Notes:

1. Partial years are scaled from the full buildout based on the portion of each land use that becomes operational for each year of construction. See Table 16 for more details.
2. The fleet type for each land use was provided by the Transportation Engineer. The Campus District will have various fleets for specific uses. Town Square and the Residential/Shopping District land uses (Residential, Retail, Park, and Hotel) are analyzed assuming a default San Mateo fleet. Hamilton Avenue Parcels North and South are combined with retail land uses. See Table 19 for more information.
3. Daily VMT and trip rates were provided by the Transportation Engineer on October 5, 2021. Total trip rates are calculated using land uses in Table 1.
4. Weekday VMT and trip rates provided by the Transportation Engineer were scaled to average trip rates using the ratio between CalEEMod® weekday and weekend one-way trip rates.
5. Annual trips and VMT are calculated by multiplying daily values by 365 for all fleets with the exception of shuttles and on-demand, which are multiplied by 260 days/year.

Abbreviations:

VMT - vehicle miles traveled

Notes:

1. Emission factors for each fleet type were developed by creating weighted emission factors based on the vehicle classes in each fleet type. EMFAC emissions were summed across each year for each vehicle class within a fleet type, then a vehicle class emission factor based on VMT and trip counts for the vehicle class was calculated. Emission factors for each vehicle class within a fleet type were weighted based on total VMTs and trips to create a fleet-wide emission factor for each year.
2. Emission factors for the Project fleets (all except the San Mateo Fleet) were calculated without electric vehicles because electric vehicle reductions are calculated separately.
3. The existing conditions for this analysis used emission factors from 2019. Partial buildout years 4, 5, and 6 used emission factors from years 2024, 2025, and 2026, respectively. Full buildout emissions used emission factors from 2026 to conservatively estimate emissions.

Abbreviations:

ROG - Reactive organic gases
NO_x - Nitrogen oxides
PM_{10} - Particulate matter less than 10 microns in diameter
$PM_{2.5}$ - Particulate matter less than 2.5 microns in diameter
RUNEX - Running exhaust emissions
RUNLOSS - Evaporative losses
STREX - Start exhaust tailpipe emissions
IDLEX - Idle exhaust emissions
DIURN - Diurnal Evaporative Hydrocarbon Emissions
HOTSOAK - Hot soak evaporative hydrocarbon emissions

					Total Full Buildout Emissions	**4,473**
Partial Buildout[5]						
					Total Year 4 Emissions[5]	83
					Total Year 5 Emissions[5]	1,567
					Total Year 6 Emissions[5]	3,515

Notes:

1. Consistent with CalEEMod Appendix A, residential building surface area was assumed to be 2.7 times the floor area, and non-residential 2 times the floor area. Also consistent with CalEEMod Appendix E, the parking painted area was assumed to be 6% of the total surface area for surface lots.
2. Consistent with CalEEMod Appendix A, 10% of all surfaces were assumed to be coated each year.
3. Consistent with CalEEMod Appendix D Table 6.1, which is based on BAAQMD Regulation 8 Rule 3 paint VOC regulations, use VOC EF of 100 g/L for flat paints, generally used indoors, and 150 g/L for all other architectural coatings.
4. Uses CalEEMod Appendix A assumption that 1 gallon of paint covers 180 square feet. Building surface area is assumed to be 75% indoors and 25% outdoors, consistent with CalEEMod Appendix A. Parking garages are assumed to have no indoor surfaces.
5. Partial buildout emissions were calculated from full buildout using scaling factors by land use type and year, as shown in Table 16.

Abbreviations:

BAAQMD - Bay Area Air Quality Management District
CalEEMod - California Emissions Estimator Model
EF - emission factor
g - grams
L - liters
lb - pound
sqft - square feet
VOC - volatile organic compound
yr - year

Total Year 4 Emissions[3]				599
Total Year 5 Emissions[3]				9,447
Total Year 6 Emissions[3]				19,982

Notes:

1. The consumer products VOC EF for office, retail, and residential land uses was derived using methodology consistent with CalEEMod with adjusted parameters for San Mateo County, as described in Table 37. The default emissions factor assumes 2020 consumer products VOC inventory for San Mateo County. The default building square footage used is from 2010, which was updated to 2020 using population growth of San Mateo County, as shown in Table 37.
2. Consumer product VOC EFs for parking and open space were taken from CalEEMod 2020.4.0. These defaults take into account pesticide and fertilizer use in city parks and degreaser use in parking areas.
3. Partial buildout emissions were calculated from full buildout using scaling factors by land use type and year, as shown in Table 16.

Abbreviations:

ARB - Air Resources Board
CalEEMod - California Emissions Estimator Model
EF - emission factor
lb - pound
sqft - square feet
VOC - volatile organic compound
yr - year

Notes:

1. This average uses the most recent three years of data.

Table 29
Energy Usage Emission Factors
Willow Village
Menlo Park, California

2. Total CO_2 intensity factors from The Climate Registry. Available at: https://www.theclimateregistry.org/our-members/cris-public-reports/. Accessed: April
3. Percent of total energy from eligible renewables is from the PG&E 2017, 2018, and 2019 Corporate Responsibility Report.
4. The emissions metric presented here was calculated based on the total CO2 intensity factor divided by the percent of energy delivered from non-RPS-eligible sources. This CO2 intensity factor includes both fossil fuel and carbon-free sources of energy, such as largescale hydro and nuclear. Diablo Canyon Nuclear Plant, which accounts for a portion of the carbon-free energy in this CO2 intensity factor, is planned to be closed by 2024-2025 (https://www.pge.com/en_US/safety/how-the-system-works/diablo-canyon-power-plant/diablo-canyon-power-plant/engagement-panel.page). According to SB 1090 (approved 9/2018), "The [California Public Utilities] commission shall ensure that integrated resource plans are designed to avoid any increase in emissions of greenhouse gases as a result of the retirement of the Diablo Canyon Units 1 and 2 powerplant." This was incorporated into CPUC section 712.7(2)(b). Based on this information, the total Non-RPS-Eligible energy CO2 intensity factor was assumed to remain constant.
5. The RPS of 44% by 2024, 52% by 2027, and 60% for 2030 are consistent with SB 100. The RPS for 2026 and 2027 were estimated by assuming a linear increase between 2024 and 2027. Available at: https://leginfo.legislature.ca.gov/faces/billNavClient.xhtml?bill_id=201720180SB100. The average percentage of energy from renewables for 2016-2018 is greater than the 2020 RPS of 33% as required by SB100. Thus, it is assumed that the 2016-2018 average CO2 and CO2e intensity factors remain constant through 2020, at which point the carbon intensity then decreases each year to comply with the future RPS requirements.
6. The intensity factor for total energy delivered was estimated by multiplying the percentage of energy delivered from non-RPS-eligible renewable energy by the CO_2 emissions per total non-RPS-eligible energy metric calculated above.

Table 29
Energy Usage Emission Factors
Willow Village
Menlo Park, California

7. Global Warming Potentials (GWP) are based on the IPCC Fourth Assessment Report. CH4 and N2O emission factors are from the CalEEMod® version 2020.4.0 defaults for PGE, and are conservatively assumed not to change from these estimates. As more renewable energy is integrated into the electricity grid, these intensity factors will also decrease.
8. Peninsula Clean Energy comes from 51% renewable sources, 35% hydro electric and 14% unspecified sources. The 14% unspecified sources were assumed to come from the same mix as the non-renewable PG&E mix of power. This is assumed to remain constant until 2030, after which the renewable percentage of the power mix is assumed to linearly increase to 100% in 2045, conistent with SB 100. Available at: https://www.peninsulacleanenergy.com/energy-
9. Natural Gas Use emission factors from Table 8.2 of CalEEMod User's Guide Appendix D.

Abbreviations:

CalEEMod - California Emissions Estimator Model
CH_4 - methane
CO_2 - carbon dioxide
CO_2e - carbon dioxide equivalents
CPUC - California Public Utilities Commission
GWP - global warming potential
lb - pound(s)
MMBtu - million British Thermal Units
MT - metric ton(s)
MWh - megawatt-hour
N_2O - nitrous oxide
NO_x - nitrogen oxides
PCE - Peninsula Clean Energy
PG&E - Pacific Gas & Electric
PM - particulate matter
$PM_{2.5}$ - PM less than 2.5 microns in diameter
PM_{10} - PM less than 10 microns in diameter
ROG - reactive organic gases
RPS - Renewable Portolio Standard
SB - Senate Bill

Partial Buildout[3]						
Total Year 4 Emissions	0.0012	0.011	8.3E-04	8.3E-04	12	0
Total Year 5 Emissions	0.0070	0.064	4.9E-03	4.9E-03	70	0
Total Year 6 Emissions	0.012	0.11	8.0E-03	8.0E-03	115	0

Notes:

1. CAP emissions result from the combustion of natural gas. As a result, CAP emissions were only calculated for natural gas usage. In compliance with the City of Menlo Park Municipal Code, natural gas usage for the Project will be offset; however, since the carbon intensity of the offset production is not known at this time, GHG emissions from natural gas were conservatively included alongside electricity GHG emissions.

2. Emissions were calculated based on energy use, shown in Table 28, and energy emission factors, shown in Table 29. Existing electricity is sourced from PCE. Project electricity will be sourced from 100% renewable sources; as such, emissions from Project electricity use are expected to be zero. Project natural gas will only be used in retail land uses for commercial cooking equipment.

3. Partial buildout emissions were calculated from full buildout using scaling factors by land use type and year, as shown in Table 16.

Abbreviations:

CAP - Criteria Air Pollutants
CO_2e - carbon dioxide equivalents
GHG - Greenhouse Gas
MT - metric ton(s)
NOx - nitrogen oxides
PM - particulate matter
$PM_{2.5}$ - PM less than 2.5 microns in diameter
PM_{10} - PM less than 10 microns in diameter
ROG - reactive organic gases
yr - year

Table 28
Energy Usage for Existing Conditions and Project Operations
Willow Village
Menlo Park, California

Land Use	Floor Area (sqft) (DU - Residential)	Annual Electricity Use (MWh/yr)	Annual Natural Gas Use (MMBtu/yr)
Existing Conditions (2019)[1]			
All	1,923,910	12,050	30,039
Total Existing Energy Usage		**12,050**	**30,039**
Full Buildout[2,3]			
Office	1,600,000	23,828	0
Retail	207,690	4,517	2,195
Residential	1,730	16,855	0
Hotel	172,000	2,528	0
Parking	1,869,240	32,082	0
Park	403,837	38	0
Total Full Buildout Energy Usage		**79,849**	**2,195**

Notes:

1. Energy use rates for existing conditions were provided for 2019 by the Project Applicant via email on August 10, 2021.
2. Electricity and natural gas usage rates for the retail, residential, and parking land uses were provided by PAE in the June 14, 2021 memorandum. Electricity usage rates for Office, Hotel, and Park were provided by Hines on June 21, 2021. The hotel and office do not use natural gas. The electricity usage includes 27,986 MWh/year of electricity use associated with the Campus District EV charging stations, which is summarized in the parking land use category. Electricity and energy use rates for the Willow Road Retail were calculated based on the CalEEMod defaults the retail land use type in Climate Zone 5.
3. Natural gas for the project is only used for the Willow Road Retail and the supermarket and restaurant land uses, which are summarized in the retail category.

Abbreviations:

Table 26
Generator Emission Factors for Diesel Engines
Willow Village
Menlo Park, California

Fuel	Engine Tier	Generator Size Range (hp)		Engine Emission Factors[1] (g/bhp-hr)				
		Minimum	Maximum	ROG	NO_x	PM_{10}	$PM_{2.5}$	CO_2e
Diesel	Tier 2	750	1,200	0.26	4.6	0.15	0.15	523
Diesel	Tier 3	300	600	0.16	2.9	0.15	0.15	523
Diesel	Tier 4	1,200	--	0.15	0.50	0.020	0.020	523

Notes:

1. Engine emission factors for PM_{10} and $PM_{2.5}$ (assumed all engines are diesel fueled and that all PM_{10} is diesel particulate matter) based on ARB standards for diesel generator engines. Emission factors for TOG and ROG were converted from NMHC values provided in the Tier standards using EPA hydrocarbon conversion factors. When an emission factor was specified as a combined NMHC+NOx factor, the NMHC/NOx ratio of 5%/95% were taken from BAAQMD guidance. The emission factors for CO_2e are based on diesel emergency generator CO_2 and CH_4 emission factors from CalEEMod User's Guide Appendix D, Table 12.1, along with a GWP of 25 for CH_4.

Abbreviations:

ARB - [California] Air Resources Board

BAAQMD - Bay Area Air Quality Management District

CalEEMod - CALifornia Emissions Estimator MODel

CEIDERS - California Emission Inventory Data and Reporting System

CO_2e - carbon dioxide equivalents

EPA - US Environmental Protection Agency

g/bhp-hr - Grams per Brake Horsepower Hour

GWP - global warming potential

Table 42
Summary of Operational GHG Emissions
Willow Village
Menlo Park, California

Emissions Source	GHG Emissions[1] (MT/yr) CO_2e	
	Existing Conditions (2019)[2]	Full Buildout Conditions[3]
Landscaping	0.063	22
Electricity Use	0	0
Natural Gas Use[4]	1613	118
Water Use	492	217
Waste Disposed	397	698
Emergency Generators	8.5	399
Total Emissions	**2,509**	**1,453**
	Net Emissions[5]	**-1,056**

Notes:

1. Emissions estimated using methods consistent with CalEEMod® version 2020.4.0.
2. Operational emissions from existing conditions were calculated using CalEEMod® default data and emission factors based on the existing land use type and energy use rates provided by the Project Applicant.
3. Full buildout operational emissions are based on electricity, natural gas, and water usage rates provided by the Project Applicant alongside CalEEMod® defaults for architectural coating, consumer product, landscaping, and waste emissions.
4. Natural gas usage for the project would be used exclusively for supermarket and dining operations.
5. Net emissions were calculated as the difference between partial buildout emissions for each year and existing condition emissions.

Abbreviations:

CalEEMod® - California Emissions Estimator Model
CO_2e - carbon dioxide equivalent
GHG - greenhouse gas
MT - metric ton
yr - year

Table 36
Mitigated Architectural Coating Emissions from Existing Conditions and Project Operations
Willow Village
Menlo Park, California

Land Use	Floor Area	Building Surface Area[1]	Application Rate[2]	Indoor Paint VOC EF[3]	Outdoor Paint VOC EF[3]	Architectural Coating VOC Emissions[4]
	(sqft)	(sqft)		(g/L)	(g/L)	(lb/yr)
Full Buildout						
Office	1,600,000	3,200,000	10%	10	150	668
Retail	207,690	415,380	10%	10	150	87
Residential	1,695,976	4,579,135	10%	10	150	955
Hotel	172,000	344,000	10%	10	150	72
Parking	1,869,240	112,154	10%	0	150	19
Park	403,837	0	10%	0	0	0
					Total Full Buildout Emissions	**1,801**
Partial Buildout[5]						
					Total Year 4 Emissions[5]	40
					Total Year 5 Emissions[5]	635
					Total Year 6 Emissions[5]	1,417

Notes:

1. Consistent with CalEEMod Appendix A, residential building surface area was assumed to be 2.7 times the floor area, and non-residential 2 times the floor area. Also consistent with CalEEMod Appendix E, the parking painted area was assumed to be 6% of the total surface area for surface lots.
2. Consistent with CalEEMod Appendix A, 10% of all surfaces were assumed to be coated each year.
3. Paint VOC content is consistent with or more stringent than BAAQMD Regulation 8 Rule 3 (Architectural Coatings). Emissions were estimated assuming that indoor painting will utilize "super-compliant" VOC architectural coatings that meet the more stringent limits in South Coast Air Quality Management District Rule 1113. For outdoor paint, assumed use of coatings with VOC content of 150 g/L, consistent with BAAQMD requirements. VOC was assumed to be equivalent to ROG for these purposes.
4. Uses CalEEMod Appendix A assumption that 1 gallon of paint covers 180 square feet. Building surface area is assumed to be 75% indoors and 25% outdoors, consistent with CalEEMod Appendix A. Parking garages are assumed to have no indoor surfaces.
5. Partial buildout emissions were calculated from full buildout using scaling factors by land use type and year, as shown in Table 16.

Abbreviations:

BAAQMD - Bay Area Air Quality Management District
CalEEMod - California Emissions Estimator Model
EF - emission factor
g - grams
L - liters
lb - pound
sqft - square feet
VOC - volatile organic compound
yr - year

Table 37
Consumer Product Emission Factor Refinement
Willow Village
Menlo Park, California

Year[1]	Consumer Products VOC inventory (tons/day)[2]	San Mateo County Population[3]	Total Building Square Footage[4]	Consumer Products VOC Emission Factor (lb/square foot/day)
2010	4.93	718,451	537,446,060	1.83E-05
2020	5.20	764,442	571,850,190	1.82E-05

Notes:

1. 2010 data are used because total building square footage was available only for 2010. Building square footage for 2020 was estimated by multiplying 2010 building square footage with the ratio of population in 2020 to that in 2010.
2. VOC inventory obtained from California Air Resources Board's emission inventory for Consumer Products under Solvent Evaporation for the respective years.
3. Population estimates obtained from US Census Bureau's QuickFacts for San Mateo County for the respective years.
4. Total building square footage for 2010 obtained from FEMA HAZUS-MH software.

Abbreviations:

lb - pound

VOC - Volatile Organic Compound

NOT A REPORT TABLE
Building Operational Capacity For Emissions Scaling
Willow Village
Menlo Park, California

Phase[1]	Subphase[1]	Percent of Year Phase Operates[2]	Percent of Building Constructed by Land Use Type					
			Office	Retail	Residential	Hotel	Parking	Park

Notes:

1. Construction phasing/subphasing information and full buildout square footage by building provided by Project Applicant.

2. The percentage of year that each building is operational is calculated using the last day of construction for each building. For each partial year of construction, the building is assumed to be operational during the fraction of the year between the last day of construction and the end of that year. The building is assumed to be 0% operational for each full year of construction and 100% operational for each year full year after the end of construction.

3. Partial buildout for years 2024, 2025 and 2026 were calculated based on the portion of building area that becomes operational each year over the total building area for each land use type.

Abbreviations:

sqft - square foot % - percent

Table 43
Unmitigated Construction and Net New Operational CAP Emissions by Year
Willow Village
Menlo Park, California

Year	Average Daily CAP Emissions[1,2] (lb/day)											
	Construction Emissions Only				Net Operational Emissions[3]				Construction and Net Operational Emissions[3]			
	ROG	NO_x	PM_{10}	$PM_{2.5}$	ROG	NO_x	PM_{10}	$PM_{2.5}$	ROG	NO_x	PM_{10}	$PM_{2.5}$

Full Buildout	--	--	--	--	#REF!	21	37	7.0	#REF!	21	37	7.0
BAAQMD Significance Threshold									54	54	82	54

Notes:

1. Emissions estimated using methods consistent with CalEEMod® version 2020.4.0.
2. Net new operational emissions are scaled for partial years of phased operations by the percent that each parcel is operational for each year relative to full buildout, as shown in Table 16.
3. Unmitigated construction emissions can be found in Table 13. Net unmitigated operational emissions were calculated by subtracting the emissions from the existing conditions from the project emissions, as reported in Table 42.

Abbreviations:

CalEEMod - California Emissions Estimator Model
CAP - Criteria Air Pollutant
lb - pounds
NO_x - nitrogen oxides
PM - particulate matter
$PM_{2.5}$ - PM less than 2.5 microns in diameter
PM_{10} - PM less than 10 microns in diameter
ROG - reactive organic gases
yr - year

Net Full Buildout Emissions	**#REF!**	**3.7**	**6.7**	**1.3**	**#REF!**	**21**	**37**	**7.0**

Notes:

1. Emissions estimated using methods consistent with CalEEMod® version 2020.4.0.
2. Operational emissions shown represent activity and emissions across 365 days per year.
3. Operational emissions from existing conditions were calculated using CalEEMod® default data and emission factors based on the existing land use type and energy use rates provided by the Project Applicant.
4. Full buildout operational emissions are based on electricity, natural gas, and water usage rates provided by the Project Applicant alongside CalEEMod® defaults for architectural coating, consumer product, landscaping, and waste emissions. Net emissions were calculated as the difference between full buildout emissions and existing condition emissions.
5. Natural gas usage for the project would be used exclusively for supermarket and dining operations.
6. Partial buildout emissions were calculated from full buildout using scaling factors by land use type and year, as shown in Table 16.
7. Net emissions were calculated as the difference between partial buildout emissions for each year and existing condition emissions.

Abbreviations:

BAAQMD - Bay Area Air Quality Management District

1,490	1	1.2E-02	4.1E-02	1.6E-03	1.6E-03	39
2,900	2	4.8E-02	1.6E-01	6.4E-03	6.4E-03	152
Total Emissions		**0.15**	**1.3**	**0.047**	**0.047**	**399**

Notes:

1. Number, size, and fuel of emergency generators were provided by the Project Applicant.
2. All generators over 1,000 HP were assumed to be Tier 4, consistent with BAAQMD BACT guidelines.
3. Operation for routine maintenance and testing was conservatively assumed to be 50 hours per year, the maximum allowable by the Airborne Toxics Control Measure (ATCM) for Stationary Compression Ignition Engines (17 CCR 93115).

Abbreviations:

BACT - Best Available Control Technology
CO_2 - carbon dioxide
CO_2e - carbon dioxide equivalents
g - grams
hp - horsepower
hr - hour
MT - metric tons
NOx - oxides of nitrogen
PM - particulate matter
PM_{10} - PM less than 10 microns in diameter
$PM_{2.5}$ - PM matter less than 2.5 microns in diameter
ROG - reactive organic gases
yr - year

Office		54	3.2	135
Retail		44	2.6	110
Residential		162	9.5	400
Hotel		22	1.3	53
Parking		0	0	0
Park		0.17	0.010	0.42
Total Full Buildout Emissions		**282**	**17**	**698**
Partial Buildout[2]				
Total Year 4 Emissions[2]		6.3	0.37	16
Total Year 5 Emissions[2]		92	5.5	229
Total Year 6 Emissions[2]		220	13	544

Notes:

1. Emissions shown in this table were calculated using default values and methods from CalEEMod Version 2020.4.0. These calculations were performed using default waste use rates by land use type and an 82% diversion rate for office land use types provided by the Project Applicant, shown in Table 33, and default solid waste landfill gas emission factors from Table 10.2 of CalEEMod User's Guide Appendix D.
2. Partial buildout emissions were calculated from full buildout using scaling factors by land use type and year, as shown in Table 16.

Abbreviations:

CalEEMod - California Emissions Estimator Model
CH_4 - methane
CO_2 - carbon dioxide
CO_2e - carbon dioxide equivalents
LFG - Landfill Gas
MT - metric ton

References:

California Air Pollution Control Officers Association (CAPCOA). California Emissions Estimator Model (CalEEMod®), Version 2020.4.0. Available online at http://www.caleemod.com

Table 33
Solid Waste Generation for Existing Conditions and Project Operations
Willow Village
Menlo Park, California

Solid Waste Generation[1]

Land Use	Size	Units	Solid Waste Disposal Rate (ton/year)
Existing Conditions (2019)			
Office	251,530	sqft	42
Commercial	123,870	sqft	10
Industrial - Warehouse	500,780	sqft	471
Industrial - Manufacturing	23,570	sqft	29
Recreational	24,060	sqft	137
Light Industrial	80,100	sqft	99
Parking	920,000	sqft	0
Full Buildout Conditions			
Office	1,600,000	sqft	268
Retail	207,690	sqft	218
Residential	1,730	DU	796
Hotel	0,193	sqft	106
Parking	1,869,240	sqft	0
Park	403,837	sqft	0.83

Notes:

1. Solid Waste Generation Rates are from Table 10.1 of Appendix D of the CalEEMod User's Guide. An 82% diversion rate, provided by the Project Applicant via email communication dated August 2, 2021, is applied to default solid waste generation rates for the existing and project office land use to account for recycling and composting. The diversion rate is generated using data from Recology with the assumption that all bins are at 100% capacity and 0% contamination.

Abbreviations:

CalEEMod - California Emissions Estimator Model

DU - dwelling unit

sqft - square feet

Total Year 5 Emissions[3]	24	22	20	7.9	74
Total Year 6 Emissions[3]	49	54	47	19	168

Notes:

1. Emissions shown in this table were calculated using default values and methods from CalEEMod Version 2020.4.0. The Water Electricity Intensity, Water Treatment Types, and Wastewater Treatment Direct Emission Factors used in the calculation can be found in Tables 9.2, 9.3 and 9.4 of Appendix D of the CalEEMod user guide, respectively. These calculations were performed using water use rates, shown in Table 31, and energy emission factors, shown in Table 29.
2. Consistent with CalEEMod, indoor water use was assumed to be processed as wastewater and outdoor water use was assumed to not be processed as wastewater.
3. Partial buildout direct emissions from Septic Tank, Aerobic, and Facultative Lagoon wastewater treatment were calculated from full buildout using scaling factors by land use type and year, as shown in Table 1. For partial buildout indirect electricity emissions from water usage and wastewater treatment, usage rates rather than emission were scaled to account for year specific energy emission factors from PG&E, as shown in Table 29.

Source: EMFAC2021 (v1.0.1) Emissions Inventory
Region Type: County
Region: San Mateo
Calendar Year: 2021, 2022, 2023, 2024, 2025, 2026
Season: Annual
Vehicle Classification: EMFAC2007 Categories
Units: miles/day for CVMT and EVMT, trips/day for Trips, kWh/day for Energy Consumption, tons/day for Emissions, 1000 gallons/day for Fuel Consumption

Region	Calendar Year	Vehicle Category	Model Year	Speed	Fuel	Population	Total VMT	CVMT	EVMT	Trips	Energy Consun	*NOx_g/mi* NOx_RUNEX	*NOx_g/trip* NOx_IDLEX	*NOx_g/trip* NOx_STREX

Source: EMFAC2021 (v1.0.1) Emissions Inventory
Region Type: County
Region: San Mateo
Calendar Year: 2021, 2022, 2023, 2024, 2025, 2026
Season: Annual
Vehicle Classification: EMFAC2007 Categories
Units: miles/day for CVMT and EVMT, trips/day for Trips, kWh/day for Energy Consumption, tons/day for Emissions, 1000 gallons/day for Fuel Consumption

Source: EMFAC2021 (v1.0.1) Emissions Inventory
Region Type: County
Region: San Mateo
Calendar Year: 2021, 2022, 2023, 2024, 2025, 2026
Season: Annual
Vehicle Classification: EMFAC2007 Categories
Units: miles/day for CVMT and EVMT, trips/day for Trips, kWh/day for Energy Consumption, tons/day for Emissions, 1000 gallons/day for Fuel Consumption

Region	Calendar Year	Vehicle Category	Model Year	Speed	Fuel	Population	Total VMT	CVMT	EVMT	Trips	Energy Consun	*NOx_g/mi* NOx_RUNEX	*NOx_g/trip* NOx_IDLEX	*NOx_g/trip* NOx_STREX

Source: EMFAC2021 (v1.0.1) Emissions Inventory
Region Type: County
Region: San Mateo
Calendar Year: 2021, 2022, 2023, 2024, 2025, 2026
Season: Annual
Vehicle Classification: EMFAC2007 Categories
Units: miles/day for CVMT and EVMT, trips/day for Trips, kWh/day for Energy Consumption, tons/day for Emissions, 1000 gallons/day for Fuel Consumption

Region	Calendar Year	Vehicle Category	Model Year	Speed	Fuel	Population	Total VMT	CVMT	EVMT	Trips	Energy Consun	*NOx_g/mi* NOx_RUNEX	*NOx_g/trip* NOx_IDLEX	*NOx_g/trip* NOx_STREX

Appendix 3.4.3

Supplemental Memorandum to the Health Risk Assessment

RAMBOLL

ENVIRONMENT
& HEALTH

MEMORANDUM

Date March 4, 2022

To Eric Harrison, Signature Development Group

From Michael Keinath
Sarah Manzano

Subject **Air Quality and Greenhouse Gas Impacts of Re-location of Dialysis Center at Willow Village in Menlo Park, California**

Ramboll
2200 Powell Street
Suite 700
Emeryville, CA 94608
USA

T +1 510 655 7400

We understand that the Dialysis Center currently in Willow Campus Building 43 may need to stay on-site for six to nine months after demolition and construction is scheduled to begin for Willow Village Mixed Use Development Project (the Project). We understand the Dialysis Center temporarily may remain at Building 43 or relocate to trailers on the southwest side of the site. Regardless of whether the Dialysis Center remains at Building 43 for several months, relocates to the southern portion of the site for several months, or moves off-site, the conclusions in the Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Report[1] (herein referred to as the "Technical Report") do not need to be updated, as discussed in detail below.

Construction Emissions

The Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Report analyzed demolition within the first two calendar years of construction, as shown in Figure 9 of the Technical Report. The location of the existing Dialysis Center at Building 43 and the potential Dialysis Center temporary relocation site in the trailers along with construction areas is shown in **Figure 1**.

If the Dialysis Center remains in Building 43 for several months after the beginning of demolition, Building 43 may need to be demolished later than anticipated. However, this demolition would still require the same extent of construction activity and thus would result in the same quantity of emissions. Furthermore, it is likely that the overall demolition duration evaluated in the Technical Report would accommodate the delayed demolition of Building 43 within the same year, so they delay would not affect emissions estimation. However, even if the demolition was pushed into a later year, the emissions change would be minor (and would likely decrease due to fleets becoming less polluting) and therefore would not affect significance conclusions.

[1] Ramboll. 2022. CEQA Air Quality, Greenhouse Gas and Health Risk Assessment Technical Report Willow Village. February.

If the Dialysis Center temporarily moves to trailers in the southern portion of the site, demolition and construction would occur on the schedule evaluated in the Technical Report. The delivery of the trailers would involve seven truck trips to drop off the trailers themselves. These trips would be single occurrences and these trips would be within the bounds of the truck trip estimates already evaluated for the Project. Furthermore, the installation would not involve heavy duty construction equipment that was not already incorporated into equipment use assumptions. Therefore, the installation of the trailers would not change construction emissions from what was estimated in the Technical Report.

Operational Emissions

The Dialysis Center would be off-site by the time the Project became operational, so the Dialysis Center would not affect or be affected by operational emissions.

However, the Dialysis Center remaining on-site for several months would adjust the reduction associated with existing emissions in the calculation of net construction and operational emissions. If the Dialysis Center does not move off-site at the beginning of construction, emissions from the building, trips to the Center and emergency generator may still occur. However, these emissions would be minor since it is only one building out of the whole campus. Further, these emissions would occur in early years when net emissions of construction emissions would be negative (i.e., when construction emissions would be less than existing emissions). This minor delay in the reduction of existing emissions would not change this conclusion.

The temporary re-location of the Dialysis Center on-site is not expected to change the existing emissions. The existing Dialysis Center uses a 324-horsepower emergency generator, and the re-located Center would use four 50 horsepower natural gas emergency generators, which would reduce emissions compared to the existing operations.

Health Risk Assessment on Off-site Receptors and On-site Residents

As discussed above, the Dialysis Center temporarily remaining in its current location might change the schedule for demolition for this single building but would not change the overall emissions estimates. The demolition would still likely occur in the first two years of construction, when exposure assumptions are highest, so would not change health impacts to off-site receptors and on-site residents.

If the Dialysis Center is temporarily relocated on-site, the demolition would still likely occur as analyzed explicitly in the Technical Report. As mentioned above the addition of the trailers would not substantively increase construction emissions, so would not impact the health risk assessment.

The Dialysis Center currently has an emergency generator. If the Dialysis Center remains at Building 43, the emergency generator may be tested a few more times after the start of demolition. However, in the Technical Report, the benefit of the removal of the emergency generator was not recognized until operations commence. Therefore, this additional testing would not affect the analysis in the Technical Report.

If the Dialysis Center temporarily moves to the trailers, four new 50-horsepower natural gas emergency generators may be installed. The total capacity of the new emergency generators is smaller than the existing emergency generator at Building 43, so would have lower emissions. Furthermore, the new emergency generators are expected to be natural gas powered. Health impacts from natural gas combustion are much lower than diesel combustion due to lower toxicity of the natural gas combustion

emissions. As such, any health impacts associated with the generators are expected to be much lower than exiting conditions. The relocation would temporarily move the emergency generators closer to the high school, but further from the residents and maximally exposed individual identified in the Technical Report. However, moving closer to the high school is not expected to change the maximally exposed individual because of the reduction in health impacts due to the use of natural gas emergency generators and their extremely low emissions profile.

Health Risk Assessment on Dialysis Center Patients

A health risk assessment of construction emissions was performed on the patients of the Dialysis Center for both the possible temporary locations: remaining at Building 43 and re-locating to the southwest portion of the site.

As discussed, construction emissions would not change from what was analyzed in the Technical Report with the Dialysis Center remaining in its current location or re-locating on-site. To perform a conservative assessment, the air dispersion modeling of the emissions was also not updated. This is conservative because it does not remove emissions from the demolition and grading associated with the respective locations (Building 43 or trailer location). Therefore, Dialysis Center receptors are co-located with emissions, which would overestimate results. Receptor locations are shown in **Figure 1**.

Exposure parameters were developed for an adult dialysis patient who requires treatment three times per week for three to four hours per treatment,[2] as shown in **Table 1**. This was implemented by using exposure parameters for an individual in the 16-70 age bin. The 95th percentile eight hour breathing rate for passive activities was used.[3] This assumes a person is exposed for 8 hours when patients would only be at the center for 3-4 hours a day. Additionally, exposure was assumed for the first 13 months of construction. This is conservative because the Dialysis Center is not expected to remain on-site for 13 months. The Modeling Adjustment Factor (MAF) of 2.55 used in the Technical Report was also used here.

Results of the health risk assessment, using the same methodologies as used in the Technical Report, are shown in **Table A** below. **Table A** shows the maximum impact at the existing location and at the relocated position, as shown in **Figure 1**. The mitigation is the same as was implemented in the technical report.

As shown in the table, the maximum impacts are the same or lower than the maximum off-site and on-site residential health impacts discussed in the Technical Report. The maximum $PM_{2.5}$ concentration at the existing location for the Dialysis Center is the same as the maximum $PM_{2.5}$ concentration reported in the Technical Report while all other health impacts are much lower than reported in the Technical Report. Therefore, further updates to the Technical Report are not necessary.

Table A. Summary of Health Risk Assessment Results at the Temporary Dialysis Center Location[A]				
	Existing Location (Building 43)		Relocated Location (Trailers)	
	Unmitigated[B]	Mitigated	Unmitigated[B]	Mitigated
Excess Lifetime Cancer Risk (in a million)	0.22	0.050	0.13	0.029
Chronic Hazard Index (HI)	0.031	0.0072	0.018	0.0041
$PM_{2.5}$ Concentration ($\mu g/m^3$)	0.46	0.18[C]	0.29	0.11[C]

Notes:

A. For the existing location (Building 43), the location of the maximum Excess Lifetime Cancer Risk and Chronic HI is UTMx 575,255, UTMy 4,148,275. Location of the maximum $PM_{2.5}$ Concentration is UTMx 575,345, UTMy 4,148,235.
For the relocated location (Trailers), the location of the maximum Excess Lifetime Cancer Risk, Chronic HI, and $PM_{2.5}$ Concentration is UTMx 575,105, UTMy 4,148,085.

B. The Unmitigated risks reflect default construction off-road equipment fleet. The Mitigated risks reflect use of 95 percent Tier 4 construction off-road equipment; the other 5 percent are assumed to have Tier 2 engines.
