so evidence that shorebirds are affected by bright light is well established. Though impacts of a consistent bright light are undocumented, it is possible that shorebirds, like other bird species, may be disoriented by a very bright light in their flight path.

Passerine species have been documented responding to increased illumination in their habitats with nocturnal foraging and territorial defense behaviors (Longcore and Rich 2004, Miller 2006, de Molenaar et al. 2006), but absent significant illumination, they typically do not forage at night, leaving them less susceptible to the attraction and disorientation caused by luminance when they are not migrating.

Migrating Birds. Hundreds of bird species migrate nocturnally in order to avoid diurnal predators and minimize energy expenditures. Bird migration over land typically occurs at altitudes of up to 5,000 feet, but is highly variable by species, region, and weather conditions (Kerlinger 1995, Newton 2008). In general, night-migrating birds optimize their altitude based on local conditions, and most songbird and soaring bird migration over land occurs at altitudes below 2,000 feet while waterfowl and shorebirds typically migrate at higher altitudes (Kerlinger 1995, Newton 2008).

It is unknown what light levels adversely affect migrating birds, and at what distances birds respond to lights (Sheppard and Phillips 2015). In general, vertical beams are known to capture higher numbers of birds flying at lower altitudes. High-powered 7,000-watt (equivalent to 105,000-lumen) spotlights that reach altitudes of up to 4 miles (21,120 feet) in the sky have been shown to capture birds migrating at varying altitudes, with most effects occurring below 2,600 feet (where most migration occurs); however, effects were also documented at the upper limits of bird migration at approximately 13,200 feet (Van Doren et al. 2017). A study of bird responses to up-lighting from 250-watt (equivalent to 3,750-lumen) spotlights placed on the roof of a 533-foot tall building and directed upwards at a company logo documented behavioral changes in more than 90% of the birds that were visually observed flying over the building at night (Haupt and Schillemeit 2011). One study of vertical lights projecting up to 3,280 feet found that higher numbers of birds were captured at altitudes below 650 feet, but this effect was influenced by wind direction and the birds' flight speed (Bolshakov et al. 2013). These studies have not analyzed the capacity for vertical lights to attract migrating birds flying beyond their altitudinal range, and the potential for the project up-lights to affect birds flying at various altitudes is unknown. Thus, birds that encounter beams from up-lights are likely to respond to the lights, and may become disoriented or attracted to the lights to the point that they collide with buildings or other nearby structures, but the range of the effect of the lights is unknown.

Observations of bird behavioral responses to up-lights indicate that their behaviors return to normal quickly once up-lights are completely switched off (Van Doren et al. 2017), but no studies are available that demonstrate bird behavioral responses to reduced or dimmed up-lights. In general, up-lights within very dark areas are more

likely to "capture" and disorient migrating birds, whereas up-lights in brightly lit areas (e.g., highly urban areas, such as Menlo Park) are less likely to capture birds (Sheppard 2017). Birds are also known to be more susceptible to capture by artificial light when they are descending from night migration flights in the early mornings compared to when they ascend in the evenings; as a result, switching off up-lights after midnight can minimize adverse effects on migrating birds (Sheppard 2017). However, more powerful up-lights (e.g., 3,000 lumen spotlights) may create issues for migrating birds regardless of the time of night they are used (Sheppard 2017).

6.2 Lighting Design Principles

To address potential impacts from artificial project lighting, the CDP requires the project to implement (i) certain lighting design principles as well as (ii) the occupancy sensor requirement in the City's bird-safe design requirements, as described below. For all Master Plan components, because the project's lighting plan has not yet been developed, a qualified biologist shall review the final lighting design as part of each ACP to ensure that the lighting design principles provided in Sections 6.2.1 and 6.2.2 below are incorporated into the final design.

The International Dark-Sky Association (2021a) recommends using lighting with a color temperature of no more than 3,000 Kelvins to minimize harmful effects on humans and wildlife. However, the effects of different light wavelengths on various species of birds are not consistent (Owens et al. 2020). Some studies have shown that using blue and green lights may be less disorienting to birds compared to red lights (Poot et al. 2008), but it is known that birds can be disoriented by red lights (Sheppard et al. 2015) and blue lights (Zhao et al. 2020). The American Bird Conservancy's Bird-Friendly Building Design guidance states that manipulating light color shows promise in its potential to reduce bird collisions with buildings, but additional study is needed to determine what colors should be used (Sheppard and Phillips 2015). Instead, the American Bird Conservancy recommends reducing exterior building and site lighting, which has been proven to reduce bird mortality (Sheppard and Phillips 2015). The City of San Francisco's Standards for Bird-Safe Buildings recommends that project proponents "consider" reducing red wavelengths where lighting is necessary, but this measure is not required; rather, they require avoidance of uplighting in lighting designs (San Francisco Planning Department 2011). As a result, the principles provided in Sections 6.5.2.1 to 6.4.2.4 below focus on minimizing lighting, rather than restricting lighting temperatures. Reducing, shielding, and directing lights on the project site and avoiding uplighting effectively limits the effects of lights by minimizing skyglow and the spillage of light outwards into adjacent natural areas, and is consistent with local (City of San Francisco) and national (American Bird Conservancy) standards for minimizing bird collisions.

6.2.1 Design Principles

The advancement of luminaires has substantially improved lighting design in recent years, and the project will employ a scientific approach to reduce overall lighting levels as well as Backlight, Up-light, and Glare ("BUG") ratings for individual fixtures to avoid and minimize the lighting impacts on birds discussed above. Accordingly, the CDP requires the following design principles to avoid and minimize potential lighting impacts on birds:

- Fixtures shall comply with lighting zone LZ-2, *Moderate Ambient*, as recommended by the International Dark-Sky Association (2011) for light commercial business districts and high-density or mixed-use residential districts. The allowed total initial luminaire lumens for the Master Plan area is 2.5 lumens per square foot of hardscape, and the BUG rating for individual fixtures shall not exceed B3-U2-G2, as follows:
    - B3: 2,500 lumens high (60–80 degrees), 5,000 lumens mid (30–60 degrees), 2,500 lumens low (0–30 degrees)
    - U2: 50 lumens (90–180 degrees)
    - G2: 225 lumens (forward/back light 80–90 degrees), 5,000 (forward 60–80 degrees), 1,000 (back light 60–80 degrees asymmetrical fixtures), 5,000 (back light 60–80 degrees quadrilateral symmetrical fixtures)
- Unshielded fixtures, flood lights, drop and sag lens fixtures, unshielded bollards, widely and poorly aimed lights, and searchlights shall be avoided. All lights shall be well-shielded and aimed appropriately to minimize up-light and glare. The materials of illuminated objects shall be considered to minimize up-lighting effects, and low-glare lighting shall be prioritized (e.g., fixtures shall be aimed no more than 25 degrees from vertical).
- Full cutoff fixtures, shielded fixtures, shielded walkway bollards, shielded and properly aimed lights, and flush-mounted fixtures will be encouraged. Full glare control and concealed sources shall be provided to minimize light trespass.
- Lighting controls such as automatic timers, photo sensors, and motion sensors shall be used. Luminaires not on emergency controls shall have occupancy sensors and an astronomic time clock.
- Low-level and human-scale lighting shall be prioritized while emphasizing areas of activity.
- All exterior luminaires shall be dimmable, and overall brightness at night shall be minimized.
- Exterior lighting along the perimeter of the Master Plan area shall be minimized.
- Soft transitions and low contrast shall be created between lighter and darker exterior spaces.
- Interior office lighting shall be directed and shielded to light task areas and minimize spillage outside of buildings.
- All energy efficiency standards shall be met.

With the adoption of these principles, the potential for lighting impacts on birds will be greatly reduced. In our professional opinion, compliance these design principles will reduce impacts due to overall lighting levels on birds to less-than-significant levels under CEQA. However, because the project lighting design has not yet been developed, and due to the sensitivity of the Master Plan area (which faces habitats along the San Francisco Bay) as well as the potential for collisions with certain project components (e.g., the atrium and stair/elevator towers), additional mitigation measures are needed in the absence of a finalized design to ensure that impacts of project lighting on birds are reduced to less-than-significant levels (see Section 6.3.1.2 below).

6.2.2 City Occupancy Sensor Requirements

As currently proposed, the project anticipates complying with City bird-safe design requirement C by implementing the requirement as stated or by requesting waivers where compliance is not feasible, as permitted by the City bird-safe design requirements. City requirement C is as follows:

C. Occupancy sensors or other switch control devices with an astronomic time clock shall be installed on nonemergency lights and programmed to shut off during non-work hours and between 10:00 p.m. and sunrise.

For the purpose of this report, we assume that the City intends this requirement to apply to interior lights only. No additional lighting measures are required as part of the City's bird-safe design requirements.

The two buildings inside the atrium, visitor center, Town Square retail pavilion, event building, Office Buildings 01–06, stair/elevator towers, security pavilions, North Garage, South Garage, hotel, and mixed-use buildings shall comply with City occupancy sensor requirements where feasible. However, occupancy sensors may not be feasible in some areas (e.g., because the space is occupied 24 hours per day). In addition, events at the atrium may extend later than 10:00 p.m. The applicant shall request waivers for areas where occupancy sensors are not feasible, as well as for events that extend later than 10:00 p.m., as permitted by the City bird-safe design requirements.

Alternative City Measures Proposed. As an alternative to this requirement, to ensure that the project meets the City's intent of minimizing the spill of lighting outwards from buildings at night and addresses high-risk collision hazards, the project proposes to implement the following alternative City measures to minimize lighting:

- When occupancy sensors are not feasible, the visitor center, Town Square retail pavilion, Office Building 04, event building, and North Garage shall program interior or exterior blinds to close on exterior windows during non-work hours and between 11:00 p.m. and sunrise in order to block lighting from spilling outward from the buildings.
- During events at the atrium, occupancy sensors shall be programmed so that interior lights shut off no later than midnight.
- For the remaining buildings on the project site (i.e., the two buildings within the atrium, hotel, residential/mixed-use buildings; Office Buildings 01, 02, 03, 05, and 06; stair/elevator towers; security pavilions, and the South Garage), if occupancy sensors or other switch control devices are not feasible, and/or interior lights cannot be programmed to shut off during non-work hours and between 10:00 p.m. and sunrise (e.g., because the space is occupied 24 hours per day or is residential), no alternative City measures are proposed.

In lieu of complying with City requirement C per se, this proposed approach would reduce bird collisions at the locations where bird collisions are most likely to occur and, in our professional opinion, adequately meet

the objective of the City's requirements (i.e., to minimize bird collisions with the buildings). Therefore, the requested waivers to the City's bird-safe design requirements are appropriate. Alternatively, if the City does not grant a waiver for requirement C, the project will comply with this requirement.

6.3 Analysis of Potential Impacts on Birds due to Lighting

No detailed information regarding the proposed lighting design for the project was available for review as part of this assessment. Nevertheless, construction of the project will create new sources of lighting on the project site. Lighting would emanate from light fixtures illuminating buildings, building architectural lighting, pedestrian lighting, and artistic lighting. Depending on the location, direction, and intensity of exterior lighting, this lighting can potentially spill into adjacent natural areas, thereby resulting in an increase in lighting compared to existing conditions. Areas to the south, east, and west of the project site are entirely developed as urban (i.e., within a city or town) habitats that do not support diverse or sensitive bird communities that might be substantially affected by illuminance from the project. Birds inhabiting more natural habitat areas along the San Francisco Bay to the north and/or the future vegetated open space areas on the project site may be affected by an increase in lighting. However, the number of shorebirds foraging near or flying over the project site is expected to be relatively low, as shorebirds do not congregate in large numbers at or near the project site.

Thus, lighting from the project has some potential to attract and/or disorient birds, especially during inclement weather when nocturnally migrating birds descend to lower altitudes. As a result, some birds moving along the San Francisco Bay at night may be (1) attracted to the site, where they are more likely to collide with buildings; and/or (2) disoriented by night lighting, potentially causing them to collide with the buildings. Certain migrant birds that use structures for roosting and foraging (such as swifts and swallows) would be vulnerable to collisions if they perceive illuminated building interiors as potential roosting habitat and attempt to enter the buildings through glass walls. Similarly, migrant and resident birds would be vulnerable to collisions if they perceive illuminated vegetation within buildings as potential habitat and attempt to enter a building through glass walls.

Potential impacts on birds due to lighting within the various Master Plan components, as well as applicable CEQA mitigation measures, are discussed Sections 6.3.1 to 6.3.4 below. For purposes of this analysis, Master Plan components are grouped together in these sections based on lighting impacts within these areas as well as the lighting design principles necessary to reduce impacts under CEQA, as follows:

- Master Plan components within the northern portion of the project site (i.e., areas north of Main Street and Office Buildings 03 and 05 surrounding the hotel, Town Square retail pavilion, Office Building 04, event building, and North Garage, but not including buildings within the atrium) are discussed together because lighting within these areas has a greater potential to (1) spill northwards into sensitive habitats along the San Francisco Bay, and (2) attract and/or disorient migrating birds during the spring and fall compared to areas farther south on the project site.

- The stair/elevator towers are discussed separately due to the potential for lighting of these towers to attract birds (especially migrants) towards these structures where they would able to see roosting opportunities behind glazed façades, and potentially collide with the glass.
- Due its unique structure and location along the northern boundary of the project site, the atrium and buildings within the atrium are discussed separately.
- Master Plan components within the southern portion of the project site (i.e., Office Buildings 01, 02, 03, 05, and 06 and the residential/mixed-use buildings) are discussed together because they have a lower potential to affect migrating birds due to the greater distance between these areas and the San Francisco Bay, the extensive opaque facades on these buildings, and the less extensive vegetation present compared to the northern portion of the site.

6.3.1 Potential Impacts due to Lighting within the Northern Portion of the Project Site

6.3.1.1 Description of Potential Impacts

As discussed above, birds inhabiting more natural habitat areas along the San Francisco Bay to the north and/or the future vegetated open space areas on the project site itself may be affected by an increase in lighting on the site. Because buildings within the northern portion of the site are located in closer proximity to natural habitats along the San Francisco Bay as well as proposed extensive vegetation on the project site itself (e.g., at the elevated park), lighting associated with the hotel, Town Square retail pavilion, Office Building 04, event building, and North Garage has a greater potential to (1) spill northwards into sensitive habitats along the San Francisco Bay, and (2) attract and/or disorient migrating birds during the spring and fall, compared to buildings located farther south on the project site. Due to the potential for birds to collide with glazing on these buildings, CEQA mitigation measures to minimize lighting at these locations are provided in Section 6.3.1.2 below to ensure that these impacts are minimized.

6.3.1.2 Additional Mitigation Measures Proposed Under CEQA

Due to the potential for lighting within the northern portion of the project site to affect birds, the City's requirement to include occupancy sensors in the project design (or the alternative City measures provided in Section 6.2.2 above) in combination with the lighting design principles provided in Section 6.2 may not reduce lighting-related impacts within this area sufficiently to avoid significant impacts under CEQA. While the project's lighting design principles provide a general strategy for lighting design and specify a BUG rating for exterior fixtures, these principles are not specific enough to ensure that the spill of lighting upwards and outwards into adjacent natural areas will be minimized to an appropriate level. With the implementation of Mitigation Measures 6–9 below, which provide greater specificity to ensure that lighting impacts are minimized, impacts on birds due to lighting in the northern portion of the site will be reduced to less-than-significant levels under CEQA, in our professional opinion.

For all exterior lighting in the northern portion of the project site (i.e., areas north of Main Street and Office Buildings 03 and 05 surrounding the hotel, Town Square retail pavilion, Office Building 04, event building, and North Garage):

- **Mitigation Measure 6.** To the maximum extent feasible, up-lighting (i.e., lighting that projects upward above the fixture) shall be avoided in the project design. All lighting shall be fully shielded to block illumination from shining upward above the fixture.

  If up-lighting cannot be avoided in the project design, up-lights shall be shielded and/or directed such that no luminance projects above/beyond objects at which they are directed (e.g., trees and buildings) and such that the light would not shine directly into the eyes of a bird flying above the object. If the objects themselves can be used to shield the lights from the sky beyond, no substantial adverse effects on migrating birds are anticipated.

- **Mitigation Measure 7.** All lighting shall be fully shielded to block illumination from shining outward towards San Francisco Bay habitats to the north. No light trespass shall be permitted more than 80 feet beyond the site's northern property line (i.e., beyond the JPB rail corridor).

- **Mitigation Measure 8.** Exterior lighting shall be minimized (i.e., total outdoor lighting lumens shall be reduced by at least 30% or extinguished, consistent with recommendations from the International Dark-Sky Association [2011]) from 10:00 p.m. until sunrise, except as needed for safety and City code compliance.

- **Mitigation Measure 9.** Temporary lighting that exceeds minimal site lighting requirements may be used for nighttime social events. This lighting shall be switched off no later than midnight. No exterior up-lighting (i.e., lighting that projects upward above the fixture, including spotlights) shall be used during events.

6.3.1.3 CEQA Impacts Summary

The project will implement the lighting design principles in Section 6.2 as well as Mitigation Measures 6–9 above and comply with City requirements (either via compliance with requirement C or the implementation of the proposed alternative City measures) to reduce impacts due to lighting in the northern portion of the project site to less-than-significant levels under CEQA. By incorporating these principles and measures, it is our professional opinion that project impacts due to bird collisions with the buildings in the northern portion of the project site would be less than significant under CEQA.

Subsequent reports prepared by a qualified biologist will accompany each of the final ACPs for the hotel, Town Square retail pavilion, Office Building 04, event building, and North Garage. It is our understanding based on considerable coordination with the design team that (1) the proposed lighting design principles, City measures, and mitigation measures are feasible, and (2) the project will implement the lighting design principles, City requirements or alternative City measures, and mitigation measures as described herein. Nevertheless, because detailed information about project lighting design was not available as part of this assessment, a qualified biologist shall review the final ACPs to confirm that the lighting design principles, City requirements or

alternative City measures, and mitigation measures described herein are incorporated into the final design such that project impacts due to bird collisions are reduced to less-than-significant levels under CEQA as described herein.

6.3.2 Potential Impacts Related to the Stair/Elevator Towers

6.3.2.1 Description of Potential Impacts

Five stair/elevator towers connect the plaza south of the atrium with the elevated park. These towers will be lit at night. As discussed above, certain migrant birds that use structures for roosting and foraging (such as swifts and swallows) would be vulnerable to collisions if they perceive illuminated building interiors as potential roosting habitat and attempt to enter the buildings through glass walls. Lighting of these towers is expected to illuminate their interiors, potentially attracting birds (especially migrants) towards these areas when they are able to see roosting opportunities behind glazed façades. Due to the potential for birds to collide with this glazing, CEQA mitigation measures to minimize lighting at these locations are provided in Section 6.3.2.2 below to ensure that impacts due to lighting at stair/elevator towers are minimized.

6.3.2.2 Additional Mitigation Measures Proposed Under CEQA

Due to the potential for lighting within the stair/elevator towers to result in bird collisions, the City's requirement to include occupancy sensors in the project design (or the alternative City measures provided in Section 6.2.2 above) in combination with the lighting design principles provided in Section 6.2 may not reduce collision impacts with these towers sufficiently to avoid significant impacts under CEQA. While the project's lighting design principles provide a general strategy for lighting design and specify a BUG rating for exterior fixtures, these principles are not specific enough to ensure that the spill of lighting outwards from the glass stair/elevator towers will be minimized to an appropriate level. With the implementation of Mitigation Measure 10 below, impacts due to lighting of the stair/elevator towers will be reduced to less-than-significant levels under CEQA, in our professional opinion.

- **Mitigation Measure 10.** Lights shall be shielded and directed so that lighting does not spill outwards from the elevator/stair towers into adjacent areas.

6.3.2.3 CEQA Impacts Summary

The project will implement the lighting design principles in Section 6.2 as well as Mitigation Measure 10 above and comply with City requirements (either via compliance with requirement C or the implementation of the proposed alternative City measures) to reduce impacts due to lighting within the stair/elevator towers to less-than-significant levels under CEQA. By incorporating these principles, requirements, and measures, it is our professional opinion that project impacts due to bird collisions with the stair/elevator towers would be less than significant under CEQA.

Subsequent reports prepared by a qualified biologist will accompany the final ACPs for the project components that include elevator towers (i.e., the hotel, Town Square, Office Building 04, event building, and atrium). It is

our understanding based on considerable coordination with the design team that (1) the proposed lighting design principles, City requirements or alternative City measures, and mitigation measures are feasible; and (2) the project will implement the lighting design principles, City requirements or alternative City measures, and mitigation measures as described herein. Nevertheless, because detailed information about project lighting design was not available as part of this assessment, a qualified biologist shall review the final ACPs to confirm that the lighting design principles, City requirements or alternative City measures, and mitigation measures described herein are incorporated into the final design such that project impacts due to bird collisions are reduced to less-than-significant levels under CEQA as described herein.

6.3.3 Potential Impacts Related to the Atrium

6.3.3.1 Description of Potential Impacts

In addition to the general site lighting impacts and up-lighting impacts discussed above, lighting within the atrium will illuminate interior vegetation and structures. The architectural features described above that are expected to make it difficult for birds to see interior vegetation during daytime would still mask the appearance of interior vegetation at night to some extent. However, if illumination makes interior vegetation more visible to birds (e.g., in early morning or late evening hours when exterior light levels are low), birds that are active between dusk and dawn may fly into the glazing on the atrium where they can see vegetation and/or structures (e.g., for roosting) on the other side of the glass. As discussed above, collisions by resident birds are expected to occur year-round; however, these birds are generally familiar with their surroundings and can be less likely to collide with buildings compared with migrant birds. In addition, resident birds are primarily active during the day. In contrast, nocturnal migrant landbirds may be attracted to lighting, and are less likely to be aware of risks such as glass compared to resident birds. As a result, relatively higher numbers of collisions by birds, especially migrant birds, could occur if vegetation and/or structures within the atrium are made more conspicuous between dusk and dawn due to interior illumination.

Conceptual views of night lighting levels within the atrium are provided in Figure 25. As discussed in Section 5 above, the visibility of interior vegetation to birds is limited within the atrium due to the presence of interior buildings and solar shades that partially block the view of this vegetation from the north and south, respectively. Nevertheless, lighting is expected to illuminate interior vegetation and structures such that they may be visible to birds outside of the atrium as follows:

- Birds located north of the atrium at any elevation will be able to see illuminated interiors of structures within the atrium. Birds flying at elevations 37 feet or higher will be able to see illuminated interior vegetation and structures on rooftops (Figure 19). The presence of exterior trees and other vegetation immediately adjacent to the north façade is expected to screen illuminated interior vegetation less than or equal to the height of these trees to birds from a distance, with the exception of the area along the East Garden (where no trees will be planted along the atrium's north façade).
- Birds located south of the atrium will be able to see illuminated interior structures and vegetation except where interior solar shades are present in between the birds and interior features (Figure 22). In addition,

the presence of exterior trees and other vegetation immediately adjacent to the south façade along the elevated park is expected to screen illuminated interior vegetation less than or equal to the height of these trees to birds from a distance.

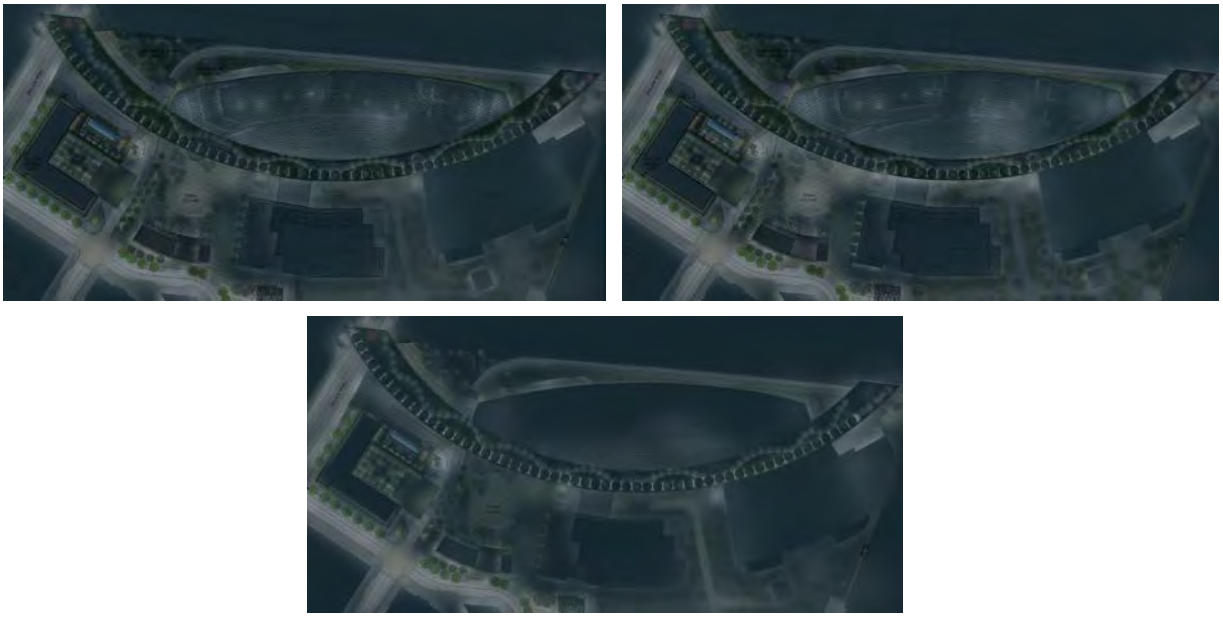

Figure 5. Anticipated conceptual lighting conditions within the atrium and immediately surrounding areas during evening hours (top left), events (top right), and after hours (bottom).

Due to the potential for birds to collide with glazing on the atrium if interior structures and vegetation are illuminated, CEQA mitigation measures to minimize the attraction of birds towards the atrium by minimizing light radiating outward from the atrium being perceived as a bright attractant to nocturnal migrants, as well as the illumination of vegetation and structures within the atrium, are provided in Section 6.3.3.2 below to ensure that impacts due to lighting within the atrium are minimized.

6.3.3.2 Additional Mitigation Measures Proposed Under CEQA

Buildings within the Atrium. Due to the potential for interior lighting within the buildings within the atrium to spill outwards to the north and affect birds, the City's requirement to include occupancy sensors in the project design (or the alternative City measures provided in Section 6.2.2 above), in combination with the lighting design principles provided in Section 6.2 above, may not reduce collisions with the atrium's north façade sufficiently to avoid significant impacts under CEQA. While the project's lighting design principles provide a general strategy for lighting design and specify a BUG rating for exterior fixtures, these principles do not ensure that any security lighting and lighting within occupied spaces will not spill outwards from these buildings towards sensitive habitats to the north. The project shall implement the following mitigation measure for interior lights within the buildings within the atrium to minimize impacts due to lighting:

- **Mitigation Measure 11.** Interior or exterior blinds shall be programmed to close on north-facing windows of interior buildings within the atrium from 10:00 p.m. to sunrise in order to block lighting from spilling outward from these windows.

Atrium. If birds are able to distinguish illuminated interior vegetation, trees, and structures within the atrium at night, collisions with the building are expected to be appreciably higher as birds attempt to fly through glazing to reach these features (e.g., during descent from migration at dawn). The project shall implement Mitigation Measures 6 and 8 above as well as the Mitigation Measure 12 below to ensure that structures, trees, and vegetation in the atrium are not illuminated by up-lighting or accent lighting such that they are more conspicuous to birds from outside compared to ambient conditions (i.e., lighting levels from fixtures within the atrium that do not specifically illuminate these features). Structures, trees, and vegetation are considered 'more conspicuous' to birds when they would be more conspicuous when viewed by the human eye from outside the atrium at any elevation.

- **Mitigation Measure 12.** Accent lighting within the atrium shall not be used to illuminate trees or vegetation. OR

  The applicant shall provide documentation to the satisfaction of a qualified biologist that the illumination of vegetation and/or structures within the atrium by accent lighting and/or up-lighting will not make these features more conspicuous to the human eye from any elevation outside the atrium compared to ambient conditions within the atrium. The biologist shall submit a report to the City following the completion of the lighting design documenting compliance with this requirement.

6.3.3.3 CEQA Impacts Summary

The project will implement the lighting design principles in Section 6.21 as well as Mitigation Measures 6, 8, 11, and 12 above and comply with City requirements (either via compliance with requirement C or the implementation of the proposed alternative City measures) to reduce impacts due to lighting within the atrium and the buildings within the atrium to less-than-significant levels under CEQA. By incorporating these principles and measures, it is our professional opinion that project impacts due to lighting within these areas would be less than significant under CEQA.

Subsequent reports prepared by a qualified biologist will accompany the final ACP for the atrium. It is our understanding based on considerable coordination with the design team that (1) the proposed lighting design principles, City requirements or alternative City measures, and mitigation measures are feasible; and (2) the project will implement the lighting design principles, City requirements or alternative City measures, and mitigation measures as described herein. Nevertheless, because detailed information about project lighting design was not available as part of this assessment, a qualified biologist shall review the final ACP to confirm that the lighting design principles, City requirements or alternative City measures, and mitigation measures described herein are incorporated into the final design such that project impacts are reduced to less-than-significant levels under CEQA as described herein.

6.3.4 Potential Impacts Related to the Southern Portion of the Project Site

6.3.4.1 Description of Potential Impacts

As discussed above, birds inhabiting more natural habitat areas along the San Francisco Bay to the north and/or the future vegetated open space areas on the project site itself may be affected by an increase in lighting on the site. Because buildings within the southern portion of the site are located farther from natural habitats along the San Francisco Bay as well as proposed extensive vegetation on the project site itself (e.g., at the elevated park), the potential for lighting associated with Office Buildings 01, 02, 03, 05, and 06 and the residential/mixed-use buildings is not expected to spill into sensitive habitats north of the site (due to the presence of buildings in between these areas and habitats to the north), and has a lower potential to attract and/or disorient migrating birds during the spring and fall compared to buildings located farther north on the project site. Nevertheless, due to the potential for birds to collide with glazing on these buildings due to lighting within these areas, CEQA mitigation measures to minimize lighting within this area are provided in Section 6.3.4.2 below to ensure that these impacts are less than significant.

6.3.4.2 Additional Mitigation Measures Proposed Under CEQA

Due to the potential for lighting within the southern portion of the project site to affect birds, the City's requirement to include occupancy sensors in the project design (or the alternative City measures provided in Section 6.2.2 above) in combination with the lighting design principles provided in Section 6.2.1 may not reduce collision impacts with Office Buildings 01, 02, 03, 05, and 06 and the residential/mixed-use buildings to less-than-significant levels under CEQA. While the project's lighting design principles provide a general strategy for lighting design and specify a BUG rating for exterior fixtures, these principles are not specific enough to ensure that lighting will be minimized sufficiently to avoid significant impacts under CEQA. With the implementation of Mitigation Measures 6 and 13, which provide greater specificity to ensure that lighting impacts are minimized, impacts due to lighting in the southern portion of the site will be reduced to less-than-significant levels under CEQA, in our professional opinion.

For Office Buildings 01, 02, 03, 05, and 06 and the residential/mixed-use buildings, the project shall implement Mitigation Measure 6 above as well as the following mitigation measure to minimize impacts due to increased lighting:

- **Mitigation Measure 13.** Exterior lighting shall be minimized (i.e., total outdoor lighting lumens shall be reduced by at least 30% or extinguished, consistent with recommendations from the International Dark-Sky Association [2011]) from midnight until sunrise, except as needed for safety and City code compliance.

6.3.4.3 CEQA Impacts Summary

The project will implement the lighting design principles in Section 6.2.1 as well as Mitigation Measures 6 and 13 and comply with City requirements (either via compliance with requirement C or the implementation of the proposed alternative City measures) to reduce impacts due to lighting in the southern portion of the project site to less-than-significant levels under CEQA. By incorporating these principles, requirements, and measures,

it is our professional opinion that project impacts due to lighting within this area would be less than significant under CEQA.

Subsequent reports prepared by a qualified biologist will accompany each of the final ACPs for Office Buildings 01, 02, 03, 05, and 06 and the residential/mixed-use buildings. It is our understanding based on considerable coordination with the design team that (1) the proposed lighting design principles, City requirements or alternative City measures, and mitigation measures are feasible; and (2) the project will implement the lighting design principles, City requirements or alternative City measures, and mitigation measures as described herein. Nevertheless, because detailed information about project lighting design was not available as part of this assessment, a qualified biologist shall review the final ACPs to confirm that the lighting design principles, City requirements or alternative City measures, and mitigation measures described herein are incorporated into the final design such that project impacts due to bird collisions are reduced to less-than-significant levels under CEQA as described herein.

Appendix A. Additional Supporting Design Detail

The project will generally conform with the designs reviewed for this report, as depicted on the figures in this Appendix A to support H. T. Harvey & Associates analysis of bird collision hazards associated with the project. In addition, the CDP will require that the project comply with the specific beneficial project features identified in this Assessment as depicted on the figures in this Appendix A, in addition to the City bird-safe design requirements, City alternative measures, mitigation measures, and lighting design principles discussed in the Assessment, to avoid or reduce to less-than-significant levels under the California Environmental Quality Act project impacts due to bird collisions.

The images provided herein were used as the basis for the Willow Village Master Plan bird-safe design analysis; however, these images are conceptual and represent design intent rather than the final project design. Because the final design may differ from the images provided in Appendix A, a qualified biologist shall review the final ACPs for each project component to confirm that the final design is consistent with this bird-safe design assessment.

Hotel

Figure 6. Illustration of buildings in the northern portion of the site showing the proposed atrium, elevated park, hotel, Town Square, Office Building 04, and event building.

Figure 4. The conceptual hotel plan includes a central courtyard on Level 1, a pool deck on Level 3, and vegetated balconies on Level 6.

Figure 5. The conceptual east (top left), north (top right), west (bottom left), and south (bottom right) facades of the hotel.

Residential/Mixed-Use Buildings

Figure 6. Illustrative site plan showing the proposed residential/mixed-use buildings and associated open space areas. Facades with highest collision risk are delineated in red.

Figure 7. The conceptual Parcel 2 residential/mixed-use building plan includes open space courtyards on Level 3.

Figure 8. The conceptual east (top), west (middle), south (bottom left), and north (bottom right) facades of the Parcel 2 residential/mixed-use building.

Figure 9. An example mark-up of areas (shown in blue) that would be required to be treated on north (top left), south (top right), east (middle) and west (bottom) facades of the conceptual Parcel 2 residential/mixed-use building to ensure that avian collisions are less-than-significant. Transparent glass corner delineations are estimated; these corners should be treated as far from the corner as it is possible to see through the corner. Free-standing glass railings are not indicated on this figure but are required to be treated in all locations.

Office Buildings

Figure 10. Conceptual site plan showing the locations of proposed office buildings and garages, as well as the proposed extent of landscape vegetation and trees.

Parking Garages

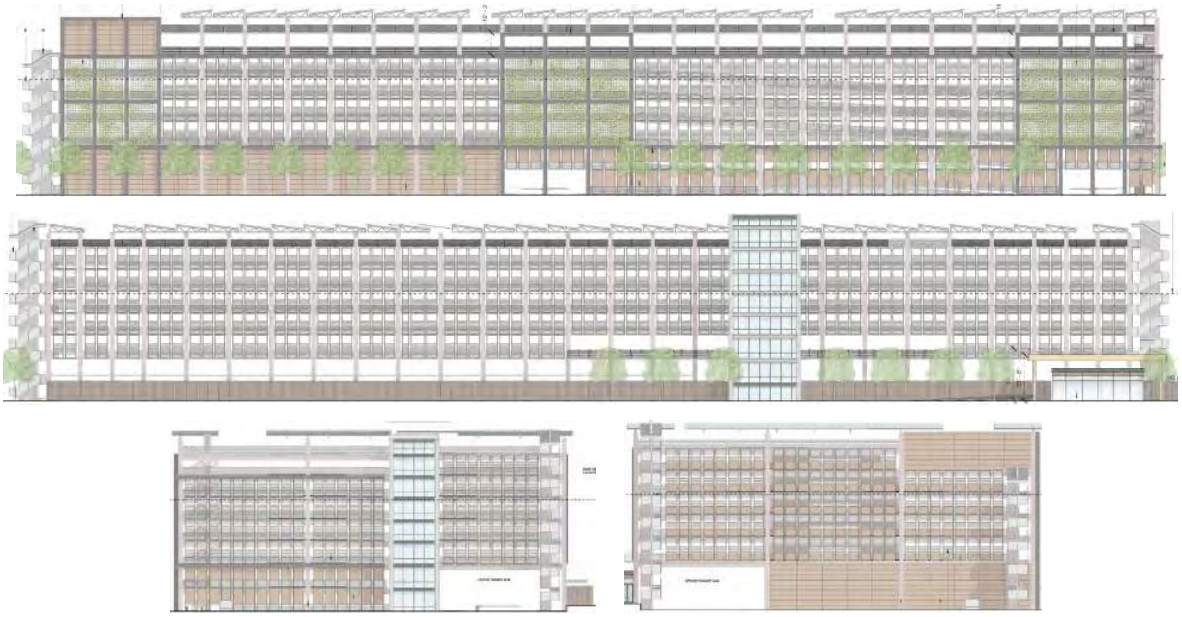

Figure 11. Conceptual North Garage elevations: east (top), west (middle), north (bottom left), and south (bottom right). The building facades are predominantly opaque; glazed areas are located on all levels the elevator towers on the west and north facades.

Event Building

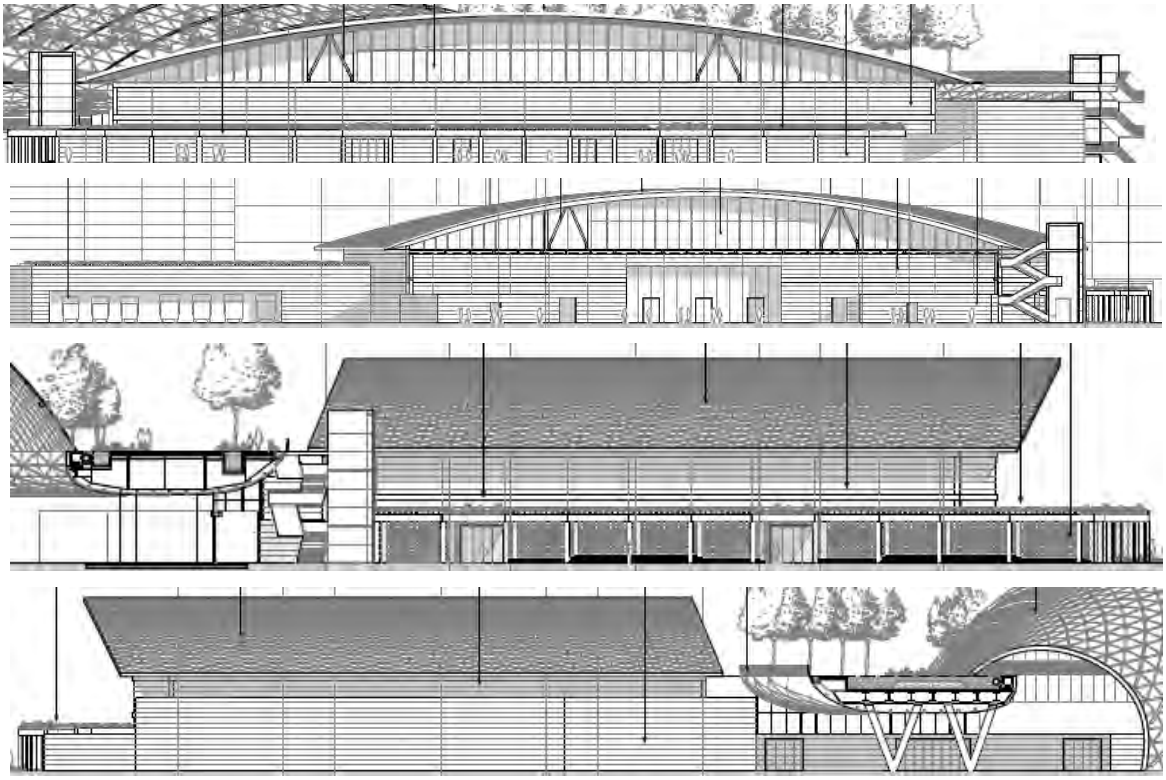

Figure 13. Illustration of the event building façades. Top to bottom: the southeast, northwest, northeast, and southwest facades.

Office Building 04

Figure 14. Conceptual Office Building 04 elevations: west (top left), east (top right), north (middle), and south (bottom).

Town Square

Figure 14. The conceptual Town Square includes a paved plaza with landscape vegetation and trees, seating areas, a glazed elevator to the elevated park, bicycle parking, and a retail pavilion.

Figure 15. The conceptual west (top left), east (top right), south (middle), and north (bottom) facades of the Town Square retail pavilion.

Security Pavilions

Figure 16. The conceptual south (top left), west (top right), north (bottom left), and east (bottom right) facades of buildings SP1 and SP2.

Atrium

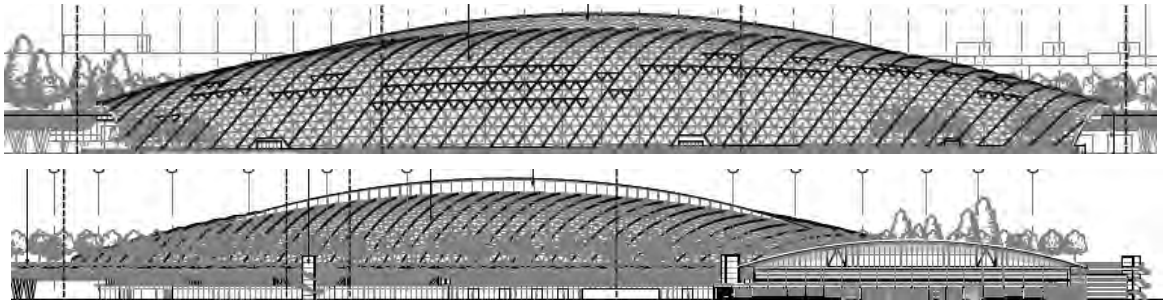

Figure 17. Conceptual drawings of the north façade (top) and south façade (bottom) of the atrium. Trees to be planted along the north façade are not shown.

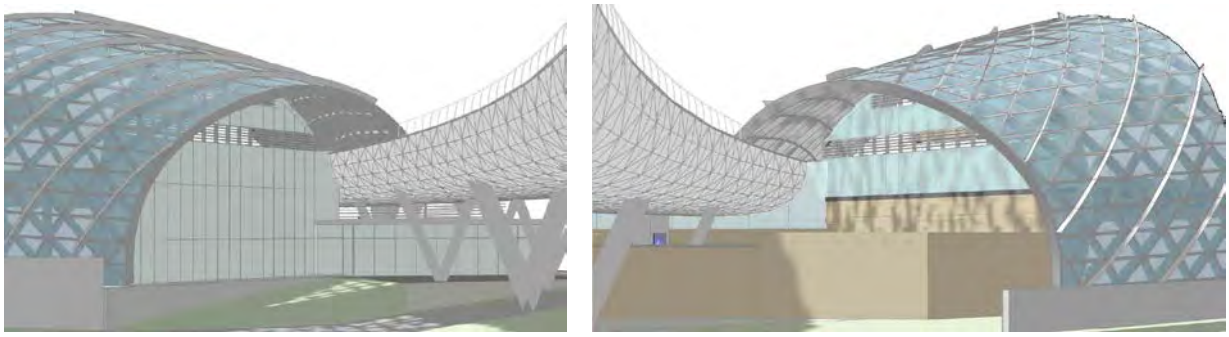

Figure 18. An illustration of the appearance of the vertical glass facades at the western (left) and eastern (right) ends of the atrium.

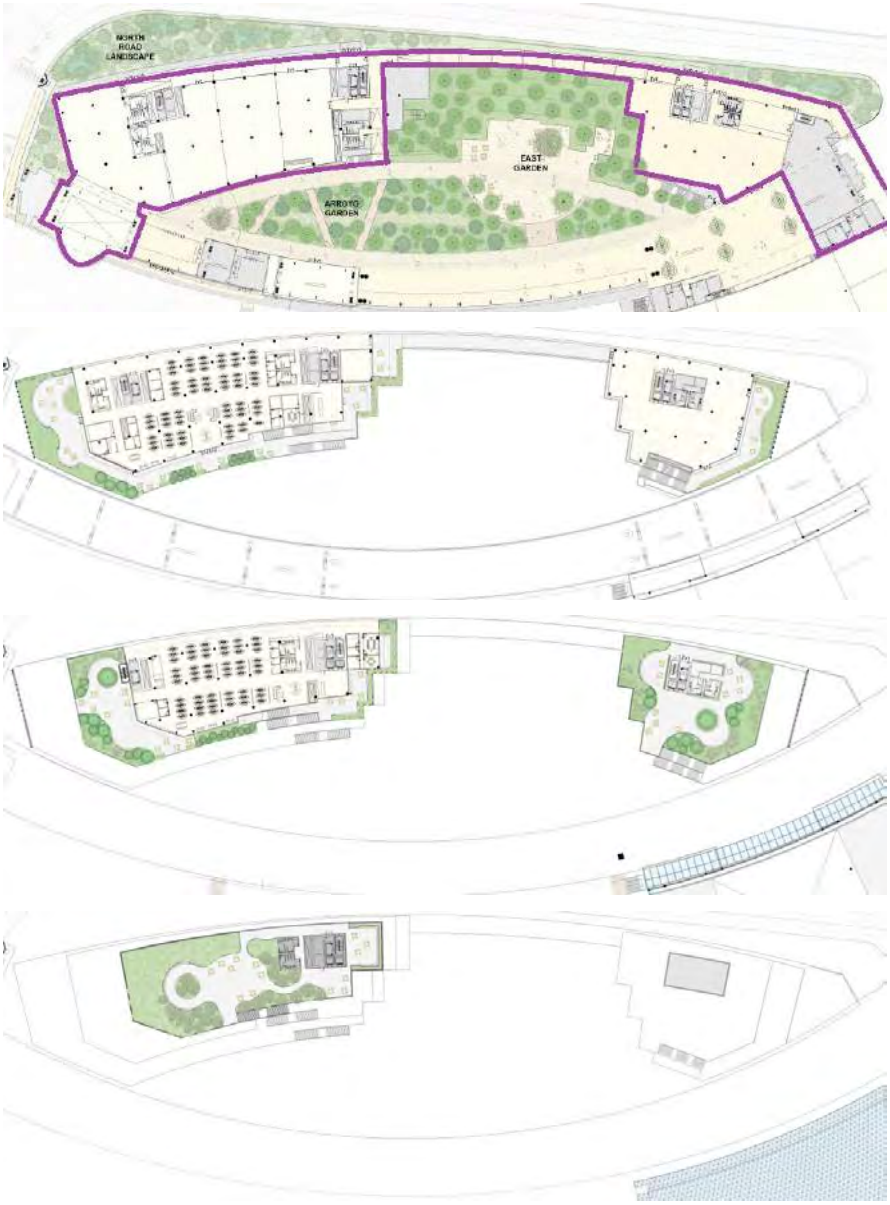

Figure 19. From top to bottom, illustrative views of landscape vegetation on Levels 1, 2, 3, and 4 of the atrium's interior. The interior building footprints and the connection between them are outlined in purple on the top image.

Figure 21. Fin-like mullions on the exterior surface of the conceptual north and south facades of the atrium will break up the smooth surface and increase the visibility of the facades to birds, especially from a distance.

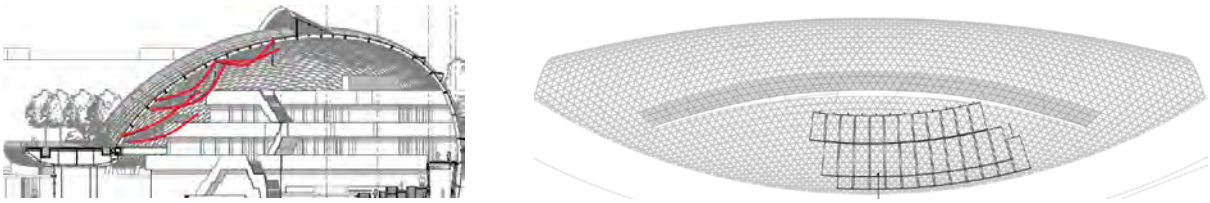

Figure 22. Interior sail shades, shown in red on the left cross-section image, are located along portions of the south façade of the atrium and will block views of interior vegetation to birds located at the elevated park or flying overhead. The approximate extent of the sail shades is shown in dark gray on the right (overhead) image.

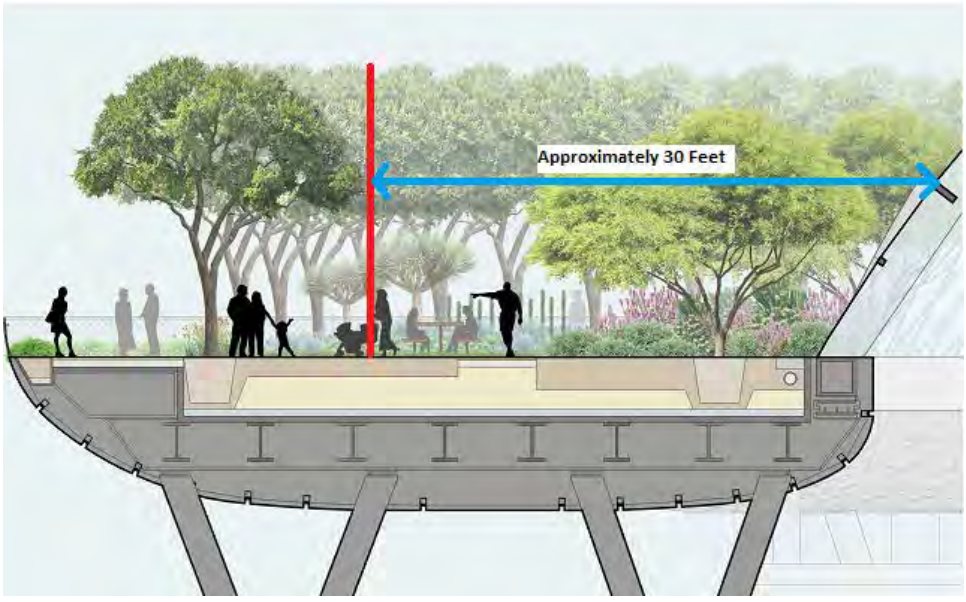

Figure 23. To the extent feasible, vegetation at the elevated park south of the site will be planted such that trees are set back from the glass façade, and dense shrubs and plants are located immediately adjacent to glass facades.

Lighting

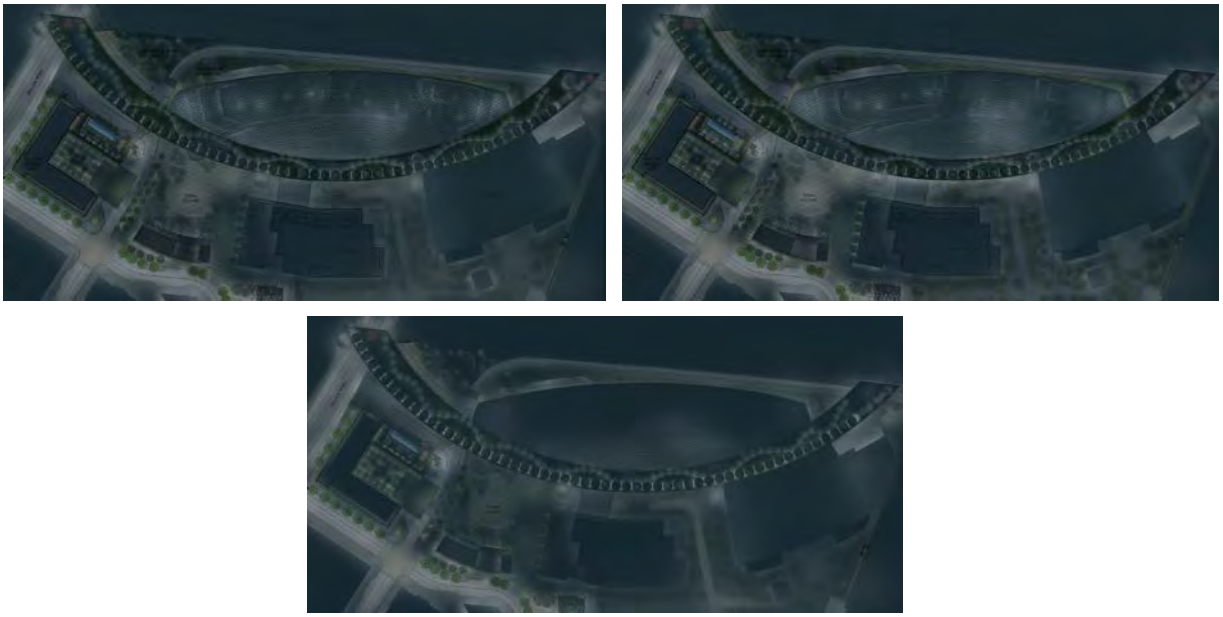

Figure 7. Anticipated conceptual lighting conditions within the atrium and immediately surrounding areas during evening hours (top left), events (top right), and after hours (bottom).

Beneficial Project Features

- The extensive opaque panels on the exterior facades of the hotel (Figure 5)
- Opaque panels, overhangs, mullions, and porticos that are not vegetated or located immediately adjacent to vegetation on the residential/mixed-use buildings (Figure 8)
- The extensive opaque facades on the North Garage and South Garage (Figure 11)
- The extensive opaque facades on the event building (Figure 13)
- Opaque panels, exterior vertical and horizontal solar shades, overhangs, mullions, and porticos that are not vegetated or located immediately adjacent to native vegetation on Office Buildings 01–06 (Figure 14)
- Opaque panels and mullions on the Town Square retail pavilion (Figure 15)
- Opaque panels and mullions on the security pavilions (Figure 16).
- The articulated structure of the atrium (Figure 20)
- Fin-like mullions on the exterior surface of the atrium's façade (Figure 21)
- Interior operable, suspended solar shades along a large portion of the south façade of the atrium Figure 22)

THE IRRIGATION VALVE SCHEDULE SHOWN ABOVE IS INTENDED TO BE USED AS A GUIDELINE ONLY AND INDICATES THE APPROXIMATE RUN TIMES IN MINUTES FOR EACH VALVE BASED ON ESTIMATED WEEKLY WATER REQUIREMENTS FOR ESTABLISHED PLANT MATERIAL. THE TIMES SHOWN ARE APPROXIMATE AND HAVE BEEN DEVELOPED FROM LOCAL AND CURRENT AVERAGES FOR EVAPOTRANSPIRATION, AND REFLECTIVE WATER REQUIREMENTS OF THE PLANT MATERIAL BASED ON PLANT TYPE AND THE APPROXIMATE PRECIPITATION OR APPLICATION RATES OF THE IRRIGATION SYSTEM TYPE. ACTUAL RUN TIMES MAY BE DIFFERENT DEPENDING ON A VARIETY OF FACTORS INCLUDING TOPOGRAPHY, SOIL STRUCTURE, SUN AND WIND EXPOSURE, WEATHER, ACTUAL PLANT WATER REQUIREMENTS, OVERALL PRECIPITATION RATE OF ZONE, ETC.

MAWA FORMULA
MAXIMUM APPLIED WATER ALLOWANCE (MAWA) GALLONS PER YEAR
MAWA = (ETo)(0.62)(LA x 0.45) + (0.55 x SLA)]

ETo = REFERENCE EVAPOTRANSPIRATION

0.45= ET ADJUSTMENT FACTOR

LA=LANDSCAPED AREA (SQUARE FEET)
0.62 = CONVERSION FACTOR (GALLONS/SQ.FT/YR)

ETWU FORMULA
ESTIMATED TOTAL WATER USE (ETWU) GALLONS PER YEAR
ETWU= (ETO)(.62)(ETAF x LA))

ETo = REFERENCE EVAPOTRANSPIRATION

PF = PLANT FACTOR FOR HYDROZONES

HA = HYDROZONE AREA (SQ.FT)
0.62 = CONVERSION FACTOR (GALLONS/SQ.FT/YR)

50 years of field notes, exploration, and excellence

HIGHLIGHTS

- 14 years of experience
- Avian ecology
- Environmental impact assessment
- Endangered Species Act consultation and compliance
- Nesting bird and burrowing owl surveys and monitoring
- Other special-status wildlife surveys and habitat assessments
- Bird-safe design

EDUCATION

MS, Fish and Wildlife Management, Montana State University

BS, Ecology, Behavior, and Evolution, University of California, San Diego

PERMITS AND LICENSES

Listed under CDFW letter permits to assist with research on bats, California tiger salamanders, California Ridgway's rails, and California black rails

USFWS 10(a)(1)(A) for California tiger salamander

PROFESSIONAL EXPERIENCE

Associate ecologist, H. T. Harvey & Associates, 2007–present

Volunteer bird bander, San Francisco Bay Bird Observatory, 2010–20

Avian field technician, West Virginia University, 2006

Graduate teaching assistant, Montana State University, 2003–06

Avian field technician, Point Blue Conservation Science (formerly PRBO Conservation Science), 2004

PROFESSIONAL PROFILE

Robin Carle is an associate wildlife ecologist and ornithologist at H. T. Harvey & Associates, with more than 14 years of experience working in the greater San Francisco Bay Area. Her expertise is in the nesting ecology of passerine birds, and her graduate research focused on how local habitat features and larger landscape-level human effects combine to influence the nesting productivity of passerine birds in the Greater Yellowstone region. She also banded, sexed, and aged resident and migrant passerine birds with the San Francisco Bay Bird Observatory for 10 years.

With an in-depth knowledge of regulatory requirements for special-status species, Robin has contributed to all aspects of client projects including NEPA/CEQA documentation, bird-safe design assessments, biological constraints analyses, special-status species surveys, nesting bird and raptor surveys and monitoring, construction implementation/permit compliance, Santa Clara Valley Habitat Plan/Natural Community Conservation Plan applications and compliance support, and natural resource management plans. Her strong understanding of CEQA, FESA, and CESA allows her to prepare environmental documents that fully satisfy the regulatory requirements of the agencies that issue discretionary permits. She manages field surveys, site assessments, report preparation, agency and client coordination, and large projects.

BIRD-SAFE DESIGN EXPERIENCE

Provides bird-safe design support for **development projects for major technology companies in Sunnyvale and Mountain View** including the preparation of avian collision risk assessments, sections of CEQA documents, assessments of project compliance with City requirements, design recommendations, avian collision monitoring plans, and calculations of qualification for LEED Pilot Credit 55.

Provided bird-safe design support for a **development project in Berkeley** including the preparation of an avian collision risk assessment and development of bird-safe design features.

Served as project manager for the preparation of an **avian collision risk assessment for the CityView Plaza project** in San José, and prepared recommendations to minimize the potential for bird nesting and perching on the building following construction.

Served as project manager for the preparation of **avian collision risk assessments for the Menlo Uptown and Menlo Portal** projects in Menlo Park, which included assessments of the potential for avian collisions to occur with the proposed buildings and the potential significance (e.g., under CEQA) of such an impact.

Provided bird-safe design support for **development at Oyster Point in South San Francisco** including the preparation of an avian collision risk assessment and providing project-specific bird-safe design measures to ensure project compliance with CEQA requirements.

PROFESSIONAL PROFILE

Dr. Steve Rottenborn is a principal in the wildlife ecology group in H. T. Harvey & Associates' Los Gatos office. He specializes in resolving issues related to special-status wildlife species and in meeting the wildlife-related requirements of federal and state environmental laws and regulations. Combining his research and training as a wildlife biologist and avian ecologist, Steve has built an impressive professional career that is highlighted by a particular interest in wetland and riparian communities, as well as the effects of human activities on bird populations and communities. Steve's experience extends to numerous additional special-status animal species. The breadth of his ecological training and project experience enables him to expertly manage multidisciplinary projects involving a broad array of biological issues.

He has contributed to more than 800 projects involving wildlife impact assessment, NEPA/CEQA documentation, biological constraints analysis, endangered species issues (including California and Federal Endangered Species Act consultations), permitting, and restoration. Steve has conducted surveys for a variety of wildlife taxa, including a number of threatened and endangered species, and contributes to the design of habitat restoration and monitoring plans. In his role as project manager and principal-in-charge for numerous projects, he has supervised data collection and analysis, report preparation, and agency and client coordination.

PROJECT EXAMPLES

Principal-in-charge for **bird-safe design support for more than 40 development projects** in more than 10 cities throughout the San Francisco Bay area. This work has entailed preparation of avian collision risk assessments, sections of CEQA documents, assessments of project compliance with requirements of the lead agency, design recommendations (e.g., related to the selection of bird-safe glazing), and avian collision monitoring plans.

Senior wildlife ecology expert on the South Bay Salt Pond restoration project — the largest (~15,000-acre) restoration project of its kind in the western United States.

Served on the **Technical Advisory Committees/Expert Panels for the Santa Clara Valley Water District's Upper Penitencia Creek, One Water, Science Advisory Hub, San Tomas/Calabazas/Pond A8 Restoration, and Coyote Creek Native Ecosystem Enhancement Tool** efforts; selected to serve on these panels for his expertise in South Bay wildlife, restoration, and riparian ecology.

Led H. T. Harvey's work on the biological CEQA assessment and permitting for extensive/regional **facilities and habitat management programs for the Santa Clara Valley Water District, San Jose Water Company, County of San Mateo, and Midpeninsula Regional Open Space District**.

Contract manager/principal-in-charge for **Santa Clara Valley Water District's Biological Resources On-Call contract** (four successive contracts, with over 120 task orders, since 2009).

Housing Needs Assessment

KEYSER MARSTON ASSOCIATES

HOUSING NEEDS ASSESSMENT

WILLOW VILLAGE MASTER PLAN PROJECT

Prepared for:
City of Menlo Park

Prepared by:
Keyser Marston Associates, Inc.

April 2022

TABLE OF CONTENTS

List of Tables

1.0 EXECUTIVE SUMMARY

This Housing Needs Assessment (HNA) provides an analysis of housing supply and housing demand impacts of the proposed Willow Village Master Plan Project (Project) in the City of Menlo Park (City) and evaluates the potential that the proposed Project could contribute to displacement of existing residents within the City of East Palo Alto (East Palo Alto) and the Belle Haven neighborhood of Menlo Park (Belle Haven), two proximate communities identified as having risk factors for displacement. The HNA is part of a range of analyses provided to decision makers and the community to inform and assist in the decision-making and entitlement process for the proposed Project. Preparation of this HNA is required under the terms of a 2017 Settlement Agreement between the cities of Menlo Park and East Palo Alto but is not required by the California Environmental Quality Act (CEQA)[1].

Following is a summary of the key findings of the HNA:

- **Regional Housing Availability[2] Impact** – The proposed Project results in an 815-unit net decrease in housing availability within the region, which is based on the difference between the estimated 2,545-unit regional employee[3] housing demand from new employees and the 1,730 new housing units included in the proposed Project. See Section 1.2 to 1.4 for additional information, including a breakout by affordability level.

- **Housing Availability Increase in Menlo Park** – The net impact on housing availability in Menlo Park is based on an estimated Menlo Park share of the 2,545-unit total regional employee housing demand and the 1,730 new units added by the proposed Project. The Menlo Park share of regional employee housing demand is estimated using two commute share scenarios, based on current commute patterns (7.4% of Meta Platforms, Inc. ("Meta") employees and 5.9% of other employees living in Menlo Park), and based on an increased commute share of 20% that reflects a goal to house a greater share of Menlo Park's workforce in the future.
    - Current Commute Share Estimate – Assuming existing commute patterns hold, there is an estimated net increase in available housing in Menlo Park of 1,553 units, based on the 1,730 new units in the Project, less an estimated Menlo Park share of regional employee housing demand of 177 units.

[1] In 2016, the City updated its General Plan, specifically the land use and circulation elements, commonly referred to as ConnectMenlo. The City completed and certified a program level EIR for ConnectMenlo, which determined that there would be a less than significant impact on population and housing, except cumulative impacts projected to be reduced to less than significant following an update of the Association of Bay Area Governments' regional forecasts. Pursuant to the terms of the 2017 City of East Palo Alto v. City of Menlo Park Settlement Agreement, preparation of this HNA is required.

[2] See Section 1.2 for a discussion of the term "Housing Availability"

[3] The terms "employee" and "worker" are used interchangeably in this report. Employment figures identified in the HNA are inclusive of both Meta and non-Meta employees within the office, retail, hotel, and multi-family residential components of the proposed Project. Not all employees will be physically present each day.

- Increased Commute Share Estimate – Assuming an increased 20% share of workers are housed in the city, there is an estimated net increase in available housing in Menlo Park of 1,221 units, considering the 1,730 new units in the Project less an estimated Menlo Park share of regional employee housing demand of 509 units.

See Table 1-1 for a summary and Section 1.5 for additional information, including a breakout by affordability level.

Table 1-1. Summary of Housing Availability Impacts

	Regional Total	Menlo Park Share	
		Current Commute Share Estimate	Increased Commute Share Estimate at 20%
A. Added Housing Supply (New Units)	1,730 Units	1,730 Units	1,730 Units
B. Added Employee Housing Demand	2,545 Units	177 Units	509 Units
C. Housing Availability, Net Impact [A. - B.]	(815 Unit) Net Decrease in Available Housing in Region	1,553 Unit Net Increase in Available Housing in Menlo Park	1,221 Units Net Increase in Available Housing in Menlo Park

- **Potential to Contribute to Displacement** – The new jobs, housing, and amenities added by the proposed Project create competing influences on the local housing market and displacement pressures in East Palo Alto and Belle Haven. The large addition to the housing supply from the proposed Project will expand availability of market rate and affordable housing in the local area, which will tend to moderate or counteract displacement pressures to some degree by relieving market pressures on the existing local housing stock. Jobs added by the Project will contribute to regional market pressures on the housing market and may create modest upward pressure on housing costs. However, a comparative analysis of real estate trends in East Palo Alto and Belle Haven to other communities vulnerable to displacement did not find clear evidence of a localized influence on housing costs from the existing Meta campuses. The new parks and shopping opportunities added by the proposed Project offer amenities that may benefit surrounding residential areas and create additional interest in living nearby, which could in turn influence housing costs. While it is challenging to determine which of the competing influences on the housing market and displacement pressures is likely to be most impactful, and a precise prediction of outcomes is not possible, on balance, the analysis suggests the proposed Project would likely, at most, represent a minor contributing factor to the substantial pre-existing displacement pressures in East Palo Alto and Belle Haven. See Section 1.6 for additional information.

1.1 Project Overview

Peninsula Innovation Partners, LLC (Project Sponsor), a subsidiary of Meta, is proposing a multi-phase, mixed-use development that includes up to approximately 1.6 million square feet of office and accessory space (consisting of meeting, collaboration, and conference space), of

which a maximum of 1.25 million square feet may be office space, up to approximately 200,000 square feet of non-office commercial/retail uses, a 193-key hotel, up to 1,730 multifamily residential units, parking, and open space improvements. The existing approximately 1,004,000 square feet of office, lab, and warehouse space on the 59-acre main Project Site, currently known as the Menlo Science and Technology Park, would be demolished. In addition, the proposed Project alters two parcels on the west side of Willow Road occupied by retail, restaurants and a service station, known as the Hamilton Avenue North and South parcels, to accommodate realignment of Hamilton Avenue at Willow Road.

A summary of the proposed Project is provided in Table 1-2, below.

Table 1-2. Project Summary

	Building Area	Units / Keys	
	square feet		
Proposed			
Office and Accessory Space [(1)]	1,600,000		
Dining	23,000		
Grocery	36,000		
Retail Shops	141,000		
Hamilton Ave: Retail / Restaurant [(2)]	28,162		
Subtotal Office and Commercial	1,828,162		
Residential	1,695,976	1,730	Units
Hotel	172,000	193	Keys
Total New	3,696,138		
Existing			
Office / Lab / Warehouse	1,003,910		
Hamilton Ave: Retail / Restaurant	20,477		
Total Existing	1,024,387		
Net Change	2,671,751	1,730	Units
		193	Keys

Source: Project Description, Willow Village Master Plan Project. ICF International.
Building area excludes parking.
(1) Of the 1.6 million sf of office and accessory space, a maximum of 1.25 million sf may be office and the balance (350,000 sf if the office sf is maximized) is for accessory uses such as meeting and collaboration space, orientation space, training space, and event space.
(2) Includes 15,702 sf of existing space proposed to remain, 4,775 sf to be relocated and rebuilt and 7,685 sf net added sf.

1.2 Housing Availability

The term “housing availability” is used to refer to the combined net housing supply and housing demand impacts of the proposed Project taking into consideration:

a) Construction of new housing units, which adds to housing availability through additions to the housing supply; and

b) Addition of jobs, which reduces housing availability by increasing demand for housing by employees.

HNAs prepared for projects that are exclusively non-residential have not used the term "housing availability" because these projects impact only the demand, or need, for housing. For purposes of a project that includes a residential component, a new term is introduced to describe combined effects on supply and demand for housing.

1.3 Estimated Impacts on Housing Supply and Housing Demand

The proposed Project will have impacts on both the supply and demand for housing. New residential units increase the supply of housing while the non-residential project components increase employment and result in demand for additional housing for workers within commuting distance. The terms "housing need" and "housing demand" are using interchangeably in this report.

- **Added Housing Supply** – The proposed Project would increase housing supply through construction of 1,730 new housing units at full buildout, of which approximately 18 percent (308 units) would be Below Market Rate (BMR) units[4] and the balance would be market rate.

- **Added Housing Demand** – New jobs added by the proposed Project would result in new worker households who need housing somewhere within commuting distance to Menlo Park. The proposed Project creates a demand for an estimated 2,545 additional housing units at full buildout. This includes an estimated need for 2,271 housing units based on the 4,332 jobs[5] added on-site plus an estimated demand for 274 housing units for workers in off-site services to new residents such as restaurants, retail, education, medical care and others. The number of jobs is translated into an estimate of employee housing demand based on an average of 1.91 workers per housing unit.

The proposed Project would result in a net decrease in housing availability of 815 units regionally (within commuting distance of Menlo Park) based on the estimated 1,730 new

[4] The BMR proposal is subject to review and action by the City Council as part of the project entitlements and is subject to change.

[5] For purposes of this analysis, on-site jobs includes both Meta and non-Meta employees who will work within the office, retail, hotel, and multi-family residential components of the proposed Project. Not all employees will be physically present each day.

residential units added to the housing supply minus the 2,545 units of added employee housing demand, as summarized in Table 1-3.

Table 1-3. Summary of Housing Availability Impacts Regionally (Within Commuting Distance)	
A. Added Housing Supply (New Units)	1,730 Units
B. Added Employee Housing Demand Within Commuting Distance	2,545 Units
C. Net Decrease in Housing Availability [A. - B.]	(815 Units)

1.4 Housing Demand and Housing Supply by Income Category

Housing demand and housing supply added by the proposed Project are identified by income category using the following six affordability categories, each expressed in relation to local Area Median Income (AMI):

- Extremely Low Income – households up to 30% of AMI;
- Very Low Income – households from 31% to 50% of AMI;
- Low Income – households from 51% to 80% of AMI;
- Moderate Income – households from 81% to 120% of AMI;
- Above Moderate Income – households from 121% to 150% of AMI; and
- Over 150% of AMI – households over 150% of AMI.

According to the California Department of Housing and Community Development (HCD), the AMI for a family of four in San Mateo County, is $149,600 as of 2021. Section 2 provides income limits applicable to each of the identified income categories. The affordability categories from 0% through 120% AMI reflect those addressed by statewide housing programs such as the Regional Housing Needs Allocation (RHNA) process. In addition, the Above Moderate Income tier is included in the analysis for consistency with HNAs prepared for prior projects in Menlo Park and to provide decision makers with information regarding a broad spectrum of housing affordability levels. Above Moderate Income households also face affordable housing challenges in Menlo Park as well as in the broader Bay Area. In fact, due to the high cost of housing, housing affordability challenges also extend to households earning over 150% of AMI[6], particularly in the for-sale housing market. The Over 150% of AMI category captures households with incomes that exceed 150% AMI and includes all households not included within one of the other income categories.

[6] An income of approximately 221% of AMI is estimated to be needed to afford the median priced home in Menlo Park. The median priced home in Menlo Park is $2.35 million based on home sales from December 2019 through December 2020 from real estate data service provider CoreLogic. Estimates assume a down payment of 30% based on the median down payment for home purchases with a mortgage in Menlo Park estimated from CoreLogic data during this period, 35% of income spent on housing, and a mortgage interest rate of 3.1% based on the average 30-year fixed mortgage rate from January through December 2020 from Freddie Mac Primary Mortgage Market Survey.

The income categories applicable to added employee housing demand are estimated by combining several data sources to estimate the household incomes of employees. Household incomes are then compared to income criteria published by HCD to identify housing demand by income category. Sources include the U.S. Bureau of Labor Statistics Occupational Employment Survey and the U.S. Census. Section 4 provides the supporting analysis for on-site workers and Section 5 provides the analysis for workers within off-site services to new residents such as retail, education, and medical care.

Residential units added by the proposed Project are identified by income category based on the Project Sponsor's proposal for compliance with the City's BMR Program guidelines. For market rate units, affordability level is based on estimated market rate rents and the household income necessary to afford these rents. The supporting analysis is presented in Section 3.

Table 1-4 presents the results of the analysis identifying added housing supply, added employee housing demand regionally (within commuting distance of Menlo Park), and the net decrease in regional housing availability by income category.

Table 1-4. Housing Availability Impacts Regionally (Within Commuting Distance)

	A. Added Housing Supply (New Units)	B. Added Employee Housing Demand Regionally (Within Commuting Distance)	C. Net Decrease in Regional Housing Availability [1] [= A. - B.]
Extremely Low	83	210	(127)
Very Low	37	307	(270)
Low	38	765	(727)
Moderate	496[2]	426	70
Subtotal: 0% to 120% AMI	654	1,708	(1,054)
Above Moderate	1,076	368	708
Subtotal: 0% to 150% AMI	1,730	2,076	(346)
Over 150% AMI	0	469	(469)
Total	1,730	2,545	(815)

(1) Negative figure represents a net decrease in housing availability in the region (added housing demand exceeds added housing supply).
(2) Includes 150 Moderate BMR units and 346 market rate studio units estimated to be affordable to Moderate Income.

As shown in Table 1-4, the 815-unit net decrease in housing availability in the region is comprised of 127 Extremely Low, 270 Very Low, 727 Low, and 469 Over 150% AMI units, partially offset by net increases in available housing within the Moderate and Above Moderate Income categories of 70 and 708 units, respectively. The net increase in available housing in the Moderate and Above Moderate categories results from the number of new housing units exceeding the added employee housing demand within these income categories.

Added housing supply within the Extremely Low, Very Low and Low Income categories identified in Table 1-4 reflect deed-restricted BMR units. Added housing supply within the

Moderate Income category includes 150 proposed Moderate Income deed-restricted BMR units and 346 market rate studio units with estimated rents that fall within a range affordable to Moderate Income households based on the analysis in Section 3. Market rate studio units would not be restricted for occupancy by Moderate Income households and could be occupied by households that have incomes that exceed income criteria for Moderate Income. Market rents are also free to adjust in response to rental market conditions and therefore affordability of the market rate units may adjust as well.

1.5 Menlo Park Share of Housing Supply and Housing Demand Impacts

This section provides an estimate of the share of the proposed Project's impacts on regional housing supply and demand that occur in the City of Menlo Park. All new residential units added by the proposed Project are in the City of Menlo Park; therefore, all 1,730 units are identified as additional housing supply in Menlo Park. The share of the added employee housing demand within Menlo Park is estimated based on commute data identifying the share of those working in Menlo Park who also live in Menlo Park.

Commute Data

According to the U.S. Census 2015-2019 American Community Survey (ACS), 5.9% of those who currently work in the City of Menlo Park also live in the City of Menlo Park. This has declined since the 2000 Census which showed that 7.2% of those who work in Menlo Park live in the city. This share is low compared to most other cities in the Bay Area,[7] attributable to a range of factors such as affordability constraints that already limit workers' ability to find housing within the city and the large number of jobs in Menlo Park relative to the size of the housing stock. Another contributing factor is the location and boundary configuration of the city making many other jurisdictions within a short commute distance.

The share of Meta employees at the company's Menlo Park campuses and leased offices who also live in Menlo Park is approximately 7.4%[8], slightly higher than the overall average of 5.9% of Menlo Park workers that both live and work in the city per the U.S. Census. Many factors influence how people select where to live, including, but not limited to, weather, family, community and cultural factors, housing affordability, quality of schools, access to employment and unit type. The reasons for a somewhat higher than average share of Meta employees living in Menlo Park are not known.

Commute Share Scenarios for Added Employee Housing Demand

To estimate Menlo Park's share of the total regional housing need from the proposed Project, the analysis considers two scenarios, a Current Commute Share Estimate, and an Increased

[7] See Appendix A Table 22 for comparable information for other cities.

[8] Based on data provided by Meta applicable to employees at its existing Menlo Park facilities as of March 2020.

Commute Share Estimate regarding the percentage share of workers who are likely to seek and find housing within Menlo Park:

1. ***Current Commute Share Estimate*** (7.4% for Meta workers / 5.9% for other workers) – The current commute share estimate uses data on existing commute patterns to estimate the number of workers who will live in Menlo Park. The 7.4% existing share of Meta workers who live in Menlo Park is used for workers within the office component of the proposed Project. For all other workers, the 5.9% city-wide average share of Menlo Park's workforce that lives in the city is used.

2. ***Increased Commute Share Estimate at 20%*** *(based on 2000 Nexus Study)* – The City Council has expressed an interest in improving the jobs housing balance and obtaining data to inform the goal of increasing the number of workers who live and work in Menlo Park. Therefore, for informational purposes, the report provides an additional goal-based estimate of housing units in Menlo Park based on a 20% commute share, which was a goal identified in the City's 2000 Commercial Linkage Fee Nexus Study. The possibility that availability and affordability of housing have contributed to a downward trend in Menlo Park's commute share is a primary reason for including this additional goal-based commute share estimate. The goal-based estimate also illustrates a scenario in which the residential units added by the proposed Project encourages a larger share of workers to live in Menlo Park[9].

Menlo Park Share of Regional Housing Supply and Housing Demand Impacts

The percent of workers residing locally with the current and increased commute share estimates are applied to the total regional housing need to calculate the number of workers in the proposed Project that are estimated to seek and find housing in Menlo Park. The two scenarios regarding the Menlo Park share of regional housing demand are then combined with the number of new residential units in Menlo Park to estimate the net impacts on housing availability in Menlo Park.

Current Commute Share Estimate – Results under the Current Commute Share Estimate are presented in Table 1-5, indicating the Menlo Park share of added housing supply, added housing demand, and net impacts on housing availability by income category. As shown, the Menlo Park share of added regional worker housing demand is estimated to total 177 units. The 1,730 new residential units added in Menlo Park by the proposed Project exceed the estimated 177 units of added employee housing demand in Menlo Park by 1,553 units, resulting in a net increase in housing availability in Menlo Park of 1,553 units.

[9] The Project Sponsor has indicated that there will not be any preference or priority for Meta employees to occupy the proposed residential units.

The 1,553-unit estimated net increase in housing availability in Menlo Park with the Current Commute Share Estimate consists of 70 Extremely Low, 15 Very Low, 466 Moderate, and 1,050 Above Moderate units, partially offset by net decreases in housing availability of 14 and 34 units within the Low and Over 150% of AMI categories, respectively. The net decrease in housing availability within the Low and Over 150% AMI categories is a result of added housing demand exceeding added housing supply within these income categories.

Table 1-5. Estimated Menlo Park Share of Regional Housing Availability Impacts - Current Commute Share Estimate

	A. Added Housing Supply in Menlo Park (New Units)	B. Menlo Park Share of Added Regional Worker Housing Demand with Current Commute Share (1)	C. Net Increase in Housing Availability in Menlo Park (2) [= A. - B.]
Extremely Low	83	13	70
Very Low	37	22	15
Low	38	52	(14)
Moderate	496 (3)	30	466
Subtotal: 0% to 120% AMI	654	117	537
Above Moderate	1,076	26	1,050
Subtotal: 0% to 150% AMI	1,730	143	1,587
Over 150% AMI	0	34	(34)
Total	1,730	177	1,553

(1) Current Commute Share is estimated at 7.4% for Meta workers, based on commute data provided by the Project Sponsor and 5.9% for all other workers based on Census data. Assumes distribution by income consistent with total housing need per Table 1-4.
(2) Negative figures represent a net decrease in housing availability (added housing demand exceeds added housing supply).
(3) Includes 150 Moderate BMR units and 346 market rate studio units estimated to be affordable to Moderate Income.

Increased Commute Share Estimate – Results under the Increased Commute Share Estimate (20%) are presented in Table 1-6. Applying an increased commute share of 20% to the total added regional employee housing demand results in an estimated Menlo Park share of regional housing need of 509 units. The 1,730 added residential units exceed the estimated 509 units of added employee housing demand in Menlo Park by 1,221 units with the Increased Commute Share Estimate, resulting in a net increase in housing availability in Menlo Park of 1,221 units.

The 1,221-unit estimated net increase in housing availability in Menlo Park with the Increased Commute Share Estimate consists of 42 Extremely Low, 411 Moderate, and 1,002 Above Moderate units, partially offset by a net decrease in housing availability of 25, 115, and 94 units within the Very Low, Low, and Over 150% of AMI categories, respectively. The net decrease in housing availability within the Very Low, Low, and Over 150% AMI categories is a result of added housing demand exceeding added housing supply within these income categories.

Table 1-6. Estimated Menlo Park Share of Regional Housing Availability Impacts – Increased Commute Share Estimate at 20%			
	A. Housing Supply Added (New Units)	B. Menlo Park Share of Net Increase in Regional Worker Housing Demand with Increased Commute Share (1)	C. Net Increase in Housing Availability in Menlo Park (2) [= A. - B.]
Extremely Low	83	41	42
Very Low	37	62	(25)
Low	38	153	(115)
Moderate	496 (3)	85	411
Subtotal: 0% to 120% AMI	654	341	313
Above Moderate	1,076	74	1,002
Subtotal: 0% to 150% AMI	1,730	415	1,315
Over 150% AMI	0	94	(94)
Total	1,730	509	1,221

(1) Uses 20% Increased commute share as described above. Assumes distribution by income consistent with total housing need per Table 1-3.
(2) Negative figures represent a net decrease in housing availability (added housing demand exceeds added housing supply).
(3) Includes 150 Moderate BMR units and 346 market rate studio units estimated to be affordable to Moderate Income.

The percentage factors used to estimate the Menlo Park share of housing need are applied uniformly across each of the income tiers. The actual distribution by income tier in Menlo Park would likely vary from these estimates based on factors such as the existing housing stock, limited availability of affordable units, and the production of market rate and affordable units in Menlo Park.

1.6 Displacement Analysis

Displacement occurs when housing or neighborhood conditions force existing residents to move, or households feel like their move is involuntary. Displacement can be caused by a range of physical, economic and social factors including but not limited to foreclosure, condominium conversion, building deterioration or condemnation, increased taxes, natural disasters, eminent domain and increases in housing costs[10, 11, 12]. The HNA is focused on economic drivers of displacement, specifically the potential for the proposed Project to affect the local housing market and contribute to increasing housing costs, although these economic drivers may also be associated with physical or social factors.

[10] Center for Community Innovation (2020). Investment and Disinvestment as Neighbors, A Study of Baseline Housing Conditions in the Bay Area Peninsula.

[11] Zuk, M. et. al. 2017. Gentrification, Displacement, and the Role of Public Investment. Journal of Planning Literature. Journal of Planning Literature 1-14.

[12] Bradshaw, K. (2019). Uneven Ground: How unequal land use harms communities in southern San Mateo County. Palo Alto Online. https://paloaltoonline.atavist.com/uneven-ground.

While displacement is not an impact for the purposes of the California Environmental Quality Act (CEQA), displacement has become an increasing regional concern in the Bay Area. A map produced by the Urban Displacement Project, a research and action initiative of UC Berkeley that aims to understand and describe the nature of gentrification and displacement, identifies numerous communities as undergoing displacement or at risk of displacement that extend from San Francisco down the Peninsula to many neighborhoods in San Jose and the East Bay.

The displacement analysis addresses the potential for the proposed Project to contribute to displacement of existing residents in two nearby communities, East Palo Alto and Belle Haven. These communities have risk factors for displacement based on their relatively lower-income existing population that includes a high percentage of households who spend 35% or more of their income on housing. They are identified by the Urban Displacement Project[13] as experiencing on-going gentrification and/or displacement or being at risk of displacement. Another recent study of baseline housing conditions in Belle Haven, East Palo Alto, and North Fair Oaks, prepared by the UC Berkeley Center for Community Innovation and its Y-PLAN initiative, identified similar conclusions[14].

The cost of housing in East Palo Alto and Belle Haven has been increasing rapidly, consistent with trends for the County and the greater Bay Area, which contribute to displacement pressures. These increases in housing costs partly reflect recovery from a decrease in housing prices during the housing market downturn and foreclosure crises during roughly the 2007 to 2012 period. However, during the subsequent economic expansion, the housing market moved well past its prior peak in 2006, although market conditions for some types of housing weakened during the early phases of the global pandemic. The displacement analysis component of the HNA evaluates the potential for the proposed Project to be a contributing factor to displacement pressures in East Palo Alto and Belle Haven by:

1) Evaluating historic relationships between job growth and real estate trends and using historic relationships to estimate the potential indirect influence on housing prices and rents.
2) Quantifying the net housing supply and housing demand impacts from the proposed Project within Menlo Park and East Palo Alto, combined.
3) Reviewing real estate trends in East Palo Alto and Belle Haven since Meta and its affiliates first began occupying its existing campuses in Menlo Park in comparison to other Bay Area communities that are also vulnerable to displacement to evaluate whether there are signs of a localized influence on housing market conditions.

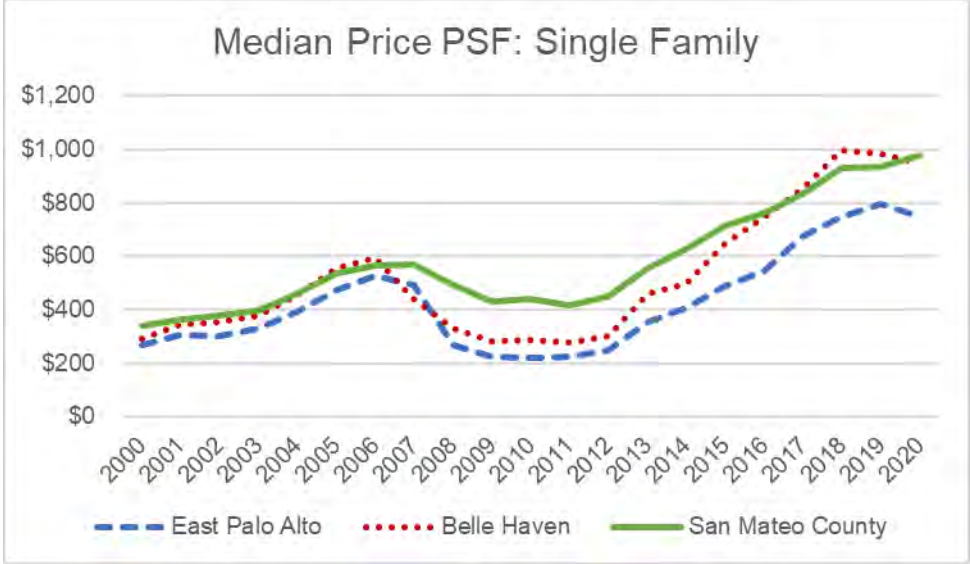
[14] Center for Community Innovation (2020). Investment and Disinvestment as Neighbors, A Study of Baseline Housing Conditions in the Bay Area Peninsula.

Home Price Trends

Home prices in East Palo Alto and Belle Haven have generally tracked broader trends in the county housing market, which has experienced significant escalation in prices. During the housing market downturn from 2007 to 2012, prices in the two communities fell further than the county overall but outpaced the county in the subsequent recovery. This pattern likely reflects the impacts of the foreclosure crisis during the housing market downturn, which is reported to have heavily impacted East Palo Alto[15]. Over the entire period from 2000 to 2020 shown in the chart below, escalation in housing prices in East Palo Alto matches that of the county while Belle Haven outpaced the county by an annualized rate of approximately 0.6% per year. Median home prices per square foot (PSF) in 2020 are now nearly 3 times what they were in 2000 in both East Palo Alto and the county overall and are more than 3 times the 2000 price level in Belle Haven.



Source: CoreLogic

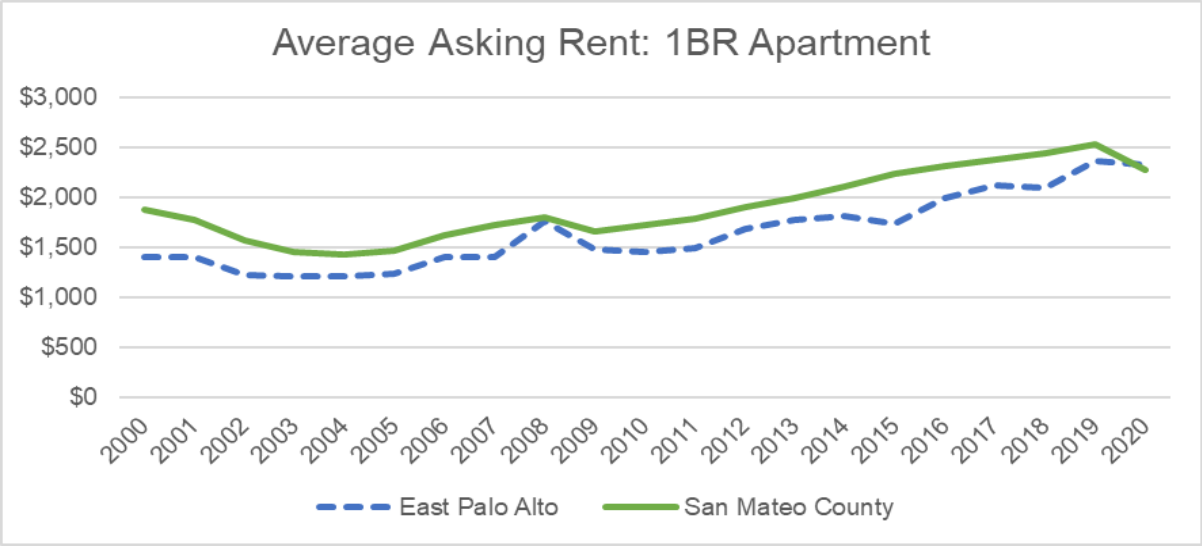
Rental Market Trends

Trends in asking rents for available apartments in East Palo Alto were compared to the San Mateo County average for the period from 2000 to 2020. Belle Haven is not presented in the chart due to limited rental market data[16]. Rents increased significantly over the time period

[15] Urban Displacement Project. 2015. East Palo Alto: An Island of Affordability in a Sea of Wealth.

[16] Only approximately 160 units (20%) built before 2016 out of the total 795-unit Belle Haven rental housing stock per the U.S. Census is covered by the historic CoStar data used in the trends analysis. Most rental housing has historically consisted of single-family or small multifamily structures with fewer than five units which are less likely to report rents regularly for purposes of the commercially available data source used in this analysis. Since 2016, two new apartment projects have added approximately 340 units to the rental housing stock, but rents of new apartments tend to command a premium relative to the existing supply and cannot be used for purposes of historic trends at the neighborhood scale. Appendix C Table 13 provides the historic data that is available.

consistent with regional trends. According to CoStar, a commercial provider of multifamily market data, asking rents in East Palo Alto have increased over the period by approximately 67% versus 21% for the county. As indicated in the chart below, rents in East Palo Alto are now similar to the county average.[17]



Source: Mean Asking Rents per CoStar. Includes all one-bedroom apartments regardless of year built.

Indirect Housing Market Effects

Job growth, especially high-income job growth, exerts upward pressure on home prices and rents throughout the region. Potential indirect housing market effects of the proposed Project are analyzed by using a simple linear regression analysis to identify how real estate conditions in San Mateo County and job growth, adjusted for new housing units, have been correlated over the period from 2000 through 2020.[18] The regression analysis findings are then applied to the jobs added by the proposed Project, adjusted for the Project's housing units, to estimate the potential range of effects on the local housing market. Key findings of this analysis are that:

- Rents are highly correlated with job growth; and
- Home prices do correlate with job growth, but the correlation is weaker than for rental housing. Other factors such as interest rates, credit availability, and other economic trends appear to have been more influential for home prices over the 2000 to 2020 period.

[17] Multifamily rental data in this section includes both new and existing buildings. In contrast, the comparison communities analysis excludes new buildings for purposes of the comparison of rental trends in East Palo Alto and eight comparison communities.

[18] Selection of 2000 as the earliest date analyzed was based on availability of rental data from CoStar for 2000 onward. Employment data for 2020 reflects an average of the first three quarters because the Quarterly Census of Employment and Wages had yet to release annual data for 2020.

The potential influence of the proposed Project on housing costs for newly vacated units is estimated to range from a 0.1% increase at the lower end up to a 1.1% increase at the upper end. These findings reflect a range of approaches to the regression analysis designed to provide an estimate of the upper and lower bounds of potential market influence from the proposed Project within East Palo Alto and Belle Haven.

Table 1-7. Analysis of Indirect Housing Market Effects
Potential Percentage Influence on Rents and Sales Prices

	Lower Estimate (3-County Analysis)	Upper Estimate (Single County Analysis)
Correlation with All Job Growth		
Rents	0.12%	0.67%
Sales Prices	0.10%	0.61%
Correlation with High-Wage Job Growth *[to capture potential multiplier effect]*		
Rents	0.18%	1.04%
Sales Prices	0.14%	1.12%

The upper estimate of potential influence on housing costs is based on a "single-county" regression analysis which attributes variation in local rents and home prices to job growth within San Mateo County. The reality is that the San Mateo County economy and housing market are highly integrated with that of the larger Bay Area. Approximately 38% of workers who live in San Mateo County work in San Francisco or Santa Clara counties. Therefore, the upper estimate that attributes changes only to San Mateo County job growth likely overstates the impacts.

The lower estimate is based on a "three-county" analysis that includes San Francisco and Santa Clara counties. A combined 95% of all workers who live in San Mateo County work in one of the three selected counties as shown in Table 7-5. Most San Mateo County workers either work within the county or commute to San Francisco or Santa Clara counties. Job growth in these three counties was anticipated to be most influential on local housing prices and rents. Alameda County was not included because just 3% of workers that live in San Mateo County commute east to jobs in Alameda County. Despite its proximity and accessibility, job growth occurring in Alameda County was assumed to be less influential on the housing market in San Mateo County because few San Mateo County residents commute to jobs located in Alameda County. The three-county analysis may understate the influence of local job growth by treating jobs added anywhere within the three counties as having an equal influence on housing costs in San Mateo County. Since the majority of San Mateo County residents work within the county (57%), job growth within San Mateo County likely has somewhat more of an influence than job growth in Santa Clara County or San Francisco.

The analysis tests how housing costs are correlated with all categories of job growth as well as a separate test of the correlation with high-wage job growth. Technology, bio-tech, and other high-wage sectors help to drive growth in other sectors of the local economy such as retail, food, and transportation supported by spending by these businesses and their workforce. Employment and economic growth generated through subsequent business and employee spending is commonly referred to as the "multiplier effect". The high-wage jobs analysis is an approach to capturing potential "multiplier effects." To the extent multiplier effects associated with the high-wage jobs are an influence on local home prices and rents, the effects would be captured in the correlation between high-wage job growth and housing costs. Consistent with this, estimated market effects of the proposed Project are higher for the scenario specifically analyzing high-wage jobs. The high-wage analysis assumes, but does not prove, that high wage jobs are the primary influence on the housing market and that lower wage jobs either have less of an influence on the market or are an indirect result of the high-wage jobs by virtue of the associated multiplier effects.

The analysis of indirect housing market effects has the potential to overstate impacts by not distinguishing the effects of other important contributing factors that are correlated with job growth. Following are examples of factors that are correlated with job growth for which the effects may be ascribed to job growth, overstating the influence of job growth on the housing market:

- *Rising Incomes* – Rising incomes of existing Bay Area households, especially those of higher-income households, enable these households to compete for limited housing supply in the most desirable locations in the Bay Area, contributing to rising housing costs.

- *New Units Coming Online* – Some communities in San Mateo County, such as Redwood City, have seen construction of a significant number of new rental units that offer superior amenities and command premium rental rates. Inclusion of these new units in the data set could bring up averages even if rents for existing units are not increasing, or not increasing at the same pace. Therefore, one contributing factor to rising rents within the county overall may simply be the addition of newer units that can command higher rents.

For rental housing, the midpoint of the upper and lower percentage impact estimates presented in Table 1-7 are 0.39% based on all jobs and 0.61% based on high-wage jobs. With for-sale housing, the midpoints are 0.36% based on all jobs and 0.63% based on high-wage jobs. The percentage findings presented in Table 1-7 may be converted to a potential dollar influence on housing costs. Multiplying the percentages applicable to rental housing by the average effective East Palo Alto rent of $2,766 per month (per CoStar for the year 2020), yields an estimated potential impact in the range of $11 to $17 per month. For for-sale housing, a comparable analysis applying the percentages to current median home prices and mortgage rates translates

to a potential monthly mortgage payment increase for potential purchasers of homes available for sale in East Palo Alto and Belle Haven of between $10 and $22 per month.

Menlo Park has already issued building permits for 1,416 housing units during the current RHNA planning cycle for 2015 to 2023 and East Palo Alto has issued building permits for 222 units for a combined 1,638 units[19]. Menlo Park has a RHNA allocation for the 2023 to 2031 planning period of 2,946 units and East Palo Alto has an allocation of 829 units for a combined 3,775 units. In addition to the proposed Project, Menlo Park has over 1,500 additional housing units in the development pipeline in the vicinity and East Palo Alto has a pipeline of nearly 1,000 new units,[20] resulting in a combined 2,500 additional pipeline units in the vicinity, of which approximately 600 units would be below market rate (BMR) affordable units[21]. Estimates of potential impact on rents and home prices are before considering any offsetting effects of this additional new housing construction that is expected to absorb additional housing demand and moderate or offset the potential effects that are estimated.

Increase in Housing Availability in East Palo Alto and Menlo Park Combined

The proposed Project results in a net increase in housing availability of 1,195 units in Menlo Park and East Palo Alto combined. This estimate considers the 1,730 new units added and a 535-unit estimated combined share of employee housing demand within Menlo Park and East Palo Alto, for a net increase in housing availability of 1,195 units. Estimated housing demand in Menlo Park is conservatively based on the Increased Commute Share Estimate while the estimated share of housing demand in East Palo Alto is based on existing commute share data. The net addition in available housing is within the Extremely Low, Moderate and Above Moderate Income categories. The 1,195-unit estimated net increase in available housing in East Palo Alto and Menlo Park is an indication that the proposed Project will help to absorb existing and future housing demand within the two communities, which will help to offset or moderate displacement pressures.

[19] 2020 Housing Element Annual Progress Reports for Menlo Park and East Palo Alto.

[20] October 6, 2020 City of East Palo Alto Staff Report to the City Council RE: Follow-Up on Study Session Related to the Affordable Housing Component of the Euclid Improvements (Woodland Park) Project, Attachment 1. East Palo Alto Housing Breakdown, which indicates approved, planned, proposed or under construction housing units totaling 969 units, not including rebuilt units.

[21] Pipeline total of approximately 600 additional BMR units is summarized from prior HNA's prepared by KMA for projects in the Bayfront Area, the applicant proposals for 123 Independence, the City of Menlo Park summary of pipeline projects in the Bayfront Area, and the staff report referenced in the prior footnote with respect to East Palo Alto pipeline projects.

Comparative Analysis of Real Estate Trends

To inform an understanding of the extent to which localized market trends in East Palo Alto and Belle Haven varied from broader regional trends since Meta and its affiliates began occupying its existing facilities in Menlo Park in 2011, real estate market trends in both communities since 2011 were analyzed in comparison to trends within other Bay Area locations that are also vulnerable to displacement.

For the comparative review of real estate trends, a total of eight comparison geographies were selected. Seven were selected based on comparable demographic, housing market, or displacement risk conditions. In addition, San Mateo County was included to provide a reference point for broader market conditions. The list of comparison geographies is as follows:

- Downtown Redwood City
- Hayward (selected zip codes)
- Bayfair / San Leandro
- Fruitvale/Oakland
- West Berkeley
- North Richmond
- East San Jose
- San Mateo County

The comparative review of real estate trends since Meta and its affiliates first began occupying its existing Menlo Park facilities does not show clear evidence of a localized influence on market conditions distinguishable from regional trends. While East Palo Alto and Belle Haven have experienced significant increases in home prices, the increases are within the range of other comparison communities in the Bay Area. The increase in apartment rents in East Palo Alto, while higher than most comparison communities, is still less than the increase that has occurred in Bayfair / San Leandro and comparable to rent growth in Hayward.

1. *Home Price Trends* – Trends in home prices for East Palo Alto and Belle Haven were compared to eight other communities for the period from 2011 to 2020 since Meta and its affiliates first began occupying its existing Menlo Park facilities. Home prices increased significantly for all the communities consistent with regional trends. East Palo Alto and Belle Haven each experienced an approximately 230% to 240% increase in pricing over the period. This increase was below the 380% increase in North Richmond and the 280% increase in Oakland's Fruitvale neighborhood. The other comparison communities ranged from a 134% to a 214% increase. These across-the-board increases are a reflection of the booming Bay Area economy over most of the past decade as well as recovery from the housing market crash and foreclosure crisis. The data indicates the very significant increases in home prices for East Palo Alto and Belle Haven are within the same range as other comparison communities in the Bay Area.

2. *Rental Market Trends* – Trends in asking rents for available, existing market rate apartments in East Palo Alto were compared to five other communities for the period from 2011 to 2020 since Meta and its affiliates first began occupying its existing campuses. Rents increased significantly for all the communities consistent with regional trends. Rents in East Palo Alto increased by 56% over the period, below the 62% increase in San Leandro, about the same as the increase in Hayward, and above the other comparisons, which ranged from a 34% to a 49% increase. Reliable data for Belle Haven, North Richmond, Fruitvale, and West Berkeley was not available.

Potential for Project to Contribute to Displacement in East Palo Alto and Belle Haven

The new jobs, housing, and amenities added by the proposed Project create competing influences on the local housing market and displacement pressures in East Palo Alto and Belle Haven. New jobs added by the Project may have a minor potential influence on housing costs by contributing to regional market pressures, as detailed in the analysis of the historical relationship between regional job growth and housing costs. While housing costs in East Palo Alto and Belle Haven are susceptible to regional market pressures, the comparative analysis of local real estate trends does not identify clear evidence of an additional, localized influence of job growth at the existing Meta campuses that can be distinguished from what many Bay Area communities experienced during the economic expansion of the prior decade. New residential units added by the Project will help to offset new housing demand generated by new workers. The expansion in the availability of market rate and affordable housing in the local area will tend to moderate or counteract displacement pressures to some degree by relieving market pressures on the existing housing stock, as has been demonstrated in recent research on the localized market effects of new housing development.[22] Finally, the new publicly accessible open spaces and shopping opportunities added by the proposed Project offer amenities that

may also benefit surrounding residential areas and may create additional interest in living in nearby areas, which could in turn influence housing costs. While it is challenging to determine which of the competing influences on the housing market and displacement pressures is likely to be most impactful, and a precise prediction of outcomes is not possible, on balance, the analysis suggests the proposed Project would likely, at most, represent a minor contributing factor to the substantial pre-existing displacement pressures in East Palo Alto and Belle Haven.

2.0 INTRODUCTION

This Housing Needs Assessment (HNA) provides an analysis of the proposed Project's impact on housing supply and housing demand and evaluates its potential to contribute to displacement of existing residents of the City of East Palo Alto (East Palo Alto) and the Belle Haven neighborhood of Menlo Park (Belle Haven), two proximate communities identified as having risk factors for displacement. The report has been prepared by Keyser Marston Associates (KMA) for the City of Menlo Park under a subcontract agreement with ICF International, prime consultant responsible for preparation of the Environmental Impact Report (EIR).

In 2016, the City updated its General Plan, specifically the land use and circulation elements, and its Zoning Ordinance (commonly referred to as ConnectMenlo). The City completed and certified a program level EIR for ConnectMenlo, which determined that there would be a less than significant impact on population and housing, except cumulative impacts projected to be reduced to less than significant following an update of ABAG regional forecasts. However, pursuant to the terms of the 2017 City of East Palo Alto v. City of Menlo Park Settlement Agreement (Settlement Agreement), preparation of this HNA is required. This HNA has been prepared consistent with the terms of that settlement agreement.

The following housing-related topics are addressed in this HNA:

1) Net impact on housing availability by income level, considering the combined effects of added housing supply and added employee housing demand;

2) Share of housing availability impacts estimated to occur within the City of Menlo Park; and

3) Potential for the proposed Project to contribute to rising housing costs and displacement of existing residents in East Palo Alto and Belle Haven.

These housing-related impacts are not required to be analyzed under the California Environmental Quality Act (CEQA) since economic or social changes are not considered significant effects on the environment. Nevertheless, this information is required by the settlement agreement and may be of interest to decision-makers and/or the public in evaluating the merits of the proposed Project.

2.1 Project Description

Peninsula Innovation Partners, LLC (Project Sponsor), a subsidiary of Meta, is proposing a multi-phase, mixed-use development that includes up to approximately 1.6 million square feet of office and accessory space (consisting of meeting, collaboration, and conference space), of which a maximum of 1.25 million square feet may be office space, up to approximately 200,000 square feet of non-office commercial/retail uses, a 193-key hotel, up to 1,730 multifamily residential units, parking, and open space improvements. The existing approximately 1,004,000

square feet of office, lab, and warehouse space on the 59-acre Project site currently known as the Menlo Science and Technology Park would be demolished. In addition, the proposed Project also alters two parcels on the west side of Willow Road occupied by retail, restaurants and a service station, known as the Hamilton Avenue North and Hamilton Avenue South parcels, to accommodate realignment of Hamilton Avenue at Willow Road and increase building area by approximately 7,700 square feet. The Project site encompasses the following addresses:

Main project site: 1350–1390 Willow Road, 925–1098 Hamilton Avenue, 1005–1275 Hamilton Court; and

Hamilton Avenue Parcels North and South: 871–883 Hamilton Avenue, and 1399-1401 Willow Road.

A summary of the proposed Project is provided in Table 2-1, below.

Table 2-1. Project Summary

	Building Area	Units / Keys	
	square feet		
Proposed			
Office and Accessory Space (1)	1,600,000		
Dining	23,000		
Grocery	36,000		
Retail Shops	141,000		
Hamilton Ave: Retail / Restaurant (2)	28,162		
Subtotal Office and Commercial	1,828,162		
Residential	1,695,976	1,730	Units
Hotel	172,000	193	Keys
Total New	3,696,138		
Existing			
Office / Lab / Warehouse	1,003,910		
Hamilton Ave: Retail / Restaurant	20,477		
Total Existing	1,024,387		
Net Change	2,671,751	1,730	Units
		193	Keys

Source: Project Description, Willow Village Master Plan Project. ICF International.
Building area excludes parking.
(1) Of the 1.6 million sf of office and accessory space, a maximum of 1.25 million sf may be office and the balance (350,000 sf if the office sf is maximized) is for accessory uses such as meeting and collaboration space, orientation space, training space, and event space.
(2) Includes 15,702 sf of existing space proposed to remain, 4,775 sf to be relocated and rebuilt and 7,685 sf net added sf.

The Project is comprised of three distinct districts including a:

- Residential/Shopping District encompassing the proposed residential units, grocery, and a portion of the dining and retail shops;
- Town Square District including the hotel, dining and retail uses; and
- Campus District encompassing the office and accessory space, parking and a portion of the retail space.

See the Draft Environmental Impact Report for the Willow Village Master Plan Project, Project Description for more information regarding the proposed Project.

2.2 Estimated On-Site Employment

The proposed Project is estimated to accommodate a total of approximately 8,128 employees, representing a net increase of 4,332 employees from the 3,796 existing on-site employees, as summarized in Table 2-2. Employment figures identified in Table 2-2 and throughout the HNA are inclusive of both Meta and non-Meta employees within the office, retail, hotel, and multi-family residential components of the proposed Project. Not all employees will be physically present each workday considering remote work, vacations, and other factors.

Table 2-2. Estimated Net Change in On-Site Employment

New Employment	8,128	Employees
Existing Employment	3,796	Employees
Net Change	4,332	Employees

Source: *Project Description, Willow Village Master Plan Project. ICF International, 2021.*

Table 2-3 provides a breakdown of employment by project component. Within the Campus District, employment in food service and building services such as maintenance, janitorial, and security are broken out separately as these services are often provided by separate contractors. Separately identifying employees of these service providers allows differences in compensation levels to be considered in the analysis. Employment estimates are drawn from the DEIR or provided by the Project Sponsor except as otherwise noted in footnotes to Table 2-3.

Table 2-3. Estimated Net Change in On-Site Employment				
Project Component	Development			Employment
	Square Feet	Units/Keys		
Proposed				
Office and Accessory Space				
Office employment				6,950
Food Service employment				198
Fitness Center employment				17
Building Services employment [1]				189
Campus District Total	1,600,000 [4]			7,354
Retail				
Dining	23,000			160
Grocery	36,000			75
Shops	141,000			130
Subtotal Main Project Site Retail	200,000			365
Hamilton Ave Retail	28,162			164

Sources: *DEIR Project Description, Willow Village Master Plan Project. ICF International*.

(1) Includes security, janitorial and maintenance employment. Security and janitorial employment estimated by Project Sponsor based on existing employment levels. Maintenance employment estimated based upon International Facility Management Association (IFMA), Operations and Maintenance Benchmarks Research Report #33. For proposed employment, the estimate is based on one employee per 50,000 square feet, which reflects a 20% increase over indicated averages due to employment density in excess of the typical range for office. For existing, the estimate is based on 60,000 square feet per employee, without the upward adjustment for employment density.
(2) Other existing tenants include a dialysis clinic, a non-profit hub, and other tenants within the existing warehousing and industrial uses.
(3) Estimated based on the ratio between the Project Sponsor estimate of janitorial and security employment in the proposed development and office employment in the proposed development, plus maintenance employment estimated consistent with footnote 1.
(4) Of the 1.6 million sf of office and accessory space, a maximum of 1.25 million sf may be office and the balance (350,000 sf if the office sf is maximized) is for accessory uses such as meeting and collaboration space, orientation space, training space, and event space.

2.3 Multiplier Effects

Technology, bio-tech, and other high-wage sectors of the local economy can drive growth in other sectors such as retail, food, transportation, construction and professional services that are supported by the spending of these businesses and their workforce. Economic growth generated through business and employee spending is commonly referred to as the "multiplier effect." Multiplier effects include indirect effects, which relate to businesses that provide goods and services supporting the operations of the business or project under study, and induced impacts, which relate to economic activity generated as workers spend their incomes in the local economy. The Settlement Agreement requires an evaluation, to the extent possible, of the effect that indirect and induced employment may have on the housing market and displacement. The requirement to analyze the potential impacts associated with "multiplier effects" on the local housing market is addressed in two ways, as described below, consistent with the methodology used by other recent HNAs prepared for the City since the Settlement Agreement was adopted.

For residential uses, indirect and induced jobs located off-site in retail, restaurants, education, medical care and other services to residents are quantified through the analysis presented in Section 5. These off-site jobs are quantified using the IMPLAN (IMpact Analysis for PLANning) model, a model widely used to quantify the impacts of changes in a local economy. Off-site jobs are estimated and included in the analysis of housing availability and displacement impacts.

For non-residential uses, potential effects on the housing market and displacement related to multiplier effects are taken into account through the analysis in Section 7. The approach is to capture potential housing market effects by analyzing historical relationships between local rents and sales prices and growth of jobs in high-wage sectors of the local economy that are primary drivers of multiplier effects. This approach allows potential housing market and displacement effects arising from multiplier effects to be assessed directly. Businesses occupying the non-residential project components are likely to utilize services or purchase supplies from off-site businesses that are more widely dispersed relative to the spending patterns of residents. For example, specialized legal or accounting services might be provided by a firm in San Francisco or Washington D.C., or wherever the relevant expertise is identified. Induced jobs supported by the spending of employees within non-residential project components will also be more widely distributed, mirroring the commute patterns of employees as identified in Table 6-5. Given the mixed-use nature of the proposed Project, with on-site retail and restaurant uses, a share of indirect and induced impacts will be internalized and included as part of on-site employment totals. Rather than attempt to quantify the number and location of off-site indirect and induced jobs and then assesses housing market and displacement impacts arising from those jobs, the analysis takes a more direct approach of assessing potential housing market and displacement effects associated with multiplier effects through an analysis of historical data, as described in Section 7. The Section 7 analysis of potential housing market effects from added jobs identifies greater impacts in the scenario designed to capture potential multiplier effects, consistent with the concept that multiplier effects could lead to greater impacts.

2.4 Income Definitions

The income levels or tiers used in the analysis are expressed in relation to local Area Median Income (AMI). For example, Extremely Low Income is defined as households earning up to 30% of AMI. The AMI for each county or group of counties is issued annually by the U.S. Department of Housing and Urban Development (HUD), and released by the California Department of Housing and Community Development. Most housing programs and policies in California and its jurisdictions utilize these income definitions. The City of Menlo Park is covered by and utilizes the AMI information provided for San Mateo County.

Per HCD and statewide programs, the analysis includes households earning less than 120% AMI. In addition, an Above Moderate Income tier covering 120% to 150% AMI is presented in this analysis because this income tier also faces affordable housing challenges in Menlo Park and the greater Bay Area. In fact, due to the high cost of housing in Menlo Park, housing affordability challenges even extend to households earning more than 150% of AMI[23], especially in the for-sale housing market. As with HNAs prepared for prior projects in Menlo Park, the Above Moderate Income tier was included to provide decision makers more information on the housing needs of a broad spectrum of housing affordability levels.

In summary, the income tiers used in the analysis are:

- Extremely Low Income – households up to 30% of AMI;
- Very Low Income – households from 31% to 50% of AMI;
- Low Income – households from 51% to 80% of AMI;
- Moderate Income – households from 81% to 120% of AMI;
- Above Moderate Income – households from 121% to 150% of AMI; and
- Over 150% of AMI – households over 150% of AMI.

The 2021 income limits by household size are presented below in Table 2-4.

[23] An income of approximately 221% of AMI, is estimated to be needed to afford the median priced home in Menlo Park. The median priced home in Menlo Park is $2.35 million based on home sales from December 2019 through December 2020 from real estate data service provider CoreLogic. Estimates assume a down payment of 30% based on the median down payment for home purchases with a mortgage in Menlo Park estimated from CoreLogic data during this period, 35% of income spent on housing, and a mortgage interest rate of 3.1% based on the average 30-year fixed mortgage rate from January through December 2020 from Freddie Mac Primary Mortgage Market Survey.

Table 2-4. 2021 Household Income Limits							
		Income Limit by Household Size					
Income Category	Percent of AMI	1-person	2-person	3-person	4-person	5-person	6-person
Extremely Low	30% of AMI	$38,400	$43,850	$49,350	$54,800	$59,200	$63,600
Very Low Income	50% of AMI	$63,950	$73,100	$82,250	$91,350	$98,700	$106,000
Low Income	80% of AMI	$102,450	$117,100	$131,750	$146,350	$158,100	$169,800
Moderate Income	120% of AMI	$125,650	$143,600	$161,550	$179,500	$193,850	$208,200
Above Moderate	150% of AMI	$157,050	$179,550	$202,000	$224,400	$242,350	$260,350
Median Income	100% of AMI	$104,700	$119,700	$134,650	$149,600	$161,550	$173,550

2.5 Report Organization

This report is organized into eight sections and three appendices:

- Section 1.0 provides an Executive Summary;
- Section 2.0 provides an Introduction;
- Section 3.0 identifies the income categories applicable to the new residential units;
- Section 4.0 provides an analysis of worker housing needs for added on-site jobs;
- Section 5.0 estimates housing demand by income for off-site workers in services to new residents such as restaurants, retail and health care;
- Section 6.0 combines the findings of Sections 3, 4 and 5 to estimate the net impact on housing availability and the share of net impacts occurring within the City of Menlo Park;
- Section 7.0 provides a discussion of the potential for the proposed Project to contribute to displacement of existing residents in East Palo Alto and Belle Haven;
- Section 8.0 provides an analysis of the Increased Residential Density Variant addressed in the DEIR;
- Appendix A provides supporting tables on worker occupation and incomes;
- Appendix B includes a summary of U.S. Census data for East Palo Alto and Belle Haven; and
- Appendix C provides supporting technical tables for the displacement analysis.

2.6 Data Sources and Qualifications

The analysis in this report has been prepared using the best and most recent data available. Sources include the American Community Survey (ACS) of the U.S. Census[24], the U.S. Bureau of Labor Statistics Quarterly Census of Employment and Wages and Occupational Employment Survey, commercial data providers CoStar, CoreLogic, ESRI Business Analyst, and employee commute data from Meta. Local data was used wherever possible. Other sources are noted in the text and footnotes. While KMA believes all sources utilized are sufficiently accurate for the purposes of the analysis, KMA cannot guarantee their accuracy. KMA assumes no liability for information from these or other sources.

[24] Much of the U.S. Census data utilized in this report is from the 2015-2019 American Community Survey (ACS). Data from the 2020 Decennial Census is partially available as of the date of preparation but data relevant to the HNA is yet to be released.

3.0 HOUSING UNITS ADDED BY THE PROJECT BY INCOME CATEGORY

This section estimates how the 1,730 new residential units added by the proposed Project will be distributed by income or affordability category.

3.1 Below Market Rate Housing Units

The City's Below Market Rate (BMR) Housing Program codified in Chapter 16.96 of the City's Zoning Code requires residential development projects with twenty or more units to provide no less than 15% BMR affordable units. Non-residential projects are required to provide BMR units on site or off site or pay an in-lieu fee. The Project Sponsor has proposed to comply with residential and non-residential BMR requirements by including 308 BMR affordable units on-site, representing approximately 17.8% of the total units. Therefore, of the 1,730 total units, 1,422 units would be market rate units and 308 would be BMR affordable units. Up to 120 of the BMR units would be part of a senior housing community. BMR rental units are required by the City's BMR ordinance and guidelines to be affordable to Low Income households. Alternative affordability levels are permitted under the City's BMR guidelines if determined to be roughly equivalent to providing all BMR units at Low Income. The Project Sponsor is proposing to provide a mix of Extremely Low, Very Low, Low and Moderate Income BMR units, as summarized in Table 3-1. In addition, the Project Sponsor is requesting the City remove the requirement established in the City's BMR guidelines that rents for BMR units be no higher than 75% of comparable market rate rents through the conditional development permit (CDP) that would regulate development of the main Project Site.

Table 3-1. Market Rate and BMR Units

		Residential Units	Percent of Units
Market Rate Rental Units		1,422	82.2%
	Proposed % AMI		
BMR Senior - Extremely Low	25% and 30%	83	4.8%
BMR Senior - Very Low	50%	37	2.1%
BMR Inclusionary - Low	80%	38	2.2%
BMR Inclusionary - Moderate	90%, 100%, 110%, 120%	150	8.7%
Subtotal BMR Units		308	17.8%
Total Units		1,730	100.0%

AMI = Area Median Income

3.2 Affordability Level of Market Rate Units

The proposed Project will include 1,422 market rate rental units including a mix of studios, one-, two- and three-bedroom units. The proposed number of units by square footage and bedroom size is summarized in Table 3-2. Market rate studio units are estimated to be affordable to households in the Moderate Income category while market rate one-, two-, and three-bedroom units are estimated to be affordable for households with Above Moderate Income. Estimated

affordability levels are based on estimated market rate rents for the units. Market rate units will not be deed restricted; therefore, the affordability level could change over time as market conditions and the income criteria used to determine affordability level change.

Table 3-2. Proposed Unit Size and Bedroom Mix

	Unit Size Range (square feet)	Market Rate Units	BMR Units	Total Units
Studio	450 - 538	346	155	501
1-BR	633 - 745	466	95	561
1-BR Plus	800 - 905	158	0	158
2- BR	929 – 1,090	407	52	459
3-Bedroom	1,125 – 1,491	45	6	51
Total		1,422	308	1,730

Source: Project Sponsor.

Market rents were estimated by KMA based on three newer rental properties in Menlo Park located on the north side of U.S. 101, the Anton Menlo at 3639 Haven (built 2017), the Elan Menlo at 3645 Haven (built 2017) and 777 Hamilton (built 2016). Data on rents for newer apartment properties in Menlo Park was supplemented with data for newly built apartments in Redwood City including the Encore at 849 Veterans Blvd (built 2019), Huxley at 1355 El Camino Real (built 2018), Indigo at 675 Bradford (built 2016) and Blu Harbor at 1 Blu Harbor Boulevard (built 2017). Market rents reflect data as of June 2020 that was accessed for prior HNAs. From June 2020 through February 2022, rents for available units in the three Menlo Park properties declined an average of 4%, which represents a partial recovery of rents from more significant declines earlier in the pandemic. Decreases in rents are consistent with trends experienced for newer apartments elsewhere in the Bay Area and are driven by increased flexibility many office workers have had to work remotely during the pandemic. Market rents as of June 2020 are used on the assumption that subsequent decreases in rents are not reflective of longer-term conditions and that rents will continue to rebound from the declines experienced during the pandemic.

Average rental rates for the comparison properties by bedroom size are shown in Table 3-3 and Charts 1 through 4. Each data point in Charts 1 through 4 represents the average effective market rate rent for units of a specific square footage size. Separate trend lines are fit to actual rents for the Menlo Park comparison properties (blue) and the Redwood City comparison properties (red). Estimated rents for the proposed Project are identified by purple circles. Square footage sizes for units within the proposed Project identified in the charts reflect the midpoint of the ranges provided by the Project Sponsor. Based on the market data and the unit sizes for the proposed Project, studios are estimated to rent for approximately $2,850 per month, one bedrooms for $3,500 per month, the larger one-bedroom “plus” units for $3,850 per month, two bedrooms for $4,200, and three bedrooms for $5,300 per month.

Source: Effective rents per CoStar, Estimate for proposed Project per KMA. Square footage sizes for the Project based on the midpoint of size ranges identified by the Project Sponsor.

Market rate rents were then used to estimate the affordability level of the units. As shown in Table 3-4, the market rate studio units are estimated to be affordable to Moderate Income households and one, two and three-bedroom units are estimated to be affordable to Above Moderate Income households. While studios are estimated to be affordable at the Moderate Income level, units would not be deed-restricted so it is possible occupants would have incomes that exceed income criteria for Moderate Income and affordability of the units could change over time.

Table 3-4. Estimated Affordability Level Applicable to Market Rate Apartments

3.3 New Residential Units by Income Level

Table 3-5 provides a summary of the income level applicable to the new residential units, combining the findings of Section 3.1 and 3.2. As shown, the proposed Project includes 83 Extremely Low Income, 37 Very Low Income, 38 Low Income, and 150 Moderate Income BMR units, 346 market rate studio units affordable to Moderate Income, and 1,076 market rate one, two and three-bedroom units affordable to households with Above Moderate Incomes.

Table 3-5. Estimated Affordability Level of New Residential Units

4.0 ADDED WORKER HOUSING NEEDS FROM INCREASE IN ON-SITE EMPLOYMENT

This section summarizes the analysis of housing needs associated with on-site employment attributable to the proposed Project. The analysis begins by quantifying the change in on-site employment by project component and type. Then, the analysis proceeds through a series of steps to estimate how the changes in on-site jobs translate into a change in worker housing need by income level. A brief overview of the methodology and structure of the analysis is provided, followed by a walk-through of the analysis steps to the output and conclusions.

4.1 Methodology

To estimate the linkages between added employment, worker households, and housing needs by affordability levels, KMA employed the same methodology used for nexus studies in support of jobs housing linkage programs. The KMA jobs housing nexus methodology was developed for analyses supporting housing linkage programs, such as Menlo Park's. The methodology has also been refined and modified for use in quantifying the housing impacts of specific large projects. The analysis inputs are all local data, to the extent possible, and are fully documented.

The analysis estimates the changes in on-site employment by type from removal of existing improvements and development of the office and accessory space, retail, and hotel components. The estimated changes in employment are then translated into an estimated impact on worker housing demand based on relationships between jobs and housing demand derived from the U.S. Census. Finally, the income level associated with the housing demand is estimated using a combination of data sources including the U.S. Bureau of Labor Statistics occupation and wage data and U.S. Census data.

4.2 Analysis Steps

Following is a description of each step in the analysis.

Analysis Step 1 – Net Change in On-Site Employment

A total of 8,128 workers are estimated upon completion of the proposed Project, representing a net increase of 4,332 jobs, as summarized in Table 4-1.

Table 4-1. Estimated Net Change in On-Site Employment by Project Component or Type			
Project Component	Existing Employees	Employees with Proposed Project	Employees Added by Proposed Project (Net Increase)
Meta Offices	3,500	6,950	3,450
Food Service	0	198	198
Fitness Center	0	17	17
Building Services	96	189	93
Dining	0	160	160
Grocery	0	75	75
Shops	0	130	130
Hamilton Ave Retail	130	164	34
Hotel	0	210	210
Residential Property Mgmt	0	35	35
Other Existing Tenants	70	0	(70)
Total	3,796	8,128	4,332

Note: employment figures are summarized from Table 2-3. See notes to Table 2-3 for additional information.

Existing office, lab and R&D space on the project site is primarily occupied by Meta, with an estimated 3,500 existing on-site workers. An estimated 70 additional on-site workers are employed by other existing tenants within the Menlo Science and Technology Park. Building services staff including janitorial and security is estimated proportionate to figures provided by the Project Sponsor upon completion of the proposed Project. Maintenance employment is estimated using ratios derived from data reported by the International Facility Management Association (IFMA). Building services workers are evaluated separately because services are typically provided by separate contract service providers. Finally, there are an estimated 130 employees within the existing retail, restaurant, and service station uses within the Hamilton Avenue North and South parcels.

A total of 8,128 employees are estimated upon completion of the proposed Project. This includes 6,950 employees[25] within the office space and 1,178 employees within the other project components comprised of 198 in food service, 189 in building services, 160 in on-site restaurants, 75 in the grocery store, 130 in the retail shops, 164 in the Hamilton Avenue North and South parcels, 210 in the hotel, 17 in the fitness center, and 35 employees in property management of the residential units.

Employment estimates are from the DEIR Project Description and were originally provided by the Project Sponsor with the exception of the estimated number of maintenance workers included within the building services staffing estimate and the number of workers within the Hamilton Avenue North and South parcels. Maintenance staff are estimated using ratios derived from data reported by the International Facility Management Association (IFMA). The number of workers for the Hamilton Avenue North and South Parcels is estimated using a combination of sources

[25] Corresponds to the 6,950 seated workers in the Meta campus.

including employment densities derived from National Restaurant Association data and the average number of employees per store for the existing Jack in the Box and Starbucks stores calculated from data reported in 10k filings with the U.S. Securities and Exchange Commission.

Step 2 – Adjustment from Employees to Employee Households

Step 2 converts the number of employees to the number of employee households, an adjustment that accounts for multiple-earner households. This step recognizes that there is, on average, more than one worker per household, and thus the number of housing units in demand would be reduced. The workers per worker household ratio eliminates from the equation all non-working households, such as households comprised of retired persons or students. The calculation is shown in Table 4-2.

KMA derived the worker per worker household figure from ACS data for 2015 to 2019. The ACS data provide estimates of the total number of workers in San Mateo County, and the total number of households with at least one working household member. The ratio of the two figures for San Mateo County is 1.91 workers per worker household. The San Mateo County figure is used in the analysis because workers will be more similar to the County as a whole than the smaller City of Menlo Park profile, which has an average of 1.73 workers per worker household. The workers per worker household ratio is used to translate the on-site employment added by the proposed Project to a change in employee households as shown in Table 4-2.

The 4,332 jobs added by the proposed Project is divided by the 1.91 workers per worker household ratio to estimate the net increase of 2,271 employee households. Table 4-2 shows the estimated number of employee households added by each component of the proposed Project.

Table 4-2. Estimated Net Change in On-Site Employee Households

Project Component	Net Change in On-Site Employment (from Table 4-1)	Net Change in Employee Households at 1.91 workers per household (1)
Meta Offices	3,450	1,809
Food Service	198	104
Fitness Center	17	9
Building Services	93	49
Dining	160	84
Grocery	75	40
Shops	130	69
Hamilton Ave Retail	34	18
Hotel	210	111
Residential Property Mgmt	35	19
Other Existing Tenants	(70)	(37)
Total	4,332	2,271

(1) Derived from 2015-2019 U.S. Census American Community Survey data for San Mateo County

Multiple-earner households have two or more workers and take a variety of forms, such as roommates and housemates, couples, and multi-generational households. The analysis makes an adjustment to recognize that if an added employee lives in a household with one or more other workers, that added employee is not responsible for creating demand for an entire housing unit, only a portion of a unit.

There is no implicit assumption in the calculation that Project employees would live with one another. Multiple-earner households are a factor that must be recognized in the analysis, irrespective of where the other working member(s) of the household is employed. Were the adjustment for multiple-earner households to be limited to the special case of Project employees living with one another in the same unit, housing needs of Project employees would be overstated by allotting an entire housing unit to one worker, even if that worker shares a housing unit with another worker who is employed elsewhere. Such an approach would result in double counting a portion of the housing demand. The following two examples provide further illustrations as to why an adjustment to account for multiple-earner households is necessary regardless of where the other working member(s) of the household is employed:

- *Example #1* – Consider a Meta worker added by the proposed Project who lives with a worker who has taken a job at another growing tech company. If it were assumed that each new worker (added by expansions at two separate companies) would require their own housing unit, the total housing demand would be overstated as a result of double counting the one unit that is shared by the two workers.

- *Example #2* – Consider two Meta workers added by the Project as well as two workers at long-established local employers. Say the two workers at long-established employers live with one another and the two Meta workers live with one another. There would be a need for two housing units in total. Now, instead say that each of the two Meta workers are in separate units, each with one of the workers at a long-established employer. There is still a need for two housing units in total. There is no difference in housing demand whether the two Meta workers live with one another or live separately with a worker who holds a job elsewhere.

Step 3 – Occupational Distribution

Occupational distribution for employees added by the proposed Project is based on data from a national survey by the Bureau of Labor Statistics (BLS). Occupation refers to job description, such as management, sales clerk, cashier, etc. The survey provides the occupational distribution for various employment “industries.” The following industry categories were identified as representative for the proposed Project:

- *Meta Offices* – NAICS code 519100, Other Information Services is used to represent the occupation profile of workers within the Meta office space.

- *Food Service* – NAICS 722500, Restaurants and Other Eating Places is used. Sales occupations are removed from the occupation profile based on Meta's practice of providing food free of charge and delivery-related occupations are removed from the occupation profile as food service would be for on-site workers.

- *Dining* – NACIS 722500, Restaurants and Other Eating Places, 722400 Drinking Paces (Alcoholic Beverages), and 722300 Special Food Services are used to represent the occupation profile of dining uses on the main project site and added jobs on the Hamilton Avenue North parcel, which are assumed to be primarily food-related consistent with existing tenants[26].

- *Retail Shops* – NAICS codes corresponding to a mix of retailers are used including health and personal care (NAICS 445100), home furnishings (NAICS 442200), electronics (443100), personal care services (812100), clothing stores (448100), dry cleaning and laundry services (812300), pharmacies and drug stores (446110), and others.

- *Hotel* – NAICS 721100, Traveler Accommodation, is used with an adjustment to remove casino hotels.

- *Building Services* – NAICS 561700, Services to Buildings and Dwellings, and NAICS 561600, Investigation and Security Services, are used to represent occupations associated with janitorial, maintenance, security and other building services.

- *Other Existing Tenants* – NAICS 621400, Outpatient Care Centers, is used to represent the dialysis clinic, NAICS 813300, Social Advocacy Organizations, and NAICS 541100, Legal Services, are used to represent the non-profit hub (which includes Community Legal Services in East Palo Alto), and NAICS 541710, Research and Development in the Physical, Engineering, and Life Sciences is used to represent other tenants within the existing office, lab and warehouse space.

For on-site property management and maintenance of residential units and the Campus District fitness facility, KMA selected representative occupations from the BLS data as shown in Appendix A Tables 13 and 18.

Table 4-3 provides a summary of worker occupations by major category. Appendix A provides a further breakdown of worker occupations by Standard Occupational Classification (SOC) System codes.

[26] A pharmacy is proposed to be located either within the main Project Site or the Hamilton Avenue Parcel North site. For purposes of the HNA, the pharmacy is assumed to be part of the retail shops located on the main Project Site.

Table 4-3. Net Change in On-Site Employee Households by Land Use and Occupation Category

Occupation Category	Office	Food Svc	Fitness Center	Dining	Grocery	Shops	Ham. Ave Retail	Hotel	Res. Prop. Mgmt	Building Services	Other Existing Tenants	Total	% of Total

Source: Bureau of Labor Statistics Occupational Employment Survey, 2020.
See Appendix A Tables 2 to 18 for more detailed breakdown of occupation categories.

Step 4 – Estimate of Employee Wage and Salary Distribution

The employee wage and salary distribution is based on the occupational distribution from Step 3 in combination with 2020 wage and salary information for each occupation for the San Francisco-Oakland-Hayward metropolitan statistical area, which includes San Mateo County from the BLS Occupational Employment Survey (OES). In addition to the average compensation levels, the analysis also utilizes BLS data regarding the percentile distribution of wages within individual occupation categories in estimating the distribution of worker compensation levels. The data on employee wages and salaries utilized in the analysis is presented in Appendix A.

Step 5 – Household Size Distribution

In this step, the household size distribution of workers is estimated using U.S. Census 2015-2019 ACS data for San Mateo County. Data for the County is used since workers are more representative of the larger area in which workers live (the County) than the City of Menlo Park. In addition to the distribution in household sizes, the data also accounts for a range in the number of workers in households of various sizes. Table 4-4 indicates the percentage distribution utilized in the analysis.

Table 4-4. Percent of Households by Size and No. of Workers

No. of Persons in Household	No. of Workers in Household	Percent of Total Households
1	1	14.7%
2	1	13.1%
	2	17.4%
3	1	7.3%
	2	10.1%
	3+	3.9%
4	1	4.9%
	2	8.9%

5	1	1.9%
	2	3.4%
	3+	2.5%
6	1	1.3%
	2	2.4%
	3+	1.7%
Total		100%

Source: 2015-2019 American Community Survey data for San Mateo County.

Step 6 – Estimate of Households that meet HCD Size and Income Criteria

This step in the analysis calculates the number of employee households that fall into each income category for each size household. This calculation is based on the employee wage and

salary distribution (Step 4), the worker household distribution (Step 5) and the 2021 HCD income limits for San Mateo County, as described above.

Household incomes are estimated based upon ratios between individual employee income and household income derived from U.S. Census data shown in Table 4-5. The ratios adjust employee incomes upward even for households with only one worker in consideration of non-wage/salary income sources such as child support, disability, social security, investment income and others. The resulting household income estimates are shown in Appendix A.

Table 4-5. Ratio of Household Income to Individual Worker Income

Individual Worker Income	One Worker Households	Two Worker Households	Three or More Workers
$25,000 to $50,000	1.31	2.86	3.50
$50,001 to $75,000	1.15	2.21	2.55
$75,001 to $100,000	1.09	1.97	2.12
$100,001 to $150,000	1.06	1.77	1.84
$150,001 to $200,000	1.04	1.60	1.63
$200,001 to $250,000	1.04	1.54	1.54
$250,001 to $300,000	1.02	1.47	1.47
$300,001 to $500,000	1.04	1.32	1.32
$500,001 and above	1.02	1.25	1.25

Source: KMA analysis of 2015 to 2019 American Community Survey PUMS data for San Francisco Bay Area.

Estimated household incomes are compared to HCD income criteria to determine the percentage that qualify within each income category. The comparison is made for each potential household size/number of workers combination. The result is multiplied by the percentage distribution of household sizes and number of workers per household from Step 5 to calculate the distribution of worker households by income.

Table 4-6 presents the estimated number of households in each income tier by worker occupation category. It represents the output of the analysis, after completing Step 4 (employee compensation levels), Step 5 (household size distribution of worker households), and Step 6 which uses this information to calculate the number of households that fall into each income category.

4.3 Summary by Income Level

Table 4-7 summarizes estimates of the additional on-site worker housing demand within commuting distance of Menlo Park by affordability level as a result of increased on-site employment from the proposed Project.

Table 4-7. Added On-Site Employee Households by Income

	Extremely Low	Very Low	Low	Moderate	Above Moderate	Over 150% AMI	Total
Meta Offices	57	182	440	341	339	450	1,809
Food Service	28	17	52	6	1	0	104
Fitness Center	1	2	4	1	1	0	9
Building Services	9	9	22	6	2	1	49
Dining	23	14	41	5	1	0	84
Grocery	10	6	19	3	1	0	39
Shops	14	11	29	8	3	3	68
Hamilton Ave Retail	5	3	9	1	0	0	18
Hotel	21	20	48	15	4	2	110
Residential Property Mgmt	2	3	7	3	2	1	18
Other Existing Tenants to be removed	(1)	(3)	(8)	(7)	(7)	(11)	(37)
Subtotal Other On-Site Employee Households	112	82	223	41	8	(4)	462
Added On-site Employee Households	169	264	663	382	347	446	2,271

The net increase in on-site employment with the proposed Project is estimated to result in demand for an additional 2,271 housing units consisting of an estimated 169 Extremely Low, 264 Very Low, 663 Low, 382 Moderate, 347 Above Moderate Income and 446 Over 150% AMI units.

5.0 HOUSING DEMAND OF OFF-SITE WORKERS IN SERVICES TO NEW RESIDENTS

The following section provides an analysis of the linkages between development of the new residential units on the Project site, jobs generated in off-site services such as retail and restaurants, and the housing needs of the workers who hold these off-site jobs. As described in Section 2, off-site jobs addressed in this section are incorporated into the analysis consistent with the terms of the Settlement Agreement which requires, to the extent possible, consideration of multiplier effects.

The analysis of housing demands for off-site workers starts with the estimated rental rate for the new units and moves through a series of linkages from the estimated income of the household that rents the unit, the portion of income available for expenditures on goods and services, jobs associated with the purchase and delivery of those services, the income of the workers doing those jobs and, ultimately, the affordability level of the housing needed by the workers.

The number of jobs by industry that are generated from the household spending of residents living in the proposed Project is estimated using the IMPLAN (IMpact Analysis for PLANning) model, a model widely used to quantify the impacts of changes in a local economy. The number of jobs by industry is then used to estimate worker housing need by income level using the same approach as in Section 4.

5.1 Estimated Household Incomes of New Residents

The estimated household incomes of residents in the new market rate residential units are drawn from the analysis provided in Section 3.2. For BMR units, household income is estimated based on the mid-point of the income range that would qualify for a BMR unit. Household income figures are then multiplied by the number of units to estimate the aggregate household income for all residents of the proposed Project as shown in Table 5-1. Aggregate household income is used to estimate household spending, the input to the IMPLAN model that is used to quantify the number of off-site jobs associated with household spending of new residents.

Table 5-1. Aggregate Household Income of New Residents

	Estimated Household Income [1]					Number of Units					
	Ext. Low	Very Low	Low	BMR Moderate	Market Rate	Ext. Low	Very Low	Low	BMR Mod	Market Rate	Aggregate Income
Studio	$34,219	$51,175	$83,200	$114,050	$118,720	75	32	10	38	346	$50,447,020
1-BR	$40,196	$58,475	$95,100	$130,350	$145,120	8	4	17	66	466	$78,401,187
1-BR Plus	$40,196	$58,475	$95,100	$130,350	$159,120	0	0	0	0	158	$25,140,960
2- BR	n/a	$65,800	$107,000	$146,650	$174,800	0	1	10	41	407	$78,292,050
3-Bedroom	n/a	n/a	$118,850	$162,925	$220,720	0	0	1	5	45	$10,865,875
Total						83	37	38	150	1,422	$243,147,092
Average Per Household											$140,547

(1) For market rate units, see Table 3-4. For BMR units, figures are based on the mid-point of the qualifying income range. For BMR Moderate and Extremely Low units, the distribution of income levels within these categories proposed by the Project Sponsor is reflected as a weighted average.

Income Available for Expenditures

The input into the IMPLAN model used in this analysis is the net income available for expenditures. To arrive at income available for expenditures, gross income must be adjusted for Federal and State income taxes, contributions to Social Security and Medicare, savings, and payments on household debt. Per KMA correspondence with the producers of the IMPLAN model (IMPLAN Group LLC), other taxes including sales tax and property tax are handled internally within the model as part of the analysis of expenditures. Payroll deductions for medical benefits and pre-tax medical expenditures are also handled internally within the model. Table 5-2 shows the calculation of the percentage of household income available for expenditures.

Table 5-2. Percent of Income Available for Expenditures (1)	
Gross Income	100%
Less:	
Federal Income Taxes (2)	11.1%
State Income Taxes (3)	5%
FICA Tax Rate (4)	7.65%
Savings & other deductions (5)	6%
Subtotal deductions	30%
Percent of Income Available for Expenditures (6)	*70%*

(1) Calculated as gross income after deduction of taxes and savings. Income available for expenditures is the input to the IMPLAN model which is used to estimate the resulting employment impacts. Housing costs are not deducted as part of this adjustment step because they are addressed separately as expenditures within the IMPLAN model.
(2) Reflects average tax rates (as opposed to marginal) based on U.S. Internal Revenue Services, Tax Statistics, Tables 1.2 and 2.1 for 2018.Tax rates reflect averages for applicable income range. Assumes the standard deduction.
(3) Average tax rate estimated by KMA based on marginal rates per the California Franchise Tax Board and ratios of taxable income to gross income estimated based on U.S. Internal Revenue Service data.
(4) For Social Security and Medicare.
(5) Household savings including retirement accounts like 401k / IRA and other deductions such as interest costs on credit cards, auto loans, etc., necessary to determine the amount of income available for expenditures. The 6% rate used in the analysis is based on and average for the 2001 to 2020 period computed from U.S. Bureau of Economic Analysis data, specifically the National Income and Product Accounts, Table 2.1 Personal Income and Its Disposition.
(6) Deductions from gross income to arrive at the income available for expenditures are consistent with the way the IMPLAN model and National Income and Product Accounts (NIPA) defines income available for personal consumption expenditures. Income taxes, contributions to Social Security and Medicare, and savings are deducted; however, property taxes and sales taxes are not. Housing costs are not deducted as part of the adjustment because they are addressed separately as expenditures within the IMPLAN model.

Income available for expenditures is estimated at approximately 70% of gross income. Federal tax rates are estimated at 11% of gross income based upon Internal Revenue Service data. State taxes are estimated to average 5% of gross income based on tax rates per the California Franchise Tax Board. The employee share of FICA payroll taxes for Social Security and Medicare is 7.65% of gross income. A ceiling of $147,000 per employee applies to the 6.3% Social Security portion of this tax rate.

Savings and repayment of household debt represent another necessary adjustment to gross income. Savings includes various IRA and 401 K type programs as well as non-retirement

household savings and investments. Debt repayment includes auto loans, credit cards, and all other non-mortgage debt. Savings and repayment of debt are estimated to represent a combined 6% of gross income based on the average for the 2001 to 2020 period derived from United States Bureau of Economic Analysis data.

The percentage of income available for expenditure for input into the IMPLAN model is prior to deducting housing costs. The reason is for consistency with the IMPLAN model which defines housing costs as expenditures. The IMPLAN model addresses the fact that expenditures on housing do not generate employment to the degree other expenditures such as retail or restaurants do, but there is some maintenance and property management employment generated.

After deducting income taxes, Social Security, Medicare, savings, and repayment of debt, the estimated income available for expenditures is 70% of gross household.

Another adjustment made to spending is to account for standard operational vacancy in rental units of 5%, a level of vacancy considered average for rental units in a healthy market.

Table 5-3 presents the estimate of household income available for expenditures in the local economy after adjustments to income available for expenditures and vacancy:

Table 5-3. Income Available for Expenditures	
Aggregate Annual Household Income, New Residents (Table 5-1)	$243,147,092
Percent Available for Expenditure (Table 5-2)	70%
Adjustment for 5% rental vacancy	95%
Aggregate Household Income Available	$161,693,000

The estimated household income available for expenditure associated with the up to 1,730 new residential units is the input into the IMPLAN model.

5.2 The IMPLAN Model

Consumer spending by residents of new housing units will create jobs, particularly in sectors such as restaurants, health care, and retail, which are closely connected to the expenditures of residents. The widely used economic analysis tool, IMPLAN, was used to quantify these new jobs by industry sector.

5.2.1 IMPLAN Model Description

The IMPLAN model is an economic analysis software package now commercially available through the IMPLAN Group, LLC. IMPLAN was originally developed by the U.S. Forest Service, the Federal Emergency Management Agency, and the U.S. Department of the Interior Bureau of Land Management and has been in use since 1979 and refined over time. It has become a widely used tool for analyzing economic impacts for a broad range of applications from major construction projects to natural resource programs.

IMPLAN is based on an input-output accounting of commodity flows within an economy from producers to intermediate and final consumers. The model establishes a matrix of supply chain relationships between industries and also between households and the producers of household goods and services. Assumptions about the portion of inputs or supplies for a given industry likely to be met by local suppliers, and the portion supplied from outside the region or study area are derived internally within the model using data on the industrial structure of the region.

The output or result of the model is generated by tracking changes in purchases for final use (final demand) as they filter through the supply chain. Industries that produce goods and services for final demand or consumption must purchase inputs from other producers, which in turn, purchase goods and services. The model tracks these relationships through the economy to the point where leakages from the region stop the cycle. This allows the user to identify how a change in demand for one industry will affect a list of over 500 other industry sectors. The projected response of an economy to a change in final demand can be viewed in terms of economic output, employment, or income.

Data sets are available for each county and state, so the model can be tailored to the specific economic conditions of the region being analyzed. This analysis utilizes the data set for San Mateo County. As will be discussed, much of the employment impact is in local-serving sectors, such as retail, eating and drinking establishments, and medical services. It is likely that many off-site employment impacts will occur in Menlo Park and other nearby jurisdictions; however, employment impacts will also extend throughout the county and beyond based on where residents of the proposed Project will shop, dine, seek medical care and other services. Consistent with the approach taken in most residential affordable housing nexus analyses, the analysis includes job impacts throughout the county.

The Covid-19 pandemic has modified consumer spending patterns due to shelter-in-place orders, business closures, and altered consumer preferences and shopping patterns in response to the virus. It is assumed that the pandemic is a temporary condition which is not representative of future conditions when the proposed Project would be completed and occupied. Spending may mostly revert to pre-pandemic patterns as the pandemic subsides. However, it is possible that some changes in response to the virus, such as an accelerated shift toward online retail, could endure to some degree post-pandemic. Since there is no data on

post-pandemic spending patterns, the analysis uses the most recent IMPLAN data set available, which is representative of the pre-pandemic pattern.

5.2.2 Application of the IMPLAN Model to Estimate Job Growth

The IMPLAN model was applied to link income to household expenditures to job growth. The estimated annual household spending of the residents of the up to 1,730 new housing units is the input to the IMPLAN model. The IMPLAN model then distributes spending among various types of goods and services (industry sectors) based on data from the Consumer Expenditure Survey and the Bureau of Economic Analysis Benchmark input-output study, to estimate the number of off-site jobs.

Job creation, driven by increased demand for products and services, was projected for each of the industries that will serve the new households. A total of 644 jobs are estimated to be generated by spending of the residents, as summarized in Table 5-4. Of the estimated 644 jobs, 121 are estimated to be captured as part of on-site employment totals for grocery, retail, and dining uses, based on the analysis in Appendix A Table 21, which are already considered as part of the Section 4 analysis addressing on-site jobs. While residents are anticipated to meet a significant share of needs within the on-site uses, not all retail categories will be available on-site and services like medical care and schools will be located off-site. On-site retail and dining will also likely serve a wider customer base that includes local residents, workers, and hotel guests, in addition to new residents of the proposed Project.

Table 5-4. Jobs Generated from Household Spending of 1,730 Residential Units	
Aggregate Household Expenditures, 1,730 units	$161,693,000
Estimated Number of Jobs Generated	644.5
Less: Estimated Portion Included in On-Site Employment Totals [(1)]	(121.4)
Estimated Number of Off-site Jobs	523.1

[(1)] See Appendix A Table 21 for supporting analysis.

The proposed Project would add new residential units to Menlo Park, increasing the population and creating net new demand for products and services, the jobs associated with delivery of these products and services are also estimated to be net new jobs. A portion of household needs will be met through the mix of retail and restaurant uses proposed to be included on-site as part of the Project while others needs such as health care are anticipated to be met off-site. While there may be an ability for existing off-site health care facilities, schools and other services to absorb a share of new demand to some extent, existing establishments will still require additional employees in many cases. For example, individual health care providers are only able to see so many patients in a day. Employment in sectors that serve residents tends to expand with population. As indicated in Section 5.2.3, the ratio between employment in resident-serving sectors of the economy and the number of housing units is relatively consistent at the city and county geographic scales, indicating resident-serving jobs tend to be proportionate to the number of housing units and population.

Table 5-5 provides a detailed breakdown of the employment by industry sorted by projected employment. The Consumer Expenditure Survey published by the Bureau of Labor Statistics tracks expenditure patterns by income level. IMPLAN utilizes this data to reflect the pattern by income bracket. Estimated employment is shown for each IMPLAN industry sector representing 1% or more of total employment. The jobs that are generated are heavily retail jobs, jobs in restaurants and other eating establishments, and in services that are provided locally such as health care.

Table 5-5. Off-Site Jobs Generated by Industry from Housing Spending		
Industry Category	Off-Site Jobs Total [1]	Percent
Full-service restaurants	25.5	5%
Limited-service restaurants	14.8	3%
All other food and drinking places	8.9	2%
Subtotal Restaurant	48.6	9%
Retail - Building material and garden equipment and supplies stores	4.6	1%
Retail - Clothing and clothing accessories stores	9.9	2%
Retail - Electronics and appliance stores	4.7	1%
Retail - Food and beverage stores	11.7	2%
Retail - Furniture and home furnishings stores	5.0	1%
Retail - General merchandise stores	16.0	3%
Retail - Health and personal care stores	5.2	1%
Retail - Miscellaneous store retailers	9.1	2%
Retail - Motor vehicle and parts dealers	4.9	1%
Retail – Non-store retailers	9.6	2%
Retail - Sporting goods, hobby, musical instrument and bookstores	3.9	1%
Personal care services	8.4	2%
Subtotal Retail and Service	93.0	18%
Offices of dentists	13.5	3%
Offices of other health practitioners	8.5	2%
Outpatient care centers	11.6	2%
Offices of physicians	16.8	3%
Medical and diagnostic laboratories	1.6	0%
Other ambulatory health care services	2.3	0%
Home health care services	8.7	2%
Hospitals	18.0	3%
Subtotal Healthcare	81.0	15%
Elementary and secondary schools	7.2	1%
Junior colleges, colleges, universities, and professional schools	10.5	2%
Other educational services	5.3	1%
Subtotal Education	22.9	4%
Individual and family services	32.9	6.3%
Automotive repair and maintenance, except car washes	15.2	2.9%
Child day care services	9.8	1.9%
Religious organizations	7.5	1.4%
Other personal services	7.4	1.4%
Transit and ground passenger transportation	6.6	1.3%
Car washes	6.4	1.2%
Other financial investment activities	11.1	2.1%
Non-depository credit intermediation and related activities	5.6	1.1%
Transit and ground passenger transportation	6.6	1.3%
All Other	168.6	32%
Total Number of Off-Site Jobs Generated	523.1	100%

(1) Estimated off-site employment generated by household expenditures of Project residents for industries representing more than 1% of total employment. Employment estimates are based on the IMPLAN Group's economic model, IMPLAN, for San Mateo County (uses 2019 IMPLAN data set, the most recent available as of June 2020). See Appendix A Table 21 for supporting analysis of the portion of total jobs generated by household spending that are located off-site. Includes both full- and part-time jobs.

5.2.3 Cross-Check Based on Existing Number of Resident-Serving Jobs

As context for the estimated number of off-site jobs and a secondary cross-check for reasonableness, Table 5-6 provides comparisons to the existing ratio of resident-serving jobs in sectors such as health care, retail, food service and education and the number of residential units within Menlo Park and San Mateo County. In Menlo Park, there are 9,072 existing jobs in resident-serving sectors based on data from the U.S. Census and 14,124 residential units based on data from the California Department of Finance. These figures translate to a ratio of approximately 1,111 resident-serving jobs for every 1,730 residential units[27]. The ratio for San Mateo County is similar at 984 resident-serving jobs for every 1,730 residential units. Based on existing relationships between resident-serving jobs and residential units for both the city and the county, estimates for the proposed Project appear reasonable.

Estimates for the proposed Project reflect a lower ratio of resident serving jobs to housing units than overall averages based on the characteristics of the proposed Project which consists of 71% studio and one-bedroom units. Households occupying the proposed Project are estimated to average 2.03 persons[28], which is smaller than the average household size for the city of 2.64 persons per household and 2.88 persons per household for the county per the California Department of Finance. Smaller household sizes will correspond to lower demand for services compared to overall averages, particularly for services like health care and education that are driven by population. In addition, the proposed Project includes 17.8% BMR units. Residents of BMR units will have lower household incomes and will drive a lower level of demand for services, particularly in sectors like restaurants that are driven more by discretionary spending. Finally, the City and County averages include employment within the identified sectors associated with serving the business and visitor population as well as residents, resulting in higher ratios than would be the case for jobs associated with residents alone. Therefore, the ratio between the estimated number of resident-serving jobs and the number of residential units for the proposed Project is appropriately less than citywide or countywide averages.

[27] Calculated as 9,072 jobs divided by 14,124 residential units and multiplied by 1,730 units. This 1,730-unit figure is selected for ready comparison to the proposed Project. Since Menlo Park residents will additionally use retail and services located in other nearby communities, the relationship for San Mateo County as a whole is also provided.

[28] Based on the unit mix of the standard for relating unit size to household size specified in California Health and Safety Code Section 50052.5, the proposed Project is estimated to correspond to an average household size of approximately 2.03 persons.

Table 5-6. Comparison to Existing City and County Relationships Between Number of Residential Units and Number of Jobs in Key Resident Serving Sectors					
	Existing Jobs [1]		Jobs Per 1,730 Residential Units		
	City of Menlo Park	San Mateo County	Actual: City of Menlo Park [4]	Actual: San Mateo County [4]	Estimate for Proposed Project [5]
Key Resident-Serving Sectors					
Health Care	3,065	41,812	375.4	256.2	151.3
Retail Trade	1,564	33,825	191.6	207.3	113.5
Food Service	2,005	39,255	245.6	240.6	99.6
Education	1,123	24,010	137.6	147.1	22.7
Other Services [2]	1,040	15,264	127.4	93.5	75.1
Arts, Entertainment, and Recreation	275	6,469	33.7	39.6	18.8
Subtotal Resident-Serving	9,072	160,635	1,111	984	481
Other Sectors	39,476	257,325	4,835	1,577	163
Total All Sectors	48,548	417,960	5,946	2,561	645
Number of Residential Units [3]	14,124	282,299			

(1) U.S. Census Longitudinal Employer-Household Dynamics, 2018 data for workplace geography.

(2) Includes a broad range of services from auto repair to dry cleaning, to religious organizations.

(3) Number of housing units as of January 1, 2021, per California Department of Finance Table E-5, Population and Housing Estimates for Cities, Counties, and the State, 2011-2021 with 2010 Census Benchmark.

(4) Calculated by dividing the total number of jobs by the number of residential units and multiplying by 1,730 units.

(5) For comparison purposes, figures from Appendix A Table 21, prior to the adjustment to remove jobs included in on-site employment totals, are used

Note: The number of jobs by industry from the HNA have been aggregated by major industry category to allow ready comparison to actual existing jobs in the City of Menlo Park and in San Mateo County.

5.3 Analysis of Housing Need by Income

This section presents a summary of the analysis linking the number of off-site jobs associated with the new residential units to the estimated number of housing units required in each of six income categories. The analysis is based on the same methodology as Section 4 and consists of the following analysis steps.

Step 1 – Adjustment from Employees to Employee Households

This step (Table 5-7) converts the number of employees identified in Table 5-5 to the number of employee households, recognizing that there is, on average, more than one worker per household, and thus the number of housing units in demand for new workers is reduced. The workers-per-worker-household ratio eliminates from the equation all non-working households, such as retired persons and students. The San Mateo County average of 1.91 workers per worker household derived from the U. S. Census Bureau 2015-2019 American Community Survey is used for this step in the analysis, consistent with Section 4. The estimated 523 off-site jobs is divided by 1.91 to estimate the number of worker households of 274.

Table 5-7. Estimated Net Change in On-Site Employee Households	
Off-Site Jobs in Services to New Residents	523.1
Number of Employee Households - Off-site workers (at 1.91 workers per household) (1)	274.2

(1) Derived from 2015-2019 U.S. Census American Community Survey data for San Mateo County

Step 2 – Occupational Distribution of Employees

The occupational breakdown of employees is the first step to arrive at income level. The output from the IMPLAN model provides the number of employees by industry sector, shown in Table 5-5. The IMPLAN output is then paired with data from the Department of Labor, Bureau of Labor Statistics Occupational Employment Survey (OES) to estimate the occupational composition of employees for each industry sector. As shown in Table 5-8, new jobs will be distributed across a variety of occupational categories. The three largest occupational categories are sales and related (12.4%), office and administrative support (13.1%), and healthcare support (10%). Table 5-8 indicates the percentage and number of employee households by occupation for off-site workers.

Table 5-8. Worker Households by Occupation – Jobs in Off-Site Services to New Residential Units		
Occupation Category	Number of Worker Households	% of Jobs
Management Occupations	14.0	5.1%
Business and Financial	13.8	5.0%
Computer and Mathematical	5.6	2.0%
Architecture and Engineering	0.6	0.2%
Sciences	1.1	0.4%
Community & Social Services	6.7	2.5%
Legal	1.8	0.6%
Education, and Library	9.7	3.5%
Arts, Design, Entertainment	3.9	1.4%
Healthcare Practitioners	21.6	7.9%
Healthcare Support	27.3	10.0%
Protective Service	3.2	1.2%
Food Prep and Serving	26.4	9.6%
Building and Grounds.	10.6	3.9%
Personal Care and Service	12.7	4.6%
Sales and Related	34.0	12.4%
Office and Admin Support	35.8	13.1%
Farming, Fishing, Forestry	0.2	0.1%
Construction and Extraction	2.4	0.9%
Installation, Maint. and Repair	12.8	4.7%
Production	4.4	1.6%
Transportation	25.7	9.4%
Totals	274.2	100.0%

See Appendix A Tables 19 and 20 for additional detail.

Step 3 – Estimates of Employee Households by Income

In this step, occupations are translated to employee incomes based on recent wage and salary information for workers in San Mateo County from the BLS Occupational Employment Survey. The wage and salary information summarized in Appendix A Table 20 provided the income inputs to the analysis.

For each occupational category shown in Table 5-8, the OES data provides a distribution of specific occupations within the category. For example, within the Food Preparation and Serving Category, there are Supervisors, Cooks, Bartenders, Waiters and Waitresses, Dishwashers, etc. In total, there are approximately 100 detailed occupation categories included in the analysis, as shown in the Appendix A Table 20. Each of these occupation categories has a different distribution of wages, which was obtained from BLS and is specific to workers in the County as of 2020.

Household incomes are estimated from employee incomes using ratios between individual employee income and household income derived from 2015-2019 ACS data for the San Francisco Bay Area. Ratios used in this section are the same as those used in Section 4 and presented in Table 4-5.

Estimated household incomes are compared to the income criteria shown in Table 2-4 to determine the percentage that qualify within each income category for each potential household size/number of workers combination.

Step 4 – Distribution of Household Size and Number of Workers

In this step, we account for the distribution in household sizes and number of workers using local data obtained from the U.S. Census. 2015-2019 ACS data is used to develop a set of percentage factors representing the distribution of household sizes and number of workers within working households. The percentage factors are the same as used in Section 4 and presented in Table 4-4. Application of these percentage factors accounts for the following:

- Households have a range in size and a range in the number of workers.
- Large households generally have more workers than smaller households.

The result of this step is a distribution of working households by number of workers and household size.

Step 5 – Estimate of Number of Households that Meet Size and Income Criteria

Step 5 is the final step to calculate the number of worker households meeting the size and income criteria for the six income tiers. The calculation combines the results from Step 3 on percentage of worker households that would meet the income criteria at each potential household size / number of workers combination, with Step 4, the percentage of worker household having a given household size / number of workers combination. The result is the

percent of households that fall into each income tier. The percentages are then multiplied by the number of households from Step 1 to arrive at number of households in each income tier.

Table 5-9 presents the resulting estimates of the number of households within each income category by worker occupation category.

Table 5-9. Employee Households by Occupation and Income (Steps 3, 4, and 5) for Workers in Off-Site Services to New Residents

Major Occupation Category [1]	Extremely Low	Very Low	Low	Moderate	Above Moderate	Over 150% AMI	Total
Management	0.1	0.5	1.9	1.8	2.5	7.2	14.0

Total Households	**41.4**	**42.8**	**102.2**	**43.7**	**21.2**	**22.9**	**274.2**
Rounded	**41.0**	**43.0**	**102.0**	**44.0**	**21.0**	**23.0**	**274.0**

[1] See Appendix A Tables 19- 20 for information on major and detailed occupation categories identified for detailed compensation analysis.
[2] Represents occupation categories which have a minor amount of employment, and for which detailed compensation analysis was not completed. These worker households are assumed to have a similar income distribution to other employees.

5.4 Summary of Housing Need by Income, Off-site Workers

Table 5-10 summarizes the demand for housing by workers in off-site services to the up to 1,730 new residential units by income category.

Table 5-10. Estimated Off-Site Employee Households by Income

	Extremely Low	Very Low	Low	Moderate	Above Moderate	Over 150% AMI	Total
Worker Households by Income	41	43	102	44	21	23	274

As shown in Table 5-10, the up to 1,730 residential units are estimated to create a demand for an additional 274 housing units for off-site workers in services such as retail, restaurants, and education. Housing demand for new off-site workers is distributed across the income tiers with the greatest number of households in the Low Income category. The finding that the jobs associated with consumer spending tend to be low-paying jobs where the workers will require housing affordable at the lower income levels is not surprising. As noted above, consumer spending results in employment that is concentrated in lower paid occupations including food preparation, administrative, and retail sales.

6.0 NET IMPACT ON HOUSING AVAILABILITY

This section combines the findings of the prior three sections to estimate the net impact on housing availability from the proposed Project by income. Net impacts on housing availability represent the combined housing supply and demand effects of the proposed Project including from:

- Added housing supply from construction of new residential units, from Section 3; and
- Added housing demand from added jobs, including on-site jobs, drawn from the analysis in Section 4 and off-site jobs in services to residents, drawn from the Section 5 analysis.

Additions to housing supply increase housing availability while increases in housing demand reduce housing availability.

Section 6.1 addresses total housing availability impacts regardless of location. Section 6.2 provides an estimate specific to impacts occurring within Menlo Park.

6.1 Net Impact on Housing Availability Regionally

The proposed Project is estimated to result in net decrease in available housing units of 815 units regionally, as shown in Table 6-1. This estimate reflects the combined effect of:

- Addition of up to 1,730 new residential units to the housing supply; and
- 2,545 units of added housing demand from new on-site and off-site workers.

Table 6-1. Estimated Net Impact of Project on Housing Availability Regionally

A. Added Housing Supply (Section 3)	1,730 Units
B. Added Worker Housing Demand	
Housing Demand for On-site workers (Section 4)	2,271 Units
Housing Demand for Off-site workers in services to new residents (Section 5)	274 Units
Subtotal Added Worker Housing Demand	2,545 Units
C. Net Decrease in Housing Availability [A. - B.]	(815 Units)

The 815-unit net decrease in regional housing availability represents an increase in housing demand that exceeds the number of new residential units added to the housing supply.

Table 6-2 provides a breakout of the findings by income category. As shown, the 815-unit net decrease in available housing throughout the region consists of 127 Extremely Low, 270 Very Low, 727 Low and 469 Over 150% AMI units. The decrease in housing availability in the Extremely Low, Very Low, Low and Over 150% AMI categories is partially offset by increases in available housing in the Moderate and Above Moderate categories of 70 and 708 units,

respectively, resulting from added housing supply that exceeds added housing demand in these income categories.

Table 6-2. Net Impacts on Regional Housing Availability by Income Level

	Extremely Low	Very Low	Low	Moderate	Above Moderate	Over 150% AMI	Total
A. Housing Supply Added (New Units)	83	37	38	496	1,076	0	1,730
B. Added Worker Housing Demand							
On-site workers: Meta Offices	57	182	440	341	339	450	1,809
On-site workers: Other Uses	112	82	223	41	8	(4)	462
Off-site workers in services to new residents	41	43	102	44	21	23	274
Subtotal Added Worker Housing Demand	210	307	765	426	368	469	2,545
C. Net Decrease in Available Housing (1) [= A. - B.]	(127)	(270)	(727)	70	708	(469)	(815)

(1) Negative figure represents a net decrease in housing availability resulting from housing demand that exceeds added housing supply.

6.2 Menlo Park Share of Impact on Housing Supply and Housing Demand

KMA estimated the share of housing supply and housing demand that would occur within the City of Menlo Park. Estimates represent an allocation of the total housing availability impacts presented in Table 6-2 based on where housing units included in the proposed Project will be constructed (in Menlo Park) and where workers will live (a share in Menlo Park and a share outside of Menlo Park). Two scenarios are presented regarding the share of workers who will seek and find housing within the City of Menlo Park:

A. ***Current Commute Share Estimate*** (7.4% for Meta workers / 5.9% for other workers) – The current commute share estimate uses data on existing commute patterns to estimate the number of workers who will live in Menlo Park. For Meta workers, the 7.4% existing share of Meta workers who live in Menlo Park is used. For all other workers, the 5.9% city-wide average share of Menlo Park's workforce that lives in the city is used.

B. ***Increased Commute Share Estimate at 20%*** (based on 2000 Nexus Study) – The City Council has expressed an interest in improving the jobs housing balance and obtaining data to inform the goal of increasing the number of workers who live and work in Menlo Park. Therefore, for informational purposes, the report provides an additional goal-based estimate of housing units in Menlo Park based on a 20% commute share, which was a goal identified in the City's 2000 Commercial Linkage Fee Nexus Study. The possibility that availability and affordability of housing have contributed to a downward trend in Menlo Park's commute share is a primary reason for including this additional goal-based commute share estimate. The goal-based estimate also illustrates a scenario in which

the residential units added by the proposed Project encourage a larger share of workers to live in Menlo Park[29].

The current (7.4% for Meta and 5.9% for other workers) and 20% commute shares, described above, are applied to estimate the number of employees that will live in Menlo Park.

The analysis under the two commute share scenarios is described below and is followed by additional discussion of the commute shares.

A. Current Commute Share Estimate

The analysis of housing availability impacts within Menlo Park under the Current Commute Share reflects the following allocation of total regional impacts identified in Section 6.1:

(1) **Menlo Park Share of Added Housing Supply –** All residential units added by the proposed Project are in the City of Menlo Park; therefore, all 1,730 units are identified as additional housing supply in Menlo Park.

(2) **Menlo Park Share of Added Housing Demand –** 177 units of 2,545 total units of housing need from added jobs are estimated to be within Menlo Park based on the existing share of Menlo Park workers who live in the city. This result is based on combining the findings on worker housing need by income level summarized in Table 6-2 with a 7.4% commute share factor for Meta workers and a 5.9% commute share factor for other workers, as shown in Table 6-3.

With the Current Commute Share Estimate, the 1,730 units of added housing supply exceed the 177-units of added housing demand in Menlo Park by 1,553 units resulting in a 1,553-unit net increase in housing availability in Menlo Park. As shown in Table 6-3, the estimated 1,553-unit increase in housing availability is comprised of 70 Extremely Low, 15 Very Low, 466 Moderate, and 1,050 Above Moderate Income units, partially offset by a net decrease in housing availability within the Low and Over 150% AMI categories of 14 and 34 units, respectively, as a result of added employee housing demand exceed the added housing supply within these income categories.

[29] The Project Sponsor has indicated that there will not be any preference or priority for Meta employees to occupy the proposed residential units.

Table 6-3. Estimated Menlo Park Share of Net Impacts on Housing Availability by Income Level – Current Commute Share Estimate								
	Basis for Allocation to Menlo Park	Extremely Low	Very Low	Low	Moderate	Above Moderate	Over 150% AMI	Total
A. Added Housing Supply (New Units)	*all units are in Menlo Park*	83	37	38	496	1,076	-	1,730
B. Menlo Park Share of Added Worker Housing Demand								
Meta Offices	*7.4% Menlo Park commute share for Meta workers*	4	14	33	25	25	33	134
Other Uses	*5.9% Menlo Park commute share from Census*	7	5	13	2	-	-	27
Off-site workers		2	3	6	3	1	1	16
Subtotal Demand		13	22	52	30	26	34	177
C. Net Increase in Housing Availability (1) [= A. - B.]		70	15	(14)	466	1,050	(34)	1,553

(1) Negative figures represent a net increase in housing demand that exceeds added housing supply within the particular income category.

The commute share factors are applied uniformly across each of the household income tiers to arrive at estimates of Menlo Park's "share" of the worker housing demand for each income tier. The actual distribution by income tier in Menlo Park would likely vary from these estimates based on factors, such as the existing housing stock in Menlo Park, limited availability of affordable units, and the future production of market rate and affordable units in Menlo Park.

B. Increased Commute Share Estimate

The Increased Commute Share Estimate is based on the City's 2000 Nexus Study which incorporated a commute share assumption of 20%. This 20% commute share assumption reflects a goal to house a larger share of the city's workforce locally that was approximately double the 10% commute share for Menlo Park as of the time the Nexus Study was prepared[30]. As stated in the 2000 Nexus Study:

[30] Per the 1990 Census, Menlo Park's commute share was 10% based on a total number working in Menlo Park of 26,048 of which 2,662 lived in Menlo Park. Figures do not include those who work out of their homes rather than commute to a separate workplace. The 1990 Census was the most recent data available at the time the 2000 Nexus Study was prepared as the 2000 Census data was not yet released. The 2000 Nexus Study references a separate factor of 23%, also as of 1990, which is not comparable to the 10% commute share in 1990. This 23% factor represents the share of Menlo Park *employed residents* (residents who are employed) who work in Menlo Park versus commute out of Menlo Park to a job located in another city.

Using a relatively higher number provides a goal for the City to achieve. Although inflated housing prices in the 1990's have resulted in a decrease in the percentage of Menlo Park workers who can afford to live in Menlo Park, the City's goal is to encourage local workers to live in Menlo Park in order to achieve a better jobs/housing balance.

This Increased Commute Share Estimate provides additional information regarding how analysis findings would vary were the City to seek to house 20% of the added workforce locally consistent with the goal identified in the 2000 Nexus Study.

With the Increased Commute Share Estimate, application of the 20% goal-based commute share results in allocation of 509 out of 2,545 units of added housing demand from new jobs. The 1,730 units of added housing supply exceed the 509-units of added housing demand in Menlo Park by 1,221 units, resulting in a 1,221-unit net increase in housing availability in Menlo Park.

Table 6-4 presents the findings by income level with the Increased Commute Share Estimate. As shown, the estimated 1,221-unit net increase in available housing units in Menlo Park consists of 42 Extremely Low, 411 Moderate, and 1,002 Above Moderate units, offset by a net decrease in housing availability within the Very Low, Low, and Over 150% AMI categories of 25, 115, and 94 units, respectively.

Table 6-4. Estimated Menlo Park Share of Net Impacts on Housing Availability by Income Level – Increased Commute Share Estimate

	Basis for Allocation to Menlo Park	Extremely Low	Very Low	Low	Moderate	Above Moderate	Over 150% AMI	Total
A. Added Housing Supply (New Units)	*all units are in Menlo Park*	83	37	38	496	1,076	-	1,730
B. Menlo Park Share of Added Worker Housing Demand								
Meta Offices	*7.4% Menlo Park commute share for Meta workers*	11	37	88	68	68	90	362
Other Uses	*5.9% Menlo Park commute share from Census*	22	16	45	8	2	(1)	92
Off-site workers		8	9	20	9	4	5	55
Subtotal Demand		41	62	153	85	74	94	509
C. Net Increase in Housing Availability (1) [= A. - B.]		42	(25)	(115)	411	1,002	(94)	1,221

(1) Negative figures represent a net increase in housing demand that exceeds added housing supply within the particular income category.

6.3 Additional Discussion of Commute Share

According to the U.S. Census 2015-2019 American Community Survey (ACS), 5.9% of those who currently work in the City of Menlo Park also live in the City of Menlo Park. The remaining 94.1% of the workforce commutes in from outside of the city. The existing percentage of workers commuting in from other jurisdictions is attributable to a number of factors including the supply of housing relative to the number of jobs and the high cost of housing in Menlo Park. Nevertheless, 5.9% does provide a benchmark for the propensity of Menlo Park workers to seek and find housing within the city.

The percentage of workers in Menlo Park who also live in the city has been generally decreasing over the decades with 10% of workers living in the city as of the 1990 Census, decreasing to 7.2% with the 2000 Census to 5.9% in the most recent ACS data. Workers most everywhere tend to commute more in recent years than in the past and, in addition, Menlo Park has become less affordable over time. The relationship between job growth in Menlo Park relative to the amount and affordability level of housing that has been added over time is likely a significant factor in this trend. However, in any metropolitan region such as the Bay Area, there are numerous individual factors that influence how workers, in general, select their neighborhoods or communities to live in beyond basic housing supply, price/rent, and proximity to work considerations. Examples listed below are by no means exhaustive and no hierarchy is implied by the order:

- Type of unit; people tend to be looking for a specific kind of housing – an apartment, a condo, a detached home. These choices are tied to stage of life as well as affordability and other factors.
- Commute to work – Travel time to work and commute options are important to those with a regular commute. In many households, more than one household member works, so a residential location may be a compromise to make commuting in multiple directions acceptable.
- Proximity to social, ethnic and religious communities.
- Accessibility to recreational resources. This can be general like proximity to parks and playgrounds, or specific to certain recreational interests ranging from jogging trails, to golf, to just about any recreational pursuit.
- Quality of schools – either indicated by specific measures or purely perception. This is mainly a factor of concern for those with children or seeking housing with future children in mind.
- Accessibility to culture and entertainment.
- Public safety – like schools either based on hard data or simply perceptions and reputation which may not be supported by hard data.

- Air quality is a commonly cited factor in the Los Angeles basin, but far less so in the Bay Area.
- Weather and microclimates in the Bay Area dictate communities of choice for many. People tend to either hate the cool fog near the ocean or love it.

Although many factors influence housing decisions, because the number of workers that both live and work in Menlo Park is so low and the cost of housing is so high, it is possible that the 5.9% existing commute share does not reflect the proportion of workers who would live in Menlo Park if they could find housing and could afford it. The possibility that availability and affordability of housing have contributed to a downward trend in Menlo Park's commute share is a primary reason for including a separate Increased Commute Share Estimate, described above.

Meta provided data on commute patterns for its existing Menlo Park workforce. The data provided by Meta indicates that approximately 7.4% of Meta's Menlo Park workforce lives in Menlo Park, somewhat higher than the percentage for Menlo Park workers overall per the ACS data. The reasons for Meta worker's slightly higher propensity to live in Menlo Park are not known. This Meta-specific commute data is applied for purposes of estimating the share of Meta workers who would seek and find housing in Menlo Park with the Current Commute Share Estimate.

The current commute shares of 5.9% for all Menlo Park workers and 7.4% for Meta workers are applied for purposes of the Current Commute Share Estimate as these factors represent the best and most current data available on the share of workers likely to seek and find housing in Menlo Park. Following is a discussion of factors that suggest a higher commute share could be possible in the future as well as opposing factors that suggest the current commute share likely provides a good indicator.

Factors that Suggest Potential for Increased Commute Share

There are several factors that suggest that an increase in the share of workers who live in Menlo Park might be possible:

1. The 1,730-unit size of the proposed Project represents an approximately 12% increase in the size of the existing Menlo Park housing stock of 14,124 units[31]. Given the large number of units being added, which would represent a material expansion of the city's existing housing stock, the proposed Project could potentially contribute to an increase in the percentage share of workers living locally.

[31] Number of housing units as of January 1, 2021 per California Department of Finance Table E-5, Population and Housing Estimates for Cities, Counties, and the State, 2011-2021 with 2010 Census Benchmark.

2. The number of housing units added by the proposed Project exceeds added housing demand in Menlo Park based on existing commute shares, resulting in an increase in housing availability that could accommodate a potential increase in the share of workers that live locally.

3. New housing added by the proposed Project would be very accessible to jobs within the Project as well as Meta's other nearby facilities. This could make the new housing uniquely desirable for Meta workers, attracting a larger share to live locally. Although, Meta workers would not receive any preference or priority to lease the units according to the Project Sponsor and, as discussed above, many factors affect choices about where to live.

4. In addition to the residential units within the proposed Project, several housing developments are currently going through the entitlement process or were recently approved in the vicinity of the proposed Project including the Menlo Uptown Project with 483 units, Menlo Portal Project with 335 units, 111 Independence Drive with 105 units, Menlo Flats with 158 units, and 123 Independence with 432 units. Combined with the 1,730 units included in the proposed Project, a total of over 3,000 new units are proposed in the vicinity. These proposed units will increase the opportunities for workers to live in Menlo Park and create the potential for an increase in the percentage share of workers who live locally. Construction of new housing can be expected to contribute toward increasing the number of workers that live locally by providing additional housing opportunities in Menlo Park.

Factors That Suggest Current Commute Share Provides Good Indicator

While the factors described previously suggest an increase in commute share could be possible, following are opposing factors that suggest that the Current Commute Share Estimate likely provides a good indicator of the share of workers who would live in Menlo Park, or that any increase in commute share is likely to be modest:

1. Census data for Menlo Park since 1990 do not show a correlation between job growth and number of Menlo Park workers residing locally. The number of jobs in Menlo Park increased by 17,478 or 67% from the 1990 Census to the 2015 - 2019 ACS. During the same period, the number who both live and work in Menlo Park, excluding those who work out of their homes, decreased from 2,662 to 2,589 (a 3% decrease). An analysis of compensation levels for jobs added since 1990 was not prepared; however, anecdotally one can observe that the employment growth during this period probably included a number of highly compensated jobs. Despite the addition of over 17,000 jobs during this period, of which at least a portion were likely highly compensated, the number of workers who both live and work in Menlo Park declined.

2. The expanding size of the Bay Area's job and housing markets combined with an increase in multiple-earner households has created more options for where to live and work and more households who must take locations of multiple jobs into account in selecting a residential location.

3. The proposed Project is very accessible to freeways including US-101 and SR-84 / the Dumbarton Bridge. It is arguably one of the most conducive locations in Menlo Park for commuting from other jurisdictions.

4. Menlo Park is viewed as a highly desirable place to live. Workers in the proposed Project who wish to live in Menlo Park would be competing for a limited amount of available housing with many other households in the Peninsula / Silicon Valley housing market who may also be seeking to live in Menlo Park.

5. Some jobs in off-site services such as retail, medical care, and restaurants may be in nearby cities rather than in Menlo Park. For those who work in nearby cities, the propensity to live in Menlo Park is expected to be less than the 5.9% commute share for Menlo Park workers[32].

6. The experience of remote work during the coronavirus pandemic has led several high-profile tech companies, including Meta, to announce plans to provide additional flexibility to work remotely on a more permanent basis. For employees that split their time between remote and in-person work, this additional flexibility may encourage employees to explore housing options further from the office, which could become an additional contributing factor to a declining share of workers who live in Menlo Park.

7. The focus of the commute shares described in this report are on the percentage share of those who work in Menlo Park that also live in Menlo Park. However, it is also possible to look at commuting from the opposite direction: considering residents of Menlo Park who are in the workforce, what share work in Menlo Park and what share commute out of the city to a job located elsewhere? Data from the ACS indicates that, 17% of working residents of Menlo Park work in Menlo Park while the remaining 83% commute out to jobs in other cities. The fact that many residents commute out to jobs elsewhere suggests a limit to how much Menlo Park's commute share could be increased by adding additional housing.

[32] For example, around 3.9% of those who work in Palo Alto live in Menlo Park based on data from the American Community Survey, lower than the 5.9% share for Menlo Park workers.

6.4 Estimated Commute Shed for Proposed Project

It is anticipated that workers at the proposed Project would commute to the Project site from throughout the region. Table 6-5 presents data on commuting by jurisdiction. The estimates reflect the same data sources as used for the Current Commute Share Estimate described above. Based on the data in Table 6-5, it is anticipated that approximately two thirds of workers would live in Santa Clara and San Mateo counties. Remaining workers are estimated to commute primarily from San Francisco and Alameda counties. Approximately 4% are estimated to commute from other counties.

The Increased Commute Share Estimate is not presented in Table 6-5 because the 20% goal is focused on Menlo Park's commute share and does not identify targets for any other specific jurisdiction. Progress toward the 20% commute share goal would tend to reduce commuting from other jurisdictions relative to levels indicated in Table 6-5 by increasing the share of workers that live in Menlo Park.

Notes:

[1] Based on data provided by Meta for its Menlo Park employees as of March 2020.

[2] Includes workers residing in jurisdictions for which the relevant commute data has been suppressed by the U.S. Census.

[3] Data is derived from the 2012-2016 American Community Survey, the most recent available complete commute distribution data at the jurisdiction level. The share of Menlo Park's worker-force living in Menlo Park is an exception for which more recent data is available from the 2015-2019 American Community Survey. A reconciliation adjustment to the Balance of San Mateo County was made to account for the 0.6% reduction in the Menlo Park Share since the prior data.

[4] Weighted based on the share of total employment within the office component of the project, anticipated to be occupied by Meta.

7.0 DISPLACEMENT ANALYSIS

This section provides an evaluation of the potential for the proposed Project to contribute to displacement of existing residents and neighborhood change in two proximate communities known to be vulnerable to displacement, East Palo Alto and Belle Haven. As noted above, displacement is not an environmental impact for purposes of CEQA, but this analysis is provided for informational purposes and consistent with the requirements of the 2017 Settlement Agreement.

Displacement occurs when housing or neighborhood conditions force existing residents to move, or households feel like their move is involuntary. Displacement can be caused by a range of physical, economic and social factors including but not limited to foreclosure, condominium conversion, building deterioration or condemnation, increased taxes, natural disasters, eminent domain, and increases in housing costs[33, 34, 35]. The HNA is focused on economic drivers of displacement, specifically the potential for the proposed Project to affect the local housing market and housing costs.

Lower income communities in the Bay Area have become increasingly vulnerable to displacement of existing residents. Employment growth, constrained housing production, and rising income inequality are among the factors that have contributed to increased displacement pressures, especially within lower income communities in locations accessible to employment centers where many households are housing-cost burdened.

Location of Proposed Project Relative to Belle Haven and East Palo Alto

The aerial image below shows the location of the proposed Project relative to Belle Haven and East Palo Alto. The Project site is located on the site of the existing Menlo Science and Technology Park in Menlo Park and is bounded by Willow Road, the currently inactive Dumbarton Rail Corridor, and the Menlo Park Labs business park to the south and east. Belle Haven is a residential neighborhood located across Willow Road to the east of the Project site generally bounded by U.S. 101, Willow Road and the Dumbarton Rail Corridor, outlined in red on the aerial image below. East Palo Alto is located west and south of the Project site beyond the Menlo Park Labs business park, outlined in green on the aerial image below.

7.1 Analysis Approach

Given the complex array of factors that influence housing markets and neighborhood change, precise estimates or projections of outcomes are not feasible; rather, the analysis provides information and context that will be useful in gauging the potential range of impacts. The following analyses were completed to provide this context:

1. *Estimated Impact on Housing Availability* – Similar to the analysis of housing availability impacts in Section 6.2, net impacts on housing availability are estimated for Menlo Park and East Palo Alto combined. This is useful for understanding whether the proposed Project will add to existing demand for housing in the two communities or help to absorb it.

2. *Comparison to countywide real estate trends* – Real estate market trends in East Palo Alto and Belle Haven since 2000 were analyzed in comparison to countywide trends. The purpose is to help understand how localized trends relate to the broader county housing market.

3. *Review of employment trends* – Employment trends were reviewed for San Mateo County and adjacent counties. Employment data is delineated by compensation level so that growth in higher-income and lower-income jobs can be separately understood.

4. *Historical Relationship Between Job Growth and Housing Costs* – The extent to which employment growth and housing costs have been correlated with one another was analyzed using linear regression. Findings are used to identify the potential range of impacts on rents and home prices that could be experienced as a result of the proposed Project.

5. *Comparison of real estate trends to other Bay Area communities vulnerable to displacement* – Real estate market trends in East Palo Alto and Belle Haven since Meta and its affiliates first began occupying its existing Menlo Park facilities are analyzed in comparison to trends in other Bay Area communities identified as vulnerable to displacement. The objective is to examine whether there are indications that Meta's existing campuses have a localized influence on the housing market.

The above analyses all contribute to understanding the potential for the proposed Project to contribute to increases in home prices, rents and displacement pressures in East Palo Alto and Belle Haven.

7.2 Risk of Displacement

East Palo Alto and Belle Haven both have risk factors for displacement. Both have a relatively lower-income existing population that includes a high percentage of households who spend 35% or more of their income on housing. A review of demographics and displacement risk factors specific to the two communities is provided in Appendix B. East Palo Alto's rent control and just cause eviction ordinance provides significant protection to existing renters within multi-family buildings built prior to 1988 but does not preclude the potential for longer-term neighborhood change. The Urban Displacement Project,[36] an initiative of UC Berkeley "aimed at understanding the nature of gentrification and displacement in the Bay Area" has identified the Belle Haven census tract and census tracts within East Palo Alto as areas experiencing "ongoing gentrification and/or displacement" or "at risk of displacement." A separate analysis by the Urban Displacement Project[37] indicates that, despite risk factors for displacement, East Palo Alto had not experienced significant gentrification during the 2000 to 2013 period, potentially due to policies aimed at preventing displacement including rent control and just cause eviction protections. For additional background, see also the Urban Displacement Project report, "East Palo Alto: An Island of Affordability in a Sea of Wealth"[38].

A recent study by UC Berkeley's Center for Community Innovation and its Y-PLAN initiative, titled *Investment and Disinvestment as Neighbors: A Study of Baseline Housing Conditions in the Bay Area Peninsula*, provided an assessment of the baseline housing conditions in Belle

[38] Zuk, M., & Chapple, K. (2015). East Palo Alto: An Island of Affordability in a Sea of Wealth. Urban Displacement Project.

Haven, East Palo Alto, and North Fair Oaks neighborhood (unincorporated San Mateo County). The study found indications of recent changes including increased population turnover, declining school age population, and an increase in homelessness. The study also identified a high incidence of rent burdened households and disproportionate pressure on the local housing market compared to the rest of San Mateo County. The study found more signs of disinvestment in East Palo Alto and more indications of real estate speculation in Belle Haven[39].

East Palo Alto has been described as an "island" of affordability within the higher-priced Silicon Valley / Peninsula housing market. Belle Haven is also historically affordable relative to other neighborhoods in Menlo Park as well as many high-priced communities in San Mateo County and Silicon Valley. However, over the past two decades, home prices in East Palo Alto have increased at the same rapid pace as the county median, while home prices in Belle Haven are now slightly greater than the county median on a per square foot basis. Market rents for available one-bedroom apartments in East Palo Alto average approximately $2,337 per month which is approximately the same as the county average of around $2,305, based on CoStar data as of April 2021. While many existing residents in East Palo Alto are shielded from escalating housing costs through rent control or having purchased homes when prices were lower, the comparatively high cost of entering East Palo Alto's housing market relative to other more affordable locations in the Bay Area suggests that longer-term neighborhood change is likely.

The City of East Palo Alto has adopted policies focused on protecting affordability in the face of displacement pressures, including a rent control and just cause eviction policy described below.

East Palo Alto's Rent Control Ordinance

The City of East Palo Alto regulates rent increases and eviction procedures through the Rent Stabilization and Just Cause for Eviction Ordinance (East Palo Alto Municipal Code Chapter 14.04). The ordinance limits annual rent increases to 80% of the increase in the Consumer Price Index over the prior year. Just cause provisions of the ordinance require landlords to present a valid for-cause basis for terminating a tenancy. Tenants are also protected from retaliation and harassment. Rent control applies to all rental units except single family homes, units in owner-occupied properties of three units or less, new units built after 1988 (other than replacement units), and certain non-profit / group-quarters living arrangements. As required by state law, rents are free to reset to market rate upon turnover. The rent control ordinance shields existing renters from increases in market rents and economic displacement. Because rents reset to market upon vacancy, the ordinance does not preclude neighborhood change over the longer term.

[39] Center for Community Innovation. (2020). Investment and Disinvestment as Neighbors, A Study of Baseline Housing Conditions in the Bay Area Peninsula.

7.3 Net Increase in Available Housing in Menlo Park and East Palo Alto Combined

The net impact of the proposed Project on housing supply and housing demand in Menlo Park is illustrated in Section 6.2. Here, findings are broadened to include East Palo Alto. Demand for housing by income in Menlo Park and East Palo Alto, combined, is estimated using data on commute patterns. Then, estimated demand is compared to added housing supply to calculate the net impact on housing availability.

Commute Data for East Palo Alto, Belle Haven and Balance of Menlo Park

Commute data provided by Meta indicates that approximately 0.5% of Meta's Menlo Park employees reside in East Palo Alto, while another 0.4% reside in Belle Haven. Data from the U.S. Census indicates approximately 3.1% of those who work in Menlo Park commute from East Palo Alto. For Belle Haven, an allocation of the citywide commute share for Menlo Park is necessary as data specific to Belle Haven is not available from the U.S. Census. This allocation is made in proportion to the number of occupied housing units and results in an estimated commute share for Belle Haven of 0.7%. Combined, approximately 7.9% of Meta workers and 9% of all Menlo Park workers reside in Menlo Park and East Palo Alto. The two data sources are combined to estimate a weighted average commute share of 8.1% for East Palo Alto and Menlo Park combined. Commute share figures are summarized in Table 7-1.

Table 7-1. Estimated Percent of Employees Residing in East Palo Alto, Belle Haven, and Balance of Menlo Park

	Based on Meta Employee Commute Flows[1]	Based on Census Average [2]	Weighted Average [3]
Live in East Palo Alto	0.5%	3.1%	1.0%

[1] Based on data provided by Meta for its existing Menlo Park employees in March 2020.
[2] Data for East Palo Alto per U.S. Census Bureau, American Community Survey 2012-2016 Five-year estimates. Special Tabulation: Census Transportation Planning. Figure for Belle Haven based on American Community Survey 2015-2019 for City of Menlo Park allocated to Belle Haven in proportionate to the number of occupied housing units.
[3] Weighted based on employment within the office component, anticipated to be occupied by Meta, as a share of the total employment within the proposed Project.

The substantial housing component of the proposed Project creates a potential for an increase in Menlo Park's commute share, as described in Section 6.3. In recognition of this possibility, and to provide a more conservative analysis, the 20% goal-based Increased Commute Share Estimate is used to illustrate the combined Menlo Park and East Palo Alto share of housing demand. The combined commute share for the two communities would be 21% assuming the 20% commute goal for Menlo Park and using the 1% weighted average existing commute share for East Palo Alto from Table 7-1. The calculation is shown in Table 7-2.

Table 7-2. Estimated Percent of Workers Residing in East Palo Alto and Menlo Park, with 20% Increased Commute Share Goal for Menlo Park	
Live in East Palo Alto	1.0%
Live in Menlo Park	20% Goal
Total East Palo Alto + Menlo Park	21%

Estimated Housing Availability Impacts for East Palo Alto and Menlo Park Combined

The commute shares described above are applied to the total housing demand figures in Section 6.1 to estimate the share of housing demand within East Palo Alto and Menlo Park combined. Applying a 21% combined commute share to the total regional housing need of 2,545 units, results in an estimated demand for 535 total units in East Palo Alto and Menlo Park. Based on the 1,730 new units added to the housing supply minus the estimated demand for 535 units in East Palo Alto and Menlo Park combined, there is an estimated net increase in available housing of 1,195 units. This 1,195-unit estimated net increase in available housing consists of 40 Extremely Low, 407 Moderate, and 998 Above Moderate Income units, partially offset by net decreases in available housing in the Very Low, Low and Over 150% AMI categories of 28, 123, and 99 units, respectively. As in Section 6, housing demand by income category is allocated proportionate to total demand; however, the actual distribution by income category will vary based on the housing units that become available through new construction or turnover of existing units.

Table 7-3. Estimate of Net Impact on Housing Availability in Menlo Park and East Palo Alto Combined

	Extremely Low	Very Low	Low	Moderate	Above Moderate	Over 150% AMI	Total
A. Added Housing Supply (New Units)	83	37	38	496	1,076	-	1,730
B. Added Housing Demand in East Palo Alto and Menlo Park Combined (based on 21% Combined Commute Share)	43	65	161	89	78	99	535
C. Net Increase in Available Housing Units (1) [= A. - B.]	40	(28)	(123)	407	998	(99)	1,195

(1) Negative figures represent a net increase in housing demand that exceeds added housing supply.

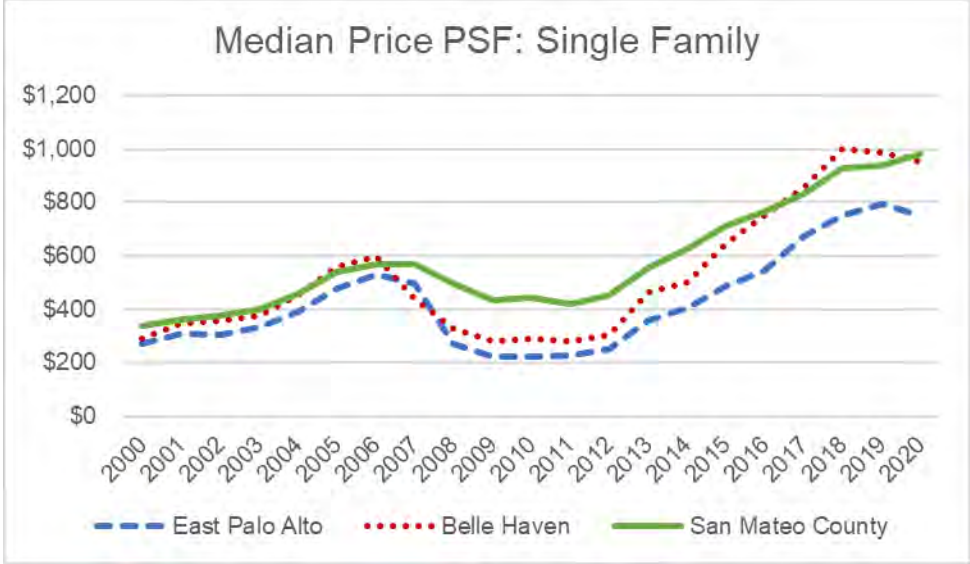
The 1,195-unit estimated net increase in housing availability in East Palo Alto and Menlo Park, inclusive of Belle Haven, is an indication that the proposed Project will help to absorb existing and future housing demand within the two communities, which will tend to moderate or reduce displacement pressures to some degree.

7.4 Real Estate Trends Since 2000

This section reviews data on real estate market trends for East Palo Alto, Belle Haven, and San Mateo County since 2000.

1. Home Prices

The chart below shows trends in median home price over the period from 2000 to 2020. In 2000, the median sales price per square foot in East Palo Alto of $270/SF represented approximately 80% of the county median of $338/SF, while the median price in Belle Haven of $291 per square foot represented 86% of the county median. In both East Palo Alto and Belle Haven, home prices decreased significantly during the housing market downturn and foreclosure crisis, reaching a low of 50% and 65% of the county median, respectively, in 2010. However, prices in both communities have escalated more rapidly than the county median over the subsequent decade. As of 2020, the median sales price in East Palo Alto of $748 per square foot is once again roughly 80% of the county median of $980 per square foot, while the price per square foot in Belle Haven has approached or exceeded the county median for the past five years and was $951 per square foot in 2020.



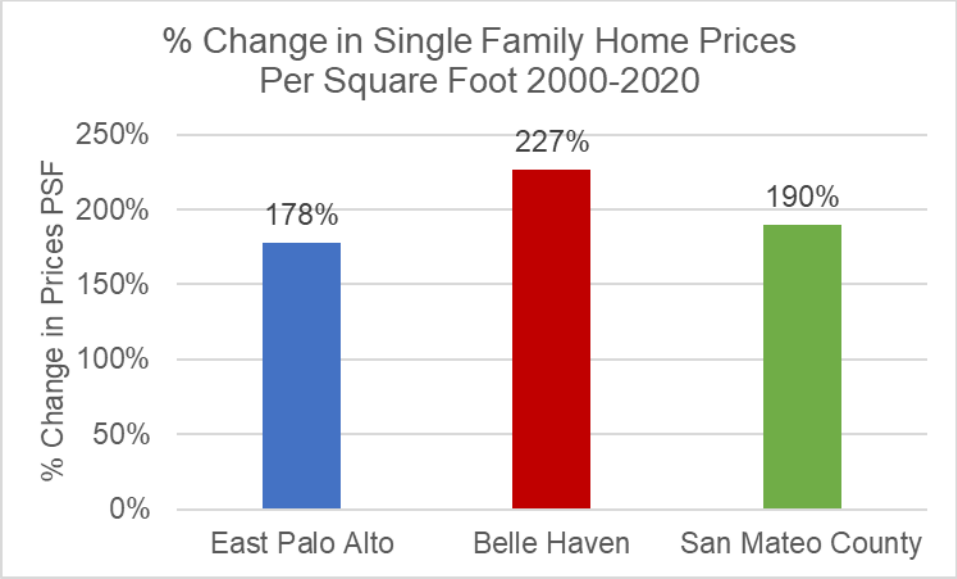
Source: CoreLogic

Table 7-4 shows how single family home prices per square foot in East Palo Alto and Belle Haven have changed over time relative to the county median.

Table 7-4. East Palo Alto and Belle Haven Median Price PSF as Percent of County		
	East Palo Alto as % of County Median Price PSF*	**Belle Haven as % of County Median Price PSF***
2000	80%	86%
2001	84%	96%
2002	80%	94%
2003	83%	94%
2004	85%	99%
2005	89%	104%
2006	93%	105%
2007	87%	77%
2008	54%	66%
2009	52%	65%
2010	50%	65%
2011	54%	67%
2012	55%	67%
2013	64%	83%
2014	65%	80%
2015	68%	90%
2016	71%	98%
2017	81%	103%
2018	81%	108%
2019	85%	105%
2020	76%	97%

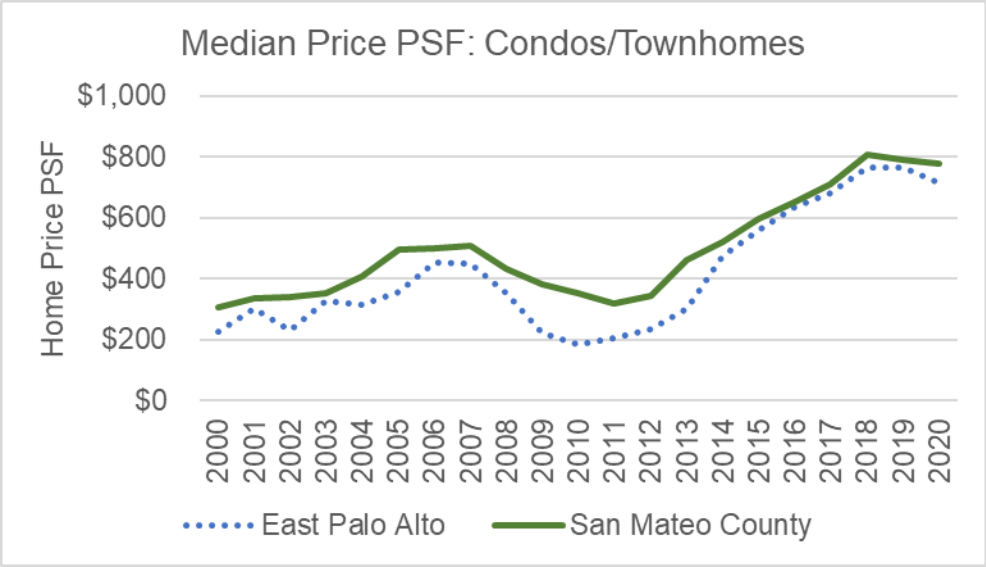
*for single family detached units

Overall, single family median home prices in East Palo Alto have increased by approximately 180% since 2000, approaching the cumulative percent increase in the county median home price of 190% over the same time period. Median single family home prices in Belle Haven increased 227%, outpacing the county. Some of the factors that likely contributed to rising home prices over the period include strong economic growth and housing demand, limited construction of new housing, favorable interest rates and credit terms, and confidence in the Bay Area economy and housing market.



Source: CoreLogic

For condos and townhomes, the median price per square foot in East Palo Alto grew from 74% of the county median in 2000 to nearly match the county median over the past seven years. Condos and townhomes represent a smaller share of the market in East Palo Alto than do single family units (20 condo/townhome sales per year on average as compared to an average of approximately 160 single family sales per year). No condo/townhome sales were recorded in Belle Haven.



Source: CoreLogic

Home prices in East Palo Alto and Belle Haven have experienced more rapid escalation in the period from 2010 to 2020, in part, due to a recovery from the housing / foreclosure crisis. Belle Haven and East Palo Alto have both experienced a steep decline in the *number* of home sales

from 2010. The number of sales in East Palo Alto fell from 260 units in 2010 to an average of 180 units per year from 2015 to 2020. In Belle Haven, the number of sales fell from 70 units in 2010 to an average of 36 units per year from 2015 to 2020. In contrast, the average number of home sales countywide from 2015 to 2020 is roughly unchanged from 2010.[40] This trend is consistent with a higher incidence of distressed sales activity in 2010 as reportedly occurred in East Palo Alto.[41] Distressed and foreclosure sales were prevalent nationally during this period and disproportionately impacted lower-income communities. Homeowners unable to sustain mortgage payments would fall into foreclosure, forcing a foreclosure sale, in some cases after an extended foreclosure process where the property was not being properly maintained. Distressed sales would drive home values in the area down and had the effect of inducing additional homeowners to go "underwater" (market value less than the mortgage debt) and let homes go to foreclosure, further exacerbating the condition, driving up the number of sales and driving down values. In some cases, homes were purchased out of foreclosure by investors who converted them to rental units. With recovery from the foreclosure crisis, the number of sales has now been reduced from the elevated levels that occurred during the foreclosure crises. Additional details on home price and sale trends are included in Appendix C Table 12. While it could be interpreted that existing homeowners will benefit from home price increases, in communities such as East Palo Alto and Belle Haven where more than a third of single-family homes are renter-occupied, rapid growth in home prices may present a heightened risk of renter displacement to the extent it encourages the sale of single family rental properties to new owner-occupants.

2. Apartment Rents

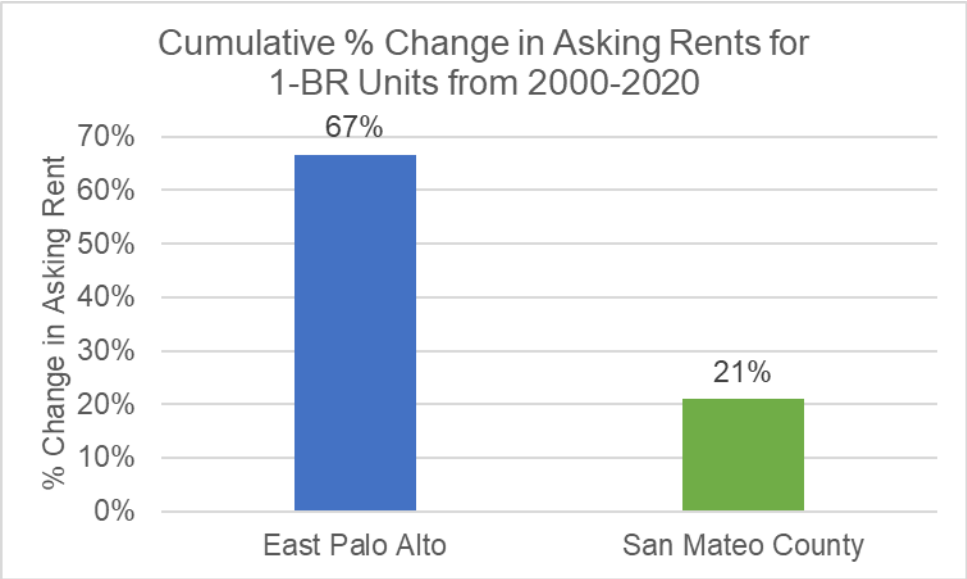
According to data from CoStar Group, which surveys multifamily buildings, apartment rents in San Mateo County increased by approximately 21% from 2000 to 2020. Rent growth in East Palo Alto outpaced the county with a 67% increase, as shown in the charts below. These rental rates reflect asking rents for one-bedroom units that have been vacated and are available for rent. For communities that have rent control, existing tenants in multifamily buildings are shielded from increases in market rents in excess of a predetermined rate (80% of CPI, in the case of East Palo Alto) as long as they remain in their current unit.

Rental market data for Belle Haven is not presented in the chart below as the data appears too limited to be reliable. CoStar data for Belle Haven is limited because three-quarters of rental units built prior to 2016 are for buildings with 10 or fewer units, less likely to be covered by published market surveys. Only approximately 160 (20%) of the 795-unit Belle Haven rental housing stock built before 2016 per the U.S. Census is covered by the historic CoStar data used in the trends analysis. While Costar data also covers two large apartment projects completed

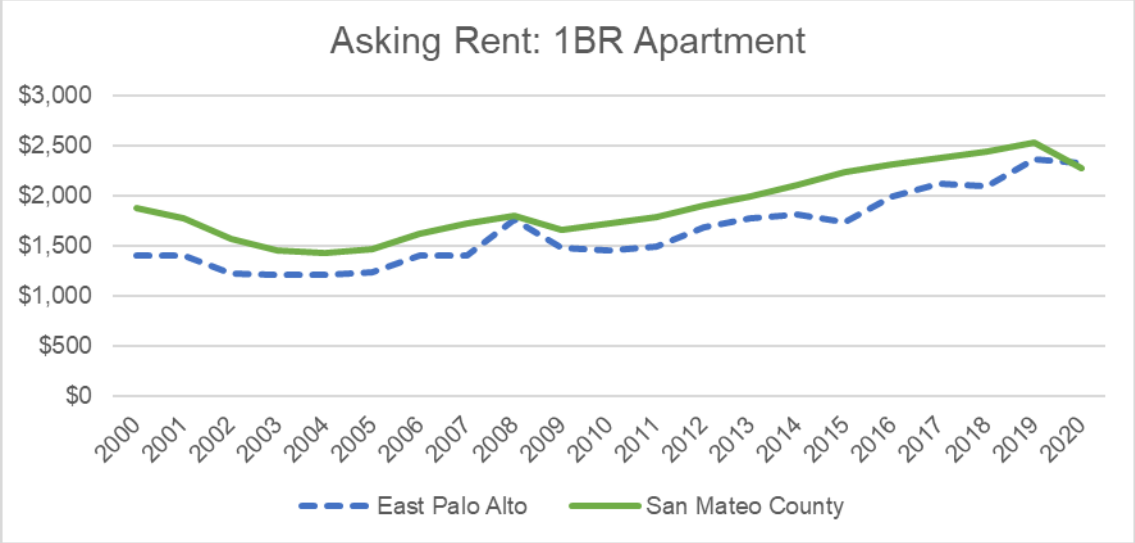
[40] All communities experienced a drop in sales volumes in 2020, likely a result of the coronavirus pandemic.

[41] KQED News. 2013. Can East Palo Alto Weather the Tech Boom and Increasing Gentrification? http://ww2.kqed.org/news/2013/07/18/104008/. The article indicates that from 2008 to 2013, 1,422 of approximately 4,000 single family homes in East Palo Alto had entered some stage of the foreclosure process.

since 2016, rents at these projects reflect a premium for new construction which does not apply to the broader rental market in Belle Haven. Appendix C Table 13 provides the historical data that is available, excluding these recently built projects.



Source: CoStar. Includes all one-bedroom apartments regardless of year built.



Source: CoStar. Includes all one-bedroom apartments regardless of year built.

Following a period of robust job growth and limited housing production, home prices and rents have been rising throughout the Bay Area. The historically affordable communities of East Palo Alto and Belle Haven have either kept pace with or exceeded the significant increases that have been occurring in the county as a whole.

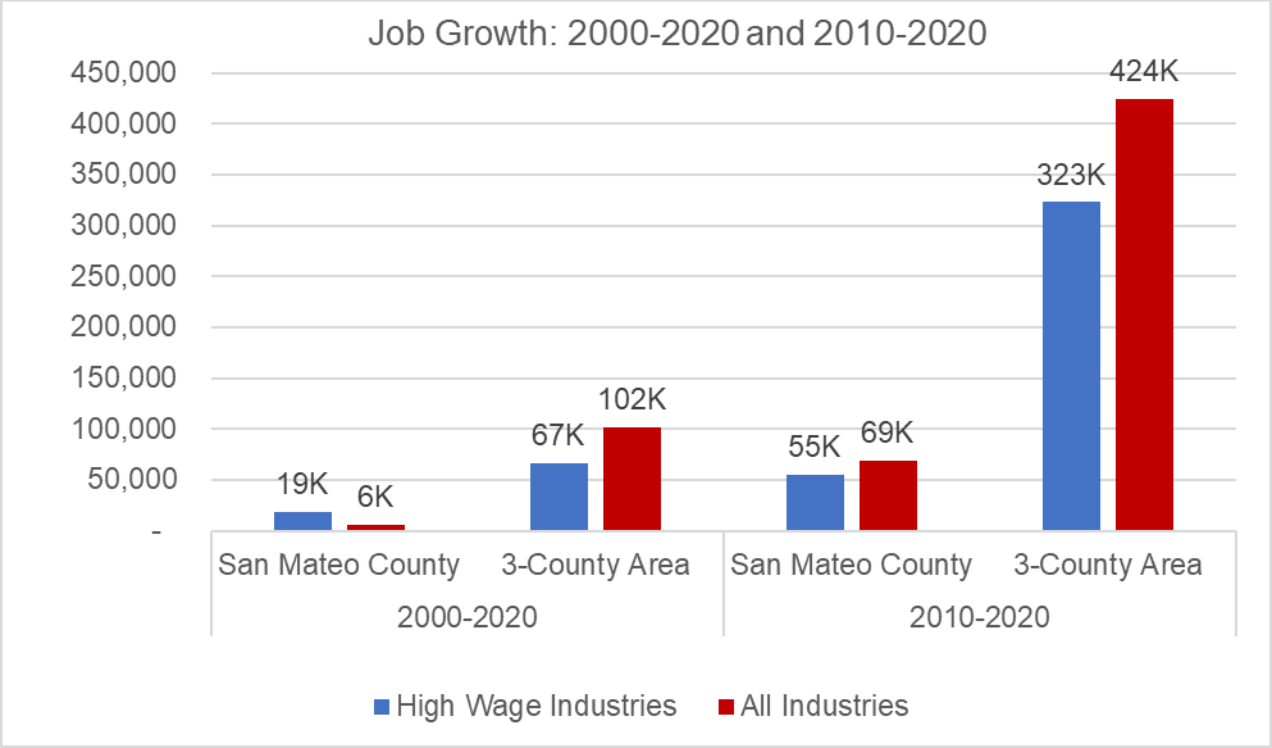
7.5 Employment Trends

Employment growth is an important driver of housing demand both at the local level and regionally. Employment growth over the past decade has likely contributed to significant upward pressure on the housing market as evidenced in the rent and price increases documented above. This section assembles data on historical employment trends since 2000 for San Mateo as well as Santa Clara and San Francisco counties. Approximately 95% of workers living in San Mateo County commute to jobs located in one of these three counties based on U.S. Census data.

According to the Quarterly Census of Employment and Wages, over the period from 2010 to 2019, a total of approximately 591,000 jobs were added in San Mateo, Santa Clara, and San Francisco counties (referred to in the chart below as the "three-county area").[42] More than half of the total job growth occurred in high-wage sectors. For purposes of this analysis, high-wage industry sectors are defined as those with average annual employee compensation above $100,000 as of 2016. From 2010 to 2019, high-wage industries posted annual job growth of 4.6% versus 3.4% annual growth for all industries. Job growth for the longer period from the peak of a previous boom cycle in 2000 to 2019 is less due to significant job losses from 2000 to 2004, offsetting more recent job growth.

The 2020 economic recession caused by the coronavirus pandemic eliminated a portion of the jobs added over the past decade. Data for the first three quarters of 2020 shows a significant decline in total employment in the three-county area. In the second quarter of 2020, total employment in the three-county area declined by 12% in all sectors and by 3% in high-wage sectors compared to the prior quarter. While some jobs were recovered in the third quarter of the year, total employment was still 6% below the first quarter in all sectors and 1% below the first quarter in high-wage sectors.

[42] Employment data for last quarter of 2020 was not yet available from the Quarterly Census of Employment and Wages as of mid-2021 when this analysis was prepared.



Source: Quarterly Census of Employment and Wages. Note: 2020 job estimate reflects first three quarters of calendar year.

Housing production has not kept pace with job growth in San Mateo County and adjacent counties. As illustrated in the chart below, the ratio of jobs to housing units steadily increased in San Mateo, Santa Clara and San Francisco counties over the prior decade. The jobs-housing ratio in 2019 neared the peak of the previous boom cycle, an imbalance that has undoubtedly contributed to increasing prices and rents. In 2020, the jobs-housing ratio declined as a result of job losses associated with the coronavirus pandemic.

7.6 Analysis of Historical Relationship Between Housing Costs and Job Growth

The following section analyzes the extent to which employment growth and real estate trends have been correlated with one another to provide context for understanding the degree of indirect influence the proposed Project may have on local home prices and rents. Simple linear regression is used to quantify the potential change in rents or home prices associated with a given change in jobs based on annual data from 2000 to 2020. Simple linear regression shows whether two variables are correlated with one another but does not prove that there is a causal relationship.

Geographic Scale

The regression analyses are performed for two geographic scales with respect to job growth:

a) San Mateo County ("single county"); and

b) San Mateo, Santa Clara, and San Francisco counties combined ("three-county").

The single-county analysis likely provides an upper-end estimate of the indirect influence of employment growth on local real estate trends, since it attributes all variation in local rents and home prices to job growth within the county. In reality, job growth in other counties would also have an influence, along with separate factors that may be correlated with job growth such as growth in incomes. Therefore, the single county analysis likely overstates the impacts.

The three-county analysis provides a lower estimate of the influence of employment growth on local real estate trends, at least for purposes of understanding the proposed Project's influence, since the analysis assumes that job growth across the three counties has a uniform influence on rents and home prices within San Mateo County. For workers who live in San Mateo County, 95% work in San Francisco, San Mateo, or Santa Clara counties as shown in Table 7-5. Comparatively few workers who live in San Mateo County commute east into Alameda County (3%). Therefore, job growth within the three selected counties is anticipated to have the greatest influence on housing prices and rents within San Mateo County. The three-county analysis may understate the influence of local job growth by treating jobs added anywhere within the three counties as having an equal influence on rents in San Mateo County. Since the majority of San Mateo County residents work within the county (57%), as shown in Table 7-5, job growth within San Mateo County likely has somewhat more of an influence than job growth in Santa Clara County or San Francisco.

Table 7-5. County of Work, Workers Residing in San Mateo County		
Workplace	Number Workers	Percent
San Mateo County	222,355	57%
San Francisco	84,195	22%
Santa Clara County	61,165	16%
Subtotal	367,715	95%
Alameda County	12,940	3%
Other Counties	6,936	2%
Grand Total	387,591	100%

U.S. Census Bureau, 2012-2016 American Community Survey 5-Year Estimates, County-to-County Commuting Flows.

Approach to Capturing Multiplier Effects: High-Wage Jobs Analysis

The regression analysis evaluated the relationship of home prices and rents to both total job growth and high-wage job growth. High-wage job growth is defined for purposes of the analysis as employment within industries that have average pay above $100,000 per year as of 2016.

The high-wage analysis is an approach to capturing the impact of "multiplier effects." Technology, bio-tech, and other high-wage sectors help drive growth in other sectors of the local economy such as retail, food, and transportation through spending by these businesses and their workforce. Employment and economic growth stimulated through this spending is commonly referred to as the "multiplier effect". Examining the relationship between housing costs and jobs in high-wage industries, specifically, enables the impact that potential multiplier effects have on housing costs to be captured. To the extent high-wage jobs are responsible for additional job creation through multiplier effects, potential impacts would be captured in the market data on home prices and rents and reflected as part of the correlative relationship identified by the analysis.

Adjustments for Inflation and Added Housing

Two adjustments were made to the real estate and employment data used in the regression analysis:

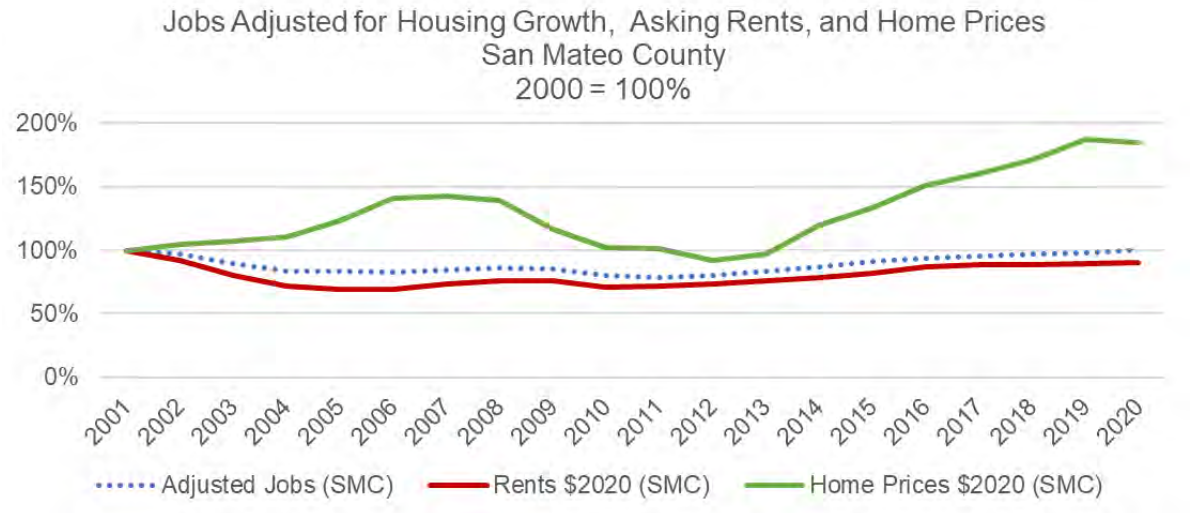
1. *Inflation adjustment* – Rent and sales price data for San Mateo County is expressed in constant 2020 dollars, adjusting for inflation based upon the Bureau of Labor Statistics Consumer Price Index for All Urban Consumers (CPI-U).

2. *Adjusted Jobs (net of housing growth)* – Employment data was adjusted to reflect the portion of job growth since 2000 that can be accommodated by housing construction since that time, using the same 1.91 workers per household factor applied in Sections 4 and 5 as detailed in Appendix C Tables 10 and 11. For example, as of 2010, there were

approximately 317,600 jobs in San Mateo County and 271,000 housing units, of which 10,400 units were built since 2000. The number of jobs accommodated by housing units built from 2000 to 2010 (10,400 housing units x 1.91 workers per household = approximately 19,900) is subtracted from total 2010 employment (317,600 jobs) to arrive at the adjusted estimate of 297,700 jobs as of 2010. In the case of the three-county analysis, employment within the three-county area is similarly adjusted by housing growth within the three-county area. Thus, the linear regression analyses estimate the relationship between inflation-adjusted rents and home prices and employment growth, net of the offsetting influence of housing growth.

Summary of the Data

The following two charts compare historical inflation-adjusted rents and home prices with changes in employment for San Mateo County and the three-county area including San Francisco and Santa Clara counties, respectively. The charts present the trends as an index relative to 2000 levels. Rents have generally trended down when the number of jobs was decreasing and up when jobs were added, suggesting a relatively strong correlation between rents and jobs. Rents decreased further than the number of jobs, in percentage terms, following the "dot com crash" around 2000 and were still below 2000 levels in inflation-adjusted terms as of 2020. Real home prices, on the other hand, grew from 2000 to 2006 by over 40% even as employment fell by approximately 15%. Jobs and home prices were positively correlated over the past decade; however, it is likely that interest rates and mortgage credit availability are as important, if not more important, than employment growth in explaining historical variation in home prices.



Sources: Quarterly Census of Employment and Wages, California Department of Finance, CoStar, CoreLogic, Bureau of Labor Statistics Consumer Price Index.

Regression Analysis Findings

Table 7-6 presents the results of the regression analysis for the eight separate scenarios tested. Additional supporting information is included in Appendix C. The primary findings of the analysis are:

- Rents have a positive, statistically significant correlation with job growth in all scenarios.
- Job growth was found to have a weak positive correlation to home prices in all scenarios tested.
- Each 10,000 total jobs added to the county (net of offsetting housing growth) is correlated with a 3.9% increase in rents and 3.6% increase in home prices and each 10,000 jobs within the three-county area is correlated with a 0.7% increase in rents and a 0.6% increase in home prices. As discussed below, the single-county and three-county findings are used to bracket an upper and lower estimate of the impacts.
- Each 10,000 high-wage jobs (net of offsetting housing growth) added to the county is correlated with a 6.1% increase in rents and 6.5% increase in home prices and each 10,000 high-wage jobs within the three-county area is correlated with a 1.0% increase in rents and a 0.8% increase in home prices.

Table 7-6. Summary of Regression Analysis Results				
	Scenario	Percent increase per 10,000 adjusted jobs	P-Value (statistically significant values = <0.05)	Adjusted R-Squared (1= perfect correlation; 0= no correlation)
	Single County Analysis [Upper Estimate]			
1	Correlation with All Job Growth			
	Rents	3.9%	<.05	0.90
	Sales Prices	3.6%	<.05	0.28
2	Correlation with High-Wage Job Growth			
	[proxy for inclusion of multiplier-effect]			
	Rents	6.1%	<.05	0.76
	Sales Prices	6.5%	<.05	0.34
	Three-County Analysis [Lower Estimate]			
3	Correlation with All Job Growth			
	Rents	0.7%	<.05	0.92
	Sales Prices	0.6%	<.05	0.22
4	Correlation with High-Wage Job Growth			
	[proxy for inclusion of multiplier-effect]			
	Rents	1.0%	<.05	0.85
	Sales Prices	0.8%	<.05	0.17

Regression Analysis Metrics

The following provides additional information regarding the regression analysis metrics identified in Table 7-6:

Adjusted R-squared – The adjusted R-squared is an indicator of the model's ability to explain historical variation in the dependent variable (rents or home prices) in relation to employment. An adjusted R-squared of 1 indicates a perfect correlation. An adjusted R-squared of 0 indicates no correlation. As would be expected based on the trends described above, the regression model explains most of the variation in rents but no more than one third of the variation in home prices.

P-Value – The p-value indicates the probability of no relationship between the independent and dependent variables. P-values of 0.05 and less indicate there is less than a 5% chance that the observed relationship can be explained by random chance and is a common threshold used to identify statistical significance. P-values for all of the scenarios are below the .05 threshold and are thus identified as significant.

Single-County Versus Three-County Results

The single-county analysis provides a more conservative estimate of the response of local housing costs to a given change in employment compared to the single-county analysis. The estimated change in asking rents and sale prices per 10,000 jobs is approximately six times larger under the single-county analysis versus the three-county analysis. The three-county analysis assumes jobs created anywhere in the three-county area have an equal influence on rents as jobs within San Mateo County. While regional employment dynamics are important, jobs added within San Mateo County probably have a more pronounced influence on local real estate conditions within the county. Thus, the change in rents and sales prices for a given change in jobs is likely to fall somewhere in between the value suggested by the single-county and three-county analysis.

The single-county regression model appears to explain most of the variation in local rents; however, it is important to recognize that job growth within San Mateo County is highly correlated with regional job growth. The single-county analysis will not distinguish the effects of county versus regional job growth and, as a result, will tend to overstate the relationship between job growth in the county and rents.

Analysis Limitations and Potential to Overstate Influence of Job Growth

The analysis relies on a very simple statistical technique to test for correlation but does not prove that the identified relationship between job growth and housing costs is causal. The approach likely overstates the importance of job growth by not distinguishing the effects of other important contributing factors that are correlated with job growth. For example, rising incomes, especially those of higher-income households, enable these households to compete for limited housing supply in the most desirable locations, contributing to rising housing costs. Some communities in San Mateo County, such as Redwood City, have seen construction of a significant number of new rental units that offer superior amenities and command a premium in the market. The inclusion of these newer units in the data set will tend to bring up averages due to higher rents being charged for the new units; however, this does not necessarily mean costs for existing units are increasing. The analysis technique will tend to attribute effects of other factors that are correlated with job growth to the job growth itself, which results in overstating the influence of job growth.

Application of Findings to Estimate Potential Project-Related Impacts

This section examines the potential for the proposed Project to contribute to displacement through an indirect influence on housing market conditions in East Palo Alto and Belle Haven. To the extent the proposed Project generates upward pressure on the housing market, effects are also likely to be experienced locally within the subject communities.

Findings from the regression analysis were applied to the jobs added by the proposed Project to estimate the potential range of impacts. The number of jobs is adjusted for the number of

housing units added by the proposed Project consistent with the adjusted jobs independent variable used in the regression analysis, as described above, and shown in Appendix C Tables 1 and 5. Findings regarding the potential influence of the Project on rents and sales prices are shown in Table 7-7. As shown, a wide range of potential influence is found, from a 0.12% and 0.10% increase in rents and sales prices, respectively, based on the finding of the three-county analysis for all jobs, up to a 1.04% and 1.12% increase in rents and sales prices, respectively, based on the single-county results for high-wage jobs. As discussed earlier, the high-wage jobs analysis is an approach to capturing potential multiplier effects in the analysis.

Table 7-7. Potential Percentage Influence on Rents and Sales Prices

	Lower Estimate (3-County Analysis)	Upper Estimate (SM County Analysis)	Midpoint (of Upper & Lower)
Correlation with All Job Growth			
Rents	0.12%	0.67%	0.39%
Sales Prices	0.10%	0.61%	0.36%
Correlation with High-Wage Job Growth *[captures potential multiplier effect]*			
Rents	0.18%	1.04%	0.61%
Sales Prices	0.14%	1.12%	0.63%

Since the upper and lower percentage impact estimates presented in Table 7-7 likely bracket the range, for purposes of the rental analysis, the midpoints of 0.39% based on all jobs and 0.61% based on high-wage jobs are used. For purposes of the for-sale analysis, the midpoints are 0.36% based on all jobs and 0.63% based on high-wage jobs. The percentage findings presented in Table 7-7 may be converted to a potential dollar influence on rents and home prices. Applying the percentages from the rental analysis to the $2,766 average effective monthly rent in East Palo Alto as of 2020 per CoStar yields an estimated dollar impact of $11 and $17, respectively. Applying the percentages from the for-sale analysis to the 2020 median home prices in East Palo Alto of $870,000[43] yields a potential dollar influence on home prices of $3,100 and $5,500, which translates to a monthly mortgage payment difference of $10 and $19 per month[44], respectively. For Belle Haven, based on the 2020 median home price of $1,010,000[45] and applying the same percentage factors, the impact to home prices is estimated between $3,600 and $6,400, which translates into an estimated monthly mortgage payment difference of between $12 and $22 per month[46]. These estimated dollar impacts on rents and

[43] Price based on CoreLogic home sales data for 2020.

[44] This estimate is based on a mortgage interest rate of 3% as of June 2021 based on the average for 30-year mortgages per the Freddie Mac Primary Mortgage Market Survey and assumes a 20% down payment.

[45] Price based on CoreLogic home sales data for 2020.

[46] This estimate is based on a mortgage interest rate of 3% as of June 2021 based on the average for 30-year mortgages per the Freddie Mac Primary Mortgage Market Survey and assumes a 20% down payment.

sales prices could have a minor influence on residential location decisions; however, estimates are likely overstated for the following reasons:

- **Analysis Approach Will Tend to Overstate Importance of Job Growth** – the analysis will tend to overstate the influence of job growth by omitting other important variables that also affect housing costs. Two such variables include rising household incomes, which can influence housing costs through increased price competition, and addition of new rental and for-sale housing with modern finishes and amenities and higher prices and rents, which can bring up averages but does not necessarily mean costs for existing units are increasing. Both factors are correlated with job growth. The analysis approach will tend to ascribe the impact of these factors to job growth alone, overstating the potential effects of the proposed Project.

- **Offsetting Effects of Nearby Housing Construction Not Reflected** – New housing construction can absorb new demand and moderate or offset the minor potential rent and home price effects estimated. The City has already issued building permits for 1,416 housing units during the current RHNA planning cycle and has over 1,500 housing units proposed in the vicinity of the proposed Project, within the Bayfront Area, in addition to the 1,730 units included within the proposed Project. East Palo Alto has issued building permits for 222 units during the current RHNA planning cycle[47] and has nearly 1,000 new housing units in the development pipeline[48]. Combined, there are over 2,500 housing units currently in the development pipeline in Menlo Park and East Palo Alto, beyond the 1,730 units included in the proposed Project, including approximately 600 below market rate (BMR) affordable units[49] in addition to the 308 below market rate units included in the proposed Project. These 2,500 additional market rate and affordable units currently in the development pipeline in East Palo Alto and Menlo Park will tend to moderate or offset the potential rent and price effects described above; however, moderating effects are not taken into account in the analysis. Therefore, estimates of potential rent and price effects are likely overstated.

7.7 Comparison Communities Analysis

To assist in evaluating whether there are indications that Meta's existing Menlo Park campuses have contributed to recent escalation in home prices and rents in East Palo Alto and Belle

[47] East Palo Alto 2020 Housing Element Annual Progress Report.

[48] October 6, 2020 City of East Palo Alto Staff Report to the City Council RE: Follow-Up on Study Session Related to the Affordable Housing Component of the Euclid Improvements (Woodland Park) Project, Attachment 1. East Palo Alto Housing Breakdown, which indicates approved, planned, proposed or under construction housing units totaling 969 units, not including 108 rebuilt units.

[49] Pipeline total of 600 BMR units summarized from prior HNA's prepared by KMA for projects in the Bayfront Area and the applicant proposal for 123 Independence, the City of Menlo Park summary of pipeline projects in the Bayfront Area and the staff report referenced in the prior footnote with respect to East Palo Alto pipeline projects.

Haven, market trends for East Palo Alto and Belle Haven since initial occupancy of Meta's existing campuses were reviewed in comparison to eight other comparison geographies summarized in Table 7-8.

Table 7-8. Areas Selected for Comparative Review of Real Estate Trends	
Areas	Boundaries
Downtown Redwood City	Zip Code 94063
Hayward (selected zip codes)	Zip Codes 94544, 94541
Bayfair / San Leandro	Zip Code 94578
Fruitvale/ Oakland	Zip Code 94601
West Berkeley	Zip Code 94710
North Richmond	Zip Code 94801
East San Jose	Zip Code 95116
San Mateo County	County

The comparison areas were selected in part based on information from the Urban Displacement Project,[50] an initiative of U.C. Berkeley "aimed at understanding the nature of gentrification and displacement in the Bay Area." Most of the selected areas are identified as vulnerable to displacement of existing residents based on market and demographic conditions, according to the classification system used by the Urban Displacement Project. Five including, Hayward, Fruitvale, West Berkeley, North Richmond, and East San Jose, are in cities that also have some level of rent control beyond what State law requires (maximum limits on rent increases vary). Table 7-9 identifies the "Displacement Typology" for each of the comparison geographies per the Urban Displacement Project.

[50] Source: Zuk, M., & Chapple, K. (2015). Urban Displacement Project.

Table 7-9. Displacement Risk Per Urban Displacement Project

Geography	Boundaries			Primary Displacement Typology[1]	Local Rent Control?
East Palo Alto	City			LISD	yes
Belle Haven	Census Tract:	6117		LISD	no
DT Redwood City	Zip:	94063		LISD	no
Hayward	Zip:	94544,	94541	SMMI	yes
Bayfair/ San Leandro	Zip:	94578		LISD	no[2]
Fruitvale	Zip:	94601		ARG	yes
West Berkeley	Zip:	94710		LISD	yes
North Richmond	Zip:	94801		ARG	yes
East San Jose	Zip:	95116		LISD	yes
San Mateo County	County			SMMI	varies

Displacement Typology Key		
	LISD	Low-Income/Susceptible To Displacement
	ARG	At Risk Of Gentrification
	SMMI	Stable Moderate/Mixed Income

[1] Primary Displacement Typology within area, weighted by population, from Chapple, K. & Thomas, T. (2020). Urban Displacement Project. Displacement typologies indicate risk/stage of displacement at the Census tract level, based on a variety of indicators including loss of affordable units, out-migration of low-income households, and real estate market trends.

[2] In San Leandro, tenants may request an independent review of rent increases above 7%.

The comparison areas were also selected in part based on shared demographic characteristics with East Palo Alto and Belle Haven, including racial/ethnic composition, household income, household size, median age, home values, and housing tenure, as summarized in Table 7-10. San Mateo County is included as an additional point of comparison and indicator of broader housing market conditions, although countywide demographics and market conditions differ from East Palo Alto and Belle Haven.

Table 7-10. Demographics: East Palo Alto, Belle Haven & Comparison Geographies (2020)

Geography [1]	Population	Avg. HH Size	Owner Occ'd % Units	Median Income	Median Home Value	Latino % Pop.	Black % Pop.
East Palo Alto	28,561	4.1	38%	$72,208	$880,910	65%	17%
Belle Haven	8,157	3.7	35%	$79,938	$949,905	69%	19%
DT Redwood City	36,984	3.1	30%	$59,118	$844,940	65%	3%
Hayward	143,743	3.2	48%	$80,767	$613,853	46%	10%
Bayfair/ San Leandro	40,604	2.7	42%	$64,628	$613,173	34%	15%
Fruitvale	53,379	3.4	32%	$52,747	$506,069	53%	14%
West Berkeley	8,452	2.4	35%	$84,537	$854,221	26%	18%
North Richmond	32,640	3.2	43%	$52,761	$351,186	60%	21%
East San Jose	53,028	3.9	38%	$60,887	$653,869	61%	2%
San Mateo County	746,752	2.8	56%	$127,547	$1,212,130	25%	3%

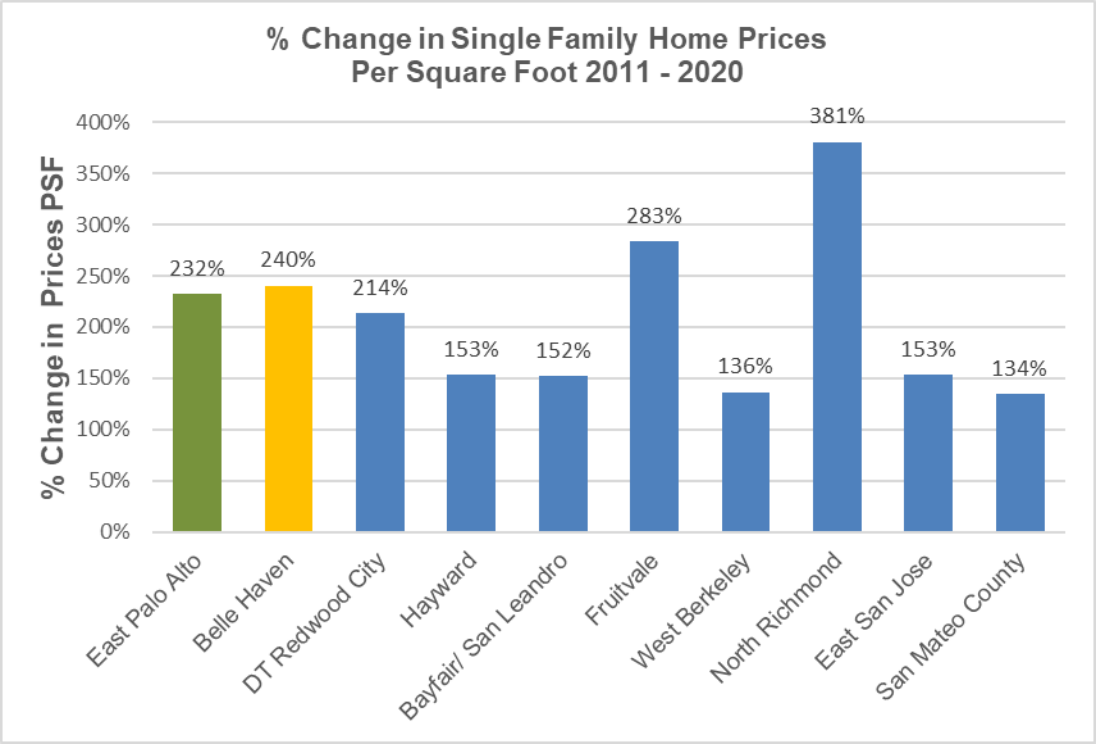
7.8 Real Estate Trends in Comparison Communities, 2011 to 2020

The following summarizes real estate trends in East Palo Alto, Belle Haven, and the eight comparison geographies for the period 2011 to 2020:

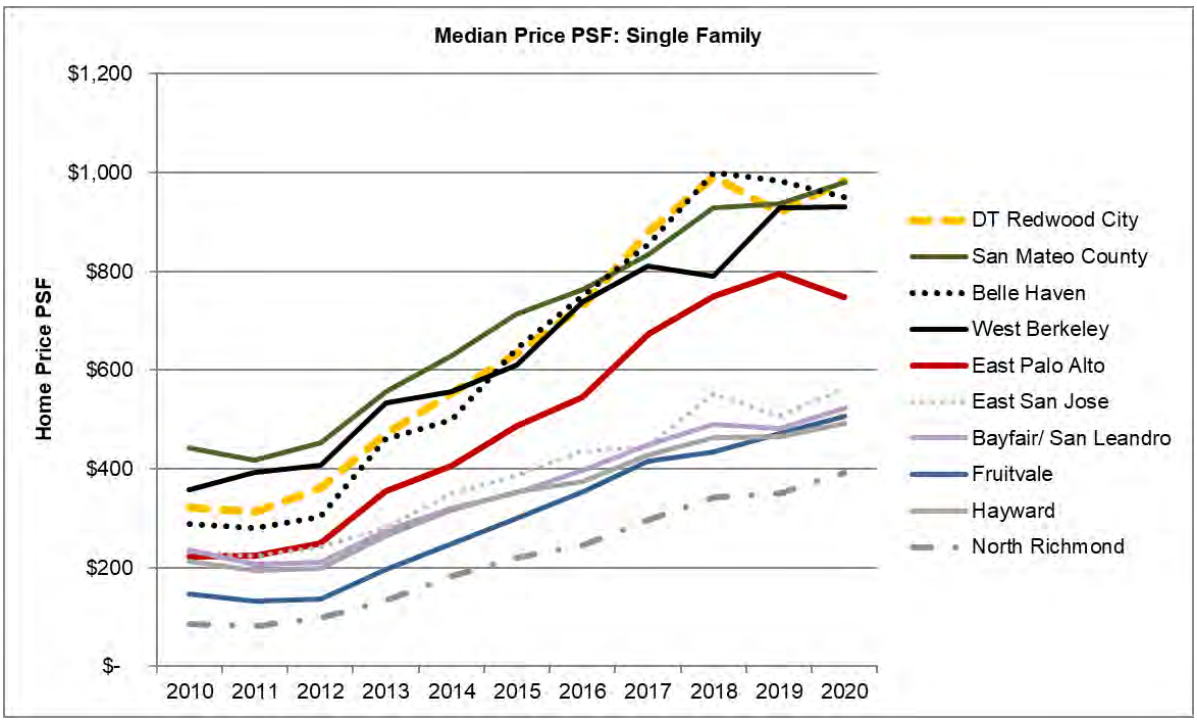
1. Single family Home Prices

Growth in single family home prices in East Palo Alto and Belle Haven has outpaced most selected comparison areas. From 2011 to 2020, the median sales price per square foot for single family homes in East Palo Alto and Belle Haven increased by 232% and 240%, respectively, trailing only Fruitvale and North Richmond. Downtown Redwood City experienced a 214% increase in home prices, while growth in remaining communities ranged from 134% to 153%.



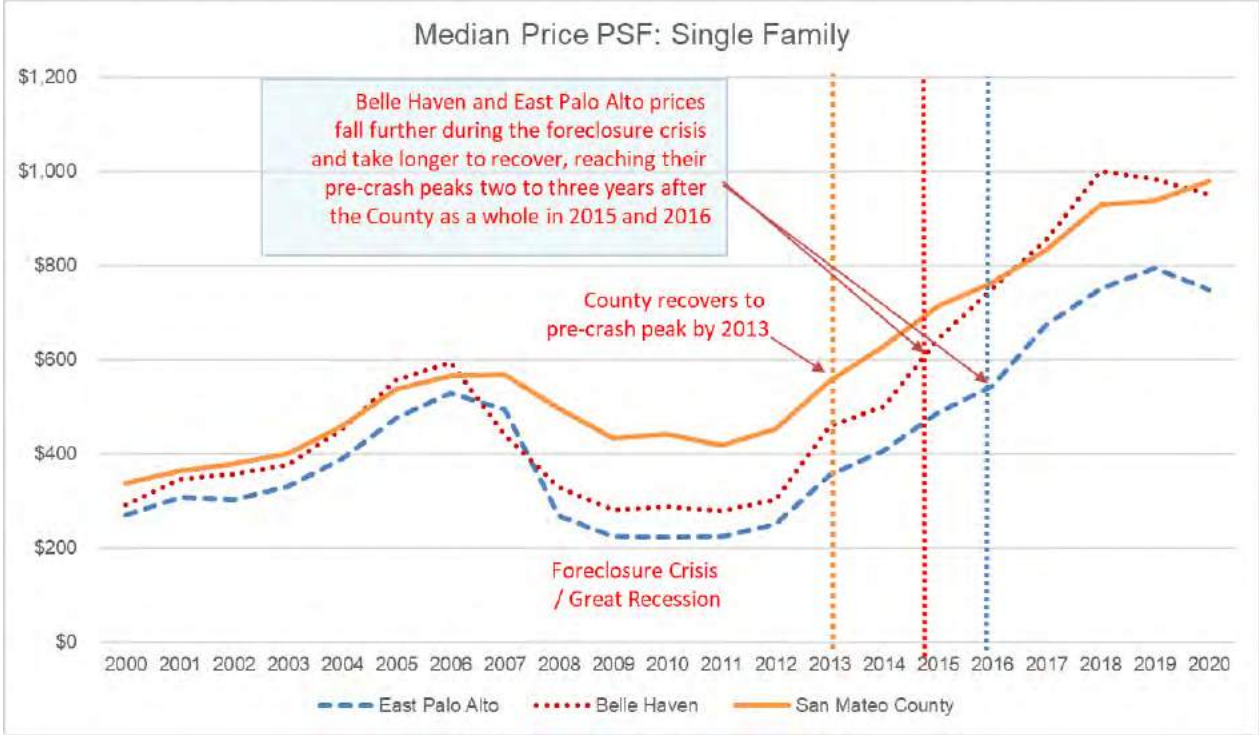
Source: CoreLogic

In 2011, the median sales price per square foot in East Palo Alto of $225/SF represented approximately one-half of the County median of $418/SF. By 2020, the median sales price in East Palo Alto at $748 per square foot was roughly 80% of the County median of $980. Appendix C Table 16 provides the supporting data.

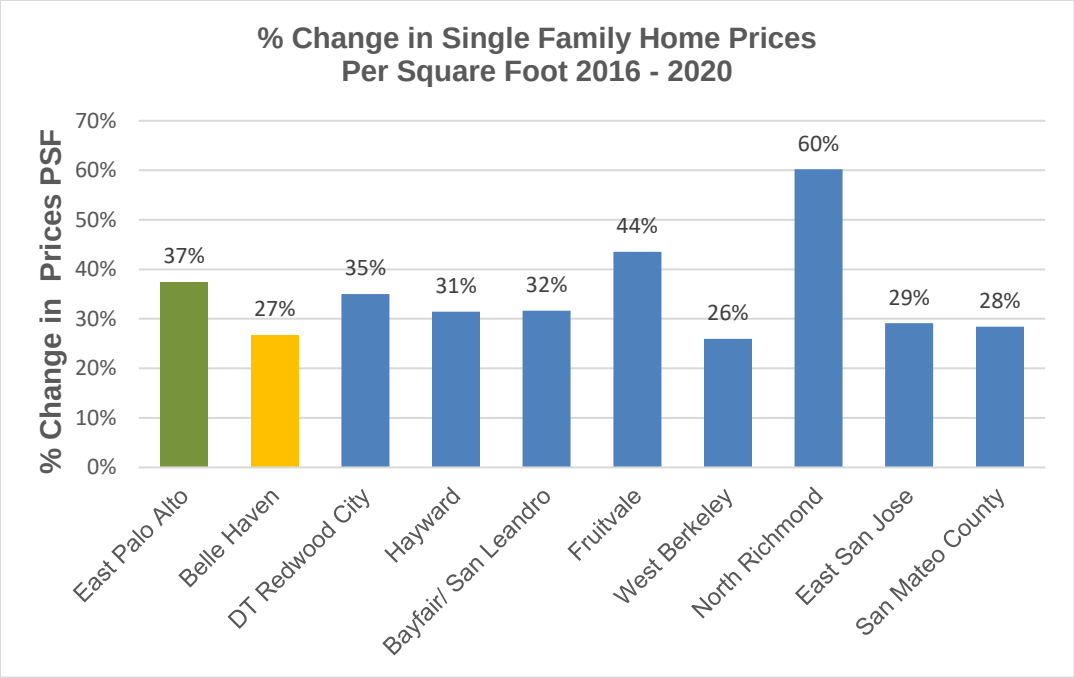


Source: CoreLogic

The percentage increase in single family home prices in East Palo Alto and Belle Haven relative to the county over the 2011 to 2020 period is partly driven by the impacts of the foreclosure crisis that began in 2008. Declines in prices during the crisis were deeper and the recovery took longer in East Palo Alto and Belle Haven than in the county as a whole. Home prices in the county had recovered to their pre-2008 peak by 2013, while prices in Belle Haven took until 2015 to recover and prices in East Palo Alto took until 2016 to reach their prior peak. The chart below provides an illustration of price trends over the longer period since 2000 to illustrate.

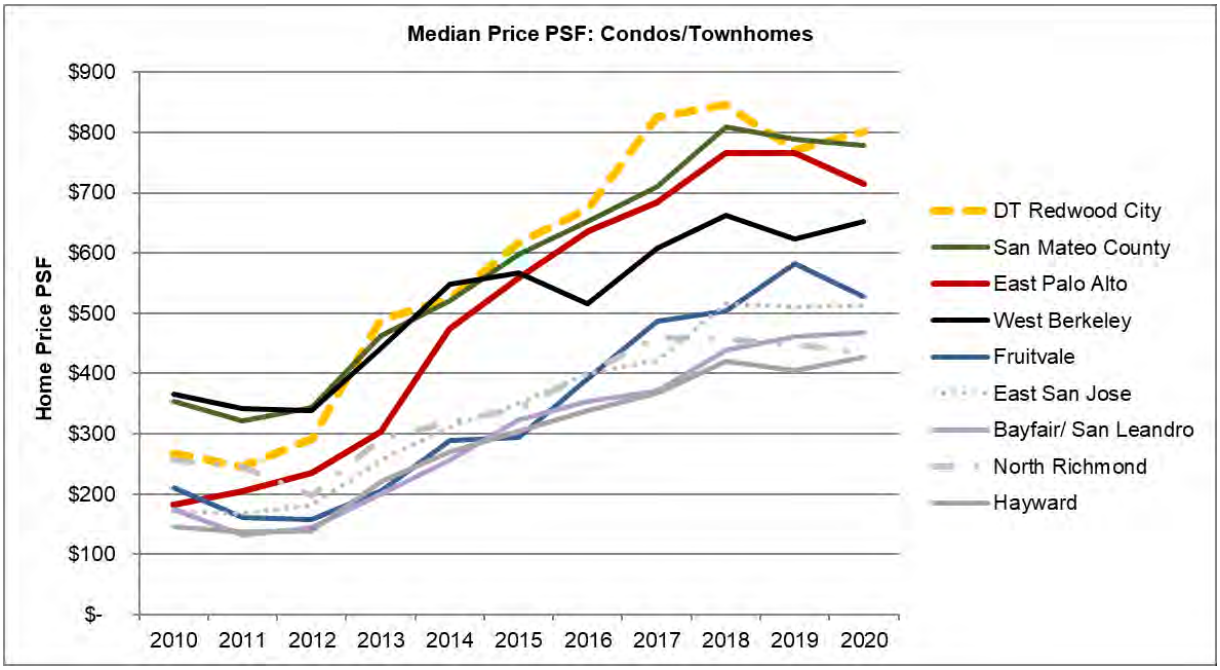


Focusing on trends from 2016 onward, once East Palo Alto had recovered to its pre-2008 peak, yields a different picture of the comparison, as illustrated in the chart below. Since 2016, prices in East Palo Alto increased by 37% and prices in Belle Haven increased 27%, more in line with the County and the other comparison communities, except Fruitvale and North Richmond which experienced greater price increases of 44% and 60%, respectively, as in the longer 2011-2020 period.



2. Condominium and Townhome Prices

For condos and townhomes, the median price per square foot in East Palo Alto grew faster from 2011 to 2020 than all comparison areas except Bayfair/San Leandro, which started from a very low median price in 2011. Condos and townhomes represent a smaller share of the market in East Palo Alto than do single family units (20 condo/townhome sales per year on average as compared to an average of 160 single family sales per year). No condo/townhome sales were recorded in Belle Haven. Appendix C Tables 16 and 17 provide the supporting data.



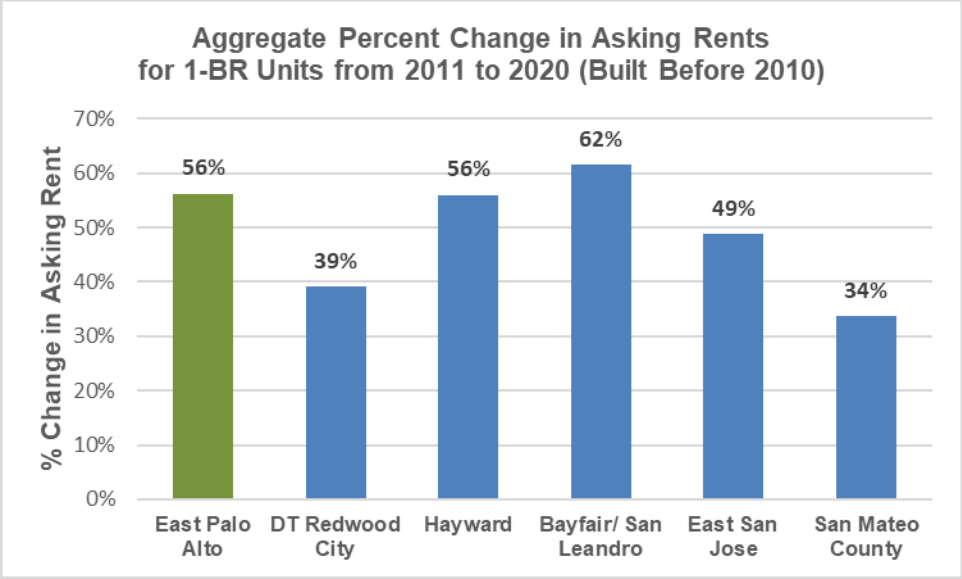
Source: CoreLogic

3. Apartment Rents

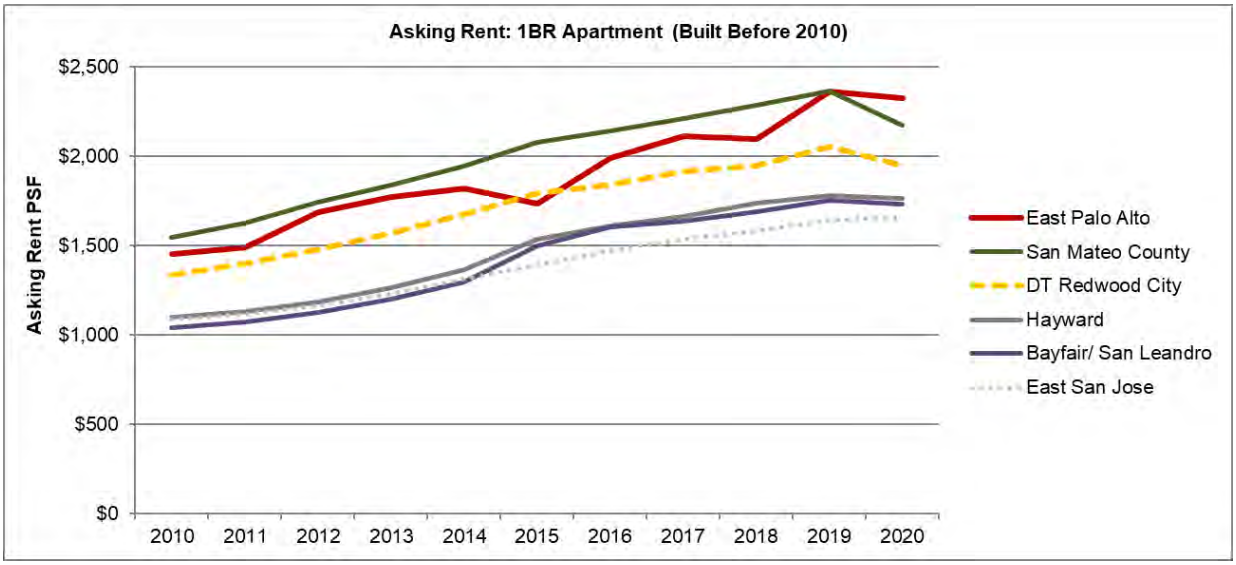
From 2011 to 2020, apartment rents across all comparison areas increased significantly. According to data from CoStar, which surveys multifamily buildings, East Palo Alto experienced one of the greatest increases in rents among the comparison areas. The average asking rent for a one-bedroom apartment grew by 62% in Bayfair / San Leandro, 56% in East Palo Alto[51] and Hayward, and 34% to 49% in the remaining communities. The average asking rent for a 1-bedroom in East Palo Alto, previously 10% less than the County average, has exceeded the County average for the past three years. These trends are presented in the charts below with additional details provided in Appendix C Table 18.

The rental trend data excludes apartments built since 2010, which tend to command higher rents than existing buildings. Reliable data on rents was not available for Belle Haven, Oakland / Fruitvale, North Richmond, and West Berkeley as the rental housing stock in these areas consists primarily of small buildings with less than 20 units that are less likely to report asking rents to CoStar.

[51] While East Palo Alto has rent control, rents reset to market upon vacancy. The 56% increase pertains to rents for units which have been vacated and are available for lease.



Source: CoStar



Source: CoStar

These rental rates reflect asking rents for units that have been vacated and available for rent. Pursuant to State law, existing tenants in multifamily buildings are shielded from annual increases in market rents in excess of 5% plus a local cost of living adjustment, as long as they remain in their current unit. For communities that have a local rent control ordinance, including East Palo Alto, the limit on market rent increases is less than the State threshold, usually no more than the rate of inflation.

Summary of Comparison Communities Analysis

Over the course of a decade-long economic expansion that concluded in early 2020, robust job growth and limited housing production caused housing market conditions to tighten across the

Bay Area with reduced vacancy and rising pricing/rents. Rent and home price trends indicate that the historically affordable communities of East Palo Alto and Belle Haven have experienced among the largest increases in housing prices for both rental and ownership housing types relative to comparable areas elsewhere in the South Bay and East Bay, as well as San Mateo County. Home price increases in East Palo Alto and Belle Haven during the first half of the last decade represented a recovery from the great recession and foreclosure crises, which resulted in a more pronounced decline in home prices in Belle Haven and East Palo Alto than in the County as a whole. Home price increases in the second half of the last decade (2016-2020) were more in line with countywide and comparison community trends, with the exception of North Richmond and Fruitvale, which experienced more pronounced price escalation than Belle Haven or East Palo Alto.

The 2020 economic recession caused by the coronavirus pandemic eliminated a portion of the jobs added over the past decade, which led to temporarily weaker demand for some types of housing. Apartment rents and attached home prices declined in 2020 in nearly all communities analyzed, including East Palo Alto. In contrast, single family home prices increased in 2020 in all areas except East Palo Alto and Belle Haven.

While East Palo Alto and Belle Haven have experienced significant increases in housing costs since Meta first began occupying its existing Menlo Park facilities, increases are within the range of the other comparison communities that are not adjacent to a major tech campus but which are vulnerable to displacement. Therefore, the comparison communities analysis does not indicate clear evidence of a localized influence on market prices and rents based on proximity to the existing Meta campuses that can be distinguished from broader regional trends.

7.9 Displacement Analysis Conclusion

Belle Haven and all areas of East Palo Alto are identified by the Urban Displacement Project as either at risk of or undergoing displacement. East Palo Alto's rent control ordinance shields existing renters in eligible units from rent increases; however, protections do not extend to the more than one third of single-family homes in East Palo Alto that are renter-occupied or to rentals in Belle Haven. Escalating rents and home prices have made these communities far less affordable than they once were. This makes longer term neighborhood change likely as units come available through rental unit turnover or sale of owner-occupied housing because newcomers will generally need to have higher incomes than existing residents to afford the cost of available units.

The proposed Project is likely to create competing influences on displacement pressures in East Palo Alto and Belle Haven, with the large addition to the housing supply pointing toward a moderating influence that could reduce pre-existing displacement pressures while other factors suggest the potential for a modest incremental increase in pre-existing displacement pressures. These competing factors are summarized as follows:

1. *Added Housing Supply Likely to Have Moderating Influence on Displacement Pressures:*

- The 1,730 new units in the proposed Project equate to an approximately 12% increase in the existing 14,124-unit Menlo Park housing stock and a 0.6% increase in the 282,299-unit housing stock of San Mateo County[52]. After taking into consideration additional housing demand in Menlo Park and East Palo Alto added by the proposed Project, there is an estimated 1,195-unit net increase in housing availability in Menlo Park and East Palo Alto combined at rents affordable to Extremely Low, Moderate and Above Moderate Income households. This 1,195-unit increase in housing availability will substantially increase housing opportunities in a very competitive market.

- Several recent studies have explored the effects of new market rate housing development on housing costs and displacement pressures within the immediate vicinity of new housing development[53]. The studies found that new residential development has moderating effects on rents and displacement pressures at the local level. New residential developments were found to decrease rents in the area surrounding the new housing either in absolute terms or relative to market trend. The research suggests the 1,730-unit residential component of the proposed Project is likely to have a moderating influence that will tend to reduce pre-existing displacement pressures in East Palo Alto and Belle Haven.

2. ***Comparative Analysis of Real Estate Trends Does Not Show Clear Evidence of Localized Influence on East Palo Alto and Belle Haven Housing Market****:*

   - The comparative analysis of real estate trends over the past decade since Meta first began to occupy its campuses in Menlo Park does not show clear evidence of a localized influence on market prices and rents based on proximity to the existing Meta campuses distinguishable from broader market trends. The analysis suggests that market trends in East Palo Alto and Belle Haven are within the same range as the other comparison communities reviewed.

   - The proposed Project is located in an existing commercial area separate from Belle Haven and East Palo Alto, and will not physically alter either community.

3. ***Added Employment and Amenities May Create Modest Upward Pressure on Housing Costs:***

   - The analysis of the potential influence of added jobs on housing costs suggests a potential impact on monthly housing costs of up to $10 to $22 for newly vacated units, depending on the analysis approach. Were an impact of this magnitude to occur, it would likely represent a minor influence on residents' decisions regarding where to live. Residents of rent control housing and existing homeowners would be protected from any increase. Further, even though a minor amount, the estimated impact is likely overstated because it is based on a methodology that does not isolate the effects of job growth from other contributing factors. In addition, while the analysis approach accounts for the new housing units proposed within the Project itself, it does not account for the significant pipeline of new housing proposed as part of nearby developments in the vicinity.

   - The proposed Project creates a new mixed-use environment that adds shopping, dining, and an elevated park that will connect Belle Haven to the Project site. Studies examining the impact of proximity to parks, open space and retail show a connection between convenient access to these amenities and higher home values.[54] Convenient access to the new park and retail amenities could potentially increase interest in living in nearby

areas of East Palo Alto and Belle Haven, which may contribute to upward pressure on rents and sales prices for available units.

The added housing, added jobs, and new amenities with the proposed Project create competing influences on the local housing market and displacement pressures in East Palo Alto and Belle Haven. While precise outcomes are not possible to predict, on balance, the analysis suggests the proposed Project would likely, at most, represent a minor contributing factor to the substantial pre-existing displacement pressures in East Palo Alto and Belle Haven.

8.0 INCREASED RESIDENTIAL DENSITY VARIANT

The DEIR evaluates an Increased Residential Density Variant with a total of up to 1,930 residential units, an increase of 200 units over the up to 1,730 units included in the proposed Project. The 200 additional residential units in the Increased Residential Density Variant are accommodated through an increase in building height and do not reduce or modify non-residential components of the proposed Project. All 200 additional units are market rate units available through utilization of either the density bonus provision of the City's BMR Program Guidelines, which allow one additional market rate unit for each BMR Unit that is provided, up to a maximum of 15% above the maximum density (100 du/ac) that is otherwise allowed by R-MU zoning, or the State Density Bonus Law.

Housing Availability Impacts with Increased Residential Density Variant

KMA modified the analyses described in Sections 3, 4, 5 and 6 to reflect the 200 additional market rate units with the Increased Residential Density Variant. The resulting modified findings regarding net impact on housing availability with the Increased Residential Density Variant are summarized below:

- **Regional Housing Availability Impact with Increased Residential Density Variant** – The Increased Residential Density Variant results in a 651-unit net decrease in housing availability within the region, which is based on the difference between the estimated 2,581-unit regional employee housing demand from new employees and the 1,930 new housing units.

- **Housing Availability Increase in Menlo Park with Increased Residential Density Variant** – The net impact on housing availability in Menlo Park is based on an estimated Menlo Park share of the 2,581-unit total regional employee housing demand and the 1,930 new units added. The Menlo Park share of regional employee housing demand is estimated under the same two commute share scenarios described previously.
    - Current Commute Share Estimate – Assuming existing commute patterns hold, there is an estimated net increase in available housing in Menlo Park of 1,750 units, based on the 1,930 new units in the Increased Residential Density Variant, less an estimated Menlo Park share of regional employee housing demand of 180 units.
    - Increased Commute Share Estimate – Assuming an increased 20% share of workers are housed in the city, there is an estimated net increase in available housing in Menlo Park of 1,414 units, considering the 1,930 new units in the Increased Residential Density Variant, less an estimated Menlo Park share of regional employee housing demand of 516 units.

  Table 8-1 provides a summary of housing availability impact findings for the Increased Residential Density Variant.

Table 8-1. Summary of Housing Availability Impacts, Increased Residential Density Variant			
		Menlo Park Share	
	Regional Total	Current Commute Share Estimate	Increased Commute Share Estimate at 20%
Increased Residential Density Variant Findings (with 1,930 residential units)			
A. Added Housing Supply (New Units)	1,930 Units	1,930 Units	1,930 Units
B. Added Employee Housing Demand	2,581 Units	180 Units	516 Units
C. Housing Availability, Net Impact [A. - B.]	(651 Unit) Net Decrease in Available Housing in Region	1,750 Unit Net Increase in Available Housing in Menlo Park	1,414 Units Net Increase in Available Housing in Menlo Park
Comparison to Findings for Proposed Project (with 1,730 residential units)			
D. Findings for proposed Project at 1,730 units (from Table 1-1)	(815 Unit) Net Decrease in Available Housing in Region	1,553 Unit Net Increase in Available Housing in Menlo Park	1,221 Units Net Increase in Available Housing in Menlo Park
E. Net Difference in Findings with Increased Residential Density Variant [C. – D.]	(+) 164 Units of Available Housing in Region	(+) 197 Units of Available Housing in Menlo Park	(+) 193 Units of Available Housing in Menlo Park

The net differences in housing availability impacts with the Increased Residential Density Variant, compared to the proposed Project with 1,730 units, are shown in Row E of Table 8-1. The 200 added units do not translate into a one-to-one increase in housing availability because on-site and off-site employee housing demand associated with the residential units also increase and partially offset the 200-unit incremental increase in housing supply.

Table 8-2 provides a breakout of the estimated net impacts on housing availability by income level with the Increased Residential Density Variant.

Table 8-2. Net Impacts on Housing Demand and Housing Supply by Income Level, Increased Residential Density Variant							
	Extremely Low	Very Low	Low	Moderate	Above Moderate	Over 150% AMI	Total
Regional Total	(132)	(275)	(741)	113	856	(472)	(651)
Menlo Park Share							
Current Commute Share Estimate	69	15	(15)	515	1,201	(35)	1,750
Increased Commute Share Estimate (20%)	41	(26)	(118)	459	1,152	(94)	1,414

Note: Negative figure represents a net decrease in housing availability resulting from housing demand that exceeds added housing supply.

Regional Housing Availability Impact with Increased Residential Density Variant – The 651-unit estimated net decrease in housing availability in the region with the Increased Residential Density Variant is comprised of 132 Extremely Low, 275 Very Low, 741 Low, and 472 Over 150% AMI units, partially offset by net increases in available housing within the Moderate and Above Moderate Income categories of 113 and 856 units, respectively.

Menlo Park Housing Availability Increase with Current Commute Share Estimate and Increased Residential Density Variant – The 1,750-unit estimated net increase in housing availability in Menlo Park with the Current Commute Share Estimate and the Increased Residential Density Variant consists of 69 Extremely Low, 15 Very Low, 515 Moderate, and 1,201 Above Moderate units, partially offset by net decreases in housing availability of 15 and 35 units within the Low and Over 150% of AMI categories, respectively.

Menlo Park Housing Availability Increase by Income with Increased Commute Share Estimate and Increased Residential Density Variant – The 1,414-unit estimated net increase in housing availability in Menlo Park with the Increased Commute Share Estimate and the Increased Residential Density Variant consists of 41 Extremely Low, 459 Moderate, and 1,152 Above Moderate units, partially offset by a net decrease in housing availability of 26, 118, and 94 units within the Very Low, Low, and Over 150% of AMI categories, respectively.

Displacement Impacts with Increased Residential Density Variant

The substantial addition to the housing supply with the proposed Project is one of several competing influences on displacement pressures, as described in Sections 1.6 and 7.9. Expansion in the availability of market rate and affordable housing in the local area is a factor that would tend to moderate or counteract displacement pressures to some degree by relieving market pressures on the existing local housing stock. The Increased Residential Density Variant results in a greater expansion in the availability of housing than the proposed Project, with respect to market rate housing. Accordingly, the counteractive effect on displacement pressures from increased availability of housing would be incrementally greater with the Increased Residential Density Variant, and the potential for displacement impacts incrementally less. The overall displacement analysis conclusion, that on balance, the proposed Project would likely, at most, represent a minor contributing factor to the substantial pre-existing displacement pressures in East Palo Alto and Belle Haven, which conclusion considers the addition to housing supply alongside other competing influences on displacement pressures, continues to hold with the Increased Residential Density Variant.

[1] The methodology utilized by the Bureau of Labor Statistics (BLS) assumes hourly paid employees are employed full-time. BLS data is adjusted by KMA to reflect the local minimum wage. Annual compensation is calculated by BLS by multiplying hourly wages by 40 hours per work week and by 52 weeks.

[2] Occupation percentages are based on the 2020 National Industry - Specific Occupational Employment survey compiled by the Bureau of Labor Statistics. Wages are based on Occupational Employment Survey data applicable to San Mateo County as of 2020.

[3] Including occupations representing 2% or more of the major occupation group.

[4] Household income estimated based average worker compensation and ratios between employee income and household income identified in Table 4-5.

[1] The methodology utilized by the Bureau of Labor Statistics (BLS) assumes hourly paid employees are employed full-time. BLS data is adjusted by KMA to reflect the local minimum wage. Annual compensation is calculated by BLS by multiplying hourly wages by 40 hours per work week and by 52 weeks.

[2] Occupation percentages are based on the 2020 National Industry - Specific Occupational Employment survey compiled by the Bureau of Labor Statistics. Wages are based on Occupational Employment Survey data applicable to San Mateo County as of 2020.

[3] Including occupations representing 2% or more of the major occupation group.

[4] Household income estimated based average worker compensation and ratios between employee income and household income identified in Table 4-5.

[1] The methodology utilized by the Bureau of Labor Statistics (BLS) assumes hourly paid employees are employed full-time. BLS data is adjusted by KMA to reflect the local minimum wage. Annual compensation is calculated by BLS by multiplying hourly wages by 40 hours per work week and by 52 weeks.

[2] Occupation percentages are based on the 2020 National Industry - Specific Occupational Employment survey compiled by the Bureau of Labor Statistics. Wages are based on Occupational Employment Survey data applicable to San Mateo County as of 2020.

[3] Including occupations representing 2% or more of the major occupation group.

[4] Household income estimated based average worker compensation and ratios between employee income and household income identified in Table 4-5.

[1] The methodology utilized by the Bureau of Labor Statistics (BLS) assumes hourly paid employees are employed full-time. BLS data is adjusted by KMA to reflect the local minimum wage. Annual compensation is calculated by BLS by multiplying hourly wages by 40 hours per work week and by 52 weeks.

[2] Occupation percentages are based on the 2020 National Industry - Specific Occupational Employment survey compiled by the Bureau of Labor Statistics. Wages are based on Occupational Employment Survey data applicable to San Mateo County as of 2020.

[3] Including occupations representing 2% or more of the major occupation group.

[4] Household income estimated based average worker compensation and ratios between employee income and household income identified in Table 4-5.

(1) Estimated employment generated by household expenditures of Project residents for Industries representing more than 1% of total employment. Employment estimates are based on the IMPLAN Group's economic model, IMPLAN, for San Mateo County (uses 2018 IMPLAN data set, the most recent available as of April 2020). Includes both full- and part-time jobs.

(2) Estimate of the share of new jobs associated with residents' household spending that would be located on-site as part of the project. Estimate is based on the proposed mix of on-site, dining, grocery, retail shops, and the existing gas station. It is expected that the actual portion of residents' needs met by on-site businesses will vary depending on the actual mix of retailers.

APPENDIX B – CENSUS DATA FOR EAST PALO ALTO AND BELLE HAVEN

The following Appendix section summarizes U.S. Census data on housing conditions and demographics for East Palo Alto and Belle Haven. In addition, data for San Mateo County as a whole is provided as a point of comparison. East Palo Alto and Belle Haven differ in several respects from San Mateo County averages including: a higher share of renter households, a concentration of households overspending on housing, a higher percentage living in overcrowded conditions, larger household sizes, a younger population, lower incomes, and an above average percentage of households below the poverty level.

1. Number of Housing Units and Tenure

East Palo Alto has an estimated 8,342 housing units. Approximately 60% of occupied units are rental and 40% are owner-occupied. Approximately 1,800 units of the rental units in East Palo Alto (39%) are part of the multi-building Woodland Park Apartments property acquired by Sand Hill Property Company in 2016 and located along the boundary with the City of Palo Alto on the West side of U.S. 101.

Belle Haven has approximately 1,670 housing units. Approximately 55% of the occupied units are rental and 45% are owner-occupied.

Housing Units by Tenure

	East Palo Alto		Belle Haven[1]		San Mateo County	
Housing Units by Tenure	Number	% of Occupied Units	Number	% of Occupied Units	Number	% of Occupied Units
Renter Occupied	4,648	60%	795	55%	105,000	40%
Owner Occupied	3,076	40%	656	45%	158,543	60%
Total Occupied Housing Units	*7,724*	100%	*1,451*	100%	*263,543*	100%
Vacant	618		219		14,230	
Total Housing Units	*8,342*		*1,670*		*277,773*	
Percent of County-wide Housing Stock	3.0%		0.6%			

(1) Reflects data for Census Tract 6117 which includes the Belle Haven neighborhood.

Source: 2015-2019 American Community Survey estimates, Table DP04

East Palo Alto represents about 3% of the total housing stock in San Mateo County and less than 1% of the more than 950,000 housing units in San Mateo and Santa Clara counties combined. Belle Haven represents approximately 0.6% of the total housing stock in San Mateo County and a fraction of the combined housing stock in the two counties.

2. Housing Units by Type

Approximately 58% of units in East Palo Alto are single family compared to 68% in Belle Haven and 65% county-wide. The balance of units are in multi-family and other structures.

Housing Units by Type

	East Palo Alto		Belle Haven[1]		San Mateo	
	Housing Units	% of Total	Housing Units	% of Total	Housing Units	% of Total
Single Family	4,848	58%	1,137	68%	179,731	65%
2- 4 unit buildings	250	3%	184	11%	19,743	7%
Five+ unit buildings	3,081	37%	331	20%	75,096	27%
Mobile Home, Boat, RV, etc.	163	2%	18	1%	3,203	1%
Total Housing Units	8,342	100%	1,670	100%	277,773	100%

(1) Reflects data for Census Tract 6117 corresponding to the Belle Haven neighborhood.
Source: 2015-2019 American Community Survey 5-Year Estimates.

3. Percent of Income Spent on Housing

In East Palo Alto, approximately 48% of renter households and 35% of homeowner households spend more than 35% of their income on housing, a general criterion for overspending, particularly for renters. In Belle Haven, the share spending more than 35% of their income on housing is 60% for renter households and 27% for homeowners. The percent spending more than 35% of their income on housing exceeds county averages in both communities.

Percent of Income Spent on Housing

	East Palo Alto		Belle Haven[1]		San Mateo County	
	Renter	Homeowner	Renter	Homeowner	Renter	Homeowner
Less than 35% of Income	48%	65%	35%	71%	57%	76%
Between 35% and 50% of Income	18%	13%	19%	14%	15%	10%
More than 50% of Income	29%	22%	41%	13%	24%	12%
Subtotal Over 35% of Income	48%	35%	60%	27%	39%	23%

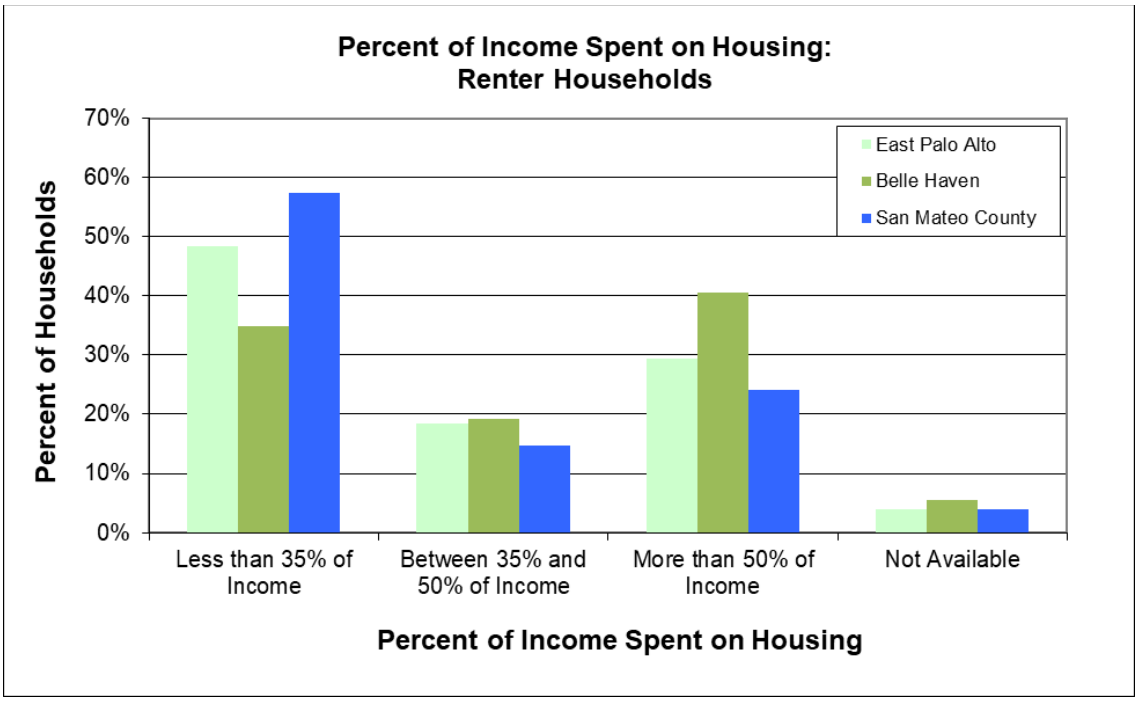
Source: 2015-2019 American Community Survey 5-Year Estimates.



Source: 2015-2019 American Community Survey 5-Year Estimates.

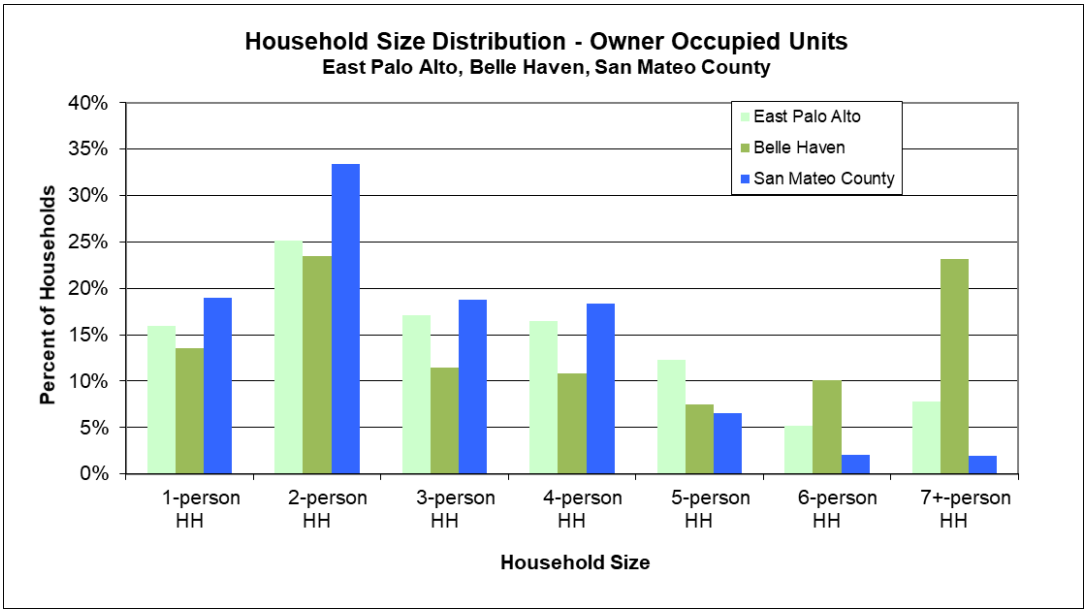
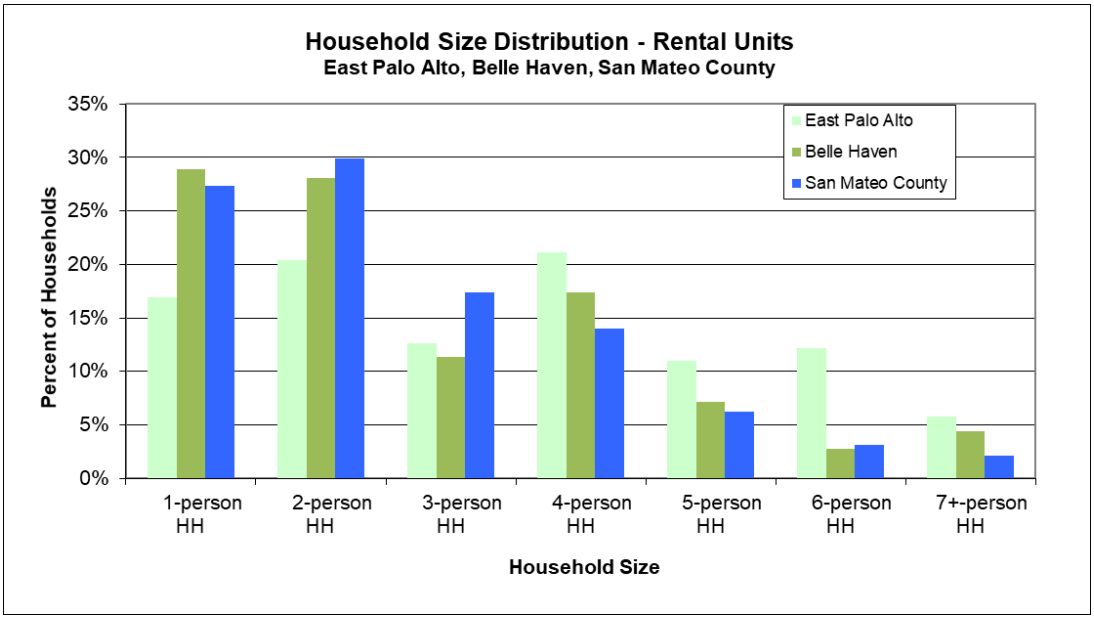
4. Household Size

Household sizes in East Palo Alto and Belle Haven are larger than county averages as shown in the charts below:

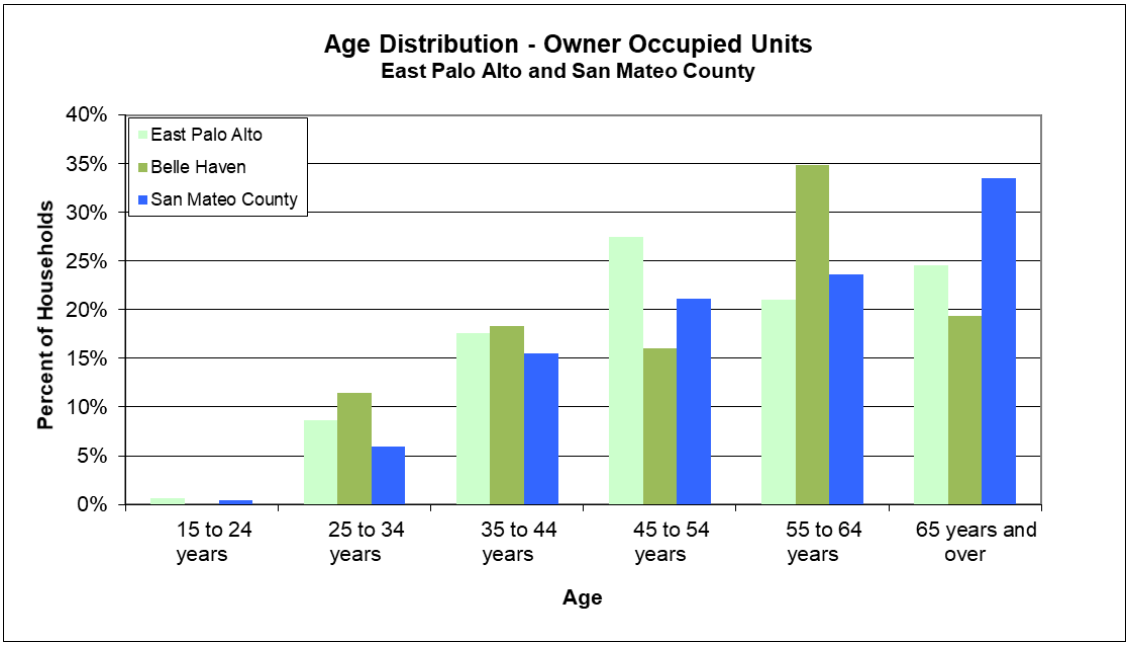


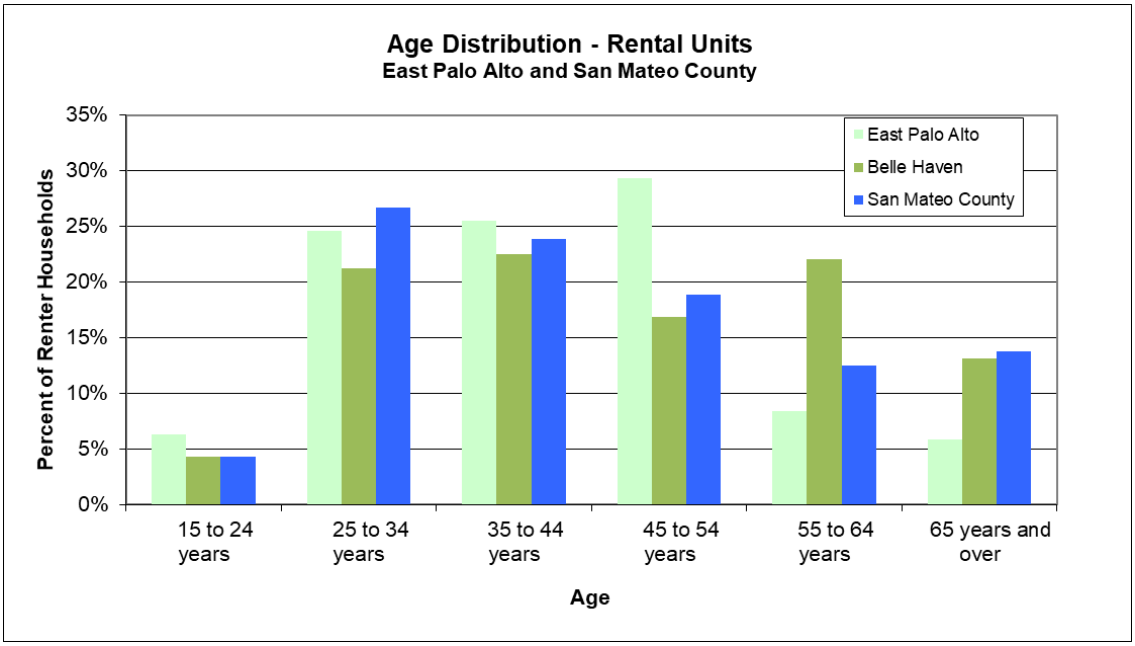


Source: American Community Survey, 2015-2019, Table B25009

5. Age

The population of East Palo Alto and Belle Haven is younger than for the county as a whole:

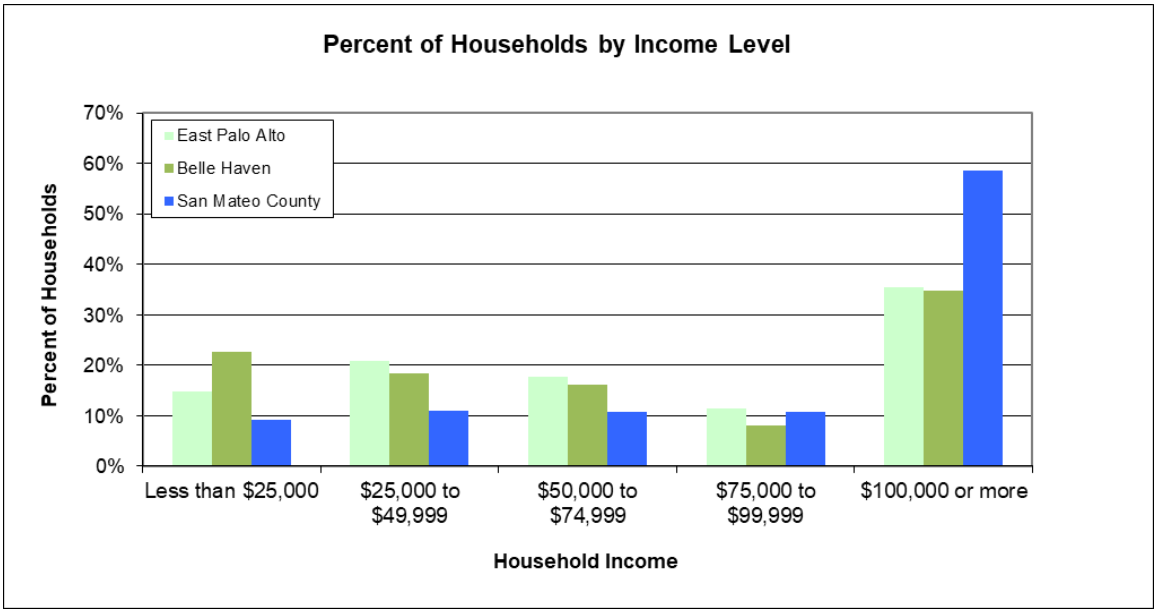




Source: American Community Survey, 2015-2019, Table B25007

6. Income and Employment status

East Palo Alto and Belle Haven households have lower incomes than county averages and a higher percentage of families below the poverty line. Unemployment levels in East Palo Alto and Belle Haven are similar to the county average.



Source: 2015-2019 American Community Survey 5-Year Estimates

Employment Status, Median Income, Poverty

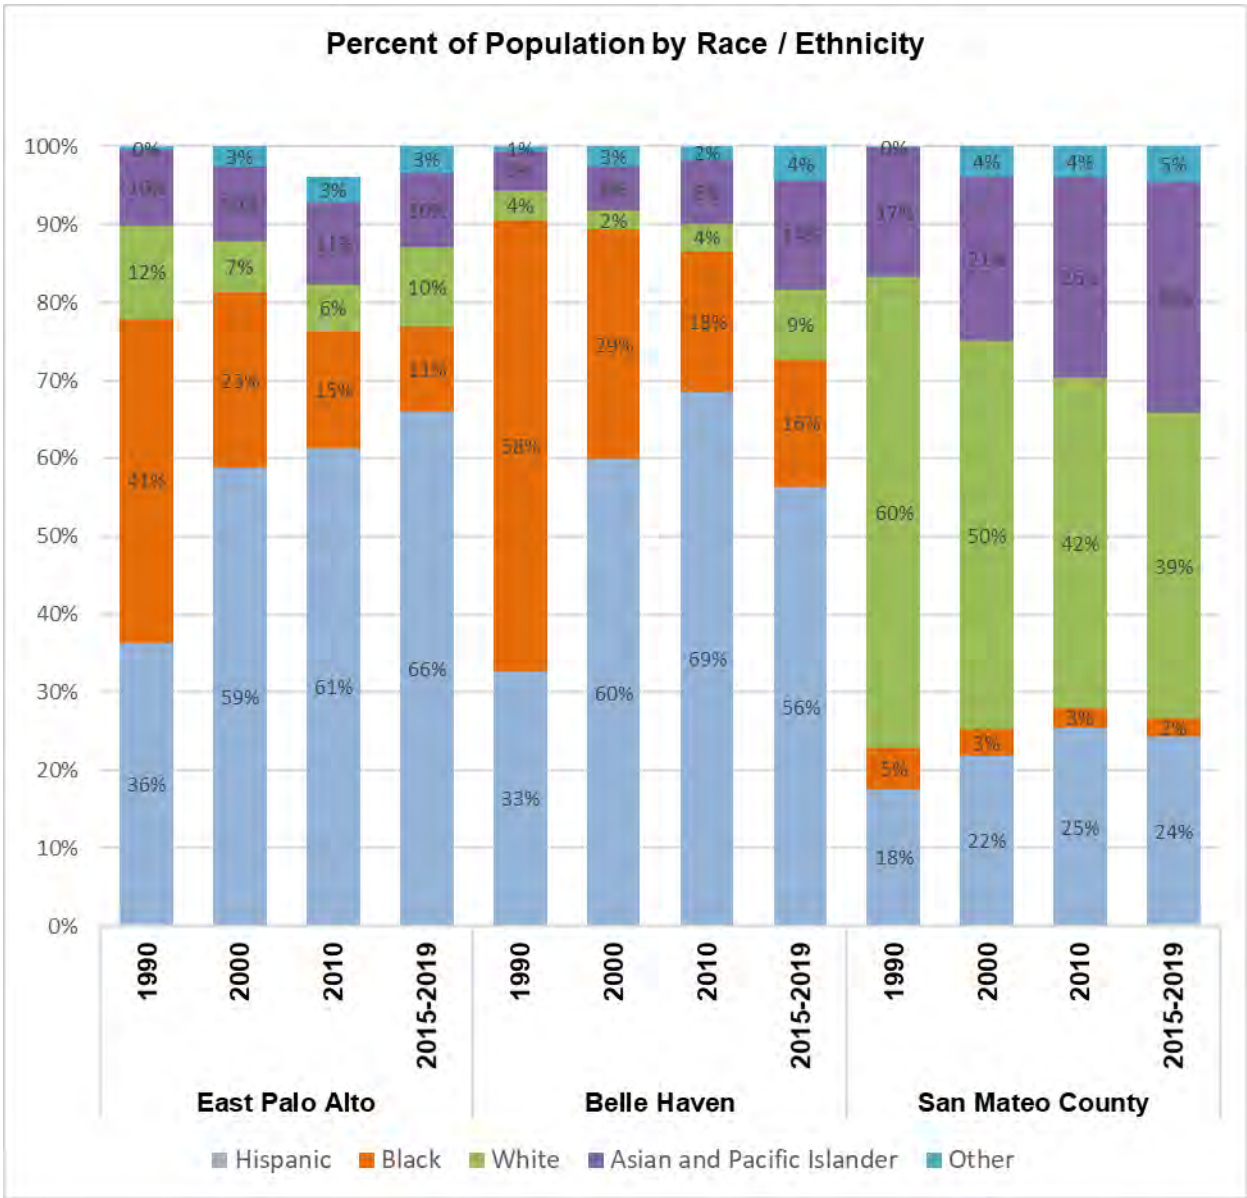
	East Palo Alto		Belle Haven		San Mateo County	
	Number	Percent	Number	Percent	Number	Percent
Employment Status						
Employed	15,507	69%	3,139	69%	414,747	66%
Unemployed	712	3%	145	3%	16,104	3%
Not in Labor Force	6,170	28%	1,252	28%	194,832	31%
Total Population Over 16 Years	22,413	100%	4,536	100%	625,917	100%
Median Household Income (2019 dollars)		$67,087		$65,613		$122,641
Percent of Families Below Poverty Level		10.60%		12.10%		4.00%

Source: 2015-2019 American Community Survey 5-Year Estimates

7. Race and Ethnicity

Approximately two-thirds of East Palo Alto and 56% of Belle Haven residents are Hispanic, compared to the county average of 24%. African American residents represent 11% and 16% of the population in East Palo Alto and Belle Haven, respectively. The Hispanic population of both

communities has increased since 1990 while the African American population has declined, as shown in the chart below. The most recent ACS data suggests a shift in longer-term trends within Belle Haven including a reversal of the trend toward increasing Hispanic population and an increase in the white and Asian populations.

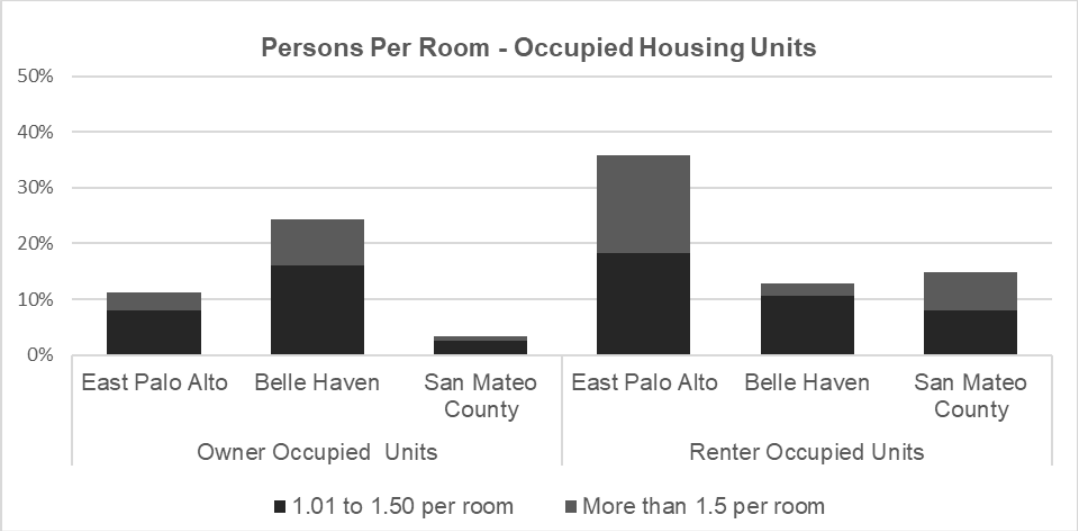


Sources: 1990, 2000, 2010 Census; 2015-2019 American Community Survey

8. Overcrowding

Overcrowding is generally defined as an occupancy level above one person per room. In East Palo Alto, about 11% of owner-occupied units and 36% of renter-occupied units have more than one person per room. The incidence of over-crowding in East Palo Alto is significantly greater than San Mateo County as a whole, especially in the rental stock. In Belle Haven, overcrowding

in owner occupied housing is also above the county average while crowding in the rental housing stock is similar to the county average.



Source: 2015-2019 American Community Survey 5-Year Estimates.

Occupants Per Room

Occupants Per Room	Owner Occupied			Renter Occupied		
	East Palo Alto	Belle Haven	San Mateo County	East Palo Alto	Belle Haven	San Mateo County
1 Person or fewer per room	89%	76%	97%	64%	87%	85%
1.01 to 1.50 per room	8%	16%	3%	18%	11%	8%
1.51 to 2.00 per room	2%	5%	1%	11%	2%	5%
2.01 or more per room	1%	3%	0%	6%	0%	2%
1.01 Per Room or more[(1)]	**11%**	**24%**	**3%**	**36%**	**13%**	**15%**
Total	100%	100%	100%	100%	100%	100%

(1) The Census has no official definition of over-crowding but it is sometimes defined as more than one person per room.

Source: 2015-2019 American Community Survey 5-Year Estimates.

Both conditions of overspending and overcrowding are directly linked to the high cost of housing relative to residents' incomes. Households are forced to spend a high percentage of their income on housing if lower cost housing is not available. Overcrowding is a direct response to high housing costs, as households make do with smaller units or double up with other family members, roommates, etc.

2020	347,720	149,195	$3.24	$939

[1] Adjusted jobs defined as total employment less the number of jobs that can be accommodated by housing growth since 2000, based on a factor of 1.91 workers per household. Housing growth adjustment for high-wage jobs reflects a lesser adjustment based on high-wage job share of overall jobs. See Appendix C Table 10 and 11 for calculations.

[2] High wage jobs defined as industries with $100k or more average annual wages in 2016.

[3] Asking rents and home prices are adjusted for inflation in linear regression analysis. See Appendix C Table 9.

REGRESSION ANALYSIS (THREE-COUNTY)
ESTIMATED PROJECT IMPACT ON LOCAL RENTS / HOME PRICES
BASED ON RELATIONSHIP BETWEEN REGIONAL JOBS & LOCAL HOUSING MARKET
WILLOW VILLAGE MASTER PLAN PROJECT
MENLO PARK CA

Three-County Analysis [3]	Total Jobs Analysis		High-Wage Jobs Analysis	
	Impact on Rents	Impact on Home Prices	Impact on Rents	Impact on Home Prices
Linear Regression				
X (Independent) Variable	Total Adjusted Jobs (1)		Adjusted High-Wage Jobs (1)	
Y (Dependent) Variable[2]	Asking Rent/ SF (One-Bedroom)	Home Price/SF	Asking Rent/ SF (One-Bedroom)	Home Price/SF
Correlation (Adjusted R-Square) (0 = no correlation, 1 = perfect correlation)	0.92 (strong)	0.22 (weak)	0.85 (strong)	0.17 (very weak)
P-Value	<.05 significant	<.05 significant	<.05 significant	<.05 significant
Estimated % Increase per 10,000 adjusted jobs[1]	0.7%	0.6%	1.0%	0.8%
Estimated Project Impact				
Added Jobs[4]	4,332	4,332	4,332	4,332
(less) Employees Housed[5]	2,612	2,612	2,612	2,612
Adjusted Jobs[1]	1,720	1,720	1,720	1,720
Lower Estimate of Potential % Increase in County Rents / Sales Prices Due to Project	0.12%	0.10%	0.18%	0.14%

1 Adjusted jobs defined as total employment less the number of jobs that can be accommodated by housing growth since 2000, based on a factor of 1.91 workers per household. Housing growth adjustment for high-wage jobs reflects a lesser adjustment based on high-wage job share of overall jobs. See Appendix C Table 10 and 11 for calculations.

[2] Asking rents and home prices are for San Mateo County and are adjusted for inflation in linear regression analysis. See Appendix C Table 9.

[3] San Mateo, Santa Clara, and San Francisco counties.

[4] Reflects on-site jobs. Potential rent and price effects associated with multiplier effects are captured through the high-wage jobs analysis as described in the report text.

[5] Based on 1,730 units and a workers per worker household ratio of 1.51, modified from the 1.91 countywide average used elsewhere based on the unit mix of the proposed Project. Modified ratio calculated from Public Use Microdata for Alameda, San Mateo, San Francisco and San Mateo counties for multifamily buildings with 50+ units and based on the specific bedroom mix in the Project.

Notes

[1] See Section 7 for boundary definitions of comparison geographies.

[2] Percent change in home prices in Belle Haven, EPA, and North Richmond may be partly attributable to fewer sales of foreclosed properties. Per Table 2, these locations experienced the largest decline in average annual single family home sales from 2015 to 2020 compared to 2010, when bank repossessions were at their peak.

Source: Costar

Notes

[1] See Section 7 for boundary definitions of comparison geographies.

[2] Rental data not shown for Belle Haven, Fruitvale, West Berkeley, and North Richmond as the data appears to be too limited to be reliable. In these areas, the rental housing stock primarily consists of small multifamily buildings with less than 20 units that are less likely to report asking rents to Costar.

EXECUTIVE SUMMARY

Overview

This Water Supply Assessment (WSA) has been prepared for Menlo Park Municipal Water (MPMW) by West Yost in accordance with California Water Code sections 10910 through 10915 in connection with the proposed Willow Village Project (Proposed Project). The Proposed Project is located in the Bayfront Area of the City of Menlo Park (City) within the Lower Zone of MPMW's service area. The Bayfront Area is between Highway 101 and Bayfront Expressway and is generally comprised of office, life sciences, mixed use residential, light industrial, commercial, and commercial business park land uses.

In 2016, the City completed a multi-year planning effort to update the Land Use and Circulation Elements of its General Plan for the 2040 planning horizon. This General Plan Update process was known as ConnectMenlo. ConnectMenlo reaffirmed existing remaining development potential throughout the City and incorporated land use changes in the Bayfront Area, including development potential for up to 4,500 new multi-family residential units, 2.3 million square feet of new non-residential uses, and 400 new hotel rooms.

The Proposed Project is within this development capacity and includes up to 1,730 multi-family residential dwelling units (with the potential for an additional 200 dwelling units under one of the project variants), up to 200,000 square feet of retail and non-office commercial uses, a hotel with up to 193 rooms, up to 1.6 million square feet of office and accessory space, consisting of up to 1.25 million square feet of office space and the balance (i.e., 350,000 square feet if office space is maximized) of accessory space in multiple buildings, and an approximately 3.5-acre public neighborhood park.

The Proposed Project would also alter parcels west of the industrial site, across Willow Road, on both the north and south sides of Hamilton Avenue (Hamilton Avenue Parcels North and South) to support realignment of the Hamilton Avenue right-of-way and provide access to the new elevated park. This would require demolition and reconstruction of a service station (Chevron gas station) at Hamilton Avenue Parcel South and possibly include the addition of up to 6,700 square feet of retail uses at the existing neighborhood shopping center (Belle Haven Retail Center) on Hamilton Avenue Parcel North.

Projected Water Demands

The projected water demands for buildout of the Proposed Project and the project variants have been calculated based on CALGreen and Model Water Efficient Landscape Ordinance (MWELO) standards. The total projected water demand for the Proposed Project ranges from 150 to 162 million gallons per year (MG/yr), depending on the project variant. Approximately 63 to 64 percent of the total water demand is potable water demand and the remaining 36 to 37 percent is non-potable water demand that will be met with recycled water. The existing potable water demand at the project site is estimated to be approximately 19 MG/yr and is assumed to be entirely replaced by the Proposed Project demand. Therefore, the net increase in potable water demand for the Proposed Project is estimated to range from 75 to 85 MG/yr, depending on the project variant.

ConnectMenlo identifies the maximum development that could occur in the ConnectMenlo study area, including potential bonus-level increased development, and the ConnectMenlo EIR further studied the maximum development potential by more specific land uses. MPMW and the City's Planning Division are actively tracking projects within the ConnectMenlo study area on a cumulative basis to ensure that developed projects remain within the maximum development permitted through ConnectMenlo and that the approved projects would be consistent with the ConnectMenlo EIR. The Proposed Project, if approved, would be within this permitted cumulative development total identified in ConnectMenlo and studied in the EIR. Because the Proposed Project is within the maximum development studied in ConnectMenlo, the water demand for the Proposed Project is included in the ConnectMenlo EIR and MPMW 2020 Urban Water Management Plan (UWMP) water demand assumptions.

The Proposed Project will include the use of recycled water to meet non-potable water demands and will include the installation of water efficient fixtures and implementation of water conservation practices.

Water Supply Availability and Reliability

As discussed in this WSA, MPMW purchases all of its potable water supplies from the Regional Water System (RWS), which is operated by the San Francisco Public Utilities Commission (SFPUC). MPMW is a Wholesale Customer of the SFPUC. The availability and reliability of MPMW's water supplies as described in this WSA are based primarily on information contained in the MPMW 2020 UWMP and the SFPUC 2020 UWMP. The MPMW 2020 UWMP is incorporated by reference into this WSA.

The reliability of the SFPUC RWS supply is highly dependent on the assumption of whether or not the 2018 Bay-Delta Plan Amendment is implemented. The Bay-Delta Plan Amendment was adopted in December 2018 by the State Water Resources Control Board (SWRCB) to establish water quality objectives to maintain the health of the Bay-Delta ecosystem. The adopted Bay-Delta Plan Amendment was developed with the stated goal of increasing salmonid populations in three San Joaquin River tributaries (the Stanislaus, Merced, and Tuolumne Rivers) and the Bay-Delta. The Bay-Delta Plan Amendment requires the release of 40 percent of the "unimpaired flow" on the three tributaries from February through June in every year type, whether wet, normal, dry, or critically dry. The implementation of the Bay-Delta Plan Amendment significantly impacts the SFPUC RWS supply reliability in dry years; however, the actual implementation of the Bay-Delta Plan Amendment is uncertain.

Because of the uncertainties surrounding the implementation of the Bay-Delta Plan Amendment, this WSA presents findings for two scenarios, one assuming the Bay-Delta Plan Amendment is implemented and one assuming that the Bay-Delta Plan Amendment is not implemented.

Under the scenario where it is assumed the Bay-Delta Plan Amendment is implemented, the total projected water supplies determined to be available for the Proposed Project in normal years will meet the projected water demand associated with the Proposed Project, in addition to MPMW's existing and planned future uses through 2040. However, with the implementation of the Bay-Delta Plan Amendment, significant supply shortfalls are projected in dry years for agencies that receive water supplies from the SFPUC RWS, as well as other agencies whose water supplies would be affected by the Amendment. For MPMW, supply shortfalls are projected in single dry years (ranging from 27 to 32 percent) and in multiple dry years (ranging from 27 to 44 percent) through 2040, with similar supply shortfalls through 2045 based on SFPUC's analysis.

If supply shortfalls do occur, MPMW expects to meet these supply shortfalls through water demand reductions and other shortage response actions by implementation of its Water Shortage Contingency Plan (WSCP). The projected single dry-year shortfalls would require implementation of Stage 3 or 4 of the MPMW WSCP, and the projected multiple dry-year shortfalls would require implementation of Stage 3, 4 or 5 of the MPMW WSCP. The Proposed Project would be subject to the same water conservation and water use restrictions as other water users within the MPMW system.

Under the scenario where it is assumed the Bay-Delta Plan Amendment is not implemented, the total projected water supplies determined to be available for the Proposed Project in normal years, single dry years, and multiple dry years will meet the projected water demand associated with the Proposed Project, in addition to MPMW's existing and planned future uses through 2040. A 16.5 percent supply shortfall is projected during the fourth and fifth consecutive dry years for base year 2045 based on SFPUC's analysis. These projected supply shortfalls are significantly less than the projected supply shortfalls if the Bay-Delta Plan Amendment is implemented. If supply shortfalls do occur, MPMW expects to meet these supply shortfalls through water demand reductions and other shortage response actions by implementation of its WSCP. The projected multiple dry year shortfall in 2045 would require implementation of Stage 2 of the MPMW WSCP. The Proposed Project would be subject to the same water conservation and water use restrictions as other water users within the MPMW system.

As described in this WSA, the SFPUC is implementing an Alternative Water Supply Planning Program to investigate and plan for new water supplies to address future long-term water supply reliability challenges and vulnerabilities on the RWS. Also, MPMW is implementing an Emergency Water Storage/Supply Project to provide a backup water supply to MPMW's Lower Zone, which the project site is located within.

A significant portion of the projected water demand for the Proposed Project (about 37 percent) is non-potable water demand that will be met with recycled water. The Project Applicant has evaluated two alternative scenarios to provide recycled water for the Proposed Project: Scenario 1 involves connecting to a new off-site water reuse facility owned and operated by the West Bay Sanitary District (WBSD) and Scenario 2 involves constructing on-site water reuse facilities to treat wastewater from the site. Under both scenarios, the Proposed Project would be able to achieve an approximate 37 percent reduction in potable water demand by serving nearly all of the non-potable water demands (including cooling, irrigation, and toilet flushing) with recycled water. The Project Applicant is currently pursuing Scenario 1 in coordination with WBSD. WBSD has completed a feasibility study exploring the viability of a Resource Recovery Center at WBSD's former treatment plant behind Bedwell Bayfront Park, which could produce approximately 500,000 gallons per day of recycled water for reuse (the MPMW 2020 UWMP projects an annual recycled water supply of 72 MG/yr from this new facility). The study concluded that the project is feasible. In a public/private partnership with Meta (the Project Applicant), the WBSD Board of Directors spearheaded the effort to install 2,800 feet of purple recycled water pipe parallel with the storm drainpipe Meta was replacing on Chilco Street. This pipe will be used to distribute recycled water in the area. According to WBSD, recycled water will be used for irrigation, industrial purposes, firefighting, public fill stations and toilet flushing in the Bayfront Area. Recycled water is estimated to be available during all hydrologic years at a volume that meets MPMW's projected recycled water demands.

1.0 INTRODUCTION

The Willow Village Project (Proposed Project) would comprehensively redevelop an approximately 59-acre project site in the Bayfront Area of the City of Menlo Park (City) in the Menlo Park Municipal Water (MPMW) service area. The site would be redeveloped to remove existing non-residential uses on the site and construct new infrastructure, housing, office uses, commercial uses (including a 193-room hotel), open space, and bicycle and pedestrian paths.

The purpose of this Water Supply Assessment (WSA) is to support the Environmental Impact Report (EIR) for the Proposed Project. The following sections describe the legal requirement for the WSA and the project background.

1.1 Legal Requirement for a Water Supply Assessment

California Senate Bill 610 (SB 610) and Senate Bill 221 (SB 221) amended state law, effective January 1, 2002, to improve the link between information on water supply availability and certain land use decisions made by cities and counties. SB 610 and SB 221 were companion measures which sought to promote more collaborative planning between local water suppliers and cities and counties. Both statutes require detailed information regarding water availability to be provided to the city and county decision-makers prior to approval of specified large development projects. The purpose of this coordination is to ensure that prudent water supply planning has been conducted, and that planned water supplies are adequate to meet existing demands, anticipated demands from approved projects and tentative maps, and the demands of proposed projects.

SB 610 amended California Water Code sections 10910 through 10915 (inclusive) to require land use lead agencies to:

- Identify any public water purveyor that may supply water for a proposed development project[1]
- Request a WSA from the identified water purveyor

The purpose of the WSA is to demonstrate the sufficiency of the purveyor's water supplies to satisfy the water demands of the proposed project, while still meeting the water purveyor's existing and planned future uses. Water Code sections 10910 through 10915 delineate the specific information that must be included in the WSA.

SB 221 amended State law (California Government Code section 66473.7) to require that approval by a city or county of certain residential subdivisions[2] requires an affirmative written verification of sufficient water supply. SB 221 was intended as a failsafe mechanism to ensure that collaboration on finding the needed water supplies to serve a new large residential subdivision occurs before construction begins.

[1] The definition of a "project" is provided in Water Code section 10912(a) and is discussed further in Section 3.1 of this WSA.

[2] Per Government Code Section 66473.7(a)(1) subdivision means a proposed residential development of more than 500 dwelling units.

1.2 Need for and Purpose of Water Supply Assessment

The purpose of this WSA is to perform the evaluation required by SB 610 (Water Code sections 10910 through 10915) in connection with the Proposed Project, located within MPMW's service area. This WSA also satisfies the SB 221 requirements as the Proposed Project does include a residential subdivision with more than 500 dwelling units.

This WSA does not reserve water, or function as a "will serve" letter or any other form of commitment to supply water (see Water Code section 10914). The provision of water service will continue to be undertaken in a manner consistent with applicable policies and procedures, consistent with existing law.

This WSA for the Proposed Project has been prepared by West Yost, as requested by MPMW, the responsible water purveyor for the Proposed Project.

1.3 Water Supply Assessment Preparation, Format, and Organization

The format of this WSA is intended to follow Water Code sections 10910 through 10915 to clearly delineate compliance with the specific requirements for a WSA. This WSA includes the following sections:

Section 1: Introduction
Section 2: Description of the Proposed Project
Section 3: Required Determinations
Section 4: Menlo Park Municipal Water System
Section 5: Menlo Park Municipal Water Demands
Section 6: Menlo Park Municipal Water Supplies
Section 7: Water Supply Reliability
Section 8: Determination of Water Supply Sufficiency Based on the Requirements of SB 610
Section 9: Verification of Water Supply Sufficiency Based on the Requirements on SB 221
Section 10: Water Supply Assessment Approval Process
Section 11: References

Relevant citations of Water Code sections 10910 through 10915 are included throughout this WSA in *italics* to demonstrate compliance with the specific requirements of SB 610.

2.0 DESCRIPTION OF THE PROPOSED PROJECT

The following sections describe the Proposed Project, including the Proposed Project's location, proposed land uses, and projected water demand.

2.1 Proposed Project Location and Overview

The Proposed Project is located in the Bayfront Area of the City, in MPMW's service area. The Bayfront Area is generally comprised of office, life sciences, mixed use residential, light industrial, commercial, and commercial business park land uses between Highway 101 and the Bayfront Expressway.

The 59-acre Proposed Project main site currently consists of approximately 1 million square feet (sf) of existing non-residential uses to be redeveloped. The Proposed Project main site is bounded by Willow Road to the west, the Joint Powers Board (JPB) rail corridor to the north, the Hetch Hetchy right of way and Mid-Peninsula High School to the south, and an existing life sciences complex to the east. The Proposed Project main site is shown on Figure 2-1.

Source: Willow Village Master Plan Conditional Development Permit, Existing Condition Aerial Map, prepared by Peninsula Innovation Partners, dated December 2021.

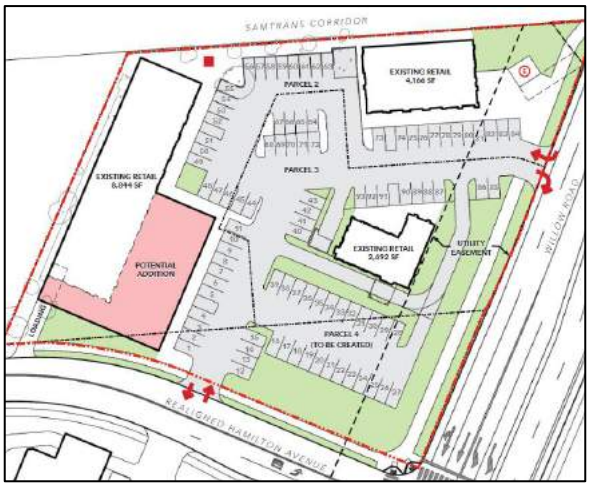
Figure 2-1. Proposed Project Location

The Proposed Project includes up to 1,730 multi-family residential dwelling units (with the potential for an additional 200 dwelling units under one of the project variants), up to 200,000 square feet of retail and non-office commercial uses, a hotel with up to 193 rooms, up to 1.6 million square feet of office and accessory space, consisting of up to 1.25 million square feet of office space and the balance (i.e., 350,000 square feet if office space is maximized) of accessory space in multiple buildings, and an approximately 3.5-acre public neighborhood park. The Proposed Project site plan is shown on Figure 2-2.

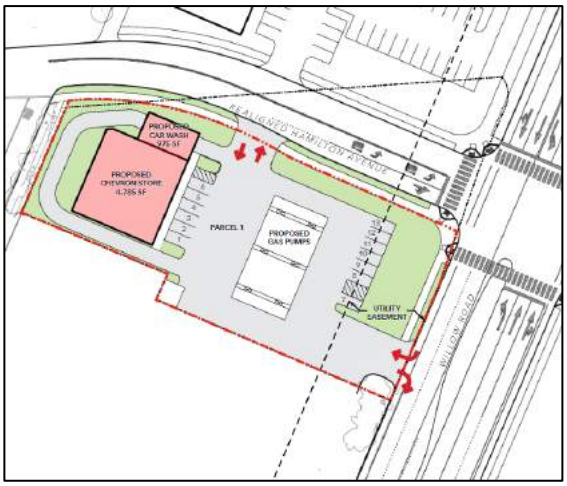
Source: Willow Village Master Plan Conditional Development Permit, Conceptual Master Plan, prepared by Peninsula Innovation Partners, dated December 2021.

Figure 2-2. Proposed Project Site Plan

The Proposed Project would also alter parcels west of the industrial site, across Willow Road, on both the north and south sides of Hamilton Avenue (Hamilton Avenue Parcels North and South) to support realignment of the Hamilton Avenue right-of-way and provide access to the new elevated park. This would require demolition and reconstruction of a service station (Chevron gas station) at Hamilton Avenue Parcel South and possibly include the addition of up to 6,700 square feet of retail uses at the existing neighborhood shopping center (Belle Haven Retail Center) on Hamilton Avenue Parcel North. Proposed development plans for the Hamilton Avenue Parcels North and South are shown on Figure 2-3.



Hamilton Avenue Parcel North



Hamilton Avenue Parcel South

Source: Willow Village Master Plan Conditional Development Permit, Conceptual Hamilton Parcels, prepared by Peninsula Innovation Partners, dated December 2021.

Figure 2-3. Proposed Development Plan for Hamilton Avenue Parcels North and South

The City has identified four project variants for the Proposed Project for analysis in the EIR:

- **Variant I: Increased Residential Density.** The Increased Residential Density Variant would increase the number of residential dwelling units by approximately 200 units, to a total of 1,930 residential units. No other changes to the Project development program would occur under this variant.
- **Variant II: No Hamilton Avenue Realignment.** In the event that the Project Applicant does not receive approval from Caltrans or affected property owners for the modifications to Willow Road necessary to realign Hamilton Avenue, the intersection of Willow Road and Hamilton Avenue would remain in the existing location and the circulation network east of Willow Road would be altered. In addition, West Street would be adjusted to terminate into Willow Road. The overall Project development program would remain unchanged; however, under this variant, no changes would occur to the existing land uses on the Hamilton Avenue Parcels North and South.
- **Variant III: No Willow Road Tunnel.** In the event that Caltrans does not approve the proposed Willow Road Tunnel, the Meta trams would utilize the public street network, Bayfront Expressway and Willow Road to access the Campus District. The overall Project development program would remain unchanged.
- **Variant IV: On-site Recycled Water.** In the event that that West Bay Sanitary District (WBSD) does not construct its proposed Bayfront Recycled Water Plant (which would be a source to provide recycled water to the Proposed Project), the On-Site Recycled Water Variant would provide recycled water to the Proposed Project through the on-site treatment of wastewater. Under this variant, the on-site treatment and production of recycled water would capture wastewater supplies, including blackwater (toilet flushing, food preparation drains), from all buildings within the Proposed Project. The overall Project development program would remain unchanged.

2.2 Projected Water Demand for the Proposed Project

The Proposed Project site has General Plan Land Use Designations of Office and Mixed-Use Residential. The site is zoned Office-Bonus (O-B) and Residential Mixed Use-Bonus (R-MU-B) under the Menlo Park Zoning Ordinance. As such, its development is required to comply with the City Municipal Code Chapter 16.43 O Office District and Chapter 16.45 R-MU Residential Mixed Use District. Both chapters of the Municipal Code include requirements for green and sustainable building, including the following specific requirements for water use efficiency and recycled water use:

> 16.43.140 (3) and 16.45.140 (3) Water Use Efficiency and Recycled Water.
>
> A. Single pass cooling systems shall be prohibited in all new buildings.
>
> B. All new buildings shall be built and maintained without the use of well water.
>
> C. Applicants for a new building more than one hundred thousand (100,000) square feet of gross floor area shall prepare and submit a proposed water budget and accompanying calculations following the methodology approved by the City. For all new buildings two hundred fifty thousand (250,000) square feet or more in gross floor area, the water budget shall account for the potable water demand reduction resulting from the use of an alternative water source for all City-approved non-potable applications. The water budget and calculations shall be reviewed and approved by the City's Public Works Director prior to certification of occupancy. Twelve (12) months after the date of the certification of occupancy, the building owner shall submit data and information sufficient to allow the City to compare the actual water use to the allocation in the approved water budget. In the event that actual water consumption exceeds the water budget, a water conservation program, as approved by the City's Public Works Director, shall be implemented. Twelve (12) months after City approval of the water conservation program, the building owner shall submit data and information sufficient to allow the City to determine compliance with the conservation program. If water consumption exceeds the budgeted amount, the City's Public Works Director may prohibit the use of water for irrigation or enforce compliance as an infraction pursuant to Chapter 1.12 until compliance with the water budget is achieved.
>
> D. All new buildings shall be dual plumbed for the internal use of recycled water.
>
> E. All new buildings two hundred fifty thousand (250,000) square feet or more in gross floor area shall use an alternate water source for all City-approved non-potable applications. An alternative water source may include, but is not limited to, treated non-potable water such as graywater. An alternate water source assessment shall be submitted that describes the alternative water source and proposed non-potable application. Approval of the alternate water source assessment, the alternative water source and its proposed uses shall be approved by the City's Public Works Director and Community Development Director. If Menlo Park Municipal Water has not designated a recycled water purveyor and/or municipal recycled water source is not available prior to planning project approval, applicants may propose conservation measures to meet the requirements of this section subject to approval of the City Council. The conservation measures shall achieve a reduction in potable water use equivalent to the projected demand of City-approved non-potable applications, but in no case shall the reduction be less than 30 percent (30%) compared to the water budget in subsection (3)(C) of this section. The conservation measures may include on-site measures, off-site measures or a combination thereof.

F. Potable water shall not be used for dust control on construction projects.

G. Potable water shall not be used for decorative features, unless the water recirculates.

As required by the City Municipal Code described above, the Project Applicant prepared a Water Use Budget for the Proposed Project. Also, because the Proposed Project includes more than 250,000 square feet of gross floor area in its proposed new buildings, an Alternative Water Source Assessment is also required and has been prepared. A copy of the Willow Village Project Water Demand, Alternative Water Source Assessment and Water Modeling Memorandum prepared by Freyer & Laureta, Inc., a consulting firm retained by the Project Applicant to prepare the water demand estimates for the Proposed Project, is included in Appendix A of this WSA. The Alternative Water Source Assessment examined two scenarios to supply the Proposed Project with non-potable water:

- Scenario 1: Connect to a new off-site water reuse facility owned and operated by the West Bay Sanitary District (WBSD)
- Scenario 2: Construct on-site water reuse facilities (WRFs) to treat wastewater from the site

Under both scenarios, the Proposed Project would be able to achieve a 36 to 37 percent reduction in potable water demand by serving nearly all of the non-potable water demands (including cooling, irrigation, and toilet flushing) with recycled water.

The Project Applicant is currently pursuing Scenario 1 in coordination with WBSD. WBSD has completed a feasibility study exploring the viability of a Resource Recovery Center at WBSD's former treatment plant behind Bedwell Bayfront Park, which could produce 500,000 gallons per day of recycled water for reuse (the MPMW 2020 UWMP projects an annual recycled water supply of 72 MG/yr from this new facility). The study concluded that the project is feasible. In a public/private partnership with Meta (the Project Applicant), the WBSD Board of Directors spearheaded the effort to install 2,800 feet of purple recycled water pipe parallel with the storm drainpipe Meta was replacing on Chilco Street. This pipe will be used to distribute recycled water in the area. According to WBSD, recycled water will be used for irrigation, industrial purposes, firefighting, public fill stations and toilet flushing in the Bayfront Area.

The Project Applicant estimated water use for the Proposed Project using the following assumptions:

- Water usage for plumbing fixtures (including water closets, urinals, public lavatories, kitchen faucets and showerheads) was estimated using 2019 CALGreen flow rates and LEED frequency of fixture use and duration times
- Water usage factors from literature were used for some retail programs such as grocery and food and beverage
- Water usage for water-based cooling systems for office building and event space was estimated using the variance in the mean monthly temperature for Menlo Park
- Water usage for irrigation was estimated in accordance with Menlo Park Municipal Code Chapter 12.44 Water Efficient Landscape Ordinance
- All non-potable demands were applied a leakage factor of 10 percent to account for losses in fixtures, broken sprinkler head, etc.

A summary of the water demands for the Proposed Project, as well as the four project variants, as estimated by the Project Applicant, is provided in Table 2-1. As shown, the total projected water demand for the Proposed Project ranges from 150 to 162 MG/yr, depending on the project variant. Approximately 63 to 64 percent of the total water demand is potable water demand and the remaining 36 to 37 percent is non-potable water demand that will be met with recycled water. As shown in Table 2-1, the existing potable water demand at the project site is estimated to be approximately 19 MG/yr and is assumed to be entirely replaced by the Proposed Project demand. Therefore, the net increase in potable water demand for the Proposed Project is estimated to range from 75 to 85 MG/yr, depending on the project variant.

Table 2-1. Projected Water Demand for the Proposed Project

Water Use	Projected Annual Water Demand, MG/yr			
	Proposed Project	Variant I: Increased Residential Density	Variant II: No Hamilton Avenue Realignment	Variant III: No Willow Road Tunnel and Variant IV: On-Site Recycled Water
Indoor Potable	98	104	94	98
Toilet Flushing (non-potable)	21	22	21	21
Cooling (non-potable)	9	9	9	9
Irrigation (non-potable)	27	27	26	27
Total Projected Water Demand	**155**	**162**	**150**	**155**
Projected Water Demand (potable)	98 (63%)	104 (64%)	94 (63%)	98 (63%)
Projected Water Demand (non-potable)	57 (37%)	58 (36%)	56 (37%)	57 (37%)
Existing Potable Water Use at Proposed Project Site[(a)]	19	19	19	19
Net increase in Potable Water Demand[(b)]	**79**	**85**	**75**	**79**

Source: Freyer & Laureta, Inc., January 2022.

(a) Existing potable water demand at the project site based on 2015 data (18.2 MG/yr plus 6 percent for unaccounted for water) and is assumed to be replaced by the Proposed Project.

(b) Assumes the existing potable water demand at the project site is replaced by the Proposed Project demand.

As shown in Table 2-1, Variant I: Increased Residential Density has the highest water demand, with a total water demand of 162 MG/yr, a potable water demand of 104 MG/yr and a non-potable water demand of 58 MG/yr. As such, the remainder of this WSA is based on the projected water demand for Variant I, as it represents the highest potential water demands for the Proposed Project, and therefore includes within it the projected water demand associated with development of the Proposed Project or any of the project variants described above.

Additional information on the water demand projections for the Proposed Project and the project variants is provided in Appendix A.

2.3 Proposed Project Relationship to ConnectMenlo

In 2016, the City completed a multi-year planning effort to update the Land Use and Circulation Elements of its General Plan for the 2040 planning horizon. This General Plan Update process was known as ConnectMenlo. ConnectMenlo reaffirmed existing remaining development potential within the City and incorporated land use changes in the Bayfront Area, including development potential for up to 4,500 new multi-family residential units, 2.3 million square feet of new non-residential uses, and 400 new hotel rooms.

A program-level EIR was prepared for ConnectMenlo. In conjunction with the ConnectMenlo EIR, a Water Supply Evaluation Study (WSE Study) was prepared to evaluate whether there would be sufficient water supply to meet the current and planned water demands within the service area during normal and dry hydrologic years over a 20-year time horizon. More specifically, the WSE Study includes:

- A summary of the WSA requirements articulated in Water Code §10910-10915 and a description of how they have been addressed in the WSE Study
- A description and analysis of the current and projected future water demands for ConnectMenlo through the year 2040
- A description and analysis of the historical, current, and projected future water demands for the MPMW service area through the year 2040
- A description and analysis of the current and projected future water supplies for the MPMW service area through the year 2040
- A comparison of the water supplies and demands for MPMW's water service area, including the projected water demands associated with ConnectMenlo

The data in the WSE Study were based primarily on the MPMW 2010 UWMP, the draft MPMW 2015 UWMP (which was being developed at the same time as the WSE Study), information from City staff, and specific information from PlaceWorks (preparer of the 2016 ConnectMenlo General Plan Update and program-level EIR). The final adopted MPMW 2015 UWMP and the MPMW 2020 UWMP incorporated the ConnectMenlo projections.

ConnectMenlo identifies the maximum development potential that could occur within the ConnectMenlo study area, including potential bonus-level increased development, and the associated program-level EIR further defines the maximum development that can occur by specific land uses. MPMW and the City's Planning Division are actively tracking projects within the ConnectMenlo study area on a cumulative basis to ensure that developed projects remain within the maximum development permitted by ConnectMenlo and are consistent with the program-level EIR.[3] The Proposed Project, if approved, would be within this permitted cumulative development total for both ConnectMenlo and the associated program-level EIR.

[3] For projects that require a water budget, the City includes Conditions of Approval requiring annual monitoring to document water usage at or below the limits identified in the approved water budget. Exempt projects (below the water budget threshold) are not tracked.

Table 2-2 shows the Proposed Project's impact on the cumulative water demand permitted for the ConnectMenlo study area based on the potable water demand for Variant I, which represents the highest potential water demand for the Proposed Project or any of the project variants discussed above. As such, the projected water demand associated with development of the Proposed Project or any of the project variants described above is included within the demand estimate for Variant I.

Table 2-2. Proposed Project Impact on ConnectMenlo Study Area Potable Water Demand

Demand Source	Annual Water Demand, MG/yr
ConnectMenlo Total Potable Water Demand at Buildout[(a)]	343
Proposed Project Net Potable Water Demand Increase[(b)]	85
Remaining Potable Water Demand for Other Projects within ConnectMenlo Study Area[(c)]	**258**

(a) Water Supply Evaluation Study for ConnectMenlo – General Plan and M-2 Area Zoning Update (Table 2), prepared by EKI, February 2016. The Water Supply Evaluation Study assumed that total water demand in the ConnectMenlo study area would be met using potable water.

(b) From Table 2-1 above; net increase in Potable Water Demand due to Proposed Project (Variant I).

(c) Other projects in the ConnectMenlo study area currently in the planning stages include 1350 Adams Court with a projected potable water demand of approximately 5 MG/yr and Commonwealth Building 3 with a projected potable water demand of approximately 14 MG/yr. These projects are still in the planning stage, so their projected water demands are subject to change. Recently approved projects subject to water budgets and annual water usage limits include Menlo Portal and Menlo Uptown which are anticipated to use 12.6 and 9.1 MG/yr, respectively.

The remaining potable water demand for other projects within the ConnectMenlo study area shown in Table 2-2 is available to serve both approved, but not yet constructed, and future projects (whether or not they require a WSA).

3.0 REQUIRED DETERMINATIONS

The following sections describe the required determinations for a WSA.

3.1 Does SB 610 Apply to the Proposed Project?

10910 (a) Any city or county that determines that a project, as defined in Section 10912, is subject to the California Environmental Quality Act (Division 13 (commencing with Section 21000) of the Public Resources Code) under Section 21080 of the Public Resources Code shall comply with this part.

10912 (a) "Project" means any of the following:

(1) A proposed residential development of more than 500 dwelling units.

(2) A proposed shopping center or business establishment employing more than 1,000 persons or having more than 500,000 square feet of floor space.

(3) A proposed commercial office building employing more than 1,000 persons or having more than 250,000 square feet of floor space.

(4) A proposed hotel or motel, or both, having more than 500 rooms.

(5) A proposed industrial, manufacturing, or processing plant, or industrial park planned to house more than 1,000 persons, occupying more than 40 acres of land, or having more than 650,000 square feet of floor area.

(6) A mixed-use project that includes one or more of the projects specified in this subdivision.

(7) A project that would demand an amount of water equivalent to, or greater than, the amount of water required by a 500-dwelling unit project.

As shown in Table 3-1, the Proposed Project does meet the definition of a "Project" as specified in Water Code section 10912(a). The Proposed Project has not been the subject of a previously adopted WSA and has not been included in an adopted WSA for a larger project. Therefore, according to Water Code section 10910(a), a WSA is required for the Proposed Project.

Table 3-1. Does the Proposed Project Meet the SB 610 Definition of a "Project"?

SB 610 Project Definition Components	Proposed Project Quantity	Meets the SB 610 Definition of a "Project"?
Residential > 500 dwelling units	Up to 1,730 units (or up to 1,930 units under Variant I)	YES
Retail > 1,000 employees or > 500,000 sf	200,000 sf	NO
Commercial Office Building > 1,000 employees or > 250,000 sf	1.6 million sf	YES
Hotel/Motel > 500 rooms	193 rooms	NO
Industrial Plant/Park > 1,000 employees or > 40 acres or > 650,000 sf	N/A	NO
Mixed Use Project that includes one or more of the above	YES	YES
A Project that would demand the amount of water required by a 500-dwelling unit project	YES	YES
SB 610 Required?	--	**YES**

The City has also determined that the Proposed Project is subject to the California Environmental Quality Act (CEQA) and that an EIR is required. Because the Proposed Project's location and development parameters are consistent with ConnectMenlo, the ConnectMenlo Program-level EIR serves as the first tier environmental analysis for the Project. However, an EIR will be prepared for the Proposed Project to address impacts that need further discussion and/or mitigation beyond that provided in the ConnectMenlo EIR, as well as to satisfy the requirements of a settlement agreement between the City of Menlo Park and the City of East Palo Alto. The EIR will utilize the findings of this WSA as appropriate in the EIR for the Proposed Project.

3.2 Does SB 221 Apply to the Proposed Project?

In 2001, SB 221 amended State law to require that approval by a city or county of certain residential subdivisions requires an affirmative written verification of sufficient water supply. Per California Government Code section 66473.7(a)(1), a subdivision means a proposed residential development of more than 500 dwelling units. The Proposed Project, with up to 1,730 new residential dwelling units (with the potential for an additional 200 dwelling units under one of the project variants) in MPMW's water service area, is therefore subject to the requirements of SB 221.

3.3 Who is the Identified Public Water System?

> *10910(b) The city or county, at the time that it determines whether an environmental impact report, a negative declaration, or a mitigated negative declaration is required for any project subject to the California Environmental Quality Act pursuant to Section 21080.1 of the Public Resources Code, shall identify any water system that is, or may become as a result of supplying water to the project identified pursuant to this subdivision, a public water system, as defined by Section 10912, that may supply water for the project*
>
> *10912 (c) "Public water system" means a system for the provision of piped water to the public for human consumption that has 3,000 or more service connections…*

The Proposed Project is located in the City within MPMW's service area. MPMW's service area consists of three zones: the Lower Zone (located north and east of El Camino Real and serves residential, small commercial, and light industrial land uses), the High Pressure Zone (located in northern Menlo Park between Highway 101 and Bayfront Expressway, north of Chilco Street, and serves multi-family residential, commercial and light industrial, and a mobile home park outside the City's northern-most boundary), and the Upper Zone (located in the southwest portion of Menlo Park near Interstate 280 and geographically and hydraulically disconnected from the other pressure zones). The Proposed Project is located in MPMW's Lower Zone. Therefore, MPMW is the identified public water system for the Proposed Project.

3.4 Does the Identified Public Water Supplier have an adopted UWMP and does the UWMP include the projected water demand for the Proposed Project?

10910(c)(1) The city or county, at the time it makes the determination required under Section 21080.1 of the Public Resources Code, shall request each public water system identified pursuant to subdivision (b) to determine whether the projected water demand associated with a proposed project was included as part of the most recently adopted urban water management plan adopted pursuant to Part 2.6 (commencing with Section 10610).

The City's most recently adopted UWMP is the 2020 UWMP, which was adopted in May 2021. The MPMW 2020 UWMP is incorporated by reference into this WSA.

The MPMW 2020 UWMP incorporated the future population, employment and water demand projections for buildout of the General Plan, including the additional allowable development associated with ConnectMenlo and other major development projects within the MPMW service area.[4] As described in Section 2.3 of this WSA, ConnectMenlo identifies the maximum development potential that could occur within the ConnectMenlo study area, including potential bonus-level increased development, and the associated program level EIR further defines the maximum development that can occur by specific land uses. MPMW and the City's Planning Division are actively tracking projects within the ConnectMenlo study area on a cumulative basis to ensure that developed projects remain within the maximum development permitted in ConnectMenlo and would be consistent with the program-level EIR. The Proposed Project, if approved, would be within this permitted total development potential permitted for both ConnectMenlo and the associated program-level EIR. Therefore, the water demand for the Proposed Project is included in the MPMW 2020 UWMP water demand.

Table 3-2 presents the projected future water demand for buildout of the General Plan, which would include the Proposed Project, in normal years as presented in the MPMW 2020 UWMP. Additional discussion on the MPMW's existing and projected water demands is provided in Section 5 of this WSA.

Table 3-2. Projected Future Water Demand – Normal Years

	Projected Water Demand after Passive and Active Conservation, MG

[4] MPMW 2020 UWMP, Section 3.2 Land Uses within Service Area, page 18.

4.0 MENLO PARK MUNICIPAL WATER SYSTEM

The following sections describe the MPMW existing water service area, including existing and projected population.

4.1 Water Service Area

MPMW is located within the City, along the San Francisco Peninsula in San Mateo County, between the cities of Palo Alto, East Palo Alto, and Redwood City. MPMW provides water service to approximately half of the City, serving an area of approximately 9 square miles. The remainder of the City is served by California Water Service, O'Connor Tract Co-operative Water Company, and Palo Alto Park Mutual Water Company.

There were 4,296 MPMW service connections as of 2020. Land uses throughout the water service area consist primarily of residential, commercial, and industrial land uses. Customer service connections include residential users, industrial connections, commercial service connections, irrigation accounts, and 'Other' connections (including temporary services and sales, private fire services, and hydrant services).

4.2 Population

The MPMW service area is largely built-out, with future growth trends principally due to redevelopment within the Bayfront Area. As shown in Table 4-1, the total population within the MPMW service area is projected to increase to 30,184 people by 2040, a 65 percent increase from the current 2020 population of 18,276 people. The City's Planning Division expects more than 40 percent of the projected population increase to occur within the next five years (2020 through 2025) based on approved and pending projects in the Bayfront Area (driven by the ConnectMenlo General Plan). The MPMW service area includes areas outside of the Bayfront Area; however, given the focus of the ConnectMenlo General Plan Update on land use changes within the Bayfront Area, most population growth through 2040 is expected to occur in that geographic area.[5]

Table 4-1. MPMW Service Area Existing and Projected Population

Year	2020	2025	2030	2035	2040
Population Served	18,276	23,383	25,166	27,675	30,184

Source: MPMW 2020 UWMP, Table 3-1.

[5] The City is conducting the required update to its Housing Element that would likely increase population growth outside of the Bayfront Area, some of which may be located within the MPMW's Upper Zone.

5.0 MENLO PARK MUNICIPAL WATER DEMANDS

10910(c)(2) If the projected water demand associated with the proposed project was accounted for in the most recently adopted urban water management plan, the public water system may incorporate the requested information from the urban water management plan in preparing the elements of the assessment required to comply with subdivisions (d), (e), (f) and (g).

The descriptions provided below for the City's water demands are based on the MPMW 2020 UWMP (adopted in May 2021).

5.1 Historical and Existing Water Demand

Table 5-1 shows the MPMW water demand (based on water production) for 2010 through 2020. According to MPMW's 2020 UWMP, from 2010 through 2020, the service area population had grown by about 24 percent, while the total volume of water sold increased by just 1.6 percent. The decrease in water demand from 2013 to 2016 can be attributed to mandatory statewide restrictions issued by the State Water Resources Control Board (SWRCB) during the drought and water conservation efforts by the City's residents and businesses. Since 2016, there has been a rebound in demand.

Table 5-1. Historical Water Demand

Year	Potable Water Demand, MG
2010	1,052
2011	1,033
2012	1,079
2013	1,189
2014	1,030
2015	883
2016	898
2017	1,003
2018	1,108
2019	1,028
2020	1,069

Source: MPMW 2020 UWMP, Table 4-2.

5.2 Future Water Demand

Table 5-2 shows MPMW's projected normal year water demands through 2040 as included in MPMW's 2020 UWMP. These projections are based on anticipated future water demands corresponding to buildout of the City's current General Plan, including development of ConnectMenlo and other planned projects within MPMW's service area. The projected increase in demand reflects a rebound in water use following the end of the suppressed demands due to the 2015-2016 drought and an accelerated growth in employment due to planned development projects.

Table 5-2. Projected Future Water Demand – Normal Years				
	Projected Water Demand after Passive and Active Conservation, MG

1,069	1,296	1,345	1,410	1,483
Source: MPMW 2020 UWMP, Table 4-5.				

5.3 Dry Year Water Demand

As shown in Table 5-1, MPMW's 2015 and 2016 demands were significantly lower than the demand in previous years. This reduction in demands occurred in response to the drought and mandated statewide reductions in urban potable water usage.

Following the drought, MPMW updated the stages of action to be taken in response to water supply shortages. The updated stages of action are reflected in MPMW's Water Shortage Contingency Plan (WSCP) and are included in Chapter 8 of the MPMW 2020 UWMP. MPMW has also implemented a demand management program with mandatory prohibitions that are in force at all times, as described in Chapter 8 of the MPMW 2020 UWMP. The projected future water demand presented in Table 5-2 includes continued implementation of the existing demand management program and is based on future normal hydrologic years.

Under dry water year conditions, MPMW anticipates implementing the demand reduction measures outlined in the WSCP as appropriate to reduce water demands to match the reduction in the supply. However, to be conservative, the MPMW 2020 UWMP and this WSA do not assume additional water conservation will occur in single dry or multiple dry years, even though additional water conservation is likely to occur during dry years or other water supply shortages as a result of MPMW implementing additional water conservation measures.

Table 5-3 presents the projected future single and multiple dry year water demand, as presented in the MPMW 2020 UWMP.

Table 5-3. Projected Future Water Demand – Dry Years					
Hydrologic Condition	Demand Reduction[a]	Projected Water Demand, MG			
		2025	2030	2035	2040
Single Dry Year[b]	0%	1,296	1,345	1,410	1,483
Multiple Dry Years[c,d]	0%	1,296	1,345	1,410	1,483

(a) Conservatively assumes no demand reduction in dry years. Demands may be reduced in dry years as a result of MPMW's implementation of its Water Shortage Contingency Plan; however, such a demand reduction is not assumed or relied upon for the purposes of the Single Dry Year and Multiple Dry Year evaluations for this WSA.

(b) Source: MPMW 2020 UWMP, Table 7-5.

(c) Source: MPMW 2020 UWMP, Table 7-6.

(d) Represents demands for each year of the 5-year multiple dry year period.

6.0 MENLO PARK MUNICIPAL WATER SUPPLIES

10910(c)(2) If the projected water demand associated with the proposed project was accounted for in the most recently adopted urban water management plan, the public water system may incorporate the requested information from the urban water management plan in preparing the elements of the assessment required to comply with subdivisions (d), (e), (f) and (g).

10910(d)(1) The assessment required by this section shall include an identification of any existing water supply entitlements, water rights, or water service contracts relevant to the identified water supply for the proposed project, and a description of the quantities of water received in prior years by the public water system…under the existing water supply entitlements, water rights, or water service contracts.

10910(e) If no water has been received in prior years by the public water system…under the existing water supply entitlements, water rights, or water service contracts, the public water system…shall also include in its water supply assessment…an identification of the other public water systems or water service contract holders that receive a water supply or have existing water supply entitlements, water rights, or water service contracts, to the same source of water as the public water system.

10910(f) If a water supply for a proposed project includes groundwater, the following additional information shall be included in the water supply assessment.

(1) A review of any information contained in the urban water management plan relevant to the identified water supply for the proposed project.

(2) A description of any groundwater basin or basins from which the proposed project will be supplied. For those basins for which a court or the board has adjudicated the rights to pump groundwater, a copy of the order or decree adopted by the court or the board and a description of the amount of groundwater the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), has the legal right to pump under the order or decree. For basins that have not been adjudicated, information as to whether the department has identified the basin or basins as overdrafted or has projected that the basin will become overdrafted if present management conditions continue, in the most recent bulletin of the department that characterizes the condition of the groundwater basin, and a detailed description by the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), of the efforts being undertaken in the basin or basins to eliminate the long-term overdraft condition.

(3) A detailed description and analysis of the amount and location of groundwater pumped by the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), for the past five years from any groundwater basin from which the proposed project will be supplied. The description and analysis shall be based on information that is reasonably available, including, but not limited to, historical use records.

(4) A detailed description and analysis of the amount and location of groundwater that is projected to be pumped by the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), from any basin from which the proposed project will be supplied. The description and analysis shall be based on information that is reasonably available, including, but not limited to, historical use records.

(5) An analysis of the sufficiency of the groundwater from the basin or basins from which the proposed project will be supplied to meet the projected water demand associated with the proposed project. A water assessment shall not be required to include the information required by this paragraph if the public water system determines, as part of the review required by paragraph (1), that the sufficiency of groundwater necessary to meet the initial and projected water demand associated with the project was addressed in the description and analysis required by paragraph (4) of subdivision (b) of Section 10631.

As described in Section 3.4 of this WSA, the projected water demand associated with buildout of ConnectMenlo, which includes the Proposed Project, was accounted for in MPMW's most recently adopted Urban Water Management Plan. The descriptions provided below for MPMW's water supplies are based on the MPMW 2020 UWMP (adopted in May 2021) and the SFPUC 2020 UWMP (adopted in June 2021).

6.1 Water Supply Overview

MPMW currently purchases all of its potable water supplies from the SFPUC RWS. MPMW has reservoirs in its Upper Zone to provide for emergency supply and an emergency groundwater well has been constructed at MPMW's Corporation Yard. Additional groundwater wells and reservoirs for emergency supply are in the planning stages for the Lower Zone and the High Pressure Zone.

Recycled water supplied by West Bay Sanitary District (WBSD) is currently utilized within the MPMW service area for irrigation at the Sharon Heights Golf & Country Club and is under development for the Bayfront Area. According to the MPMW 2020 UWMP, MPMW plans to utilize up to 120 MG/yr of recycled water from WBSD for landscape and golf course irrigation and commercial non-potable applications at Sharon Heights and in the Bayfront Area.

6.2 Water Supply from the SFPUC RWS

The SFPUC RWS supplies water to both retail and wholesale customers. Retail customers include residents, businesses, and industries located within the City and County of San Francisco's boundaries. Wholesale customers include 26 cities and water supply agencies in Alameda, San Mateo and Santa Clara counties, including MPMW.

MPMW is a member agency of Bay Area Water Supply and Conservation Agency (BAWSCA) and purchases treated water from the SFPUC RWS in accordance with the November 2018 Amended and Restated Water Supply Agreement between the City and County of San Francisco and Wholesale Customers in Alameda, San Mateo and Santa Clara Counties, which was adopted in 2019. The term of the agreement is 25 years, with a beginning date of July 1, 2009 and an expiration date of June 30, 2034. Per the agreement, MPMW has an Individual Supply Guarantee (ISG) of 4.456 million gallons per day (mgd), or 1,630 million gallons per year, supplied by the SFPUC RWS. Over the last five years (2016-2020) MPMW has purchased between 52 percent and 66 percent of its ISG.

Additional discussion of the SFPUC RWS water supplies is provided in MPMW's 2020 UWMP and SFPUC's 2020 UWMP.

6.3 Groundwater Supply

MPMW does not rely upon groundwater supplies for its potable water supply since the entirety of the MPMW supply is purchased from the SFPUC RWS. However, MPMW has undertaken a multi-year Emergency Water Storage/Supply Project to construct emergency groundwater wells. As such, this WSA evaluates groundwater basin conditions pursuant to Section 10910(f).

6.3.1 Groundwater Basin Description

The MPMW service area overlies the southern end of the Santa Clara Valley Groundwater Basin's San Mateo Plain Groundwater Subbasin (DWR basin number 2-9.03; DWR, 2004; or "subbasin"). The

subbasin is not adjudicated, nor has it been found by the Department of Water Resources (DWR) to be in a condition of overdraft. As part of the implementation of the Sustainable Groundwater Management Act (SGMA), the subbasin was ranked as a "very low priority" basin under the California Statewide Groundwater Elevation Monitoring basin prioritization process. As such, the basin is not subject to the requirements of SGMA.

Located within the 45-square mile San Francisquito Creek Watershed, the MPMW service area contains both mountainous bedrock terrain and comparatively flat alluvial deposits. Coarse- and fine-grained alluvial deposits from the San Francisquito Creek can be found in the MPMW service area. There is a shallow aquifer and a deep aquifer that has an upper and a lower zone in the MPMW service area. Both aquifers lie beneath a laterally extensive confining layer. The shallow aquifer is unconfined while the deep aquifer is semi-confined. Pump tests and empirical transmissivity data show that it is feasible to develop a municipal supply from the groundwater subbasin. It is estimated that the groundwater subbasin can be as thick as 1,000 feet in some locations.

Groundwater in the Santa Clara Valley Groundwater Basin naturally flows toward the San Francisco Bay from the uplands in the southwest. Reverse groundwater gradients, from the San Francisco Bay toward the uplands, have been seen when pumping has exceeded the rate of recharge. The estimated annual recharge rate of the San Francisquito Creek watershed ranges from 4,000 to 8,000 acre-feet per year, equivalent to 3.6 to 7.2 mgd.

Additional discussion of the groundwater conditions and groundwater management is provided in MPMW's 2020 UWMP.

6.3.2 MPMW Emergency Water Storage/Supply Project

The MPMW Emergency Water Storage/Supply Project intends to provide a backup water supply to MPMW's Lower Zone, which lacks emergency storage, in the event water from the SFPUC RWS is reduced or unavailable. The MPMW Emergency Water Storage/Supply Project will provide a total capacity of up to 3,000 gpm, or approximately 4.32 mgd, between two to three wells at separate locations. MPMW initiated the project in 2010 and completed site screening, site ranking, and detailed engineering and hydrologic evaluation in 2013, including extensive community engagement. The City selected the Corporation Yard at 333 Burgess Drive for the first well, completed the CEQA evaluation in 2016, and drilled the well in 2017. Construction of the well facility (e.g., generator, disinfection equipment, associated piping) was completed in late 2020, and MPMW is working with the State Water Resources Control Board (SWRCB) to permit the well. MPMW is also investigating locations for a future underground reservoir for the Lower Zone and High Pressure Zone.

The SWRCB Division of Drinking Water classifies wells as "active" or "standby." Active wells, with water quality testing requirements every 3 years, must meet all primary and secondary standards and have no restrictions on when the well can be used. Standby wells, with water quality testing requirements every 9 years, must meet all primary standards (but not secondary standards) and have restrictions that the well cannot be used for more than 14 days per year or more than 5 consecutive days. To provide flexibility, the City plans to permit its emergency wells as "active" wells as long as primary and secondary standards can be met. The City's plan is to use the wells for emergency purposes only but have the flexibility to provide well water during emergencies that last more than 14 days per year or more than 5 consecutive days.

6.4 Recycled Water Supply

WBSD provides wastewater collection services to the MPMW service area. WBSD also acts as the recycled water purveyor in MPMW's Upper Zone and WBSD is developing a recycled water system to serve the Lower Zone and High Pressure Zone.

Currently, recycled water is only used at the Sharon Heights Golf & Country Club, which is a 170-acre property located in the Upper Zone of MPMW's service area. The recycled water system consists of the Sharon Heights Recycled Water Facility, a pump station, recycled water distribution pipelines to the golf course irrigation system, and a solids disposal pipeline. In 2020, the satellite wastewater treatment plant (WWTP) provided 20 MG of recycled water to the Sharon Heights Golf & Country Club, offsetting demand in potable water purchased from SFPUC. A second phase of the project, in the very early planning stages, could supply approximately 28 MG of recycled water over seven months a year to the Stanford Linear Accelerator Center for irrigation and industrial uses such as for cooling towers.

Planning for a similar recycled water facility in the Bayfront Area is ongoing. WBSD has completed a feasibility study exploring the viability of a Resource Recovery Center at WBSD's former treatment plant behind Bedwell Bayfront Park, which could produce approximately 500,000 gallons per day of recycled water for reuse (the MPMW 2020 UWMP projects an annual recycled water supply of 72 MG/yr from this new facility). The feasibility study concluded that the project is feasible. In a public/private partnership with Meta (the Project Applicant), the WBSD Board of Directors spearheaded the effort to install 2,800 feet of purple recycled water pipe parallel with the storm drainpipe Meta was replacing on Chilco Street. This pipe will be used to distribute recycled water in the area. According to WBSD, recycled water will be used for irrigation, industrial purposes, firefighting, public fill stations and toilet flushing in the Bayfront Area.

6.5 Summary of Existing and Additional Planned Future Water Supplies

Table 6-1 provides a summary of MPMW's current and projected future normal year supplies as presented in MPMW's 2020 UWMP. The availability and reliability of MPMW's water supplies in dry years is discussed in Section 7 of this WSA.

Table 6-1. MPMW Current and Projected Future Water Supplies – Normal Years

Water Source	Water Supply, MG				
	2020 Actual[a,b]	2025[c]	2030[c]	2035[c]	2040[c]
Potable Water - Purchased from SFPUC RWS	1,069	1,630	1,630	1,630	1,630
Recycled Water – Sharon Heights Recycled Water Facility	20	48	48	48	48
Recycled Water – Bayfront Recycled Water Facility	--	0	72	72	72
Total	**1,089**	**1,678**	**1,750**	**1,750**	**1,750**

(a) 1,069 MG represents only 65.5% of the ISG to MPMW.
(b) Source: MPMW 2020 UWMP, Table 4-7.
(c) Source: MPMW 2020 UWMP, Table 6-9.

7.0 WATER SUPPLY RELIABILITY

10910(c)(4) If the city or county is required to comply with this part pursuant to subdivision (b), the water supply assessment for the project shall include a discussion with regard to whether the total projected water supplies, determined to be available by the city or county for the project during normal, single dry, and multiple dry water years during a 20-year projection, will meet the projected water demand associated with the proposed project, in addition to existing and planned future uses, including agricultural and manufacturing uses.

10911(a) If, as a result of its assessment, the public water system concludes that its water supplies are, or will be, insufficient, the public water system shall provide to the city or county its plans for acquiring additional water supplies, setting forth the measures that are being undertaken to acquire and develop those water supplies. If the city or county, if either is required to comply with this part pursuant to subdivision (b), concludes as a result of its assessment, that water supplies are, or will be, insufficient, the city or county shall include in its water supply assessment its plans for acquiring additional water supplies, setting forth the measures that are being undertaken to acquire and develop those water supplies. Those plans may include, but are not limited to, information concerning all of the following:

(1) The estimated total costs, and the proposed method of financing the costs, associated with acquiring the additional water supplies.

(2) All federal, state, and local permits, approvals, or entitlements that are anticipated to be required in order to acquire and develop the additional water supplies.

(3) Based on the consideration set forth in paragraphs (1) and (2), the estimated timeframes within which the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), expects to able to acquire additional water supplies.

The current reliability of MPMW's water supply is largely dependent upon its water supply contract with SFPUC and SFPUC's water supply reliability. The reliability discussion provided below is based on the MPMW 2020 UWMP (adopted in May 2021) and the SFPUC 2020 UWMP (adopted in June 2021). It should be noted that SFPUC's 2020 UWMP extends to a 2045 horizon year, which is beyond the statutorily required horizon year of 2040 presented in the MPMW 2020 UWMP.

7.1 SFPUC RWS Reliability

Information regarding the reliability of the SFPUC RWS was provided to MPMW by BAWSCA, in coordination with SFPUC, during the preparation of the MPMW 2020 UWMP. The following sections describe the potential impacts of the 2018 Bay-Delta Plan Amendment on SFPUC RWS reliability, allocation of RWS supplies during supply shortages, as well as SFPUC's Alternative Water Supply Planning Program designed to investigate and plan for new water supplies to address future long-term water supply reliability challenges and vulnerabilities on the RWS.

7.1.1 Potential Impacts of the 2018 Bay-Delta Plan Amendment on SFPUC RWS Reliability

In December 2018, the SWRCB adopted amendments to the Water Quality Control Plan for the San Francisco Bay Sacramento-San Joaquin Delta Estuary (Bay-Delta Plan Amendment) to establish water quality objectives to maintain the health of the Bay-Delta ecosystem. The SWRCB is required by law to regularly review this plan. The adopted Bay-Delta Plan Amendment was developed with the stated goal of increasing salmonid populations in three San Joaquin River tributaries (the Stanislaus, Merced, and Tuolumne Rivers) and the Bay-Delta. The Bay-Delta Plan Amendment requires the release of 40 percent of the "unimpaired flow" on the three tributaries from February through June in every year type, whether wet, normal, dry, or critically dry.

The SWRCB has stated that it intends to implement the Bay-Delta Plan Amendment on the Tuolumne River in 2022, assuming all required approvals are obtained by that time. But implementation of the Plan Amendment is uncertain for several reasons:

- Since adoption of the Bay-Delta Plan Amendment, over a dozen lawsuits have been filed in both state and federal court, challenging the SWRCB's adoption of the Bay-Delta Plan Amendment, including two legal challenges filed by the federal government, at the request of the U.S. Department of Interior, Bureau of Reclamation in state and federal courts. These cases are in the early stage and there have been no dispositive court rulings to date.
- The Bay-Delta Plan Amendment is not self-implementing and does not allocate responsibility for meeting its new flow requirements to the SFPUC or any other water rights holders. Rather, the Plan Amendment merely provides a regulatory framework for flow allocation, which must be accomplished by other regulatory and/or adjudicatory proceedings, such as a comprehensive water rights adjudication or, in the case of the Tuolumne River, the 401 certification process in the Federal Energy Regulatory Commission's (FERC) relicensing proceeding for Don Pedro Dam. The license amendment process is currently expected to be completed in the 2022-23 timeframe. This process and the other regulatory and/or adjudicatory proceedings would likely face legal challenges and have lengthy timelines, and quite possibly could result in a different assignment of flow responsibility (and therefore a different water supply impact on the SFPUC).
- In recognition of the obstacles to implementation of the Bay-Delta Plan Amendment, SWRCB Resolution No. 2018-0059 adopting the Bay-Delta Plan Amendment directed staff to help complete a "Delta watershed-wide agreement, including potential flow measures for the Tuolumne River" by March 1, 2019, and to incorporate such agreements as an "alternative" for a future amendment to the Bay-Delta Plan to be presented to the SWRCB "as early as possible after December 1, 2019." In accordance with the SWRCB's instruction, on March 1, 2019, SFPUC, in partnership with other key stakeholders, submitted a proposed project description for the Tuolumne River that could be the basis for a voluntary substitute agreement with the SWRCB ("March 1st Proposed Voluntary Agreement"). On March 26, 2019, the Commission adopted Resolution No. 19-0057 to support SFPUC's participation in the Voluntary Agreement negotiation process. To date, those negotiations are ongoing under the California Natural Resources Agency and California Environmental Protection Agency and the leadership of the Newsom administration. The negotiations for a voluntary agreement have made significant progress since an initial framework was presented to the SWRCB on December 12, 2018. The package submitted on March 1, 2019 is the product of renewed discussions since Governor Newsom took office. While significant work remains, the package represents an important step forward in bringing together diverse California water interests.[6]

[6] In late October 2021, State regulators announced that these negotiations stopped before an agreement was reached. It is unclear whether or when negotiations might be reinitiated.

Because of the uncertainties surrounding the implementation of the Bay-Delta Plan Amendment, the SFPUC 2020 UWMP analyzed two supply scenarios, one with the Bay-Delta Plan Amendment assuming implementation starting in 2023, and one without the Bay-Delta Plan Amendment. Results of these analyses are summarized as follows[7]:

- If the Bay-Delta Plan Amendment is implemented, SFPUC will be able to meet its contractual obligations to its wholesale customers as presented in the SFPUC 2020 UWMP in normal years but would experience significant supply shortages in dry years. In single dry years, supply shortages would range from 36 to 46 percent. In multiple dry years, supply shortages would range from 36 to 54 percent. Implementation of the Bay-Delta Plan Amendment will require rationing in all single dry and multiple dry years through 2045.
- If the Bay-Delta Plan Amendment is not implemented, SFPUC would be able to meet 100 percent of the projected purchases of its wholesale customers during all year types through 2045 except during the fourth and fifth consecutive dry years for base year 2045 when 15 percent wholesale supply shortages are projected.

In June 2021, in response to various comments from wholesale customers regarding the reliability of the RWS as described in SFPUC's 2020 UWMP, the SFPUC provided a memorandum describing SFPUC's efforts to remedy the potential effects of the Bay-Delta Plan Amendment. As described in the memorandum (included in Appendix B of this WSA), SFPUC's efforts include the following:

- Pursuing a Tuolumne River Voluntary Agreement
- Evaluating the drought planning scenario in light of climate change
- Pursuing alternative water supplies
- In litigation with the State over the Bay-Delta Plan Amendment
- In litigation with the State over the proposed Don Pedro FERC Water Quality Certification

7.1.2 Allocation of RWS Supplies During Supply Shortages

The wholesale customers and SFPUC adopted the November 2018 Amended and Restated Water Supply Agreement in 2019, which included a Water Shortage Allocation Plan (WSAP) to allocate water from the RWS to retail and wholesale customers during system-wide shortages of 20 percent or less, including such shortages occurring as a result of implementation of the Bay-Delta Plan Amendment. The WSAP has two tiers which are described below.

- The Tier One Plan allocates water between SFPUC and the wholesale customers collectively based on the level of the shortage (up to 20 percent). This plan applies only when SFPUC determines that a system-wide water shortage exists and issues a declaration of a water shortage emergency under California Water Code Section 350. The SFPUC may also opt to request voluntary cutbacks from San Francisco and the wholesale customers to achieve

[7] BAWSCA Drought Allocation Tables by Agency (Table E: Percent Cutback to the Wholesale Customers with Bay-Delta Plan and Table N: Percent Cutback to the Wholesale Customers Without Bay-Delta Plan), dated April 1, 2021.

necessary water use reductions during drought periods. The allocations outlined in the Tier One Plan are provided in Table 7-1.

Table 7-1. Tier One Plan Water Shortage Allocations

System-Wide Reduction Required, percent	Share of Available Water, percent	
	SFPUC	Wholesale Customers
≤ 5	35.5	64.5
6 to 10	36.0	64.0
11 to 15	37.0	63.0
16 to 20	37.5	62.5

- The Tier Two Plan allocates the collective wholesale customer share among the wholesale customers based on a formula that accounts for each wholesale customer's ISG, seasonal use of all available water supplies, and residential per capita use. BAWSCA calculates each wholesale customer's Allocation Factors annually in preparation for a potential water shortage emergency.

BAWSCA recognizes that the Tier Two Plan was not designed for RWS shortages greater than 20 percent, and in a memorandum dated March 1, 2021, BAWSCA provided a refined methodology to allocate RWS supplies during projected future single dry and multiple dry years in the instance where supply shortfalls are greater than 20 percent for the purposes of the BAWSCA member agencies' 2020 UWMPs. The revised methodology developed by BAWSCA allocates the wholesale supplies as follows:

- When the average Wholesale Customers' RWS shortages are 10 percent or less, an equal percent reduction will be applied across all agencies. This is consistent with the existing Tier Two requirements in a Tier Two application scenario.
- When average Wholesale Customers' shortages are between 10 and 20 percent, the Tier Two Plan will be applied.
- When the average Wholesale Customers' RWS shortages are greater than 20 percent, an equal percent reduction will be applied across all agencies.

In another memorandum dated February 18, 2021, BAWSCA explains that in actual RWS shortages greater than 20 percent, BAWSCA Member Agencies would have the opportunity to negotiate and agree upon a more nuanced and equitable approach. This would likely consider basic health and safety needs, the water needs to support critical institutions, and minimizing economic impacts on individual communities and the region. As such, the allocation method described in the MPMW 2020 UWMP is only intended to serve as the preliminary basis for the 2020 UWMP supply reliability analysis. The analysis provided in the SFPUC 2020 UWMP and the MPMW 2020 UWMP does not in any way imply an agreement by BAWSCA member agencies as to the exact allocation methodology. BAWSCA member agencies are in discussions about jointly developing an allocation method that would consider additional equity factors in the event that SFPUC is not able to deliver its contractual supply volume, and its cutbacks to the RWS supply exceed 20 percent.

7.1.3 Alternative Water Supply Program

In early 2020, the SFPUC began implementation of the Alternative Water Supply Planning Program (AWSP), a program designed to investigate and plan for new water supplies to address future long-term water supply reliability challenges and vulnerabilities of the RWS particularly in light of the possible implementation of the Bay-Delta Plan Amendment.

Included in the AWSP is a suite of diverse, non-traditional supply projects that, to a great degree, leverage regional partnerships and are designed to meet the water supply needs of the SFPUC Retail and Wholesale Customers through 2045. As of the most recent Alternative Water Supply Planning Quarterly Update, SFPUC has budgeted $264 million over the next ten years to fund water supply projects. The drivers for the program include: (1) the adoption of the Bay-Delta Plan Amendment and the resulting potential limitations to RWS supply during dry years; (2) the net supply shortfall following the implementation of SFPUC's Water System Improvement Plan (WSIP)[8]; (3) San Francisco's perpetual obligation to supply 184 mgd to the Wholesale Customers; (4) adopted Level of Service Goals to limit rationing to no more than 20 percent system-wide during droughts; and, (5) the potential need to identify water supplies that would be required to offer permanent status to interruptible customers.

The SFPUC is considering several water supply options and opportunities to meet all foreseeable water supply needs, including surface water storage expansion, recycled water expansion, water transfers, desalination, and potable reuse. These efforts and their expected benefit to supply reliability are listed below, and described in further detail in the MPMW 2020 UWMP and SFPUC 2020 UWMP:

- Daly City Recycled Water Expansion (Regional; Normal and Dry-Year Supply)
- Alameda County Water District – Union Sanitary District Purified Water Partnership (Regional; Normal and Dry-Year Supply)
- Crystal Springs Purified Water (Regional; Normal and Dry-Year Supply)
- Los Vaqueros Reservoir Expansion (Regional; Dry Year Supply)
- Bay Area Brackish Water Desalination (Regional; Normal and Dry-Year Supply)
- Calaveras Reservoir Expansion (Regional; Dry Year Supply)
- Groundwater Banking (Dry Year Supply)
- Inter-Basin Collaborations

Capital projects under consideration would be costly and are still in the early feasibility and conceptual planning stages. The exact yields from these projects are not quantified at this time, as these supply

[8] The Water System Improvement Program (WSIP) is a $4.8 billion dollar, multi-year capital program to upgrade the SFPUC's regional and local water systems. The program repairs, replaces, and seismically upgrades crucial portions of the Hetch Hetchy Regional Water System. The program consists of 87 projects (35 local projects located within San Francisco and 52 regional projects) spread over seven counties from the Sierra foothills to San Francisco. The San Francisco portion of the program is 100 percent complete as of October 2020. The Regional portion is approximately 99 percent complete. The current forecasted date to complete the overall WSIP is May 2023. Additional information on the WSIP is provided in Chapter 7 of MPMW's 2020 UWMP.

projects would take 10 to 30 years to implement and the exact amount of water that can be reasonably developed is currently unknown.

As with traditional infrastructure projects, there is a need to progress systematically from planning to environmental review, and then on to detailed design, permitting and construction of these alternative water supply projects. Given the complexity and inherent challenges, these projects will require a long lead time to develop and implement. SFPUC staff have developed an approach and timeline to substantially complete planning and initiate environmental review by July 2023 for a majority of the alternative water supply projects under consideration.

Additional information on the AWSP is provided in Chapter 7 of MPMW's 2020 UWMP.

7.2 MPMW Water Supply Reliability

In the MPMW 2020 UWMP, projected normal year supplies are shown to be adequate to satisfy MPMW's projected normal year demands. However, in the MPMW 2020 UWMP, and this WSA, MPMW's purchased supplies from the SFPUC RWS assume dry year supply reductions as a result of the implementation of the Bay-Delta Plan Amendment, which significantly reduces dry year allocations for SFPUC wholesale customers. Recycled water is estimated to be available during all hydrologic years at a volume that meets MPMW's projected recycled water demands.

Table 7-2 shows MPMW's projected supplies during normal, single dry and multiple dry years through 2040 based on the assumptions in the MPMW 2020 UWMP which assumes implementation of the Bay-Delta Plan Amendment. Based on the SFPUC's analysis, similar water supply quantities would be available to MPMW in 2045 under the various hydrologic conditions.[9]

Table 7-2. Projected MPMW Water Supplies with Bay-Delta Plan Amendment

Hydrologic Condition	Projected Water Supply, MG[(a)]			
	2025	2030	2035	2040
Normal Year[(b)]	1,678	1,750	1,750	1,750
Single Dry Year[(c)]	877	978	1,018	1,062
Multiple Dry Years – Year 1[(d)]	877	978	1,018	1,062
Multiple Dry Years – Year 2[(d)]	760	854	887	927
Multiple Dry Years – Year 3[(d)]	760	854	887	927
Multiple Dry Years – Year 4[(d)]	760	854	887	832
Multiple Dry Years – Year 5[(d)]	760	854	824	832

(a) Includes projected potable water supply from the SFPUC RWS and projected recycled water supply (48 MG/yr in 2025 and 120 MG/yr for 2030 to 2040) (see Table 6-1).
(b) Source: MPMW 2020 UWMP, Table 7-4.
(c) Source: MPMW 2020 UWMP, Table 7-5.
(d) Source: MPMW 2020 UWMP, Table 7-6

[9] BAWSCA Drought Allocation Tables by Agency (Table K: Individual Agency Drought Allocations, Base Year 2045, With Bay-Delta Plan), dated April 1, 2021.

The water supply estimates provided in Table 7-2 use the best available data at the time of the MPMW 2020 UWMP, but do not account for the following factors:

- Potential changes to the implementation of the Bay-Delta Plan Amendment as discussed in Section 7.1.1 of this WSA
- Climate change impacts on the SFPUC RWS
- Potential delays in completion of the WSIP[10]

For comparison purposes, the SFPUC 2020 UWMP also evaluated a scenario without implementation of the Bay-Delta Plan Amendment. Table 7-3 shows MPMW's projected supplies during normal, single dry and multiple dry years for 2025 through 2040 assuming that the Bay-Delta Plan Amendment is not implemented. SFPUC's analysis indicated that it would be able to meet 100 percent of the wholesale projected purchases during all year types through 2045 except during the fourth and fifth consecutive dry years for base year 2045 when a 16.5 percent supply shortfall is projected for MPMW (note that 2045 supplies are not shown in Table 7-3 as they were not shown in MPMW's 2020 UWMP).

As required under SB 610, in light of these identified water supply shortages, Section 8 of this WSA describes MPMW's proposals for reducing water demands and developing additional water supplies, including measures that are being undertaken to acquire and develop those water supplies.

Table 7-3. Projected MPMW Water Supplies without Bay-Delta Plan Amendment

Hydrologic Condition	Projected Water Supply, MG[(a)]			
	2025	2030	2035	2040
Normal Year[(b)]	1,678	1,750	1,750	1,750
Single Dry Year[(c)]	1,344	1,465	1,530	1,603
Multiple Dry Years – Year 1[(c)]	1,344	1,465	1,530	1,603
Multiple Dry Years – Year 2[(c)]	1,344	1,465	1,530	1,603
Multiple Dry Years – Year 3[(c)]	1,344	1,465	1,530	1,603
Multiple Dry Years – Year 4[(c,d)]	1,344	1,465	1,530	1,603
Multiple Dry Years – Year 5[(c,d)]	1,344	1,465	1,530	1,603

(a) Includes projected potable water supply from the SFPUC RWS (based on projected purchases) and projected recycled water supply (48 MG/yr in 2025 and 120 MG/yr for 2030 to 2040) (see Table 6-1).

(b) Source: MPMW 2020 UWMP, Table 7-4.

(c) Source: BAWSCA Drought Allocation Tables by Agency (Table A: Wholesale RWS Actual Purchases in 2020 and Projected Purchases for 2025, 2030, 2035, 2040 and 2045), dated April 1, 2021. Totals include projected recycled water supply.

(d) A 16.5 percent reduction in supply from the SFPUC RWS is projected for MPMW in the fourth and fifth years of a multiple dry year drought, but not until 2045 (BAWSCA Drought Allocation Tables by Agency (Table O2: Individual Agency Drought Allocations, Base Year 2045, Without Bay-Delta Plan), dated April 1, 2021.

[10] The San Francisco portion of the WSIP is 100 percent complete as of October 2020. The Regional portion of the WSIP is approximately 99 percent complete. The current forecasted date to complete the overall WSIP is May 2023.

8.0 DETERMINATION OF WATER SUPPLY SUFFICIENCY BASED ON THE REQUIREMENTS OF SB 610

> *10910(c)(4) If the city or county is required to comply with this part pursuant to subdivision (b), the water supply assessment for the project shall include a discussion with regard to whether the total projected water supplies, determined to be available by the city or county for the project during normal, single dry, and multiple dry water years during a 20-year projection, will meet the projected water demand associated with the proposed project, in addition to existing and planned future uses, including agricultural and manufacturing uses.*
>
> *10911 (a) If, as a result of its assessment, the public water system concludes that its water supplies are, or will be, insufficient, the public water system shall provide to the city or county its plans for acquiring additional water supplies, setting forth the measures that are being undertaken to acquire and develop those water supplies.*

Because of the uncertainties surrounding the implementation of the Bay-Delta Plan Amendment, this WSA presents findings for two scenarios, one assuming the Bay-Delta Plan Amendment is implemented and one assuming that the Bay-Delta Plan Amendment is not implemented.

Table 8-1 summarizes the scenario where it is assumed the Bay-Delta Plan Amendment is implemented. Under this scenario, the total projected water supplies determined to be available for the Proposed Project in normal years will meet the projected water demand associated with the Proposed Project, in addition to MPMW's existing and planned future uses, through 2040. However, with the implementation of the Bay-Delta Plan Amendment, significant supply shortfalls are projected in dry years for agencies that receive water supplies from the SFPUC RWS, as well as other agencies whose water supplies would be affected by the Amendment. For MPMW, supply shortfalls are projected in single dry years (ranging from 27 to 32 percent) and in multiple dry years (ranging from 27 to 44 percent) through 2040. Based on SFPUC's analysis, similar supply shortfalls would occur through 2045.

If supply shortfalls do occur, MPMW expects to meet these supply shortfalls through water demand reductions and other shortage response actions by implementation of its WSCP.[11] The projected single dry year shortfalls would require implementation of Stage 3 or 4 of the MPMW WSCP, and the projected multiple dry year shortfalls would require implementation of Stage 3, 4 or 5 of the MPMW WSCP.

As described in Section 7.1.3 of this WSA, the SFPUC is implementing an Alternative Water Supply Planning Program to investigate and plan for new water supplies to address future long-term water supply reliability challenges and vulnerabilities on the RWS. Also, as described in Section 6.3.2 of this WSA, MPMW is implementing an Emergency Water Storage/Supply Project to provide a backup water supply to MPMW's Lower Zone. However, because these potential additional supplies are still being developed, they are not included in Table 8-1.

[11] A main focus of MPMW's planned demand reduction measures is to increase public outreach and keep customers informed of the water shortage emergency and actions they can take to reduce consumption. The City will utilize its emergency supply well(s) as supply augmentation during WSCP Stages 5 and 6. Other actions that the City will take will include coordination with other agencies, implementing drought surcharge, increasing water waste patrols, etc. Additional information on MPMW's WSCP is provided in Chapter 8 of MPMW's 2020 UWMP.

Table 8-1. MPMW Summary of Water Demand Versus Supply with Bay-Delta Plan Amendment During Hydrologic Normal, Single Dry, and Multiple Dry Years

Hydrologic Condition		Supply and Demand Comparison, MG			
		2025	2030	2035	2040
Normal Year					
Available Water Supply[(a)]		1,678	1,750	1,750	1,750

	Total Water Demand[(d)]	1,296	1,345	1,410	1,483
	Potential Surplus (Deficit)	(536)	(491)	(523)	(557)
	Percent Shortfall of Demand	41%	37%	37%	38%
Multiple-Dry Year 4	Available Water Supply[(c)]	760	854	887	832
	Total Water Demand[(d)]	1,296	1,345	1,410	1,483
	Potential Surplus (Deficit)	(536)	(491)	(523)	(652)
	Percent Shortfall of Demand	41%	37%	37%	44%
Multiple-Dry Year 5	Available Water Supply[(c)]	760	854	824	832
	Total Water Demand[(d)]	1,296	1,345	1,410	1,483
	Potential Surplus (Deficit)	(536)	(491)	(586)	(652)
	Percent Shortfall of Demand	41%	37%	42%	44%

(a) From Table 6-1 of this WSA.
(b) From Table 5-2 of this WSA.
(c) From Table 7-2 of this WSA.
(d) From Table 5-3 of this WSA.

Table 8-2 summarizes the scenario where it is assumed the Bay-Delta Plan Amendment is not implemented. Under this scenario, the total projected water supplies determined to be available for the Proposed Project in normal years, single dry years and multiple dry years will meet the projected water demand associated with the Proposed Project, in addition to MPMW's existing and planned future uses through 2040. As described in Section 7.2 of this WSA, based on SFPUC's analysis, a 16.5 percent supply shortfall is projected during the fourth and fifth consecutive dry years for base year 2045 (note that 2045 supplies and demands are not shown in Table 8-2 as they were not shown in MPMW's 2020 UWMP). These projected supply shortfalls are significantly less than the projected supply shortfalls if the Bay-Delta Plan Amendment is implemented.

If supply shortfalls do occur, MPMW expects to meet these supply shortfalls through water demand reductions and other shortage response actions by implementation of its WSCP.[12] The projected multiple dry year shortfalls in 2045 would require implementation of Stage 2 of the MPMW WSCP.

The water demand associated with buildout of ConnectMenlo, which includes the Proposed Project, is included in the MPMW water demand projections in its 2020 UWMP, and the Proposed Project would be subject to the same water conservation and water use restrictions as other water users within the MPMW system.

[12] A main focus of MPMW's planned demand reduction measures is to increase public outreach and keep customers informed of the water shortage emergency and actions they can take to reduce consumption. The City will utilize its emergency supply well(s) as supply augmentation during WSCP Stages 5 and 6. Other actions that the City will take will include coordination with other agencies, implementing drought surcharge, increasing water waste patrols, etc. Additional information on MPMW's WSCP is provided in Chapter 8 of MPMW's 2020 UWMP.

Table 8-2. MPMW Summary of Water Demand Versus Supply without Bay-Delta Plan Amendment During Hydrologic Normal, Single Dry, and Multiple Dry Years

Hydrologic Condition		Supply and Demand Comparison, MG			
		2025	2030	2035	2040
Normal Year					
Available Water Supply[(a)]		1,678	1,750	1,750	1,750

(b) From Table 5-2 of this WSA.
(c) From Table 7-3 of this WSA.
(d) From Table 5-3 of this WSA.

9.0 VERIFICATION OF WATER SUPPLY SUFFICIENCY BASED ON THE REQUIREMENTS OF SB 221

The Proposed Project, with up to 1,730 residential dwelling units, is also subject to the requirements of SB 221 (Government Code section 66473.7). SB 221 applies to residential development projects of more than 500 dwelling units (such as the Proposed Project) and requires that the water supplier (MPMW) provide a written verification that the water supply for the Proposed Project is sufficient.

Verification must demonstrate supply sufficiency by showing that water supplies available during Normal, Single Dry and Multiple Dry years within a projected 20-year period will meet the projected demand associated with the Proposed Project, in addition to existing and planned future uses, including, but not limited to, agriculture and industrial uses. Per the requirements of SB 221, the following must be considered:

- Historical water deliveries for the previous 20 years
- Urban water shortage contingency analysis prepared for the UWMP
- Supply reduction for specific water use sectors
- Amount of water expected from specified supply projects

The specific considerations to be evaluated for the SB 221 verification are described below and reference applicable sections of the MPMW 2020 UWMP and this WSA.

9.1 Historical Water Deliveries

MPMW's water supplies are described in Section 6 of this WSA and Chapter 6 of the MPMW 2020 UWMP. Table 9-1 presents MPMW's historical use of these supplies over the past 20 years. The use of these supplies will continue into the future with increasing recycled water usage, as described in Section 6 of this WSA.

Table 9-1. MPMW Historical Water Supplies

Water Source	Historical Water Supply, MG				
	2000	2005	2010	2015	2020
Potable Water Purchased Water from the SFPUC RWS	1,354[(a)]	1,268[(b)]	1,052[(c)]	883[(c)]	1,069[(c)]
Recycled Water Purchased from WBSD	--	--	--	--	20[(d)]
Total	**1,354**	**1,268**	**1,052**	**883**	**1,089**

(a) MPMW 2015 UWMP, Appendix E, Table 4
(b) MPMW 2015 UWMP, Table 3-1.
(c) MPMW 2020 UWMP, Table 4-2.
(d) MPMW 2020 UWMP, Table 4-7.

Water supply availability and reliability during Normal, Single Dry and Multiple Dry years is described in Section 7 of this WSA.

9.2 Projected Water Demand by Customer Sector

Projected potable and recycled water demands in the MPMW service area are described in Section 5.2 of this WSA based on information provided in Chapter 4 of MPMW's 2020 UWMP. Projected potable water demand by customer sector within MPMW's service area is documented in the MPMW's 2020 UWMP (Chapter 4) and is summarized in Table 9-2.

Table 9-2. Actual and Projected Potable Water Demands

Water Use Type	Water Demand, MG				
	2020 (Actual)[a]	2025[b]	2030[b]	2035[b]	2040[b]
Single Family	361	306	299	293	288
Multi-Family	113	158	176	203	230
Commercial	203	346	345	373	401
Industrial	140	134	122	112	102
Institutional/ Governmental	98	98	105	115	126
Landscape	139	95	61	71	85
Losses	12	110	116	122	128
Other Potable	3	1	1	1	2
Total	**1,069**	**1,248**	**1,225**	**1,290**	**1,362**

(a) MPMW 2020 UWMP, Table 4-1.
(b) MPMW 2020 UWMP, Table 4-6.

As described in Section 2.2 of this WSA, the water demand for the Proposed Project is included in the MPMW 2020 UWMP under the approved ConnectMenlo development limit. The projected potable water demand for the Proposed Project will be reduced through the use of recycled water supplies to meet the non-potable water demands for the Proposed Project.

9.3 Water Shortage Contingency Analysis

Chapter 8 and Appendix J of the MPMW 2020 UWMP provide a Water Shortage Contingency Plan to address situations when catastrophic water supply interruptions occur due to regional power outage, earthquake, or other disasters; and when drought occurs. The primary objective of the WSCP is to ensure that MPMW has adequate resources and management responses needed to protect health and human safety, minimize economic disruption, and preserve environmental and community assets during a water supply shortage or interruption. The plan is based on Menlo Park Municipal Code Section 7.35, requiring water rationing and conservation and granting MPMW the authority to enforce penalties.

The MPMW 2020 WSCP builds upon the WSCP established in 2015, including additional provisions required by California Water Code. On an annual basis, MPMW in coordination with BAWSCA will evaluate water supply information provided by SFPUC or BAWSCA to determine if a water shortage exists, as well as the severity of a particular water shortage. In response to water use reductions required by SFPUC or another governing body, City Council may declare a water shortage. The MPMW 2020 WSCP defines six water shortage stages ranging from 10 percent to greater than 50 percent water shortage, in addition to

water waste prohibitions that are in effect at all times. MPMW monitors water use in its service area through monthly meter readings, which allows high water use to be identified and resolved during a water shortage. In addition, MPMW plans to install advanced metering infrastructure over the next two fiscal years to provide automated real-time water use data, and allow MPMW to aggressively target leaks and high water use.

If an emergency or drought condition were to occur that requires MPMW to implement its WSCP, all MPMW customers, including those within the Proposed Project, would be subject to the same water conservation and water use restrictions included in the 2020 WSCP.

9.4 Verification of Sufficient Water Supply

As described in Section 8 of this WSA, the sufficiency of supplies to meet the Proposed Project demands depends on the assumed reliability of the SFPUC RWS supplies, which depends on the assumed implementation of the Bay-Delta Plan Amendment. If it is assumed the Bay-Delta Plan Amendment is implemented, projected supplies during normal years are sufficient to meet the Proposed Project demands, but significant supply shortfalls are projected in dry years for agencies that receive water supplies from the SFPUC RWS, as well as other agencies whose water supplies would be affected by the Amendment. For MPMW, supply shortfalls are projected in single dry years (ranging from 27 to 32 percent) and in multiple dry years (ranging from 27 to 44 percent) through 2040, with similar findings through 2045 based on SFPUC's analysis. If it is assumed the Bay-Delta Plan Amendment is not implemented, projected supplies during normal years, single dry years and multiple dry years are sufficient to meet the Proposed Project demands through 2040; a 16.5 percent supply shortfall is projected during the fourth and fifth consecutive dry years for base year 2045 based on SFPUC's analysis.

As described in Section 8 of this WSA, if supply shortfalls occur, MPMW expects to meet these supply shortfalls through water demand reductions and other shortage response actions by implementation of its WSCP. Under the scenario which assumes the Bay-Delta Plan Amendment is implemented, the projected single dry year and multiple dry year shortfalls would require implementation of Stages 3, 4 or 5 of the MPMW WSCP. Under the scenario which assumes the Bay-Delta Plan Amendment is not implemented, the projected multiple dry year shortfalls in 2045 would require implementation of Stage 2 of the MPMW WSCP. The Proposed Project would be subject to the same water conservation and water use restrictions as other water users within the MPMW system.

10.0 WATER SUPPLY ASSESSMENT APPROVAL PROCESS

> *10910 (g)(1) Subject to paragraph (2), the governing body of each public water system shall submit the assessment to the city or county not later than 90 days from the date on which the request was received. The governing body of each public water system, or the city or county if either is required to comply with this act pursuant to subdivision (b), shall approve the assessment prepared pursuant to this section at a regular or special meeting.*

The Menlo Park City Council must approve this WSA at a regular or special meeting. This WSA will be included in the Draft EIR being prepared for the Proposed Project.

TECHNICAL MEMORANDUM

January 27, 2022

To: Eric Harrison
Senior Vice President
Signature Development Group

From: Richard Laureta, PE

RE: Willow Village Project Water Demand, Alternative Water Source Assessment, and Water Modelling Memorandum

---

BACKGROUND

This memorandum presents how the subject project is meeting the City's Water Use Budget Guidelines for New Developments in the Office, Life Sciences and Residential Mixed-Use Zoning Districts as described in Sections 16.43.140 and 16.45.130 "Green and sustainable building" of the Municipal Code. The anticipated water consumption for the proposed development has been developed using industry-standard literature references, information from similar, mixed-use developments and from applicable building certification programs, such as USGBC's LEED framework and the CALGreen code. While water use by parcel and by program are provided herein, our understanding is that the City will take a comprehensive look at the water budget across all parcels and programs. The data presented in the Technical Memorandum includes data for the baseline project and updated values for an increase of 200 residential units to the baseline project. This Technical Memorandum also presents the estimated percent savings the total Water Demand for the project will benefit from with the use of recycled water for non-potable uses, for both the baseline and 200-unit variant scenarios.

Also attached to this Technical Memorandum as Appendices are the Water Use Budget per Parcel for both the baseline and 200-unit variant scenarios, and the Water Flow Rate Criteria for Water System Modelling Technical Memorandum.

The Project team is available to meet and discuss this information with the City staff and their consultants should any questions arise or should any additional information be required. Thank you for the opportunity to present this information to the City of Menlo Park.

WATER USE BUDGET

The Willow Village Project exceeds 250,000 square feet in gross floor area and thus must submit a proposed water budget with accompanying calculations, per Section 16.43.140.3.C and 16.45.130.3.C of the Municipal code. The water budget accounts for the potable water demand reduction resulting from the use of an alternative water source for all City-approved non-potable applications. Table 1 below presents a summary of the Baseline Project water use budget. Please refer to the accompanying Microsoft Excel spreadsheet document titled "Willow Village Water Use Budget baseline" for the supporting calculations for Table 1. Table 2 below presents a summary of the Project EIR Increased Residential Density Variant. Please refer to the accompanying Microsoft Excel spreadsheet document titled "Willow Village Water Use Budget residential 200-unit variant" for the supporting calculations for Table 2.

Indoor Water Demands

Water budget calculations are presented in terms of building use (program) for non-residential and residential mixed-use spaces. Occupancy information was either provided by the Project architects or is based off Table 1004.5 Occupant Load in the 2019 California Building Code (CBC). Fixture demands are developed based on 2019 CALGreen fixture flow rates and LEED frequency of fixture use and duration times. Note that water demand factors from literature were used for some retail programs (grocery and food and beverage) to better represent water demands for these water-intense retail spaces. Refer to "Indoor" tab in the attached spreadsheet for the unit demands and estimated water demands.

Cooling demands are presented for the two programs that will be met with water-based cooling: office buildings and event space. Monthly water use demands are calculated using the variance in mean monthly temperature for Menlo Park. Refer to "Cooling" tab in the attached spreadsheet for cooling demands for these two spaces.

Outdoor Water Demands

Planning level irrigation demands are calculated in accordance with Menlo Park Municipal Code Chapter 12.44 Water-Efficient Landscaping Ordinance. Evapotranspiration data was found in the CIMIS Reference Evapotranspiration Zone Map, Department of Water Resources, 1999. Per Section 12.44.030.xxx, areas irrigated with recycled water are deemed a "Special landscape area (SLA)". Section 12.44.030.s states that special landscape areas shall not exceed an ET adjustment factor (ETAF) value of 1.0. As outlined in a following section of this memo, an alternate water supply is expected for this project and thus an ETAF of 1.0 was used in the calculations. Refer to the "Irrigation" tab in the previously described spreadsheets for these planning level demands.

Water Losses

It is anticipated that some water losses would occur on-site through the distribution system and fixtures. For example, leaky fixtures, pipe connections, broken sprinkler heads and taps unintentionally left running can be sources of unplanned water use. The Project team has included a 10% leakage factor in each water demand to adequately account for these scenarios. As a nearby jurisdictional precedent, this buffer aligns with values used by the SFPUC potable water allocation program.

UNIT WATER DEMAND FACTORS

Water demand factors for similar, mixed-use projects are presented below for interior demands and seasonal demands (cooling demands and irrigation demands). It is our project team's understanding that the WSA study will use these values to calculate water demands for the Project. The following sections describe the proposed water demand factors for each program area.

Interior Demands

Table 3 presents water demands for each program per person and per area for ease of reference and includes the increased residential variant. Office, residential and hotel demands were developed by "building-up" an occupant's daily water demand through fixture flow rates and expected frequency of use. These values were equated to water demand per area for comparison to the retail demands, available as gallon per building floor area in the literature. References are provided for each demand factor.

TABLE 3: Interior demands and associated water demand factors (Increased Residential Variant)

Program	Water Demand, MGY (excluding leakage factor)	Gross Floor Area (GFA, sq. ft.)	Occupancy (capita)	Water Demand Factors		Demand Breakdown		*Reference*
				gal/ca-d	gal/sf-d	Potable (%)	Non-Potable (%)	
Office	30.3	1,250,000	7,993	14.16	0.07	78	22	*4*
Event Space	1.6	350,000	320	13.7	0.01	78	22	*4*

4. Build-up based on anticipated occupancy, CalGreen fixture flows and LEED frequency of use.
5. AWWA, "Commercial and Institutional End Uses of Water", 2000

Office

The proposed office demand factor of 14.16 gal/ca-d is based primarily on CalGreen fixture flow rates for offices and fixture frequency of use per LEED. Water demands for offices include restrooms and the occasional shower user. Additional amenities are planned as part of the proposed office program including onsite cafe and a private fitness center. The water use associated with these amenities has been estimated using data measured at similar facilities in operation. Water demand at the cafes is built up based on meals per person per day and gallons of water use per meal using these data. Water demand at the fitness center includes additional showering.

The projected average daily occupancy in the proposed offices is calculated at the annual level to account for weekends and holidays. Occupancy values anticipate that 100% of staff are present on weekdays and 15% of staff occupy the office buildings on weekends and holidays; an additional 15% of unseated, support staff are also included. The resulting occupancy factor is 73%, or about 268 days of the year when offices are at full occupancy. Accounting for this anticipated occupancy, the proposed demand factor is 0.07 gal/sf-d.

Event Center

Events of varying scales will be held at the proposed event center throughout the year, ranging from 100 to 5,000 occupants per event. It is estimated that the event center will host 55 events per year. The proposed demand factor is estimated by assuming those participating in events would use an equivalent amount of water per day to that of a full-time employee (restroom and food facilities). Over the course of a year, it is estimated that there will be 117,500 event attendees. The total annual water demand for the events center is divided across the 350,000 square feet of gross floor area to calculate a proposed water demand factor of 0.01 gal/sf-d.

Residential

The Project plan proposes 1,930 residential units and estimates an average of two occupants per unit. Using residential fixture flow rates from the 2019 CalGreen Building Standards Code, Section 4.303, a residential demand factor of 44.0 gal/ca-d was developed. This value aligns with published municipal values such as in San Francisco, where SFPUC reports residential water demand to be approximately 41 gal/ca-d.[1] Each residential unit is estimated to use 88.0 gal/d.

[1] SFPUC Water Resources Report FY '16-'17: https://sfwater.org/modules/showdocument.aspx?documentid=11472

Hotel
The Project proposes 193 hotel rooms and estimates an average of two occupants per room. It is assumed that there would be an additional 15% support staff. Similar to the residential demand factors, the hotel demand factor was built-up using CalGreen fixture flow rates for toilets, sinks and showers. CalGreen does not present values for commercial laundry in hotels nor demands for the hotel kitchen and icemakers. As such a demand factor for these additional demands was applied using another reference.[2] These sources yield a demand factor of 93.6 gallons per room per day.

Retail and Commercial
Demands at retail and commercial spaces can vary depending on the type of establishment. Retail spaces are expected to have demands associated with restrooms for employees and transients (customers). Restaurants have a much higher water demand for activities including cooking, cleaning, and consumption.

Typical retail demands, which were applied to pharmacy, cinema, and bowling areas, were developed using CalGreen fixture flow rates and an expected customer load of 60 sf/ca based on the 2019 California Building Code (CBC), Table 1004.5. Transients demands are associated with using retail restroom facilities. Retail employees are estimated to be 15% of total customers and are expected to use the same amount of water as someone in an office building over the course of a day. This approach yields a demand factor of 0.02 gal/sf-d.

The American Water Works Association (AWWA) conducts a water submetering study periodically that provides demand factors for program types not available in other literature. The grocery store demand factor is taken from the most recent such study.[3]

The food and beverage unit demand factor is built up from a gallon per restaurant seat value. The CBC density for restaurants (60 sf/ca) was used to estimate that there would be 383 restaurant seats. Each seat serves 5 meals per day[2] and 9 gallons per meal.[4] Accounting for an additional 15% occupancy for employees yields a unit demand for restaurants of 0.77 gal/sf-d.

The public retail fitness water demands were built up using CalGreen fixture flow rates and an increased shower and laundry demand. Using a density of 50 sf/ca[5] and accounting for an additional 15% occupancy for employees yields a unit demand factor for fitness of 0.08 gal/sf-d.

Lastly, the coworking and office space is estimated to have the same core fixture demands as the campus office space, excluding cafe and fitness amenities. It is expected that the

[2] 2000 Pacific Institute study “Commercial Water Use and Potential Savings: Appendix E”
[3] 2000 AWWA study “Commercial and Institutional End Uses of Water”.
[4] Crites & Tchobanoglous, "Small and Decentralized Wastewater Management Systems", Table 4-2
[5] California Building Code 2019, Table 1004.5 Occupant Load

coworking and office space would have twice the density of the campus office and will use 0.10 gal/sf-d.

Seasonal Demands

Cooling Demand
It is anticipated that retail and residential program areas will employ air-based cooling technologies; therefore, a water demand for mechanical cooling has not been assigned to those buildings. Water demands for cooling were estimated for the campus and event space only. Cooling technology selection has not been finalized and will impact these demands. Project mechanical engineers estimate that cooling demands for the campus space will range between 2.8-4.8 gal/sf-year and the event space will use 1.4 - 4.5 gal/sf-year. Conservatively using the high end of these ranges results in an annual demand of 8.0 MGY.

Irrigation Demand
There will be an estimated 18 acres of irrigated landscape within the Project area, including potential green roofs. Irrigated areas are outlined in Table 3. These are estimated values and are based on preliminary landscape concepts that will be further refined during the design process.

TABLE 4: Planning level irrigated areas and potential annual irrigation demands

Parcel	Area	Irrigated Area (gsf)	Irrigation Demands (gallons per year)	Notes
Parcels 2 – 7	Retail/Residential	292,000	9,043,000	Irrigated area is calculated as 50% of parcel area.
Parcel 1	Event Building	161,032	4,987,000	Includes 2.1-acre elevated park.
Parcel 1	Office Campus	103,623	3,209,000	
Parcels A & B	Park	169,884	5,261,000	Assume 100% of parcel is irrigated.
Parcels C, D, E	Private Street Medians	42,000	1,301,000	Assumes equivalent of 10% of parcel is street median and irrigated area.
Public ROW	Public ROW Street Medians	19,000	-	
TOTAL IRRIGATED AREA		768,539	23.8 MGY	
Parcels West of Willow		31,117	1.0 MGY	
TOTAL		799,656	24.8 MGY	

Water Losses
This water budgets presented in Tables 1 and 2 include a 10% leakage factor for water losses. It is anticipated that some water losses would occur on-site through leaky fixtures, pipe connections and taps unintentionally left running, for example.

ALTERNATIVE WATER SOURCE ASSESSMENT

As previously noted, the proposed project exceeds 250,000 square feet of new construction, which under Section 16.43.140.3.E and 16.45.130.3.E of the Municipal code, requires an alternative water source assessment. Two scenarios to supply the project with recycled water for non-potable water uses have been contemplated:

- Scenario 1: Connect to a new off-site water reuse facility owned and operated by the West Bay Sanitary District (WBSD)
- Scenario 2: Construct on-site water reuse facilities (WRFs) to treat wastewater from the site

Under both scenarios, the proposed project with increased residential units would be able to achieve an approximate 36 percent reduction in potable water demand by serving nearly all of the non-potable water demands (including cooling, irrigation, and toilet flushing) with recycled water.

The Project Applicant is currently pursuing Scenario 1 in coordination with WBSD. WBSD has completed a feasibility study exploring the viability of a Resource Recovery Center at WBSD's former treatment plant behind Bedwell Bayfront Park, which could produce 500,000 gallons per day of recycled water for reuse. In a public/private partnership with Facebook (the Project Applicant), the WBSD Board of Directors spearheaded the effort to install 2,800 feet of purple recycled water pipe parallel with the sanitary sewer and storm drainpipe Facebook was replacing on Chilco Street. This pipe will be used to distribute recycled water in the area. Recycled water will be used for irrigation, industrial purposes, firefighting, public fill stations and toilet flushing in the Bayfront Area.

Table 5 below presents a summary of the reduction in potable water demand for both the baseline and 200-unit variant scenarios, by serving nearly all non-potable water demands with recycled water.

TABLE 5: Percentage of Water Demand Savings

Development Scenario	Total Water Demand (Mgal/year)	Recycled Water Use (Mgal/year)	Reduction Percentage (%)
Baseline	154.89	57.21	37
Baseline with 200 Unit Variant	161.77	58.22	36

Water Flow Rate Criteria for Water System Modelling Technical Memorandum

FREYER & LAURETA, INC.

WATER FLOW RATE CRITERIA FOR WATER SYSTEM MODELLING TECHNICAL MEMORANDUM

WILLOW VILLAGE

100% Submittal

January 27, 2022

Prepared by:

FREYER & LAURETA, INC.

1.0 Background

This Technical Memorandum provides criteria for water system modeling for the Willow Village Development. Willow Village has two development scenarios, a Baseline Scenario and a scenario that increases the Baseline Scenario by 200 residential units, referred to as the Residential Variant Scenario in this technical memorandum. The Baseline development scenario includes up to 1,730 multi-family residential dwelling units, up to 200,000 square feet of retail and non-office commercial uses, a hotel with up to 193 rooms, up to 1.6 million square feet of office and accessory space, consisting of up to 1.25 million square feet of office space and the balance (i.e., 350,000 square feet if office space is maximized) of accessory space in multiple buildings, and an approximately 3.5-acre public neighborhood park. The Residential Variant development scenario increase residential units to up to 1,930 multi-family residential dwelling units.

2.0 Criteria for Water Model

Water Connections

There are four (4) connections to existing water mains proposed for the Willow Village water system, as shown in Figure 1.

Domestic Water Demand

Water demands for each scenario is presented in the Willow Village Project Water Demand and Alternative Source Assessment Technical Memorandum dated January 26, 2022, and shown in Table 1 below.

TABLE 5: Percentage of Water Demand Savings

Development Scenario	Total Water Demand (Mgal/year)	Potable Water Use (Mgal/year)	Recycled Water Use (Mgal/year)
Baseline	154.89	97.68	57.21
Residential Variant	161.77	103.55	58.22

Projected potable water demand for the site is much less that the fire flow required for each building, and fire flow is typically the water demand volume used in system modeling. For this model, we recommend using the Fire Flow Demand for the system water model.

Fire Flow Demand

Specific building types are still being determined and hydrant spacing may be subject to change, however Fire Flow Demand is derived from the Menlo Fire Protection District Ordinance No. 45-2019, an Ordinance of the Menlo Park Fire Protection District Adopting the 2018 Edition of the International Fire Code with the 2018 California Fire Code and Local Amendments.

Table B105.2 from Ordinance No.45-2019 lists allowed fire flow reductions should sprinkler systems be installed. As shown in the table, the Ordinance allows for 50% reduction for sprinklered buildings.

TABLE B105.2
REQUIRED FIRE FLOW FOR BUILDINGS OTHER THAN ONE-AND TWO-FAMILY DWELLINGS, GROUP R-3 AND R-4 BUILDINGS AND TOWNHOMES

AUTOMATIC SPRINKLER SYSTEM (Design Standard)	MINIMUM FIRE FLOW (gallons per minute)	FLOW DURATION (hours)
No automatic sprinkler system	Value in Table B105.1(2)	Duration in Table B105.1(2)
Section 903.3.1.1 of the California Fire Code	50% of the value in Table B105.1(2)[a]	Duration in Table B105.1(2) at the reduced flow rate
Section 903.3.1.2 of the California Fire Code	50% of the value in Table B105.1(2)[b]	Duration in Table B105.1(2) at the reduced flow rate

For SI: 1 gallon per minute = 3.785L/m
a. The reduced fire flow shall not be less than 1,000 gallons per minute
b. The reduced fire flow shall not be less than 1,500 gallons per minute

Table B105.1(2) lists fire flow requirements in gallons per minute and flow duration required. For purposes of this modeling effort, the maximum flow rate in the Table is used, which is 8,000 gpm at 20 pounds per square inch (psi) with 4 hours of flow duration. Since buildings will be sprinkled, the flow rate value is reduced by 50%.

For modeling purposes to size the on-site water system, the flow rate per building should be 4,000 gpm at 20 psi at 4 hours of flow duration. As also shown in Table B105.2, reduced fire flow shall not be less than 1,500 gpm. For purposes of the model, 4,000 gpm fire flow demand is proposed to be modeled distributed across two fire hydrants closest to each building, using two hydrants at 2,000 gpm each. Fire hydrants are numbered and shown on Figure 1. Proposed fire flow distribution modeling is shown in Table 2.

Recycled Water Demand

It is anticipated that recycled water will be used for a portion of the site including irrigation at the parks at Parcels A, B and the elevated park at Parcel 9. Potential sources of recycled water include an off-site water reuse facility, currently being actively pursued with the West Bay Sanitary District, or onsite water reuse facilities. Recycled water demands for the site include landscape irrigation, toilet fixture flushing and cooling applications for mechanical systems.

Fire Flow Hydrant Tests

Fire flow tests have been on two existing hydrants on-site. The flow test results are included in this memo.

TO: SFPUC Wholesale Customers

FROM: Steven R. Ritchie, Assistant General Manager, Water

DATE: June 2, 2021

RE: Regional Water System Supply Reliability and UWMP 2020

This memo is in response to various comments from Wholesale Customers we have received regarding the reliability of the Regional Water System supply and San Francisco's 2020 Urban Water Management Plan (UWMP).

As you are all aware, the UWMP makes clear the potential effect of the amendments to the Bay-Delta Water Quality Control Plan adopted by the State Water Resources Control Board on December 12, 2018 should it be implemented. Regional Water System-wide water supply shortages of 40-50% could occur until alternative water supplies are developed to replace those shortfalls. Those shortages could increase dramatically if the State Water Board's proposed Water Quality Certification of the Don Pedro Federal Energy Regulatory Commission (FERC) relicensing were implemented.

We are pursuing several courses of action to remedy this situation as detailed below.

Pursuing a Tuolumne River Voluntary Agreement

The State Water Board included in its action of December 12, 2018 a provision allowing for the development of Voluntary Agreements as an alternative to the adopted Plan. Together with the Modesto and Turlock Irrigation Districts, we have been actively pursuing a Tuolumne River Voluntary Agreement (TRVA) since January 2017. We believe the TRVA is a superior approach to producing benefits for fish with a much more modest effect on our water supply. Unfortunately, it has been a challenge to work with the State on this, but we continue to persist, and of course we are still interested in early implementation of the TRVA.

Evaluating our Drought Planning Scenario in light of climate change

Ever since the drought of 1987-92, we have been using a Drought Planning Scenario with a duration of 8.5 years as a stress test of our Regional Water System supplies. Some stakeholders have criticized this methodology as being too conservative. This fall we anticipate our Commission convening a workshop

regarding our use of the 8.5-year Drought Planning Scenario, particularly in light of climate change resilience assessment work that we have funded through the Water Research Foundation. We look forward to a valuable discussion with our various stakeholders and the Commission.

Pursuing Alternative Water Supplies

The SFPUC continues to aggressively pursue Alternative Water Supplies to address whatever shortfall may ultimately occur pending the outcome of negotiation and/or litigation. The most extreme degree of Regional Water System supply shortfall is modeled to be 93 million gallons per day under implementation of the Bay-Delta Plan amendments. We are actively pursuing more than a dozen projects, including recycled water for irrigation, purified water for potable use, increased reservoir storage and conveyance, brackish water desalination, and partnerships with other agencies, particularly the Turlock and Modesto Irrigation Districts. Our goal is to have a suite of alternative water supply projects ready for CEQA review by July 1, 2023.

In litigation with the State over the Bay-Delta Plan Amendments

On January 10, 2019, we joined in litigation against the State over the adoption of the Bay-Delta Water Quality Control Plan Amendments on substantive and procedural grounds. The lawsuit was necessary because there is a statute of limitations on CEQA cases of 30 days, and we needed to preserve our legal options in the event that we are unsuccessful in reaching a voluntary agreement for the Tuolumne River. Even then, potential settlement of this litigation is a possibility in the future.

In litigation with the State over the proposed Don Pedro FERC Water Quality Certification

The State Water Board staff raised the stakes on these matters by issuing a Water Quality Certification for the Don Pedro FERC relicensing on January 15, 2021 that goes well beyond the Bay-Delta Plan amendments. The potential impact of the conditions included in the Certification appear to virtually double the water supply impact on our Regional Water System of the Bay-Delta Plan amendments. We requested that the State Water Board reconsider the Certification, including conducting hearings on it, but the State Water Board took no action. As a result, we were left with no choice but to once again file suit against the State. Again, the Certification includes a clause that it could be replaced by a Voluntary Agreement, but that is far from a certainty.

I hope this makes it clear that we are actively pursuing all options to resolve this difficult situation. We remain committed to creating benefits for the Tuolumne River while meeting our Water Supply Level of Service Goals and Objectives for our retail and wholesale customers.

Air Quality Project Variants Analysis

RAMBOLL

ENVIRONMENT
& HEALTH

DRAFT MEMORANDUM

Date: February 20, 2022

To: Eric Harrison, Signature Development Group

From: Michael Keinath
Sarah Manzano

Subject: **Air Quality, Greenhouse Gas, and Energy Analysis of the Willow Village Project Variants**

Ramboll
2200 Powell Street
Suite 700
Emeryville, CA 94608
USA

T +1 510 655 7400
F +1 510 655 9517
www.ramboll.com

1. PURPOSE OF MEMORANDUM

As a supplemental analysis to the CEQA Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Report prepared for the construction and operation of the proposed mixed-use development at Willow Village in Menlo Park, California (referred to hereafter as "the Project"), Ramboll evaluated potential criteria air pollutant (CAP) emissions, greenhouse gas (GHG) emissions, and health impacts associated with the Project variants at the maximally exposed individual receptor (MEIR) as described below. Variants are elements that may or may not be proposed as part of the Project for particular reasons.

2. PROJECT VARIANTS

2.1 Increased Residential Density Variant

The Increased Residential Density Variant would increase the number of residential dwelling units by approximately 200 units, to a total of up to 1,930 residential units. These additional dwelling units would be included in Parcel 4, which is one of the last buildings to be built. No other changes to the Project would occur under this Variant. Updates to the land use summary can be found in **Table 1V**.

An analysis consistent with the Project analysis was performed to evaluate the potential impacts associated with the increase in dwelling units. Table references included herein correspond to the similar tables in the Technical Report that would be replaced by the changes associated with the Increased Residential Density Variant.

2.1.1 *Construction Emissions and Health Risk Assessment*

This Variant results in additional construction activity to build the additional 200 dwelling units. The Project Applicant indicated that there would be no change to the foundations or excavation necessary to accommodate the additional dwelling units. However, the core and shell phase for Parcel 4 would be increased by one month and tenant improvements would increase by three months. Both phases would use the same equipment information for the extended construction period. This increased activity

would result in additional emissions, which are shown in **Table 12V**[1] for construction architectural coating off-gassing emissions, **Table 13V** for unmitigated criteria air pollutant emissions, **Table 14V** for mitigated criteria air pollutant emissions and **Table 15V** for GHG emissions. As shown in these tables, emissions would increase slightly, but conclusions would not change.

The increase in emissions would also affect health impacts. A health risk assessment was performed using the same methodology as was used in the Technical Report with these additional emissions. Results are shown in **Tables 59V**, **60V** and **61V**. Additional discussion on findings is in **Section 2.1.3.**

2.1.2 *Operational Emissions and Health Risk Assessment*

Increasing the density of the residential area by 200 units, or roughly 12% compared to the original 1,730 units, would be expected to increase the residential emissions associated with consumer products, architectural coatings, water use, and energy use by approximately the same margin. Landscaping and generator emissions are not expected to change because the additional units would be installed by increasing the height of existing apartment buildings, leaving landscaping and generator requirements the same. The impacted building operational capacity can be found in **Table 16V**.

The Transportation Engineer provided increased traffic associated with this Variant, which increases the daily average residential trip rate and VMT from 7,359 trips and 69,910 miles to 8,210 trips and 77,992 miles, respectively.

The emissions due to increased traffic and operational emissions associated with this Variant can be found in **Tables 17V**, **18V**, **21aV**, **21bV**, **22V**, **23V**, **24aV**, **24bV**, **25aV**, **25bV**, **28V**, **30V-36V**, **38V**, and **39V**. A summary of increased emissions can be found in **Tables 40V**, **41V**, and **42V**.

The total construction and operations emissions increase from this Variant can be found in **Tables 43V** and **44V**. As shown in **Table 44V**, an additional 200 DU is not expected to change significance findings compared to the Project.

The increase in dwelling units would also increase the traffic volumes on certain roadways. Analysis comparing volumes by roadways at the MEIR from the Technical Report was performed to determine the impact of the additional traffic. **Table 47V** shows how traffic volumes scale by segment. As shown in **Table 59V**, operational emissions due to this Variant would increase the operational only lifetime excess cancer risk from 3.3 in a million to 3.4 in a million for the On-Site MEIR and from 3.4 to 3.6 in a million for the Off-Site MEIR. Based on these results, the increase in cancer risk associated with this Variant is minor and remains below the Bay Area Air Quality Management District cancer risk threshold of 10 in a million.

The potential for exposure to the increased traffic volumes to result in adverse chronic noncancer effects and excess $PM_{2.5}$ concentrations were evaluated by conservatively scaling the Project operations chronic noncancer hazard index and excess $PM_{2.5}$ concentrations by the maximum change in traffic volumes for any segment. The impact from the Increased Residential Density Variant remains below threshold.

[1] Table numbers referenced herein correspond to the similar table in the Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Report.

2.1.3 *Combined Construction and Operational Health Impacts*

Similar to the analysis for the Project, health impacts from Increased Residential Variant construction and operations were added together to estimate the combined health impacts of construction activities and operation. A breakdown of excess lifetime cancer risk from construction, operational generators, and operational traffic at the Project MEIR is shown in **Table 59V**. The table also shows the Scenario for which the maximum was identified. Similar breakdowns for chronic HI and $PM_{2.5}$ concentration are shown in **Table 60V** and **Table 61V**, respectively. These tables also show the Scenario for which the maximums were identified, as well as the year for which the maximum occurred since chronic HI and $PM_{2.5}$ concentrations are annual impacts.

All health impacts remain below thresholds, except **Table 59V** shows a maximum cancer risk of 10.6 in a million for the new on-site residents, which exceeds the BAAQMD threshold of significance for cancer risk of 10 in a million.

Building code requires new residences to be equipped with MERV-13 filtration. Filters that meet MERV-13 rating filter particulates at a rate of 80-90%.[2] Estimated health impacts conservatively do not incorporate this filtration. Therefore, residents would be exposed to lower concentrations of diesel particulate matter than used to estimate health impacts. The filtration associated with the MERV-13 filters are expected to reduce health impacts to the new on-site residents to less than the BAAQMD threshold of significance.

2.1.4 *Other Air Impacts*

This Variant also would not change conclusions of the odor, carbon monoxide and cumulative assessments. This Variant would not substantially change emissions of odor and would not increase traffic volumes to above the screening levels discussed in the carbon monoxide assessment in the Technical Report. This Variant also would not change the MEIR, so the cumulative assessment would not change, and cumulative health impacts would remain below thresholds.

2.1.5 *Energy*

This Variant would increase energy use associated with construction and operations. However, increases in energy use would be minor, similar to the increase in emissions, and significance findings would not change.

2.2 No Hamilton Avenue Realignment Variant

The No Hamilton Avenue Realignment Variant assumes that no changes would occur to the existing land uses on the Hamilton Avenue Parcels and that the intersection of Willow Road and Hamilton Avenue would remain in the existing location. This would alter the circulation network east of Willow Road to accommodate retaining the Willow Road and Hamilton Avenue intersection in its current alignment. This Variant would result from forces outside of the Project's control, such as not receiving approval from Caltrans or affected property owners.

2.2.1 *Construction Emissions and Health Risk Assessment*

This Variant results in less construction activity due to the lack of construction of the Hamilton Avenue Realignment and lack of increase in retail and relocation of the service station at the

[2] United States Environmental Protection Agency. 2009. Residential Air Cleaners, A Summary of Available Information. EPA 402-F-09-002. August. Available online at: https://19january2017snapshot.epa.gov/indoor-air-quality-iaq/residential-air-cleaners-second-edition-summary-available-information_.html

Hamilton Avenue Parcels North and South. Therefore, construction emissions would be reduced. However, emissions would not be reduced to a level that would change significance findings of construction criteria air pollutant emissions since construction associated with these parcels were relatively minor.

As a result of the emissions reduction due to the reduction in equipment activity, health impacts would also be reduced. However, the reduction in emissions is far from the MEIR reported in our Technical Report. Therefore, the reduction in construction activity would not have a substantial change in health impacts reported in the Technical Report due to the dispersion of the emissions at the MEIR. The reduction also would not substantially reduce required mitigation of construction equipment.

2.2.2 *Operational Emissions and Health Risk Assessment*

Operational emissions would be reduced as a result of the reduction in additional retail associated with the Hamilton Avenue Parcels North and South. Emissions from architectural coatings, consumer products, landscaping, mobile, energy use, water, waste and emergency generators would be reduced as a result of the reduction in additional retail with this Variant. For context, the Hamilton Avenue Parcels North and South account for only 0.7% of daily trips and 0.4% of daily vehicle miles traveled of the Project at Full Buildout. This Variant would decrease Project traffic emissions by a similarly insubstantial margin. Therefore, the change in emissions associated with this Variant would be minimal and would not change significance findings.

The overall effect on the operational health impacts of the Project is expected to be negligible. Considering both the relatively small decrease in emissions and the Hamilton Avenue Parcels being approximately 0.25 miles to the onsite MEIR and 0.5 miles to offsite MEIR, it is unlikely that this Variant would produce a meaningful reduction to the health impacts associated with the Project.

2.2.3 *Other Air Impacts*

This Variant also would not change conclusions of the odor, carbon monoxide and cumulative assessments. This Variant would not substantially change emissions of odor and would not increase traffic volumes to above the screening levels discussed in the carbon monoxide assessment in the Technical Report. This Variant also would not change the MEIR, so the cumulative assessment would not change, and cumulative health impacts would remain below thresholds.

2.2.4 *Energy*

This Variant would not have an appreciable effect on energy use compared to the Project. As mentioned above, construction activity would be reduced with this Variant due to the reduction in activity at the Hamilton Avenue Parcels North and South. Therefore, construction fuel use would be minorly reduced. However, the reduction in fuel use would not change any significance findings due to the minor reduction.

Project building related energy use would also be minorly reduced due to the reduction in new retail space. The minor change in traffic patterns associated with this Variant would have a negligible impact on energy use associated with vehicle travel. These changes would not change any significance findings due to the minor changes.

2.3 No Willow Road Tunnel Variant

The No Willow Road Tunnel Variant assumes the tunnel from the northwest corner of the Project site to the southeast corner of the Bayfront campus would not be constructed, resulting from

forces outside of the Project's control. With this Variant, the trams would continue to operate, but would use Willow Road instead of the tunnel. Pedestrians and bicyclists would use the sidewalk and on-street bike lanes to move along the Willow Road corridor.

2.3.1 *Construction Emissions and Health Risk Assessment*

This Variant results in less construction activity due to the lack of construction of the Willow Road Tunnel. Therefore, construction emissions will be reduced. However, emissions would not be reduced to a level that would change significance findings of construction criteria air pollutant emissions.

As a result of the emissions reduction due to the reduction in equipment activity, health impacts would also be reduced. However, the reduction in emissions is far from the MEIR reported in our Technical Report. Therefore, the reduction in construction activity would not have a substantial change in health impacts reported in the Technical Report due to the dispersion of the emissions at the MEIR. The reduction also would not substantially reduce required mitigation of construction equipment.

2.3.2 *Operational Emissions and Health Risk Assessment*

Emissions from architectural coatings, consumer products, energy use, and emergency generators would not be affected by this Variant. Landscaping emissions may change slightly due to the change in landscape in this area. However, the parameters used to estimate emissions from landscaping, as prescribed in CalEEMod, would not change. Therefore, any change in landscaping emissions would be small.

This Variant would move trams, pedestrians and bicyclists from the tunnel to Willow Road. Pedestrians and bicyclists do not release emissions. The tram and shuttle schedule would not be affected by the lack of tunnel under Willow Road. The slight change in distance traveled by the trams and shuttles would be negligible and would not change emissions associated with their travel.

The change in travel patterns for the trams and shuttles also would not affect the health impacts from traffic reported in the Technical Report. The onsite and offsite MEIR is far from where this change in location of emissions would occur and the change in location of emissions is small. Therefore, this Variant would have a negligible change on reported health impacts. Furthermore, without the Project, the trams and shuttles would travel on this segment of Willow Road. Therefore, the change in health impacts to sensitive receptors near the tunnel with this Variant would be negligible.

2.3.3 *Other Air Impacts*

This Variant also would not change conclusions of the odor, carbon monoxide and cumulative assessments. This Variant would not substantially change emissions of odor and would not increase traffic volumes to above the screening levels discussed in the carbon monoxide assessment in the Technical Report. This Variant also would not change the MEIR, so the cumulative assessment would not change, and cumulative health impacts would remain below thresholds.

2.3.4 *Energy*

This Variant would not have an appreciable effect on energy use compared to the Project. As mentioned above, construction activity would be reduced with this Variant. Therefore, construction fuel use would be minorly reduced. However, the reduction in fuel use would not change any significance findings due to the minor reduction. Building related energy use would not be affected

by this Variant. The minor change in traffic patterns associated with this Variant would have a negligible impact on energy use associated with vehicle travel.

2.4 On-site Recycled Water Variant

The On-Site Recycled Water Variant would provide recycled water to Willow Village through the on-site treatment of wastewater. The on-site treatment and production of recycled water would capture wastewater supplies, including blackwater, from all Willow Village buildings by providing four water reuse facilities. The recycled water would be utilized for irrigation, toilet flushing and cooling. This Variant would be included in the Project if the West Bay Sanitary District does not construct its proposed Bayfront Recycled Water Plant and associated improvements to convey recycled water to the Project Site.

2.4.1 *Construction Emissions and Health Risk Assessment*

This Variant results in very little change in construction activity. Any equipment to be used to install the water treatment facility would already be on-site for the other components of construction and any activity associated with the installation would be encompassed in the existing schedule. Therefore, construction emissions would not be expected to change as a result of the On-site Recycled Water Variant.

Since emissions are not expected to change, health impacts are also not expected to change as a result of the On-site Recycled Water Variant.

2.4.2 *Operational Emissions and Health Risk Assessment*

Emissions from architectural coatings, consumer products, landscaping, mobile, waste and emergency generators would not be affected by this Variant. Any increase in on-site energy use associated with the on-site treatment would be offset by the reduction in energy to pump the water to a central treatment facility and energy the central treatment facility would use to treat the water. As a result, this Variant would not alter emissions as compared to the Project.

Similarly, health impacts of operations would not change as a result of this Variant.

2.4.3 *Other Air Impacts*

This Variant also would not change conclusions of the odor, carbon monoxide and cumulative assessments. Recycled water systems that employ biological treatment are capable of removing odor causing organic compounds and sulfides. These odorous compounds are oxidized to carbon dioxide, sulfates and water by microorganisms in the biological reactor in the presence of dissolved oxygen. Any remaining compounds that might volatilize are quickly diluted by the surrounding air. Therefore, this Variant would not change odor impacts. This Variant would not change traffic volumes, so the carbon monoxide assessment would not change. This Variant also would not change the MEIR, so the cumulative assessment would not change, and cumulative health impacts would remain below thresholds.

2.4.4 *Energy*

This Variant would not have an appreciable effect on energy use compared to the Project. Any increase in on-site energy use due to the water treatment would be offset by the reduction in energy use at a central treatment plant and the energy to pump the water to the treatment plant.

TABLES

Table 1V
Land Use Summary
Willow Village - Increased Residential Variant Analysis
Menlo Park, California

Land Use[1]	CalEEMod® Land Use	Size	Units[2]	Square Footage
Existing Conditions (2019)				
Office	General Office Building	252	ksf	251,530
R&D	Research and Development	124	ksf	123,870
Warehouse	Unrefrigerated Warehouse-No Rail	501	ksf	500,780
Lab & Manufacture	Manufacturing	24	ksf	23,570
Health Center	Health Club	24	ksf	24,060
Former Fire Department Building	General Light Industry	80	ksf	80,100
Parking	Enclosed Parking with Elevator	2,300	Spaces	920,000

Partial Buildout by Year[3]			
Land Use Type[4]	**Percent Operational by Year**		
	Year 4	**Year 5**	**Year 6**
Office	3.1%	58%	95%
Retail	10%	59%	98%
Residential	0%	16%	64%
Hotel	0%	41%	100%
Parking	53%	75%	96%
Park	89%	95%	100%

Full Buildout			
Land Use Type[4]	**Size**	**Units[2]**	**Square Footage**
Office	1,600	ksf	1,600,000
Retail	208	ksf	207,690
Residential	1,930	DU	1,892,043
Hotel	193	Rooms	172,000
Parking	1,869	ksf	1,869,240
Park	404	ksf	403,837

Notes:

1. Land uses analyzed based on information provided by the Project Applicant, as found in the Project Description. "Office" land use mapped to General Office Building and Research and Development; "Office/Lab" mapped to General Office Building, Research and Development, Health Club, and Manufacturing; "Warehouse" mapped to Unrefrigerated Warehouse-No Rail and General Light Industry, and "Warehouse/Office" mapped to Unrefrigerated Warehouse-No Rail and Research and Development CalEEMod land use types on a building-by-building basis.
2. The Project Applicant provided Project land uses in units of square footage, hotel rooms, and dwelling units. For the existing parking land use, each parking space is assumed to be 400 sqft. This assumption is based on CalEEMod defaults.
3. Partial buildout for Year 4, Year 5, and Year 6 were calculated based on the portion of building area for each land use type that becomes operational each year, based on the construction schedule, as shown in Table 2.
4. For Hamilton Avenue Parcels North and South, only net new square footage was included in the analysis. This is under the conservative assumption that the existing retail area and the retail land use that will replace it have similar operational emissions.

Abbreviations:

DU - dwelling unit
ksf - 1,000 square feet
sqft - square foot

Table 12V
Project Construction Architectural Coating Off-Gassing Emissions
Willow Village - Increased Residential Variant Analysis
Menlo Park, CA

Notes:

1. VOC content of paint is assumed to be consistent with BAAQMD Regulation 8, Rule 3 for flat and nonflat coatings. VOC is assumed to be equivalent to ROG for these purposes.
2. Paint VOC content is consistent with or more stringent than BAAQMD Regulation 8 Rule 3 (Architectural Coatings). Emissions are estimated assuming that indoor painting will utilize "super-compliant" VOC architectural coatings that meet the more stringent limits in South Coast Air Quality Management District Rule 1113. For outdoor paint, assumes use of coatings with VOC content of 150 g/L, consistent with BAAQMD requirements. VOC is assumed to be equivalent to ROG for these purposes.
3. The emission factor is calculated using CalEEMod default architectural coating emissions parameters. The default assumptions account for the painting surface area relative to the floor square footage assuming 1 gallon of paint covers 180 sqft of surface area.
4. Consistent with CalEEMod Appendix A, recreational areas were excluded from the floor square footage in calculating VOC emissions due to architectural coatings.
5. Project square footage by land use was provided by the Project Applicant.
6. ROG emissions are allocated to each year based on the construction schedule for each building or parcel.

Abbreviations:

BAAQMD - Bay Area Air Quality Management District
CalEEMod - California Emissions Estimator MODel
CEQA - California Environmental Quality Act
ft^2 - square feet
g - gram
gal - gallons
L - liters
lb - pounds
ROG - reactive organic gas
sqft - square feet
VOC - volatile organic compound

Threshold[5]	54	54	82	54

Notes:

1. Construction emissions were estimated with methodology equivalent to CalEEMod 2020.4.0. Emissions were estimated using on-road emissions factors from EMFAC2021 and off-road construction equipment emission factors from OFFROAD2017. Onroad trips and offroad construction equipment use were provided by the Project Applicant.

2. Unmitigated construction emissions from offroad equipment are calculated using fleet-average emission factors.

Table 13V
Summary of Unmitigated Project Construction Criteria Air Pollutant Emissions
Willow Village - Increased Residential Variant Analysis
Menlo Park, CA

[3] Area 1 includes Parcel 2, Parcel 3, North Garage, Office Building 4, Hotel, Town Square, and Meeting, Collaboration, Park. Area 2 includes Parcel 6, Parcel 7, South Garage, Office Building 1, Office Building 2, Office Building 3, Office Building 5, and Office Building 6. Area 3 includes Parcel 4 and Parcel 5, along with the Tunnel Construction.

[4] The mass emissions shown above are converted from pound per year to gram per second for the health risk assessment. The conversion is based on 365 days per year and 11 hours per day, consistent with the modeled hours from 7 AM - 6 PM.

[5] Thresholds are from BAAQMD California Environmental Quality Act (CEQA) Guidelines. Bolded values indicate threshold exceedances. Fugitive emissions sources are excluded from comparison to this threshold.

Abbreviations:

CAP - criteria air pollutant
CalEEMod - California Emissions Estimate Model
ROG - reactive organic gases
NO_X - nitrous oxide

Threshold[5]	54	54	82	54

Notes:

1. Construction emissions were estimated with methodology equivalent to CalEEMod® 2020.4.0. Emissions were estimated using on-road emissions factors from EMFAC2021 and off-road construction equipment emission factors from OFFROAD. Onroad trips and offroad construction equipment use were provided by the Project Applicant.
2. Mitigated construction emissions from offroad equipment are calculated using Tier 4 Final emission factors for 95 percent of the equipment before residents move on-site in Year 5 and 98 percent of the equipment after residents move on-site in Year 5. The other 5 percent and 2 percent (before and after on-site residents, repspectively) of non-Tier 4 equipment are assumed to be Tier 2.
3. Area 1 includes Parcel 2, Parcel 3, North Garage, Office Building 4, Hotel, Town Square, and Meeting, Collaboration, Park. Area 2 includes Parcel 6, Parcel 7, South Garage, Office Building 1, Office Building 2, Office Building 3, Office Building 5, and Office Building 6. Area 3 includes Parcel 4 and Parcel 5, along with the Tunnel Construction.
4. The mass emissions shown above are converted from pound per year to gram per second for the health risk assessment. The conversion is based on 365 days per year and 11 hours per day, consistent with the modeled hours from 7 AM - 6 PM.
5. Thresholds are from BAAQMD California Environmental Quality Act (CEQA) Guidelines. Fugitive emissions sources are excluded from comparison to this threshold.

Summary of Project Construction Annual GHG Emissions by Year				
Year	Emissions[4,5]			
	CO_2	CH_4	N_2O	CO_2e
	MT/year			
Year 1	157	0.0083	0.020	163
Year 2	4,514	0.44	0.44	4,657
Year 3	7,605	1.1	0.30	7,722
Year 4	4,871	0.40	0.25	4,954
Year 5	4,471	0.29	0.23	4,548
Year 6	1,462	0.069	0.070	1,484
			Total	23,528

Notes:

1. Emissions were estimated using onroad emissions factors from EMFAC2021 and offroad construction equipment emission factors from OFFROAD. Onroad trips and offroad construction equipment use were provided by the Project Applicant.
2. Area 1 includes Parcel 2, Parcel 3, North Garage, Office Building 4, Hotel, Town Square, and Meeting, Collaboration, Park. Area 2 includes Parcel 6, Parcel 7, South Garage, Office Building 1, Office Building 2, Office Building 3, Office Building 5, and Office Building 6. Area 3 includes Parcel 4 and Parcel 5, along with the Tunnel Construction.
3. Carbon dioxide equivalent emissions were determined using IPCC 5th Assessment Report Global Warming Potentials for CH_4 and N_2O.
4. The Summary of Project Construction Annual GHG Emissions by Year is the sum of the values represented above as well as Construction Water Use Emissions, shown in Table 10.
5. The BAAQMD does not have an adopted Threshold of Significance for construction-related GHG emissions.

Abbreviations:

CalEEMod® - California Emissions Estimate Model
GHG - greenhouse gases
CH_4 - methane
CO_2 - carbon dioxide
N_2O - nitrous oxide
CO_2e - carbon dioxide equivalent
MT - metric ton
IPCC - Intergovernmental Panel on Climate Change

Partial Buildout by Year and Land Use Type[3]	**Year 4**	3.1%	10%	0%	0%	53%	86%			
	Year 5	58%	59%	14%	41%	75%	94%			
	Year 6	95%	98%	58%	100%	96%	100%			

Notes:

1. Construction area/subphasing information and full buildout square footage by building provided by Project Applicant.
2. The percentage of year that each building is operational is calculated using the last day of construction for each building. For each partial year of construction, the building is assumed to be operational during the fraction of the year between the last day of construction and the end of that year. The building is assumed to be 0% operational for each full year of construction and 100% operational for each year full year after the end of construction.
3. Partial buildout for Year 4, Year 5, and Year 6 were calculated based on the portion of building area that becomes operational each year over the total building area for each land use type.

Abbreviations:

% - percent

Table 17V
Traffic Data Provided by the Transportation Engineer
Willow Village - Increased Residential Variant Analysis
Menlo Park, California

Daily Trips Rates and VMT

Land Use	Fleet Type / Land Use	Trip Rate Units[1]	Weekday Trips per Day per Unit[1]	Weekday daily VMT[2]
			TOTAL	TOTAL
Main Project Site - Existing Conditions	Cars	per 1,000 s.f.	9.19	110,860
	Trucks	per 1,000 s.f.	0.22	2,640
	Shuttles	per 1,000 s.f.	0.66	21,088
	On-Demand	per 1,000 s.f.	0.66	7,919
Campus District - Full Buildout	Cars	per 1,000 s.f.	10.05	178,766
	Trucks	per 1,000 s.f.	0.23	4,056
	Shuttles	per 1,000 s.f.	0.44	21,088
	On-Demand	per 1,000 s.f.	0.68	12,168
Town Square and the Residential/Shopping District - Full Buildout	Residential	per d.u.	4.35	79,792
	Retail[3]	per 1,000 s.f.	25.07	33,594
	Hamilton Avenue Parcels North and South[3]	per 1,000 s.f.	28.31	1,461
	Park	per acre	42.80	1,147
	Hotel	per room	6.69	14,814

Notes:

1. Daily project trip rates were provided by the Transportation Engineer in terms of trip rates per land use amount.
2. Daily Project VMT provided by the Transportation Engineer include reductions for pass-by and diverted trips. Daily VMT is given in VMT per day. For the increased residential variant, the residential trips and VMT are based on an increasing the residential dwelling units by 200, to a total of 1930 residential dwelling units.
3. The trip rates and VMT for Hamilton Avenue Parcels North and South were provided separately and added to retail totals in calculations.

Abbreviations:

VMT - Vehicle miles traveled
s.f. - Square feet
d.u. - Dwelling unit

Table 18V
Trip Rates and VMT for Existing Conditions and Project Operations
Willow Village - Increased Residential Variant Analysis
Menlo Park, California

Notes:

1. Partial years are scaled from the full buildout based on the portion of each land use that becomes operational for each year of construction. See VariantTable 16 for more details.
2. The fleet type for each land use was provided by the Transportation Engineer. The Campus District will have various fleets for specific uses. Town Square and the Residential/Shopping District land uses (Residential, Retail, Park, and Hotel) are analyzed assuming a default San Mateo fleet. Hamilton Avenue Parcels North and South are combined with retail land uses. See AQTR Table 19 for more information.
3. Daily VMT and trip rates were provided by the Transportation Engineer on October 5, 2021. Total trip rates are calculated using land uses in AQTR Table 1.
4. Weekday VMT and trip rates provided by the Transportation Engineer were scaled to average trip rates using the ratio between CalEEMod® weekday and weekend one-way trip rates.
5. Annual trips and VMT are calculated by multiplying daily values by 365 for all fleets with the exception of shuttles and on-demand, which are multiplied by 260 days/year.

Abbreviations:

VMT - vehicle miles traveled

Table 21aV
Mobile CAP Emissions Before EV Reductions
Willow Village - Increased Residential Variant Analysis
Menlo Park, California

Notes:

1. Hamilton Avenue Parcels North and South were provided separately and added to the retail land use totals.
2. Trip counts and VMTs by land use type were broken out by year using a scaling factor representing the percent of each fleet that is operational in a given year leading up to full buildout. This percent was determined based on the square footage of the land use associated with each fleet that is operational in a given year relative to that land use's full buildout square footage. See Table 16 for more details on scaling. See Table 18 for Project Trip Rates and VMT.
3. Criteria air pollutants are calculated by year using emission factors for the associated year and fleet from EMFAC2021. Electric vehicles are not included in the emission factors for Campus District fleets (all fleet types except San Mateo Fleet), as reductions associated with EVs are considered separately. Project emission factors are shown in AQTR Table 20a.
4. Full buildout emissions are conservatively calculated using 2026 emission factors.

Abbreviations:

EV - electric vehicle
lb - pound
NO_x - nitrogen oxides
VMT- vehicle miles traveled
PM_{10} - particulate matter less than 10 microns in diameter
$PM_{2.5}$ - particulate matter less than 2.5 microns in diameter
ROG - reactive organic gases

Notes:
1. Hamilton Avenue Parcels North and South were provided separately and added to the retail land use totals.
2. VMT and trip rates for the increased residential variant were provided by the Transportation Engineer on February 9, 2022, and are summarized in Table 1
3. Greenhouse Gases are calculated by year using emission factors for the associated year and fleet from EMFAC2021. Electric vehicles are not included in the emission factors for Campus District fleets (all fleet types except San Mateo Fleet), as reductions associated with EVs are considered separately. Project emission factors are shown in AQTR Table 20b.
4. Full buildout emissions are conservatively calculated using 2026 emission factors.

Abbreviations:

GHG - Greenhouse Gas
CO_2 - carbon dioxide
CH_4 - methane
N_2O - Nitrous Oxide
CO_2e - Carbon dioxide equivalent
EV - electric vehicle
MT - Metric Ton
VMT- vehicle miles traveled

Existing Conditions Charging Energy Usage[6]	kWh/year	534,955
Full Buildout Charging Energy Usage[7]	kWh/year	2,925,608

eVMTs from Project Chargers at the proposed Campus District

Year	Land Use Category[8]	Project Increase in Annual eVMTs[9]
		eVMT/year
Existing Conditions	Campus District	1,783,182
Partial Buildout - Year 4		298,927
Partial Buildout - Year 5		5,701,922
Partial Buildout - Year 6		9,259,481
Full Buildout		9,752,026

Notes:

1. An average EV fuel economy of 0.30 kWh per mile was used. The fuel economy is based on electric fleet data from fueleconomy.gov. Available at: https://www.fueleconomy.gov/.
2. Meta provided energy usage and areas for EV charging at their existing campuses: Classic, Bayfront, Chilco, Willow, Gateway. The provided data was used to evaluate an average ratio of EV charging energy usage per campus area.
3. The percent eVMT for existing conditions is calculated by dividing the eVMT in existing conditions by the annual VMT from the 'Car' and 'On-Demand' vehicle types in existing conditions. For existing conditions VMT, see Variant Table 18.
4. ARB is currently preparing its 2020 Mobile Source Strategy (MSS) update to the ARB VISION Model (version 2.1) estimating future fleet characteristics. The Mobile Source Strategy projects eVMTs reflecting the aspirational target identified in EO N-79-20, assuming 100% of passenger vehicle sales in California are ZEV or PHEV, and GHG emissions assumed to have reduced by 2.0% per year from 2026 to 2035. The increase in annual eVMTs charged by the Campus District is scaled from the increase in fleet eVMT from existing conditions to full buildout.
5. A 10% Loss Factor was applied to the annual project energy uses to account for expected losses. Source available at: https://www.fueleconomy.gov/
6. The EV charging energy consumption for existing conditions was based on existing charger energy usage data for Willow Village for 2019 provided by the Project applicant. The total energy usage was reduced assuming a 10% loss factor.

Table 22V
EV Assumptions for Campus District
Willow Village - Increased Residential Variant Analysis
Menlo Park, California

7. The EV charging energy consumption for the Project at full buildout was determined using an average ratio of existing charging sites kWh/sqf and multiplying it by the Campus District land use area at full buildout (1.6 million sqf). This number was scaled by the increase in fleet eVMT from existing conditions to full buildout based on the MSS scenario of the VISION model. A 10% loss factor was applied to the total energy usage per year. All relevant data sources were provided by the Project applicant.
8. Meta offers an EV charging program to its workers. Charging on campus is free and valets move cars into chargers to maximize charging time. Therefore, the EV charging annual electricity for the Campus District was provided based on studies from Meta's existing campuses in the area. The electricity for EV charging at the Project would be supplied with 100% renewable energy.
9. For years where the Campus District is only operational a proportion of the year, the annual kWh is multiplied by a scaling fraction for the Campus District land use, found in Table 16.

Abbreviations:

EV - Electric vehicle (includes battery electric or plug-in hybrid technology)
eVMT- Electric vehicle miles traveled
kWh - Kilowatt hour
sqf- Square foot
MSS - Mobile Source Strategy

Notes:

1. The miles charged per hour charged is representative of a typical charge rate for an EV of 6.25 kWh per hour and a fuel economy of 0.30 kWh per mile. The charge rate is based on capability of existing battery-electric vehicles and Level 2 charging stations. Reference: Chargepoint. 2017. Level Up Your EV Charging Knowledge. Available at: https://www.chargepoint.com/blog/level-your-ev-charging-knowledge/. The fuel economy is based on electric fleet data from fueleconomy.gov. Available at: https://www.fueleconomy.gov/.
2. The two scenarios analyzed are the Reference and the Mobile Source Strategy scenarios. ARB is currently preparing its 2020 Mobile Source Strategy (MSS) update to the ARB VISION Model (version 2.1). The 2020 MSS uses "scenario planning to take an integrated approach to identifying the technology trajectories and programmatic concepts" to model projected years of electric vehicle miles for assessed scenarios. The Mobile Source Strategy projects eVMTs reflecting the aspirational target identified in EO N-79-20, assuming 100% of passenger vehicle sales in California are ZEV or PHEV, and GHG emissions assumed to have reduced by 2.0% per year from 2026 to 2035. The 2020 update only considers passenger vehicles (LDA, LDT1, LDT2, and MDV). To determine the eVMT percent of the passenger vehicle fleets, the 2020 MSS update was downloaded in July 13, 2021. The increase in annual eVMTs charged by the Project from the Reference Scenario to the MSS Scenario is used to determine the eVMTs the Project can take credit for based on providing additional charging infrastructure for the state to reach aspirational EV fleet penetration.
3. The number of chargers in the Town Square and the Residential/Shopping District was provided by the Project Applicant in the Willow Village Mixed Use Development Concept Level Energy Use Summary, dated June 14, 2021, detailing chargers available for all mixed-use traffic. 249 EV Charging Stations are available to serve the 1,694 residential spaces and 500 commercial spaces.
4. Meta offers a valet service to charge EVs from 7am to 7pm, average daily hours of availability for charging per charger is conservatively assumed to be 10 hours per day. When demand is met, the full 10 hours will be used for charging, with each vehicle cycling out of the charging spot before or as the car reaches full charge. The number of chargers are available for all Town Square and the Residential/Shopping District land uses, and it is expected that there will be 10 hours a day of active charging taking place due to the frequency of turnover associated with retail, restaurant, hotel, and park land uses. Town Square and the Residential/Shopping District land uses are assumed to operate 365 days per year. Any charging inefficiencies associated with cars remaining plugged in after reaching full charge is assumed to balance out due the likelihood of more than 10 hours of activity a day associated with Town Square and the Residential/Shopping District activity.
5. Town Square and the Residential/Shopping District Total VMT and trips includes all proposed Project residential, retail, park, and hotel land uses, consistent with Table 18. Retail land uses include Hamilton Parcels North and South and are added to total VMT and trips.
6. EV Annual Trips and EV Annual VMT are determined based on Project trips and VMTs and the VISION Reference Scenario percent of Electric Fleet. These eVMTs (electric vehicle miles traveled) represents the number of project VMTs that are driven by electric vehicles.
7. 249 EV Charging Stations are proposed for the full buildout. To reflect the EV charging stations that will come online during construction in the partial years leading up to full buildout, a scaling factor was applied based on the ratio of square feet of the parking land use that is built out in a given year to the total square feet that will be built. The scaling factor for a given year was applied to the 249 chargers at full buildout. To see scaling factors used, refer to the parking land use from Table 16.
8. Total annual charge hours available from the project are determined by multiplying the average daily hours of charging per charger (10 hours) by the annual days of charger activity (365 days). The annual charge hours available from the project are then multiplied by 25 miles charged per charge hour to determine the number of eVMT available from the project.
9. The Project EV chargers for Town Square and the Residential/Shopping District land uses are determined to be at capacity, meaning used fully for all available charge hours per day, when the electric vehicle miles associated with the Project are in excess of the maximum electric vehicle miles the Project chargers can charge. If there is a surplus of chargers relative to EVs coming to the site, then the Project chargers are under-capacity, and only a fraction of chargers will be used as the number of EVs coming to the site are fewer than the total number of charger capacity. If there is a surplus of EVs coming to the site relative to the chargers at the site, all chargers will be used and the site will be at capacity. In the scenario when the chargers are at capacity, the full capacity of VMTs the site can charge are assumed to be charged.

Abbreviations:

EV - electric vehicle (includes battery electric or plug-in hybrid technology)
Hr - hour
TDM - Transportation Demand Management
VMT - vehicle miles travelled
eVMT - electric vehicle mile traveled

Notes:

1. Expected eVMT and trips charged by the Project chargers in Town Square and the Residential/Shopping District land uses are calculated based on the San Mateo Fleet, charger usage assumptions, ARB's Vision Model, and traffic data provided by the Transportation Engineer. For calculation details, see Table 23.
2. Emissions reductions from EV charging represent the decrease in emissions from increases in electric vehicle use due to the installation of EV chargers throughout the site. For Town Square and the Residential/Shopping District land uses, the eVMT and trips from additional Project chargers is calculated based on the difference between the MSS scenario and the baseline scenario, representing the additional eVMT due to the installation of additional chargers.
3. Emissions reductions use emission factors developed in EMFAC2021 that represent passenger vehicles (LDA, LDT1, LDT2, MCY). The eVMTs determined for Town Square and the Residential/Shopping District are based on ARB's VISION Model, which includes expected electric vehicle fleet % for passenger vehicles only (LDA, LDT1, LDT2, MCY).
4. EVs emit particulate matter brake wear and tire wear, therefore those emissions are not considered in the reductions.
5. Expected eVMT charged by additional Project chargers is measured based on anticipated charging energy usage provided by the Project Applicant. For calculation details see Variant Table 22.
6. Trip counts from Project chargers were calculated by dividing the increased eVMTs from project chargers by the average VMTs per trip for the passenger vehicles (Cars) in a given year, based on traffic data provided by the Transportation Engineer.

Abbreviations:

eVMT - electric vehicle miles traveled
lb - pound
EV - electric vehicle
ROG - reactive organic gases
NOx - nitrogen oxides
PM_{10} - particulate matter less than 10 microns in diameter
$PM_{2.5}$ - particulate matter less than 2.5 microns in diameter

Full Buildout	9,752,026	876,981	-2,882	-0.082	-0.069	-2,905

Year	Electric VMT GHG Emissions Reduction (MT/year)			
	CO_2	CH_4	N_2O	CO_2e
Existing Conditions	-580	-0.024	-0.019	-586
Full Buildout	-4,278	-0.13	-0.11	-4,313

Notes:

1. Expected eVMT and trips charged by the Project chargers in Town Square and the Residential/Shopping District land uses are calculated based on the San Mateo Fleet, charger usage assumptions, ARB's Vision Model, and traffic data provided by the Transportation Engineer. For calculation details, see Table 23.

2. Emissions reductions from EV charging represent the decrease in emissions from increases in electric vehicle use due to the installation of EV chargers throughout the site. For Town Square and the Residential/Shopping District land uses, the eVMT and trips from additional Project chargers is calculated based on the difference between the MSS scenario and the baseline scenario, representing the additional eVMT due to the installation of additional chargers.
3. Emissions reductions use emission factors developed in EMFAC2021 that represent passenger vehicles (LDA, LDT1, LDT2, MCY). The eVMTs determined for Town Square and the Residential/Shopping District are based on ARB's VISION Model, which includes expected electric vehicle fleet % for passenger vehicles only (LDA, LDT1, LDT2, MCY).
4. Expected eVMT charged by additional Project chargers is measured based on anticipated charging energy usage provided by the Project Applicant. For calculation details see Table 22.
5. Trip counts from Project chargers were calculated by dividing the increased eVMTs from project chargers by the average VMTs per trip for the passenger vehicles (Cars) in a given year, based on traffic data provided by the Transportation Engineer.

Abbreviations:

GHG - Greenhouse Gas
CO_2 - carbon dioxide
CH_4 - methane
N_2O - Nitrous Oxide
CO_2e - Carbon dioxide equivalent
eVMT - electric vehicle miles traveled
MT - metric ton
EV - electric vehicle

Table 25aV
Summary of Mobile CAP Emissions
Willow Village - Increased Residential Variant Analysis
Menlo Park, California

Total Emissions Before Reductions:[1]

Year	CAP Emissions without Reductions (ton/year)			
	ROG	NO_x	PM_{10}[2]	$PM_{2.5}$[2]
Total Emissions by Year				
Existing Conditions[3]	5.0	8.0	4.0	0.84
Year 4	0.61	0.67	0.46	0.092
Year 5	5.8	6.3	5.1	1.0
Year 6	10	11	9.4	1.9
Full Buildout	12	13	11	2.2
Net Emissions by Year				
Full Buildout	**7.1**	**5.1**	**7.0**	**1.3**

Total Emissions with Reductions:[4]

Year	CAP Emissions with Reductions (ton/year)			
	ROG	NO_x	PM_{10}[2]	$PM_{2.5}$[2]
Total Emissions by Year				
Existing Conditions[3]	5.0	8.0	4.0	0.84
Year 4	0.56	0.64	0.46	0.091
Year 5	5.0	5.9	5.1	1.0
Year 6	8.9	10	9.4	1.8
Full Buildout	**10**	**12**	**11**	**2.2**
Net Emissions by Year				
Full Buildout	**5.3**	**4.1**	**7.0**	**1.3**

Notes:

1. Calculations of CAP emissions before reductions are shown in detail in Table 21a. Net emissions subtract the emissions from the existing conditions in 2019.
2. PM10 and PM2.5 emissions include exhaust, tire wear, brake wear, and fugitive dust. Fugitive dust emissions factors are calculated in AQTR Table 8.
3. The Existing Conditions includes EV reductions associated with existing Project Site chargers.
4. CAP Emissions after reductions account for the reductions associated with EVs as shown in Table 24a. The emissions reductions are subtracted from the total Project emissions.

Abbreviations:

lb - pound
MT - metric ton
EV - electric vehicle
ROG - reactive organic gases
NOx - nitrogen oxides
PM_{10} - particulate matter less than 10 microns in diameter
$PM_{2.5}$ - particulate matter less than 2.5 microns in diameter

Table 28V
Energy Usage for Existing Conditions and Project Operations
Willow Village - Increased Residential Variant Analysis
Menlo Park, California

Land Use	Floor Area (sqft) (DU - Residential)	Annual Electricity Use (MWh/yr)	Annual Natural Gas Use (MMBtu/yr)
Existing Conditions (2019)[1]			
All	1,923,910	12,050	30,039
Total Existing Energy Usage		**12,050**	**30,039**
Full Buildout[2,3]			
Office	1,600,000	23,828	0
Retail	207,690	4,517	2,195
Residential	1,930	18,804	0
Hotel	172,000	2,528	0
Parking	1,869,240	32,183	0
Park	403,837	38	0
Total Full Buildout Energy Usage		**81,898**	**2,195**

Notes:

1. Energy use rates for existing conditions were provided for 2019 by the Project Applicant via email on August 10, 2021.
2. Electricity and natural gas usage rates for the retail, residential, and parking land uses were provided by PAE in the June 14, 2021 memorandum. Electricity usage rates for Office, Hotel, and Park were provided by Hines on June 21, 2021. The hotel and office do not use natural gas. The electricity usage includes 27,986 MWh/year of electricity use associated with the Campus District EV charging stations, which is summarized in the parking land use category. Electricity and energy use rates for the Willow Road Retail were calculated based on the CalEEMod defaults the retail land use type in Climate Zone 5.
3. Natural gas for the project is only used for Hamilton Avenue Parcels North and South and the supermarket and restaurant land uses, which are summarized in the retail category.

Abbreviations:

CalEEMod - California Emissions Estimator Model
DU - dwelling unit
kBTU - thousand British Thermal Units
kWh - kilowatt-hour
MMBTU - million British Thermal Units
MWh - Megawatt-hour
sqft - square feet
yr - year

References:

California Air Pollution Control Officers Association (CAPCOA). California Emissions Estimator Model (CalEEMod), Version 2020.4.0. Available online at http://www.caleemod.com

Table 30V
Energy Usage Emissions from Existing Conditions and Project Operations
Willow Village - Increased Residential Variant Analysis
Menlo Park, California

Location	Natural Gas Emissions[1,2]					Electricity Emissions[1,2]
	ROG	NOx	PM_{10}	$PM_{2.5}$	CO_2e	
	(tons/yr)				(MT/yr)

Full Buildout						
Retail	0.012	0.11	8.2E-03	8.2E-03	118	0
Total Full Buildout Emissions	**0.012**	**0.11**	**8.2E-03**	**8.2E-03**	**118**	**0**
Partial Buildout[3]						
Total Year 4 Emissions	0.0012	0.011	8.3E-04	8.3E-04	12	0
Total Year 5 Emissions	0.0070	0.064	4.9E-03	4.9E-03	70	0
Total Year 6 Emissions	0.012	0.11	8.0E-03	8.0E-03	115	0

Notes:

1. CAP emissions result from the combustion of natural gas. As a result, CAP emissions were only calculated for natural gas usage. In compliance with the City of Menlo Park Municipal Code, natural gas usage for the Project will be offset; however, since the carbon intensity of the offset production is not known at this time, GHG emissions from natural gas were conservatively included alongside electricity GHG emissions.
2. Emissions were calculated based on energy use, shown in Table 28, and energy emission factors, shown in AQTR Table 29. Existing electricity is sourced from PCE. Project electricity will be sourced from 100% renewable sources; as such, emissions from Project electricity use are expected to be zero. Project natural gas will only be used in retail land uses for commercial cooking equipment.
3. Partial buildout emissions were calculated from full buildout using scaling factors by land use type and year, as shown in Table 16.

Abbreviations:

CAP - Criteria Air Pollutants
CO_2e - carbon dioxide equivalents
GHG - Greenhouse Gas
MT - metric ton(s)
NOx - nitrogen oxides
PM - particulate matter
$PM_{2.5}$ - PM less than 2.5 microns in diameter
PM_{10} - PM less than 10 microns in diameter
ROG - reactive organic gases
yr - year

Hotel		172,000	sqft	7.6	2.5
Parking		1,869,240	sqft	0	1.4
Park		403,837	sqft	0	14
Partial Buildout[3]					
			Total Year 4 Usage[3]	1.5	13
			Total Year 5 Usage[3]	37	23
			Total Year 6 Usage[3]	89	32

Notes:

1. Existing water use was calculated using the CalEEMod default water consumption profile for each land use.
2. Project indoor water use rates and outdoor water use for all parcels except Willow Road Retail were provided by the Project Applicant on June 14, 2021. Indoor and outdoor water use rates for Willow Road Retail were calculated using the CalEEMod default water consumption profile for the retail land use type.
3. Partial buildout usage rates were calculated from full buildout using scaling factors by land use type and year, as shown in Table 16.

Abbreviations:

CalEEMod - California Emissions Estimator Model

Total Year 4 Emissions[3]	5.0	0.92	0.81	0.32	7.1
Total Year 5 Emissions[3]	24	22	20	7.9	74
Total Year 6 Emissions[3]	49	54	48	19	170

Notes:

1. Emissions shown in this table were calculated using default values and methods from CalEEMod Version 2020.4.0. The Water Electricity Intensity, Water Treatment Types, and Wastewater Treatment Direct Emission Factors used in the calculation can be found in Tables 9.2, 9.3 and 9.4 of Appendix D of the CalEEMod user guide, respectively. These calculations were performed using water use rates, shown in Table 31, and energy emission factors, shown in AQTR Table 29.
2. Consistent with CalEEMod, indoor water use was assumed to be processed as wastewater and outdoor water use was assumed to not be processed as wastewater.
3. Partial buildout direct emissions from Septic Tank, Aerobic, and Facultative Lagoon wastewater treatment were calculated from full buildout using scaling factors by land use type and year, as shown in Table 1. For partial buildout indirect electricity emissions from water usage and wastewater treatment, usage rates rather than emission were scaled to account for year specific energy emission factors from PG&E, as shown in AQTR Table 29.

Abbreviations:

CalEEMod - California Emissions Estimator Model
CO_2e - carbon dioxide equivalents
MT - metric ton
yr - year

References:

California Air Pollution Control Officers Association (CAPCOA). California Emissions Estimator Model (CalEEMod®), Version 2020.4.0. Available online at http://www.caleemod.com

Table 33V
Solid Waste Generation for Existing Conditions and Project Operations
Willow Village - Increased Residential Variant Analysis
Menlo Park, California

Solid Waste Generation[1]

Land Use	Size	Units	Solid Waste Disposal Rate (ton/year)
Existing Conditions (2019)			
Office	251,530	sqft	42
Commercial	123,870	sqft	10
Industrial - Warehouse	500,780	sqft	471
Industrial - Manufacturing	23,570	sqft	29
Recreational	24,060	sqft	137
Light Industrial	80,100	sqft	99
Parking	920,000	sqft	0
Full Buildout Conditions			
Office	1,600,000	sqft	268
Retail	207,690	sqft	218
Residential	1,930	DU	888
Hotel	193	Rooms	106
Parking	1,869,240	sqft	0
Park	403,837	sqft	0.83

Notes:

1. Solid Waste Generation Rates are from Table 10.1 of Appendix D of the CalEEMod User's Guide. An 82% diversion rate, provided by the Project Applicant via email communication dated August 2, 2021, is applied to default solid waste generation rates for the existing and project office land use to account for recycling and composting. The diversion rate is generated using data from Recology with the assumption that all bins are at 100% capacity and 0% contamination.

Partial Buildout[5]						
Total Year 4 Emissions[5]						83
Total Year 5 Emissions[5]						1,567
Total Year 6 Emissions[5]						3,547

Notes:

1. Consistent with CalEEMod Appendix A, residential building surface area was assumed to be 2.7 times the floor area, and non-residential 2 times the floor area. Also consistent with CalEEMod Appendix E, the parking painted area was assumed to be 6% of the total surface area for surface lots.
2. Consistent with CalEEMod Appendix A, 10% of all surfaces were assumed to be coated each year.
3. Consistent with CalEEMod Appendix D Table 6.1, which is based on BAAQMD Regulation 8 Rule 3 paint VOC regulations, use VOC EF of 100 g/L for flat paints, generally used indoors, and 150 g/L for all other architectural coatings.
4. Uses CalEEMod Appendix A assumption that 1 gallon of paint covers 180 square feet. Building surface area is assumed to be 75% indoors and 25% outdoors, consistent with CalEEMod Appendix A. Parking garages are assumed to have no indoor surfaces.
5. Partial buildout emissions were calculated from full buildout using scaling factors by land use type and year, as shown in Table 16.

Abbreviations:

BAAQMD - Bay Area Air Quality Management District
CalEEMod - California Emissions Estimator Model
EF - emission factor
g - grams
L - liters
lb - pound
sqft - square feet

Parking	1,869,240	112,154	10%	0	150	19
Park	403,837	0	10%	0	0	0
Total Full Buildout Emissions						**1,911**
Partial Buildout[5]						
Total Year 4 Emissions[5]						40
Total Year 5 Emissions[5]						635
Total Year 6 Emissions[5]						1,430

Notes:

1. Consistent with CalEEMod Appendix A, residential building surface area was assumed to be 2.7 times the floor area, and non-residential 2 times the floor area. Also consistent with CalEEMod Appendix E, the parking painted area was assumed to be 6% of the total surface area for surface lots.
2. Consistent with CalEEMod Appendix A, 10% of all surfaces were assumed to be coated each year.
3. Paint VOC content is consistent with or more stringent than BAAQMD Regulation 8 Rule 3 (Architectural Coatings). Emissions were estimated assuming that indoor painting will utilize "super-compliant" VOC architectural coatings that meet the more stringent limits in South Coast Air Quality Management District Rule 1113. For outdoor paint, assumed use of coatings with VOC content of 150 g/L, consistent with BAAQMD requirements. VOC was assumed to be equivalent to ROG for these purposes.
4. Uses CalEEMod Appendix A assumption that 1 gallon of paint covers 180 square feet. Building surface area is assumed to be 75% indoors and 25% outdoors, consistent with CalEEMod Appendix A. Parking garages are assumed to have no indoor surfaces.
5. Partial buildout emissions were calculated from full buildout using scaling factors by land use type and year, as shown in Table 16.

Abbreviations:

BAAQMD - Bay Area Air Quality Management District
CalEEMod - California Emissions Estimator Model
EF - emission factor
g - grams
L - liters
lb - pound
sqft - square feet
VOC - volatile organic compound
yr - year

Consumer Product Emissions from Existing Conditions and Project Operations
Willow Village
Menlo Park, California

Land Use	Building Area (sqft)	Consumer Products VOC EF[1,2] (lb/sqft/day)	Days per Year	Consumer Products VOC emissions (lb/yr)
Existing Conditions (2019)				
Office	251,530	1.8E-05	365	1,670
Commercial	123,870	1.8E-05	365	822
Industrial - Warehouse	500,780	1.8E-05	365	3,324
Industrial - Manufacturing	23,570	1.8E-05	365	156
Recreational	24,060	1.8E-05	365	160
Light Industrial	80,100	1.8E-05	365	532
Parking	920,000	3.5E-07	365	119
Existing Conditions Emissions				**6,783**
Full Buildout				
Office	1,600,000	1.8E-05	365	10,621
Retail	207,690	1.8E-05	365	1,379
Residential	1,892,043	1.8E-05	365	12,560
Hotel	172,000	1.8E-05	365	1,142
Parking	1,869,240	3.5E-07	365	242
Park	403,837	5.2E-08	365	7.6
Total Full Buildout Emissions				**25,950**
Partial Buildout[3]				
Total Year 4 Emissions[3]				599
Total Year 5 Emissions[3]				9,447
Total Year 6 Emissions[3]				20,130

Notes:

1. The consumer products VOC EF for office, retail, and residential land uses was derived using methodology consistent with CalEEMod with adjusted parameters for San Mateo County, as described in AQTR Table 37. The default emissions factor assumes 2020 consumer products VOC inventory for San Mateo County. The default building square footage used is from 2010, which was updated to 2020 using population growth of San Mateo County, as shown in AQTR Table 37.
2. Consumer product VOC EFs for parking and open space were taken from CalEEMod 2020.4.0. These defaults take into account pesticide and fertilizer use in city parks and degreaser use in parking areas.
3. Partial buildout emissions were calculated from full buildout using scaling factors by land use type and year, as shown in Table 16.

Abbreviations:

ARB - Air Resources Board
CalEEMod - California Emissions Estimator Model
EF - emission factor
lb - pound
sqft - square feet
VOC - volatile organic compound
yr - year

Net Full Buildout Emissions	17	4.1	7.0	1.3	94	23	38	7.4

Notes:

1. Emissions estimated using methods consistent with CalEEMod® version 2020.4.0.
2. Operational emissions shown represent activity and emissions across 365 days per year.
3. Operational emissions from existing conditions were calculated using CalEEMod® default data and emission factors based on the existing land use type and energy use rates provided by the Project Applicant.
4. Full buildout operational emissions are based on electricity, natural gas, and water usage rates provided by the Project Applicant alongside CalEEMod® defaults for architectural coating, consumer product, landscaping, and waste emissions. Net emissions were calculated as the difference between full buildout emissions and existing condition emissions.
5. Natural gas usage for the project would be used exclusively for supermarket and commercial cooking.
6. Partial buildout emissions were calculated from full buildout using scaling factors by land use type and year, as shown in Table 16.
7. Net emissions were calculated as the difference between partial buildout emissions for each year and existing condition emissions.

Onsite Roadways[3]

Source Group Name	Distance (m)	Volume (vehicles/day)	VMT (mi/day)
ONSITE - Project	2570	10,782	17,217
ONSITE - Project + Variant	2570	11,219	17,915

Intercampus Shuttles[4]

Source Group Name	Distance (m)	Volume (vehicles/day)	VMT (mi/day)
SHUTTLES	7278	361	1,633

Notes:

1. Net new offsite traffic volumes for both the Campus District and the Town Square were provided by Hexagon in the data request received in February 2022. Offsite traffic for the Campus District was modeled using a percent breakdown of the fleet (88% cars, 6% on-demand, 2% trucks), provided by Hexagon. Offsite traffic for the Town Square and Residential/Shopping District was modeled as the default San Mateo fleet. A summary of fleet mix categories can be found in AQTR Table 19. Modeled offsite roadway segments can be found in AQTR Figure 8.

2. The increased residential variant increases the traffic for the Town Square and Residential/Shopping District. Total traffic volumes and VMT are calculated by summing the Facebook Campus District fleets with the Town Square and Residential/Shopping District fleet. The total Project volume and VMT without contributions from the variant are shown for comparison purposes.

3. Net new onsite traffic volumes were provided by Hexagon in the data request received in February 2022 which include the increased traffic volumes due to the residential variant. Onsite traffic volumes were taken as the sum of all net new onsite traffic volumes divided by two to account for round trips. Onsite traffic was modeled exclusively as the cars fleet type. A summary of the cars fleet mix can be found in Table 19. Modeled onsite roadway segments can be found in AQTR Figure 7.

4. Shuttle traffic volumes, which account for the remaining 4% of the offsite fleet mix, were conservatively modeled as the sum of all inbound and outbound vehicle trips across all regions and routes, divided by two to account for round trips. Inbound and outbound vehicle trips were provided by the Project Applicant in June 2021. A summary of the shuttles fleet mix can be found in AQTR Table 19. Modeled shuttle roadway segments can be found in AQTR Figure 9.

Abbreviations:
VMT - Vehicle Miles Traveled m - meter mi - mile

Table 59V
Project Cancer Risk at Off-Site and On-Site MEIR
Willow Village - Increased Residential Variant Analysis
Menlo Park, California

Source Category	Lifetime Excess Cancer Risk[1] (in a million)					
	Construction + Operations				Operations Only	
	Unmitigated[2]		Mitigated[2]			
Project Contribution	On-Site MEIR[3,5]	Off-Site MEIR[4,5]	On-Site MEIR[3,5]	Off-Site MEIR[4,5]	On-Site MEIR[3,5]	Off-Site MEIR[4,5]
	Scenario 3	Scenario 2	Scenario 3	Scenario 2	Scenario 3	Scenario 4
Construction	172	57	8.06	7.6	--	--
Operational Generators	1.6	0.65	1.40	0.65	1.4	0.55
Operational Traffic	1.2	0.93	1.16	0.93	2.0	3.0
Total Project Contribution	175	58	10.6	9.2	3.4	3.6

Notes:

1. Excess lifetime cancer risk from construction and operations are combined since cancer risk is evaluated over a 30-year lifetime. Thus, the risk takes into account exposure to Project emissions beginning during construction and continuing through operations. Off-site receptors are exposed to all Project construction and subsequent Project operations. On-site receptors are exposed to overlapping construction emissions and subsequent Project operations.

   The cancer risks were estimated using the following equation:

   Riskinh = Ci x CF x IFinh x CPFi x ASF
   Where:
   Riskinh = Cancer Risk for the Inhalation Pathway (unitless)
   Ci = Annual Average Air Concentration for Chemical "i" (µg/m3)
   CF = Conversion Factor (mg/µg)
   IFinh = Intake Factor for Inhalation (m3/kg-day)
   CPFi = Cancer Potency Factor for Chemical "i" (mg/kg-day)-1

2. The Unmitigated Project reflects default construction off-road equipment fleet. The Mitigated Project reflects use of 95 percent Tier 4 construction off-road equipment before residents move on-site and 98 percent Tier 4 construction off-road equipment after residents move on-site. The other 5 percent and 2 percent (before and after on-site residents, respectively) are assumed to have Tier 2 engines. Unmitigated emissions are estimated to be much larger than mitigated emissions as a result of two assumptions made during the calculations: 1) the emission factor for Tractors/Loaders/Backhoes with low HP ratings is significantly higher than that of subsequently higher HP ranges and many construction equipment fall under this classification; and 2) many pieces of construction equipment such as Bobcats were conservatively classified as Tractors/Loaders/Backhoes rather than other equipment types with lower emission factors.

3. On-site Project MEIR was identified as the on-site sensitive receptor location with the maximum total cancer risk attributed to the emissions associated with the Project.

4. Off-site Project MEIR was identified as the off-site sensitive receptor location with the maximum total cancer risk attributed to the emissions associated with the Project.

5. On-site and off-site MEIR locations are documented below:

Table 59V
Project Cancer Risk at Off-Site and On-Site MEIR
Willow Village - Increased Residential Variant Analysis
Menlo Park, California

MEIR by Scenario	MEIR Location[6]					
	Construction + Operations				Operations Only	
	On-Site MEIR[3]	Off-Site MEIR[4]	On-Site MEIR[3]	Off-Site MEIR[4]	On-Site MEIR[3]	Off-Site MEIR[4]
	Scenario 3	Scenario 2	Scenario 3	Scenario 2	Scenario 3	Scenario 4
UTMx (m)	575,225	575,500	575,245	575,500	575,275	574,840
UTMy (m)	4,148,065	4,147,960	4,148,135	4,147,960	4,148,145	4,147,800
Receptor Height (m)	4.8	1.8	4.8	1.8	1.8	1.8
Receptor Type	Residential	Residential	Residential	Residential	Residential	Residential

6. Three exposure scenarios were modeled. Scenario 1 evaluates off-site receptors and begins at the start of construction. Scenario 2 evaluates off-site receptors and begins at the start of Area 2 Grading and Utilities construction. Scenario 3 evaluates on-site receptors and begins at the conclusion of Town Center and Residential/Shopping District construction when Area 1 residents move in.

Abbreviations:

kg - kilogram
m - meter
MEIR - maximally exposed individual receptor
mg - miligram
UTMx - Universal Transverse Mercator x-coordinate
UTMy - Universal Transverse Mercator y-coordinate
ug - microgram

Table 60V
Project Chronic Hazard Index at Off-Site and On-Site MEIR
Willow Village - Increased Residential Variant Analysis
Menlo Park, California

Source Category	Lifetime Excess Chronic Hazard Index[1] (unitless)					
	Construction + Operations				Operations Only	
	Unmitigated[2]		Mitigated[2]			
Project Contribution	On-Site MEIR[4,6]	Off-Site MEIR[5,6]	On-Site MEIR[4,6]	Off-Site MEIR[5,6]	On-Site MEIR[4,6]	Off-Site MEIR[5,6]
	Scenario 3	Scenario 1	Scenario 3	Scenario 1	Scenario 3	Scenario 1
Construction	0.23	0.11	9.1E-03	0.011	--	--
Operational Generators	4.0E-04	6.6E-04	4.0E-04	2.1E-04	3.3E-04	3.0E-03
Operational Traffic[3]	2.1E-03	1.4E-03	2.1E-03	3.3E-03	6.0E-03	1.3E-03
Total Project Contribution	0.23	0.11	0.012	0.014	6.3E-03	4.3E-03

Notes:

1. The potential for exposure to result in adverse chronic non-cancer effects is evaluated by comparing the estimated annual average air concentration (which is equivalent to the average daily air concentration) from construction and operations to the non-cancer chronic REL for each chemical. When calculated for a single chemical, the comparison yields a ratio termed a hazard quotient or HQ. To evaluate the potential for adverse chronic non-cancer health effects from simultaneous exposure to multiple chemicals, the hazard quotients for all chemicals are summed, yielding a hazard index or HI.

   The chronic HI for each receptor was estimated using the following equation:

   HIinh =Ci / cREL
   Where:
   HIinh = Chronic HI for the Inhalation Pathway (unitless)
   Ci = Annual Average Air Concentration for Chemical "i" (µg/m3)
   cREL = Chronic Reference Exposure Level (µg/m3)

2. The Unmitigated Project reflects default construction off-road equipment fleet. The Mitigated Project reflects use of 95 percent Tier 4 construction off-road equipment before residents move on-site and 98 percent Tier 4 construction off-road equipment after residents move on-site. The other 5 percent and 2 percent (before and after on-site residents, respectively) are assumed to have Tier 2 engines. Unmitigated emissions are estimated to be much larger than mitigated emissions as a result of two assumptions made during the calculations: 1) the emission factor for Tractors/Loaders/Backhoes with low HP ratings is significantly higher than that of subsequently higher HP ranges and many construction equipment fall under this classification; and 2) many pieces of construction equipment such as Bobcats were conservatively classified as Tractors/Loaders/Backhoes rather than other equipment types with lower emission factors.

3. The operational traffic analysis reflects impacts from the Project. If traffic risks are conservatively scaled by the maximum change in vehicle miles traveled due to the Residential Increase Variant, chronic risks remain significantly below threshold.

4. On-site Project MEIR was identified as the on-site sensitive receptor location with the maximum chronic HI attributed to the emissions associated with the Project.

5. Off-site Project MEIR was identified as the off-site sensitive receptor location with the maximum chronic HI attributed to the emissions associated with the Project.

6. On-site and off-site MEIR locations are documented below:

Operational Traffic	0.040	0.030	0.092	0.12	0.11	0.12
Total Project Contribution	1.1	0.56	0.13	0.18	0.11	0.12

Notes:

1. PM2.5 concentrations at off-site receptors include contributions from multiple phases of Project construction and subsequent Project operations. PM2.5 concentrations at on-site receptors include contributions from overlapping construction emissions and subsequent Project operations.

   The PM2.5 concentration at each receptor was estimated using the following equation:

   Ci =E x Di
   Where:
   C = Concentration of PM2.5 at receptor "i" (µg/m3)
   Di = Dispersion factor associated with unit emissions at receptor "i" (µg/m3)/(g/s)
   E = Emission Rate (g/s)

2. The Unmitigated Project reflects default construction off-road equipment fleet. The Mitigated Project reflects use of 95 percent Tier 4 construction off-road equipment before residents move on-site and 98 percent Tier 4 construction off-road equipment after residents move on-site. The other 5 percent and 2 percent (before and after on-site residents, respectively) are assumed to have Tier 2 engines. Unmitigated emissions are estimated to be much larger than mitigated emissions as a result of two assumptions made during the calculations: 1) the emission factor for Tractors/Loaders/Backhoes with low HP ratings is significantly higher than that of subsequently higher HP ranges and many construction equipment fall under this classification; and 2) many pieces of construction equipment such as Bobcats were conservatively classified as Tractors/Loaders/Backhoes rather than other equipment types with lower emission factors.

3. The operational traffic analysis reflects excess $PM_{2.5}$ concentration from the Project. If traffic concentrations are conservatively scaled by the maximum change in vehicle miles traveled due to the Residential Increase Variant, $PM_{2.5}$ concentrations remain significantly below threshold.

4. On-site Project MEIR was identified as the on-site sensitive receptor location with the maximum chronic HI attributed to the emissions associated with the Project.

5. Off-site Project MEIR was identified as the off-site sensitive receptor location with the maximum chronic HI attributed to the emissions associated with the Project.

6. On-site and off-site MEIR locations are documented below:

Appendix 6
Air Quality Alternatives Calculations

Table 1
Land Use Summary
Willow Village - Base Project Alternative Analysis
Menlo Park, California

Land Use[1]	CalEEMod® Land Use	Size	Units[2]	Square Footage
Existing Conditions (2019)				
Office	General Office Building	252	ksf	251,530
R&D	Research and Development	124	ksf	123,870
Warehouse	Unrefrigerated Warehouse-No Rail	501	ksf	500,780
Lab & Manufacture	Manufacturing	24	ksf	23,570
Health Center	Health Club	24	ksf	24,060
Former Fire Department Building	General Light Industry	80	ksf	80,100
Parking	Enclosed Parking with Elevator	2,300	Spaces	920,000

Partial Buildout by Year[3]			
Land Use Type[4]	**Percent Operational by Year**		
	Year 4	**Year 5**	**Year 6**
Office	3.1%	58%	95%
Retail	10%	59%	98%
Residential	0%	16%	64%
Hotel	0%	41%	100%
Parking	53%	75%	96%
Park	86%	94%	100%

Full Buildout			
Land Use Type[4]	**Size**	**Units[2]**	**Square Footage**
Office	714	ksf	713,841
Retail	279	ksf	279,386
Residential	523	DU	678,390
Hotel	193	Rooms	172,000
Parking	733	ksf	733,041
Park	404	ksf	403,837

Notes:

1. Land uses analyzed based on information provided by the Project Applicant, as found in the Project Description. "Office" land use mapped to General Office Building and Research and Development; "Office/Lab" mapped to General Office Building, Research and Development, Health Club, and Manufacturing; "Warehouse" mapped to Unrefrigerated Warehouse-No Rail and General Light Industry, and "Warehouse/Office" mapped to Unrefrigerated Warehouse-No Rail and Research and Development CalEEMod land use types on a building-by-building basis.
2. The Project Applicant provided Project land uses in units of square footage, hotel rooms, and dwelling units. For the existing parking land use, each parking space is assumed to be 400 sqft. This assumption is based on CalEEMod defaults.
3. Partial buildout for Year 4, Year 5, and Year 6 were calculated based on the portion of building area for each land use type that becomes operational each year, based on the construction schedule, as shown in Table 2.
4. For Hamilton Avenue Parcels North and South, only net new square footage was included in the analysis. This is under the conservative assumption that the existing retail area and the retail land use that will replace it have similar operational emissions.

Abbreviations:

DU - dwelling unit
ksf - 1,000 square feet
sqft - square foot
CalEEMod® - California Emissions Estimator Model

Table 17
Traffic Data Provided by the Transportation Engineer
Willow Village - Base Project Alternative Analysis
Menlo Park, California

Daily Trips Rates and VMT

Land Use	Fleet Type / Land Use	Trip Rate Units[1]	Weekday Trips per Day per Unit[1]	Weekday daily VMT[2]
			TOTAL	TOTAL
Main Project Site - Existing Conditions	Cars	per 1,000 s.f.	9.19	110,860
	Trucks	per 1,000 s.f.	0.22	2,640
	Shuttles	per 1,000 s.f.	0.66	21,088
	On-Demand	per 1,000 s.f.	0.66	7,919
Campus District - Full Buildout	Cars	per 1,000 s.f.	10.05	79,756
	Trucks	per 1,000 s.f.	0.23	1,810
	Shuttles	per 1,000 s.f.	0.44	9,408
	On-Demand	per 1,000 s.f.	0.68	5,429
Town Square and the Residential/Shopping District - Full Buildout	Residential	per d.u.	4.35	21,622
	Retail[3]	per 1,000 s.f.	25.07	47,098
	Hamilton Avenue Parcels North and South[3]	per 1,000 s.f.	28.31	1,461
	Park	per acre	42.80	1,147
	Hotel	per room	6.69	14,814

Notes:

1. Daily project trip rates were provided by the Transportation Engineer in terms of trip rates per land use amount.
2. Daily Project VMT provided by the Transportation Engineer include reductions for pass-by and diverted trips. Daily VMT is given in VMT per day. The Project trips and VMT have been scaled based on the Base Alternative's land uses in Table 1.
3. The trip rates and VMT for Hamilton Avenue Parcels North and South were provided separately and added to retail totals in calculations.

Abbreviations:

VMT - Vehicle miles traveled
s.f. - Square feet
d.u. - Dwelling unit

Table 18
Trip Rates and VMT for Existing Conditions and Project Operations

	Hotel	San Mateo	14,814	1,290	14,244	1,241	5,199,035	452,878

Notes:

1. Partial years are scaled from the full buildout based on the portion of each land use that becomes operational for each year of construction. See Table 16 for more details.

Table 18
Trip Rates and VMT for Existing Conditions and Project Operations
Willow Village - Base Project Alternative Analysis
Menlo Park, California

2. The fleet type for each land use was provided by the Transportation Engineer. The Campus District will have various fleets for specific uses. Town Square and the Residential/Shopping District land uses (Residential, Retail, Park, and Hotel) are analyzed assuming a default San Mateo fleet. Hamilton Avenue Parcels North and South are combined with retail land uses. See AQTR Table 19 for more information.
3. Daily VMT and trip rates were provided by the Transportation Engineer on October 5, 2021. Total trip rates are calculated using land uses in AQTR Table 1.
4. Weekday VMT and trip rates provided by the Transportation Engineer were scaled to average trip rates using the ratio between CalEEMod® weekday and weekend one-way trip rates.
5. Annual trips and VMT are calculated by multiplying daily values by 365 for all fleets with the exception of shuttles and on-demand, which are multiplied by 260 days/year.

Abbreviations:
VMT - vehicle miles traveled

	Retail	San Mateo	2,401,410	16,604,534	2.3	2.4	1.8	0.35	13	13	10	1.9
	Park	San Mateo	231,140	1,548,641	0.22	0.23	0.17	0.033	1.2	1.3	0.91	0.18
	Hotel	San Mateo	452,878	5,199,035	0.55	0.65	0.55	0.11	3.0	3.6	3.0	0.60
			6,039,011	**55,981,062**	**6.8**	**7.3**	**6.0**	**1.2**	**37**	**40**	**33**	**6.5**

Notes:

1. Hamilton Avenue Parcels North and South were provided separately and added to the retail land use totals.
2. Trip counts and VMTs by land use type were broken out by year using a scaling factor representing the percent of each fleet that is operational in a given year leading up to full buildout. This percent was determined based on the square footage of the land use associated with each fleet that is operational in a given year relative to that land use's full buildout square footage. See Table 16 for more details on scaling. See Table 18 for Project Trip Rates and VMT.
3. Criteria air pollutants are calculated by year using emission factors for the associated year and fleet from EMFAC2021. Electric vehicles are not included in the emission factors for Campus District fleets (all fleet types except San Mateo Fleet), as reductions associated with EVs are considered separately. Project emission factors are shown in AQTR Table 20a.
4. Full buildout emissions are conservatively calculated using 2026 emission factors.

Abbreviations:

EV - electric vehicle
lb - pound
NO_x - nitrogen oxides
VMT- vehicle miles traveled
PM_{10} - particulate matter less than 10 microns in diameter
$PM_{2.5}$ - particulate matter less than 2.5 microns in diameter
ROG - reactive organic gases

	Retail	San Mateo	2,401,410	16,604,534	5,847	0.23	0.25	5,928
	Park	San Mateo	231,140	1,548,641	546	0.022	0.024	554
	Hotel	San Mateo	452,878	5,199,035	1,809	0.055	0.070	1,831
			6,039,011	**55,981,062**	**20,186**	**0.60**	**1.0**	**20,498**

Notes:

1. Hamilton Avenue Parcels North and South were provided separately and added to the retail land use totals.
2. VMT and trip rates are summarized in Table 18.
3. Greenhouse Gases are calculated by year using emission factors for the associated year and fleet from EMFAC2021. Electric vehicles are not included in the emission factors for Campus District fleets (all fleet types except San Mateo Fleet), as reductions associated with EVs are considered separately. Project emission factors are shown in AQTR Table 20b.
4. Full buildout emissions are conservatively calculated using 2026 emission factors.

Abbreviations:

GHG - Greenhouse Gas
CO_2 - carbon dioxide
CH_4 - methane
N_2O - Nitrous Oxide
CO_2e - Carbon dioxide equivalent
EV - electric vehicle
MT - Metric Ton
VMT- vehicle miles traveled

Table 22
EV Assumptions for Campus District
Willow Village - Base Project Alternative Analysis
Menlo Park, California

Campus District EV Parameters

Description	Units	Value
Electricity required per mile charged[1]	kWh/mi	0.30
Total Charging Energy of Meta Campuses[2]	kWh/year	3,791,856
Total Area of Meta Campuses[2]	sqf	4,753,594
Total Meta Campus Energy per Area[2]	kWh/sqf	0.80
Existing Conditions Fleet eVMT per Total VMT[3]	Percent	5.5%
Full Buildout Fleet MSS eVMT per Total VMT[4]	Percent	14%
Electricity Loss Factor[5]	Percent	10%
Existing Conditions Charging Energy Usage[6]	kWh/year	534,955
Full Buildout Charging Energy Usage[7]	kWh/year	1,305,262

eVMTs from Project Chargers at the proposed Campus District

Year	Land Use Category[8]	Project Increase in Annual eVMTs[9]
		eVMT/year
Existing Conditions	Campus District	1,783,182
Partial Buildout - Year 4		133,367
Partial Buildout - Year 5		2,543,916
Partial Buildout - Year 6		4,131,123
Full Buildout		4,350,873

Notes:

1. An average EV fuel economy of 0.30 kWh per mile was used. The fuel economy is based on electric fleet data from fueleconomy.gov. Available at: https://www.fueleconomy.gov/.
2. Meta provided energy usage and areas for EV charging at their existing campuses: Classic, Bayfront, Chilco, Willow, Gateway. The provided data was used to evaluate an average ratio of EV charging energy usage per campus area.
3. The percent eVMT for existing conditions is calculated by dividing the eVMT in existing conditions by the annual VMT from the 'Car' and 'On-Demand' vehicle types in existing conditions. For existing conditions VMT, see Table 18.
4. ARB is currently preparing its 2020 Mobile Source Strategy (MSS) update to the ARB VISION Model (version 2.1) estimating future fleet characteristics. The Mobile Source Strategy projects eVMTs reflecting the aspirational target identified in EO N-79-20, assuming 100% of passenger vehicle sales in California are ZEV or PHEV, and GHG emissions assumed to have reduced by 2.0% per year from 2026 to 2035. The increase in annual eVMTs charged by the Campus District is scaled from the increase in fleet eVMT from existing conditions to full buildout.
5. A 10% Loss Factor was applied to the annual project energy uses to account for expected losses. Source available at: https://www.fueleconomy.gov/
6. The EV charging energy consumption for existing conditions was based on existing charger energy usage data for Willow Village for 2019 provided by the Project applicant. The total energy usage was reduced assuming a 10% loss factor.

Table 22
EV Assumptions for Campus District
Willow Village - Base Project Alternative Analysis
Menlo Park, California

7. The EV charging energy consumption for the Project at full buildout was determined using an average ratio of existing charging sites kWh/sqf and multiplying it by the Campus District land use area at full buildout (714 thousand sqf). This number was scaled by the increase in fleet eVMT from existing conditions to full buildout based on the MSS scenario of the VISION model. A 10% loss factor was applied to the total energy usage per year. All relevant data sources were provided by the Project applicant.

8. Meta offers an EV charging program to its workers. Charging on campus is free and valets move cars into chargers to maximize charging time. Therefore, the EV charging annual electricity for the Campus District was provided based on studies from Meta's existing campuses in the area. The electricity for EV charging at the Project would be supplied with 100% renewable energy.

9. For years where the Campus District is only operational a proportion of the year, the annual kWh is multiplied by a scaling fraction for the Campus District land use, found in Table 16.

Abbreviations:

EV - Electric vehicle (includes battery electric or plug-in hybrid technology)
eVMT- Electric vehicle miles traveled
kWh - Kilowatt hour
sqf- Square foot
MSS - Mobile Source Strategy

Notes:

1. The miles charged per hour charged is representative of a typical charge rate for an EV of 6.25 kWh per hour and a fuel economy of 0.30 kWh per mile. The charge rate is based on capability of existing battery-electric vehicles and Level 2 charging stations. Reference: Chargepoint. 2017. Level Up Your EV Charging Knowledge. Available at: https://www.chargepoint.com/blog/level-your-ev-charging-knowledge/. The fuel economy is based on electric fleet data from fueleconomy.gov. Available at: https://www.fueleconomy.gov/.
2. The two scenarios analyzed are the Reference and the Mobile Source Strategy scenarios. ARB is currently preparing its 2020 Mobile Source Strategy (MSS) update to the ARB VISION Model (version 2.1). The 2020 MSS uses "scenario planning to take an integrated approach to identifying the technology trajectories and programmatic concepts" to model projected years of electric vehicle miles for assessed scenarios. The Mobile Source Strategy projects eVMTs reflecting the aspirational target identified in EO N-79-20, assuming 100% of passenger vehicle sales in California are ZEV or PHEV, and GHG emissions assumed to have reduced by 2.0% per year from 2026 to 2035. The 2020 update only considers passenger vehicles (LDA, LDT1, LDT2, and MDV). To determine the eVMT percent of the passenger vehicle fleets, the 2020 MSS update was downloaded in July 13, 2021. The increase in annual eVMTs charged by the Project from the Reference Scenario to the MSS Scenario is used to determine the eVMTs the Project can take credit for based on providing additional charging infrastructure for the state to reach aspirational EV fleet penetration.
3. The number of chargers in the Town Square and the Residential/Shopping District was provided by the Project Applicant in the Willow Village Mixed Use Development Concept Level Energy Use Summary, dated June 14, 2021, detailing chargers available for all mixed-use traffic. 249 EV Charging Stations are available to serve the 1,694 residential spaces and 500 commercial spaces.
4. Meta offers a valet service to charge EVs from 7am to 7pm, average daily hours of availability for charging per charger is conservatively assumed to be 10 hours per day. When demand is met, the full 10 hours will be used for charging, with each vehicle cycling out of the charging spot before or as the car reaches full charge. The number of chargers are available for all Town Square and the Residential/Shopping District land uses, and it is expected that there will be 10 hours a day of active charging taking place due to the frequency of turnover associated with retail, restaurant, hotel, and park land uses. Town Square and the Residential/Shopping District land uses are assumed to operate 365 days per year. Any charging inefficiencies associated with cars remaining plugged in after reaching full charge is assumed to balance out due the likelihood of more than 10 hours of activity a day associated with Town Square and the Residential/Shopping District activity.
5. Town Square and the Residential/Shopping District Total VMT and trips includes all proposed Project residential, retail, park, and hotel land uses, consistent with Table 18. Retail land uses include Hamilton Parcels North and South and are added to total VMT and trips.
6. EV Annual Trips and EV Annual VMT are determined based on Project trips and VMTs and the VISION Reference Scenario percent of Electric Fleet. These eVMTs (electric vehicle miles traveled) represents the number of project VMTs that are driven by electric vehicles.
7. 249 EV Charging Stations are proposed for the full buildout. To reflect the EV charging stations that will come online during construction in the partial years leading up to full buildout, a scaling factor was applied based on the ratio of square feet of the parking land use that is built out in a given year to the total square feet that will be built. The scaling factor for a given year was applied to the 249 chargers at full buildout. To see scaling factors used, refer to the parking land use from Table 16.
8. Total annual charge hours available from the project are determined by multiplying the average daily hours of charging per charger (10 hours) by the annual days of charger activity (365 days). The annual charge hours available from the project are then multiplied by 25 miles charged per charge hour to determine the number of eVMT available from the project.
9. The Project EV chargers for Town Square and the Residential/Shopping District land uses are determined to be at capacity, meaning used fully for all available charge hours per day, when the electric vehicle miles associated with the Project are in excess of the maximum electric vehicle miles the Project chargers can charge. If there is a surplus of chargers relative to EVs coming to the site, then the Project chargers are under-capacity, and only a fraction of chargers will be used as the number of EVs coming to the site are fewer than the total number of charger capacity. If there is a surplus of EVs coming to the site relative to the chargers at the site, all chargers will be used and the site will be at capacity. In the scenario when the chargers are at capacity, the full capacity of VMTs the site can charge are assumed to be charged.

Abbreviations:

EV - electric vehicle (includes battery electric or plug-in hybrid technology)
Hr - hour
TDM - Transportation Demand Management
VMT - vehicle miles travelled
eVMT - electric vehicle mile traveled

Notes:

1. Expected eVMT and trips charged by the Project chargers in Town Square and the Residential/Shopping District land uses are calculated based on the San Mateo Fleet, charger usage assumptions, ARB's Vision Model, and traffic data provided by the Transportation Engineer. For calculation details, see Table 23.

2. Emissions reductions from EV charging represent the decrease in emissions from increases in electric vehicle use due to the installation of EV chargers throughout the site. For Town Square and the Residential/Shopping District land uses, the eVMT and trips from additional Project chargers is calculated based on the difference between the MSS scenario and the baseline scenario, representing the additional eVMT due to the installation of additional chargers.

3. Emissions reductions use emission factors developed in EMFAC2021 that represent passenger vehicles (LDA, LDT1, LDT2, MCY). The eVMTs determined for Town Square and the Residential/Shopping District are based on ARB's VISION Model, which includes expected electric vehicle fleet % for passenger vehicles only (LDA, LDT1, LDT2, MCY).

4. EVs emit particulate matter brake wear and tire wear, therefore those emissions are not considered in the reductions.

5. Expected eVMT charged by additional Project chargers is measured based on anticipated charging energy usage provided by the Project Applicant. For calculation details see Table 22.

6. Trip counts from Project chargers were calculated by dividing the increased eVMTs from project chargers by the average VMTs per trip for the passenger vehicles (Cars) in a given year, based on traffic data provided by the Transportation Engineer.

Abbreviations:

eVMT - electric vehicle miles traveled
lb - pound
EV - electric vehicle
ROG - reactive organic gases
NOx - nitrogen oxides
PM_{10} - particulate matter less than 10 microns in diameter
$PM_{2.5}$ - particulate matter less than 2.5 microns in diameter

Table 25a
Summary of Mobile CAP Emissions
Willow Village - Base Project Alternative Analysis
Menlo Park, California

Total Emissions Before Reductions:[1]

Year	CAP Emissions without Reductions (ton/year)			
	ROG	NO_x	PM_{10}[2]	$PM_{2.5}$[2]
Total Emissions by Year				
Existing Conditions[3]	5.0	8.0	4.0	0.84
Year 4	0.57	0.62	0.40	0.081
Year 5	3.8	4.1	3.1	0.62
Year 6	6.3	6.7	5.5	1.1
Full Buildout	6.8	7.3	6.0	1.2
Net Emissions by Year				
Full Buildout	**1.8**	**-0.70**	**1.9**	**0.35**

Total Emissions with Reductions:[4]

Year	CAP Emissions with Reductions (ton/year)			
	ROG	NO_x	PM_{10}[2]	$PM_{2.5}$[2]
Total Emissions by Year				
Existing Conditions[3]	5.0	8.0	4.0	0.84
Year 4	0.53	0.59	0.40	0.081
Year 5	3.3	3.8	3.1	0.61
Year 6	5.5	6.3	5.5	1.1
Full Buildout	**5.8**	**6.8**	**6.0**	**1.2**
Net Emissions by Year				
Full Buildout	**0.9**	**-1.2**	**1.9**	**0.34**

Notes:

1. Calculations of CAP emissions before reductions are shown in detail in Table 21a. Net emissions subtract the emissions from the existing conditions in 2019.
2. PM10 and PM2.5 emissions include exhaust, tire wear, brake wear, and fugitive dust. Fugitive dust emissions factors are calculated in AQTR Table 8.
3. The Existing Conditions includes EV reductions associated with existing Project Site chargers.
4. CAP Emissions after reductions account for the reductions associated with EVs as shown in Table 24a. The emissions reductions are subtracted from the total Project emissions.

Abbreviations:

lb - pound
MT - metric ton
EV - electric vehicle
ROG - reactive organic gases
NOx - nitrogen oxides
PM_{10} - particulate matter less than 10 microns in diameter
$PM_{2.5}$ - particulate matter less than 2.5 microns in diameter

Table 28
Energy Usage for Existing Conditions and Project Operations
Willow Village - Base Project Alternative Analysis
Menlo Park, California

Land Use	Floor Area (sqft) (DU - Residential)	Annual Electricity Use (MWh/yr)	Annual Natural Gas Use (MMBtu/yr)
Existing Conditions (2019)[1]			
All	1,923,910	12,050	30,039
Total Existing Energy Usage		**12,050**	**30,039**
Full Buildout[2,3]			
Office	713,841	10,631	0
Retail	279,386	6,106	2,966
Residential	0,523	5,095	0
Hotel	172,000	2,528	0
Parking	733,041	12,621	0
Park	403,837	38	0
Total Full Buildout Energy Usage		**37,019**	**2,966**

Notes:

1. Energy use rates for existing conditions were provided for 2019 by the Project Applicant via email on August 10, 2021.
2. Electricity and natural gas usage rates for the retail, residential, and parking land uses were provided by PAE in the June 14, 2021 memorandum. Electricity usage rates for Office, Hotel, and Park were provided by Hines on June 21, 2021. The hotel and office do not use natural gas. The electricity usage includes 27,986 MWh/year of electricity use associated with the Campus District EV charging stations, which is summarized in the parking land use category. Electricity and energy use rates for the Willow Road Retail were calculated based on the CalEEMod defaults the retail land use type in Climate Zone 5.
3. Natural gas for the project is only used for Hamilton Avenue Parcels North and South and the supermarket and restaurant land uses, which are summarized in the retail category.

Abbreviations:

CalEEMod - California Emissions Estimator Model
DU - dwelling unit
kBTU - thousand British Thermal Units
kWh - kilowatt-hour
MMBTU - million British Thermal Units
MWh - Megawatt-hour
sqft - square feet
yr - year

California Air Pollution Control Officers Association (CAPCOA). California Emissions Estimator Model (CalEEMod), Version 2020.4.0. Available online at http://www.caleemod.com

Table 30
Energy Usage Emissions from Existing Conditions and Project Operations
Willow Village - Base Project Alternative Analysis
Menlo Park, California

Location	Natural Gas Emissions[1,2]					Electricity Emissions[1,2]
	ROG	NOx	PM_{10}	$PM_{2.5}$	CO_2e	
	(tons/yr)				(MT/yr)	
Existing Conditions (2019)						
All	0.16	1.5	0.11	0.11	1,613	0
Total Existing Emissions	**0.16**	**1.5**	**0.11**	**0.11**	**1,613**	**0**
Full Buildout						
Retail	1.6E-02	0.15	1.1E-02	1.1E-02	159	0
Total Full Buildout Emissions	**1.6E-02**	**0.15**	**1.1E-02**	**1.1E-02**	**159**	**0**
Partial Buildout[3]						
Total Year 4 Emissions	1.6E-03	1.5E-02	1.1E-03	1.1E-03	16	0
Total Year 5 Emissions	9.5E-03	0.086	6.6E-03	6.6E-03	94	0
Total Year 6 Emissions	0.016	0.142	0.011	0.011	156	0

Notes:

1. CAP emissions result from the combustion of natural gas. As a result, CAP emissions were only calculated for natural gas usage. In compliance with the City of Menlo Park Municipal Code, natural gas usage for the Project will be offset; however, since the carbon intensity of the offset production is not known at this time, GHG emissions from natural gas were conservatively included alongside electricity GHG emissions.
2. Emissions were calculated based on energy use, shown in Table 28, and energy emission factors, shown in AQTR Table 29. Existing electricity is sourced from PCE. Project electricity will be sourced from 100% renewable sources; as such, emissions from Project electricity use are expected to be zero. Project natural gas will only be used in retail land uses for commercial cooking equipment.
3. Partial buildout emissions were calculated from full buildout using scaling factors by land use type and year, as shown in Table 16.

Abbreviations:

CAP - Criteria Air Pollutants
CO_2e - carbon dioxide equivalents
GHG - Greenhouse Gas
MT - metric ton(s)
NOx - nitrogen oxides
PM - particulate matter
$PM_{2.5}$ - PM less than 2.5 microns in diameter
PM_{10} - PM less than 10 microns in diameter
ROG - reactive organic gases
yr - year

Total Year 5 Emissions[3]	15	12	10	4.1	41
Total Year 6 Emissions[3]	26	25	22	9	82

Notes:

1. Emissions shown in this table were calculated using default values and methods from CalEEMod Version 2020.4.0. The Water Electricity Intensity, Water Treatment Types, and Wastewater Treatment Direct Emission Factors used in the calculation can be found in Tables 9.2, 9.3 and 9.4 of Appendix D of the CalEEMod user guide, respectively. These calculations were performed using water use rates, shown in Table 31, and energy emission factors, shown in AQTR Table 29.
2. Consistent with CalEEMod, indoor water use was assumed to be processed as wastewater and outdoor water use was assumed to not be processed as wastewater.
3. Partial buildout direct emissions from Septic Tank, Aerobic, and Facultative Lagoon wastewater treatment were calculated from full buildout using scaling factors by land use type and year, as shown in Table 1. For partial buildout indirect electricity emissions from water usage and wastewater treatment, usage rates rather than emission were scaled to account for year specific energy emission factors from PG&E, as shown in AQTR Table 29.

Abbreviations:

CalEEMod - California Emissions Estimator Model
CO_2e - carbon dioxide equivalents
MT - metric ton
yr - year

Residential	0,523	DU	241
Hotel	193	Rooms	106
Parking	733,041	sqft	0
Park	403,837	sqft	0.83

Notes:

1. Solid Waste Generation Rates are from Table 10.1 of Appendix D of the CalEEMod User's Guide. An 82% diversion rate, provided by the Project Applicant via email communication dated August 2, 2021, is applied to default solid waste generation rates for the existing and project office land use to account for recycling and composting. The diversion rate is generated using data from Recology with the assumption that all bins are at 100% capacity and 0% contamination.

Solid Waste Emissions[1]

Location	CalEEMod® Land Use Subtype	CO_2 (MT/year)	CH_4 (MT/year)	CO_2e (MT/year)
Existing Conditions (2019)				
Office	General Office Building	8.5	0.51	21
Commercial	Research and Development	2.0	0.12	5.0
Industrial - Warehouse	Unrefrigerated Warehouse-No Rail	96	5.6	237
Industrial - Manufacturing	Manufacturing	5.9	0.35	15
Recreational	Health Club	28	1.6	69
Light Industrial	General Light Industry	20	1.2	50
Parking	Enclosed Parking with Elevator	0	0	0
	Total Existing Emissions	**160**	**9.5**	**397**
Full Buildout Conditions				
Office		24	1.4	60
Retail		60	3.5	148
Residential		49	2.9	121
Hotel		22	1.3	53
Parking		0	0	0
Park		0.17	0.010	0.42
	Total Full Buildout Emissions	**154**	**9.1**	**382**
Partial Buildout[2]				
	Total Year 4 Emissions[2]	6.9	0.41	17
	Total Year 5 Emissions[2]	66	3.9	164
	Total Year 6 Emissions[2]	134	7.9	332

Notes:

1. Emissions shown in this table were calculated using default values and methods from CalEEMod Version 2020.4.0. These calculations were performed using default waste use rates by land use type and an 82% diversion rate for office land use types provided by the Project Applicant, shown in Table 33, and default solid waste landfill gas emission factors from Table 10.2 of CalEEMod User's Guide Appendix D.
2. Partial buildout emissions were calculated from full buildout using scaling factors by land use type and year, as shown in Table 16.

Abbreviations:

CalEEMod - California Emissions Estimator Model
CH_4 - methane
CO_2 - carbon dioxide
CO_2e - carbon dioxide equivalents
LFG - Landfill Gas
MT - metric ton

Parking	920,000	55,200	10%	0	150	9.6
Total Existing Conditions Emissions						**1,057**
Full Buildout						
Office	713,841	1,427,682	10%	100	150	745
Retail	279,386	558,772	10%	100	150	291
Residential	678,390	1,831,653	10%	100	150	955
Hotel	172,000	344,000	10%	100	150	179
Parking	733,041	43,982	10%	0	150	8
Park	403,837	0	10%	0	0	0
Total Full Buildout Emissions						**2,178**
Partial Buildout[5]						
Total Year 4 Emissions[5]						56
Total Year 5 Emissions[5]						837
Total Year 6 Emissions[5]						1,787

Notes:

1. Consistent with CalEEMod Appendix A, residential building surface area was assumed to be 2.7 times the floor area, and non-residential 2 times the floor area. Also consistent with CalEEMod Appendix E, the parking painted area was assumed to be 6% of the total surface area for surface lots.
2. Consistent with CalEEMod Appendix A, 10% of all surfaces were assumed to be coated each year.
3. Consistent with CalEEMod Appendix D Table 6.1, which is based on BAAQMD Regulation 8 Rule 3 paint VOC regulations, use VOC EF of 100 g/L for flat paints, generally used indoors, and 150 g/L for all other architectural coatings.
4. Uses CalEEMod Appendix A assumption that 1 gallon of paint covers 180 square feet. Building surface area is assumed to be 75% indoors and 25% outdoors, consistent with CalEEMod Appendix A. Parking garages are assumed to have no indoor surfaces.
5. Partial buildout emissions were calculated from full buildout using scaling factors by land use type and year, as shown in Table 16.

Abbreviations:

BAAQMD - Bay Area Air Quality Management District
CalEEMod - California Emissions Estimator Model
EF - emission factor
g - grams
L - liters
lb - pound
sqft - square feet
VOC - volatile organic compound
yr - year

Willow Village - Base Project Alternative Analysis
Menlo Park, California

Land Use	Floor Area	Building Surface Area[1]	Application Rate[2]	Indoor Paint VOC EF[3]	Outdoor Paint VOC EF[3]	Architectural Coating VOC Emissions[4]
	(sqft)	(sqft)		(g/L)	(g/L)	(lb/yr)
Full Buildout						
Office	713,841	1,427,682	10%	10	150	298
Retail	279,386	558,772	10%	10	150	117
Residential	678,390	1,831,653	10%	10	150	382
Hotel	172,000	344,000	10%	10	150	72
Parking	733,041	43,982	10%	0	150	8
Park	403,837	0	10%	0	0	0
Total Full Buildout Emissions						**876**
Partial Buildout[5]						
Total Year 4 Emissions[5]						25
Total Year 5 Emissions[5]						338
Total Year 6 Emissions[5]						719

Notes:

1. Consistent with CalEEMod Appendix A, residential building surface area was assumed to be 2.7 times the floor area, and non-residential 2 times the floor area. Also consistent with CalEEMod Appendix E, the parking painted area was assumed to be 6% of the total surface area for surface lots.
2. Consistent with CalEEMod Appendix A, 10% of all surfaces were assumed to be coated each year.
3. Paint VOC content is consistent with or more stringent than BAAQMD Regulation 8 Rule 3 (Architectural Coatings). Emissions were estimated assuming that indoor painting will utilize "super-compliant" VOC architectural coatings that meet the more stringent limits in South Coast Air Quality Management District Rule 1113. For outdoor paint, assumed use of coatings with VOC content of 150 g/L, consistent with BAAQMD requirements. VOC was assumed to be equivalent to ROG for these purposes.
4. Uses CalEEMod Appendix A assumption that 1 gallon of paint covers 180 square feet. Building surface area is assumed to be 75% indoors and 25% outdoors, consistent with CalEEMod Appendix A. Parking garages are assumed to have no indoor surfaces.
5. Partial buildout emissions were calculated from full buildout using scaling factors by land use type and year, as shown in Table 16.

Abbreviations:

Park	403,837	5.2E-08	365	7.6
			Total Full Buildout Emissions	**12,340**
Partial Buildout[3]				
			Total Year 4 Emissions[3]	390
			Total Year 5 Emissions[3]	5,121
			Total Year 6 Emissions[3]	10,421

Notes:

1. The consumer products VOC EF for office, retail, and residential land uses was derived using methodology consistent with CalEEMod with adjusted parameters for San Mateo County, as described in AQTR Table 37. The default emissions factor assumes 2020 consumer products VOC inventory for San Mateo County. The default building square footage used is from 2010, which was updated to 2020 using population growth of San Mateo County, as shown in AQTR Table 37.
2. Consumer product VOC EFs for parking and open space were taken from CalEEMod 2020.4.0. These defaults take into account pesticide and fertilizer use in city parks and degreaser use in parking areas.
3. Partial buildout emissions were calculated from full buildout using scaling factors by land use type and year, as shown in Table 16.

Abbreviations:

ARB - Air Resources Board
CalEEMod - California Emissions Estimator Model

Net Full Buildout Emissions	**4.6**	**-1.2**	**1.9**	**0.4**	**25**	**-6.5**	**11**	**1.9**

Notes:

1. Emissions estimated using methods consistent with CalEEMod® version 2020.4.0.
2. Operational emissions shown represent activity and emissions across 365 days per year.
3. Operational emissions from existing conditions were calculated using CalEEMod® default data and emission factors based on the existing land use type and energy use rates provided by the Project Applicant.
4. Full buildout operational emissions are based on electricity, natural gas, and water usage rates provided by the Project Applicant alongside CalEEMod® defaults for architectural coating, consumer product, landscaping, and waste emissions. Net emissions were calculated as the difference between full buildout emissions and existing condition emissions.
5. Natural gas usage for the project would be used exclusively for supermarket and commercial cooking.
6. Partial buildout emissions were calculated from full buildout using scaling factors by land use type and year, as shown in Table 16.
7. Net emissions were calculated as the difference between partial buildout emissions for each year and existing condition emissions.

Full Buildout	--	--	--	--	22	-6.5	11	1.9	22	-6.5	11	1.9
BAAQMD Significance Threshold									54	54	82	54

Notes:

1. Emissions estimated using methods consistent with CalEEMod® version 2020.4.0.
2. Net new operational emissions are scaled for partial years of phased operations by the percent that each parcel is operational for each year relative to full buildout, as shown in Table 16.
3. Mitigated construction emissions can be found in Table 14. Net mitigated operational emissions were calculated by subtracting the emissions from the existing conditions from the project emissions, as reported in Table 43.

Abbreviations:

CalEEMod - California Emissions Estimator Model
CAP - Criteria Air Pollutant
lb - pounds
NO_x - nitrogen oxides
PM - particulate matter
$PM_{2.5}$ - PM less than 2.5 microns in diameter
PM_{10} - PM less than 10 microns in diameter
ROG - reactive organic gases
yr - year
